"HIV reservoirs" in serpositive people seem to include: a) the epithelium of testis/epididymis, colorectum; b) monocytes/macrophages/endothelial cells of the uterine cervix; c) macrophages, antibody-producing B cells, endothelial cells of blood vessels, neuronal and non-neuronal brain cells. There are remarkable variations in HIV infectivity rate: some couples may be infected after 10 - 20 sexual contacts, whereas others can resist infection after thousands of sexual encounters. In asymptomatic seropositive healthy and HIV-carrier men, the titers of HIV in the semen is higher than most of other body fluids. Monocytes/macrophages and CD_8/T lymphocytes concentration and reverse transcriptase activity in semen are very variable. The molecular mechanisms of HIV-heterosexual transmission and the rate of infectivity/susceptibility have been evaluated in the semen using sensitive techniques such as immunofluorescent microscopy, TEM/SEM/and immunoelectron microscopy, flow cytometry, northern blot, reverse transciptase activity, and coculture/co infection of HIV from mononuclear cell fractions in seminal plasma. Monoclonal antibodies have been extensively applied to identify various antibody-binding sites on plasma membranes of mammalian spermatozoa. Various potential membrane barriers and different antigens patters include different segments of the acrosome post-acrosomal region, the midpiece, mitchondrial sheath.

C.653

ROLE OF HIV ENVELOPE GENE IN THE PATHOGENESIS OF HIV

Gabriella Tudor, James Hoxie*, Masahiro Inoue and E. Premkumar Reddy
Wistar Institute and *The University of Pennsylvania, Philadelphia PA 19104, U.S.A.

The role of HIV envelope gene in the pathogenesis of HIV was studied following two approaches. First portions of the envelope gene were mutagenized and their effect on the biological properties of HIV analyzed following the rescue of the virus from transfected cells. In a second approach, naturally occurring mutants of HIV which lack the cytopathic effects were characterized by molecular cloning, nucleotide sequence analysis and construction of recombinants between wild type proviral DNA and mutant proviral DNA. These studies indicate that mutations in multiple domains affect the cytopathic nature of HIV.

C.654

ALTERATION OF (2'-5')OLIGOADENYLATE METABOLISM AND RIBONUCLEASE L ACTIVITY IN H9 CELLS BY HIV

Müller, Werner E.G.; Schröder, H.C.
Institut für Physiologische Chemie, Universität, Duesbergweg, 6500 Mainz, West Germany.

Objective. To study the alteration of the 2',5'-oligoadenylate <(2'-5')A> metabolism in HIV-1-infected cells in relation to HIV production. Methods. Human T cells (H9), infected with HIV-1, have been used for the studies. Results. The synthesis of (2'-5')A was found to proceed in close association with the nuclear matrix. After HIV infection the (2'-5')A synthetase activity increased from 1.1 pmol (2'-5')A synthesized per 100 µg of nuclear matrix protein to 8.2 pmol at day 3 p. i. Then the activity dropped to the initial value. Simultaneously with the decrease of the (2'-5')A level the cells start to release HIV. At the time of maximum synthetase levels the (2'-5')A-activated Ribonuclease L (RNase L) activity strongly increased. Experimental evidence is provided revealing that RNase L degraded HIV transcripts. Conclusion. A correlation could be established between high levels of (2'-5')A and RNase L and a failure of the cells to release HIV. These results open a novel molecular pharmacologic approach on the level of (2'-5')A metabolism to screen in a rational way for new anti-HIV compounds. Refs.: Schröder *et al.*, Biol. Chem. Hoppe-Seyler 369, 985 (1988); Schröder *et al.*, J. Biol. Chem. 264, in press (1989). Supported by grants from the Bundesgesundheitsamt.

C.655

DIFFUSE INFILTRATIVE CD8 LYMPHOCYTOSIS IN HIV INFECTION IS ASSOCIATED WITH A PARTICULAR SUBTYPE OF HLA-DR5.

Silviu Itescu, L. Brancato, P.K. Gregersen and R. Winchester, Hospital for Joint Diseases, NYU Medical Center, New York, N.Y., U.S.A.

Objective. A disorder characterized by circulating and diffuse infiltrative CD8 lymphocytosis (DILS), predominantly involving the lungs and salivary glands, has been associated with HLA-DR5 in HIV-infected individuals. We sought to determine the relative risk conferred by HLA-DR5 to developing DILS, and to define the particular allele associated with this host immune response.
Methods. HLA typing was performed on patients with DILS and a control black population. HLA-DR5 subtype characterization was performed in three patients, using the polymerase chain reaction to obtain DNA sequence analysis of DRβ1 chains.
Results. HLA typing of nine black men with DILS revealed all (9/9) to be DR5. The frequency of HLA-DR5 in black control populations has been reported to be approximately 20-30%; DR5 was present in 33% of our local New York black control population. Thus, in black individuals with HIV infection, HLA DR5 confers an estimated relative risk for DILS of 35 ($p=0.001$). Four different subtypes of HLA-DR5 have been defined by mixed lymphocyte culture and DNA sequence analysis. One of these, designated JVM, is characterized by distinctive amino acid substitutions at positions 67 (Phe→Ile), 71 (Arg→Glu) and 86 (Gly→Val), in the third hypervariable region of the DRβ1 chain. This allele is present in approximately one third of all blacks typed serologically as DR5 (A.H. Johnson, unpublished results). All three patients that have been analyzed to date contained the identical JVM sequence in the third hypervariable region.
Conclusion. The data indicate that a distinct MHC class II allele, DR5 JVM, is associated with susceptibility to DILS in individuals infected with HIV. Furthermore, specific sequence polymorphisms in the third hypervariable region of the DRβ1 chain, which form the α helical rim of the MHC class II molecule, appear to be responsible for this effect. One interpretation of these findings is that a specific MHC-restricted immune recognition event is able to modify the host immune response in HIV infection.

C.656

SYNTHESIS, PROCESSING AND SECRETION OF AN IMMUNODOMINANT EPITOPE OF THE GP41 OF HIV EXPRESSED IN YEAST.

Gairin, Jean Edouard ; Madaule, P. and Rossier, J.
Laboratoire de Physiologie Nerveuse, CNRS, 91198 Gif/Yvette Cedex, France.

Aim. We describe a very efficient method for the production of a glycosylated peptide which is an immunodominant epitope in the gp41 of HIV.
Method. We used a new expression vector pSE-X which allows the synthesis and secretion of foreign gene products in *S. Cerevisiae*. The foreign DNA is inserted downstream the leader sequence of the mating pheromone α-factor. The secreted peptide is processed through a similar way to that of the α-factor (cleavage at the first KR site by the endoprotease KEX2 followed by removal of $(EA)_2$ by STE13 to generate the N-terminal matured peptide). N- or O-glycosylation may occur when potential sites are present in the sequence of the peptide.
Results. The HIV1 gene fragment (nucl.7573-7730) we inserted in pSE-X encoded for a peptide (51 a.a) containing the major viral epitope (WGCSG-KLICT) of the gp41 currently mapped as well as potential glycosylation sites. Time-course of the secretion in culture medium revealed an optimal production at 30h.(overall yield ≈ 200nmol/l). Western-blot, protein microsequencing and RIA analysis showed an heterogeneity of secreted recombinant peptide, probably due to different post-translational modifications. In ELISA assays, 1 µl/well of crude supernatant is sufficient for detection by monoclonal antibodies or sera from HIV infected individuals.
Conclusion. Recombinant (glyco)peptides produced by this system should be considered as antigens of interest usable in ELISA diagnostic tests and if strongly immunogen, in the development of vaccines.

C.657

C.658

A RAPID AND SENSITIVE MICROASSAY TO DETECT HIV-LTR ACTIVITY IN HUMAN CELL LINES USING LUCIFERASE LUMINESCENCE

Hazan, Uriel**; Schwartz, O.*; Hénin, Y.*; Montagnier, L.* and Virelizier J.L.**
*Unité d'oncologie virale, **Laboratoire d'immunologie virale, Inst. Pasteur, Paris, France

Objective. To develop a rapid, sensitive and unexpensive microassay that allow study of transactivator or inhibitor factor effects on HIV promoter.
Methods. Plasmids were constructed with the reporter gene firefly luciferase under the control of different versions of HIV-LTR. These plasmids were transfected in different cell lines: lymphoid, monocyte/macrophage and various adherent cell lines, using either DEAE-Dextran or Calcium Phosphate methods. These plasmids were also cotransfected with a vector expressing the autologous transactivator Tat-3 gene driven by the CMV immediate early promoter/enhancer. Assays were done in quadruplicates using 96 well microplates. After 24 or 48 hours incubation, cell viability was monitored by the MTT absorbance assay, and luciferase activity was measured in cell extracts as described elsewhere. Luciferase activity index was defined using the formula: [Mean(sample luciferase activity)-Mean (mock luciferase activity)]/Mean(sample MTT absorbance assay).
Results. For the different cell lines the following parameters were studied : cell concentration, plasmid amount, incubation time. Optimal conditions were obtained with 2.10^5 cells and 10 to 50 ng of plasmid(s), 2.10^4 cells and 5 to 10 ng of plasmid(s) in 250 µl culture medium per microwell, for adherent and non adherent cell lines respectively. Fold amplifications (ratio: transactivated LTR activity/basal LTR activity) were in the same order of magnitude as determined in a classical CAT assay, using 5 µg of each plasmid (LTR-CAT, CMV-Tat) for 15 millions cells.
Conclusion. Our microassay system allows determination of LTR driven luciferase activity using 100 to 1000 time less plasmids, 75 to 100 time less cells than classical CAT assay . Results can be obtained within 24 h incubation, without use of radiolabelled molecule. This method appears to be usefull for the study of the effects of antiviral drugs or immunological signals on the functionning of the HIV-LTR.

C.659

SEQUENCE VARIATION WITHIN AND BETWEEN HIV-INFECTED PATIENTS

Balfe, Peter; Simmonds, P.; Leigh Brown, A.J. and Bishop, J.O.
Department of Genetics, University of Edinburgh, UNITED KINGDOM

In early 1984 33 haemophiliac patients were treated with a batch of a factor VIII subsequently shown to have been contaminated with HIV-1; 18 of these patients have since seroconverted. There is good evidence that these patients were infected only from this source. These patients form a useful set for the quantitation of the rates of sequence change in HIV.

Lymphocyte DNA was prepared from early isolation material or buffy coats from several patients in the cohort and amplified by PCR. Several clones were made from each PCR product and sequenced. Amplifications of the env, gag and gag-pol junction region, were made. No variation has been seen at the putative ribosomal frame shift heptamer in the gag-pol junction DNA (Jacks et al., Cell 55: 447-58).

Estimates have been made both of the sequence divergence between patients and of the divergence between sequences within a single sample. The observed average inter-patient nucleotide distance of 0.07 is not significantly higher than the observed average intra-patient distance of 0.04. These distances agree well with the estimated nucleotide divergences from restriction enzyme mapping of other patients (Saag et al., Nature 334: 441-4).

C.660

HIV2 IDENTIFICATION THROUGH PCR.

Valérie Courgnaud* **; Lauré, F.* ****; Dazza, M.C.**; Sonigo, P.***; Brun-Vézinet, F.** and Bréchot, C.*.
*INSERM U.75 CHU Necke., Paris, **Laboratoire de Virologie, Hôpital Bichat, Paris, ***INSERM U.163, Institut Pasteur, Paris, ****Diagnostics Pasteur, Marnes la Coquette, France.

Objective. 1) To detect HIV2 DNA sequences in uncultured PBL from infected subjects. 2) To analyze the genetic variability of different HIV2 isolates.
Patients. 12 subjects with serological results clearly consistent with HIV2 infection. For 10/12 both PBL and cell cultures and for 2/12 only cell culture was available.
Methods. PCR with 40 cycles and 4 sets of primers (LTR, Gag, Pol, Env). Cloning of amplified products and sequencing.
Results. HIV2 DNA sequences were identified in 10/12 subjects including 8/10 PBL. In PBL samples only 2/8 scored positive with all primers tested while 6/8 scored positive with only 1-3 sets of primers.
When results with PBL and cell cultures were compared, the overall results were identical although cell culture samples scored positive for more sets of primers than PBL.
Conclusions. PCR can be used for HIV2 identification. Combination of several sets of primers appear critical to obtain reliable results. Sequence analysis of the amplified products is ongoing for analysis of genetic variability.

C.661

C.662

AUTOMATIZED FLUOROMETRIC SCREENING ASSAY FOR HIV-1 ASPARTYL PROTEASE INHIBITORS

Ph.-Henri Hirel, J. Boiziau, F. Parker, D. Outerovitch,
J.-F. Mayaux et T. Cartwright. Institut des Biotechnologies. Rhône-Poulenc Santé Vitry, France

Objective. To devise a fluorometric assay of HIV protease which allows automated random screening of inhibitors.
Methods. HIV-1 aspartyl protease was expressed to high levels in *E. coli* using a T7 expression system (Rosenberg *et al.* 1987). The fluorometric assay was based an analogous renin assay (Murakami *et al.* 1981).
Results. About 50% of insoluble proteins was composed of aggregated protease. Subsequent renaturation and purification yielded a homogeneous enzyme able to cleave various heptapeptidic substrates *in vitro*. with a K_m around 2.5 mM. We used the synthetic intramolecularly quenched fluorogenic substrate Suc-TLNFPIS-4MCA (the heptapeptide TLNFPIS which encompasses the protease/reverse transcriptase junction is coupled to the fluorophore 7-amino-4-methylcoumarin and blocked at the NH_2-terminus). The enzyme cleaves this substrate between Phe and Pro, conditions were optimized for liberation of 7AMC from the generated PIS-4MCA. 7AMC was monitored with a microplate fluorescence scanner.
Conclusion. The known aspartyl protease inhibitor pepstatin A consistently gave $K_i = 2.10^{-6}$ M. Other synthetic and natural compounds are currently being tested.

C.663

EPITOPE MAPPING OF THE HUMAN IMMUNODEFICIENCY VIRUS gag GENE PRODUCTS p24 AND p26 WITH MURINE MONOCLONAL ANTIBODIES.

Butman, Bryan; Venetta, T.; Crush-Stanton, S.; Swerdlow, B.; Youngbar, P*.; and Lockwood, D*. Bionetics Research Institute, Rockville, MD, *Organon Teknika Corporation, Durham, NC, USA.

Objective. To map immunogenic domains of HIV-1 p24 and HIV-2 p26 using murine monoclonal antibodies and to define epitopes conserved between the two proteins.
Methods. Overlapping synthetic and recombinant peptides of p24 were prepared and tested for reactivity with each monoclonal antibody (Mab) using ELISA and Western blotting techniques.
Results. Sixteen murine monoclonal antibodies reactive against native viral p24 were also reactive with a full-length recombinant clone of p24 generated from a cDNA library of HIV-1$_{RF}$. The Mab map within four discrete ranges along the 230 amino acid length of p24:

Map Group:	Amino acid residues (within gag open reading frame)
A	264-344
B	345-363
C	143-209
D	133-142

In addition, two of the Mab are cross-reactive with HIV-2 p26. Three of the Mab have proven useful in a sandwich ELISA for the detection of p24 and p26 in sera/plasma from infected patients and cell culture supernatants.
Conclusion. A large variety of epitope specificities are represented by the Mab and this has proven useful for the development of an in vitro assay.

C.664

HIV INFECTION OF THE GASTROINTESTINAL TRACT: COMPARISON OF THE SENSITIVITIES OF HYBRIDIZATION AND IMMUNOASSAY

Kotler, Donald P*; Reka, S*; Cronin, W**; Clayton F*; Fox, CH***.
*St. Luke's-Roosevelt Hospital Center, New York; **Lenox Hill Hospital, New York, ***Laboratory of Immunoregulation, NIH, Bethesda, MD, U.S.A.

Objectives. To use hybridization and immunoassay for detecting evidence of HIV in rectal mucosa; to compare the results with histopathologic features in the tissues.
Methods. Rectal biopsies from 25 HIV seropositive subjects (19 AIDS, 6 ARC) were examined by RNA in situ hybridization, polymerase chain reaction (PCR), a quantitative p24 ELISA, and p24 immunohistologic stains. Coded sections were examined for specific histologic features.
Results. Positive results were obtained by in situ hybridization in 24%, by PCR in 70%, by quantitative p24 Elisa in 73%, and by p24 immunoperoxidase stains in 80%. Only one AIDS patient was negative by all methods used. In situ RNA hybridization was demonstrated only in lamina propria lymphocytes and macrophages. By immunoperoxidase, p24 antigen could be detected in lamina propria lymphocytes and macrophages in 64% of cases. Antigen also could be detected in epithelial cells in 40% and intraepithelial lymphocytes in 24%. There were no correlations between the presence of HIV nucleic acids or tissue p24 content and specific histopathologic features.
Conclusions. Evidence of HIV in rectal mucosa is common. Of the methods used, in situ hybridization with viral RNA was the least sensitive technique for detecting virions. PCR was the most sensitive method for detecting viral genome. Methods to detect p24 antigen in mucosal homogenates or in tissue sections also are sensitive means of revealing evidence of HIV infection in the intestine.

C.665

ENZYME IMMUNOASSAY OF RECOMBINANT HIV PROTEINS.

Lewis, Stephen, Hufnagle, G., Scott, H., Bullard, W. and Van Winkle, M. (Beckman Instruments, Inc., Irvine, CA, U.S.A.)

Three enzyme immunoassays were developed to specifically quantitate 6 recombinant Type 1 HIV proteins in support of our development of ASQ-HIV assay for antibody to HIV.
- Using a direct solid phase sandwich technique, antigen under study was precoated in microtiter plate wells and reacted with specific mouse monoclonal antibody (Mab). After incubating in turn with rabbit anti-mouse alk. phos. conjugate and pNPP substrate, antigen was quantitated photometrically at 410 nm.
- In the second method, soluble antigen was studied using a competitive sandwich technique. This assay used precoated control antigens to react simultaneously with antigen specific Mab and the soluble antigen under study. Competition between soluble and bound antigen for Mab generated signal which was inversely correlated with concentration of soluble antigen.
- Finally, a more complex solid phase direct sandwich method was developed which featured the use of 1) avidin/biotin enhancement; 2) Mab to HIV proteins of both G1 and G2 subtypes and 3) rabbit, alkaline phosphatase conjugated antibody to the mouse monoclonal subtypes. The competitive assay was needed to speed analysis by alleviating the need to precoat plates with the antigens under test. The multistep avidin/biotin technique was employed when competitive displacement curves were difficult to obtain.

C.666

PROTEOLYTIC CLEAVAGE OF THE 66-Kd FORM OF THE HIV-1 REVERSE TRANSCRIPTASE.

Ferris, Andrea*, Hizi, A.**, Pichuantes, S.***, Babe, L.***, Craik, C.***, Showalter, S.D.**** and Hughes, S.H.*.

*BRI-Basic Research Program, ****Program Resources, Inc., NCI-Frederick Cancer Research Facility, Frederick, Maryland, USA, **Sackler School of Medicine, Tel Aviv University, Ramat Aviv, Israel, ***University of California, San Francisco, San Francisco, California, USA,

Objective. We wished to test the ability of viral and non-viral proteases to convert purified 66-Kd reverse transcriptase (RT) to the 51-Kd form.
Methods. The 66-Kd form of HIV-1 RT and the viral protease were separately purified to homogeneity from two recombinant strains of *E. coli*. Proteolytic cleavage sites on HIV-1 RT were mapped using a battery of monoclonal antibodies that recognize known positions in HIV-1 RT.
Results. Using a viral protease produced in *E. coli* we have been able to reproduce the specific conversion of the 66-Kd form to the 51-Kd form in a reaction that contains only HIV-1 RT and the protease. However, this poses the question of whether the specificity of cleavage resides in the protease or in the structure of the properly folded 66-Kd form of the RT. We have found that certain other proteases produce cleavage products closely related to the 51-Kd protein produced by the viral protease.
Conclusions. Of the tested proteases, the viral protease most closely reproduces the cleavage event seen in virions; however, unrelated proteases make similar cleavages suggesting that the structure of the 66-Kd form of the RT plays a significant role in defining the the site of protease cleavage.

C.667

STUDIES ON THE MECHANISM OF ENHANCEMENT OF HIV-ENVELOPE (env) EXPRESSION BY HIV-rev GENE USING ADENOVIRAL EXPRESSION VECTOR SYSTEM

Bhat, Bheem, Chanda, P., Natuk, R., Cholodofsky, S., Mason, B., Morin, J., Dheer, S., Molnar-Kimber, K., Lubeck, M., Mizutani, S., Davis, A., Hung, P. Biotechnology and Microbiology Division, Wyeth-Ayerst Research, P.O. Box 8299, Philadelphia, PA U.S.A.

The enhanced expression (30-70 fold) of HIV-env gene in human cell line, by co-infection of Adenovirus recombinants (Ad7-env and Ad7-rev) is a good vector system to explore the direct mechanism mediated by HIV-rev gene, since no other HIV-proviral gene(s) are present in these vectors. By comparing the steady state levels of mRNAs isolated from Ad7-env and also after co-infection with Ad7-rev, revealed that: 1) the env-specific mRNA(s) present in the cytoplasmic fraction after the co-infection with Ad7-rev, were qualitatively and quantitatively different from that in Ad7-env recombinant; 2) however, in the nuclear fraction of the above experiment, the env-mRNA(s) showed only a qualitative difference. Addition of Actinmycin D, 20 hr post-infection with Ad7-env for 1- 6 hr prior to mRNA extraction, resulted in a significant reduction in the cytoplasmic env-mRNA(s). In a similar experiment, but in presence of rev, there was no decrease in the cytoplasmic env-mRNA(s). Using these replicating Adenoviral recombinants in understanding the direct interaction of rev on env-mRNA processing will be discussed.

C.668

HIGH LEVEL EXPRESSION OF THE ENVELOPE GLYCOPROTEINS OF THE HUMAN IMMUNODEFICIENCY VIRUS (HIV) USING RECOMBINANT ADENOVIRUS VECTORS

Pranab K. Chanda, Robert J. Natuk, Lynda Greenberg, Bruce B. Mason, Bheem Bhat, Surendra K. Dheer, John E. Morin, Katherine L. Molnar-Kimber, Michael D. Lubeck, Satoshi Mizutani, Alan R. Davis, and Paul P. Hung. Biotechnology and Microbiology Division, Wyeth-Ayerst Research, P.O. Box 8299, Philadelphia, PA, U.S.A.

Recombinant adenoviruses containing either the envelope (env) or the rev (art/trs) genes of the human immunodeficiency virus type 1 (HIV) were constructed by inserting the genes into a cassette which contained adenovirus major late promoter, tripartite leader containing intervening sequence and the polyA. The cassette was then inserted between the E4 and ITR region on adenovirus genome. A549 cells infected with the env recombinant virus produced the envelope glycoproteins gp160, gp120, and gp41. HIV envelope gene expression made by the env-adenovirus recombinant can be greatly enhanced (30-70 fold) in A549 cells that were simultaneously infected with the rev-adenovirus recombinant as measured by ELISA, western blotting, and immunoperoxidase staining of infected cells. A double recombinant adenovirus which contains both rev and env genes was also constructed by inserting the rev gene in the deleted E3 region and the env gene in the terminal cassette. This double recombinant virus expressed high levels of env antigen in A549 cells similar to that expressed by cells that were doubly infected with both the env and rev recombinant viruses.

C.669 HPLC PURIFICATION OF p24 ANTIGEN FROM HIV-1 AND HIV-2 LYSATES

Tyson, R.L., Lile, C.C., Kilduff, J., Huskins, K.R., Furness, J.N., Reagan, K.J.
E. I. Du Pont Co., Medical Products Department, Glasgow Site, Wilmington, DE 19898, USA

Objective: To develop HPLC methods for the preparative isolation of the major internal core protein, p24, from HIV-1 and HIV-2 viral lysates.
Methods: Doubly inactivated, gradient purified HIV-1 lysate was chromatographed on a weak anion-exchange HPLC column. Fractions were analyzed by a combination of Western Blot, SDS-PAGE, and antigen ELISA methods. The pooled active fractions were further fractionated via reverse-phase HPLC and samples were analyzed for p24 immunoreactivity. HIV-2 viral lysate was treated in a similar manner.
Results: Anion-exchange chromatography of HIV-1 viral lysate afforded a complex profile in which the major peak contained p24 activity. Analysis of the active fractions by reverse-phase HPLC demonstrated that two viral components were present. These were separated by direct injection of the anion-exchange eluant onto a preparative reverse-phase column. A single component had p24 immunoreactivity and was shown to be homogeneous by SDS-PAGE and Western Blot analyses. HIV-2 viral lysate was initially analyzed by the same HPLC sequence. Subsequent experiments demonstrated that it was possbile to isolate homogeneous HIV-2 p24 by reverse-phase HPLC alone.
Conclusion: HPLC is a fast and efficient technique for the purification of the major viral core proteins from HIV lysates. Problems associated with other techniques such as immunoaffinity chromatography are avoided.

C.670 MEASUREMENT OF HIV GENE FUNCTION IN NORMAL HUMAN MONOCYTES/MACROPHAGES BY TRANSFECTION.

Elbeik, Tarek*; Kirihara, J.*; Crowe, S.**; McGrath, M.*; Mills, J.*.
*University of California, San Francisco, California.
**Fairfield Hospital, Melbourne Australia.

Objective. To understand the function of individual HIV genes in normal human peripheral monocytes/macrophages.
Methods. Both adherent and non-adherent macrophages as well as human foreskin fibroblasts were transfected with the constitutive CAT (chloramphenicol acetyl transferase) expression vector RSV-CAT and HIV LTR-CAT by three different transfection assays: lipofectin (BRL, Bethesda, Maryland, USA), calcium phosphate and DEAE dextran. Cell lysates were then assayed for CAT activity.
Results. CAT activity was detected in cell lysates from adherent macrophages transfected with RSV-CAT using the lipofectin reagent. No CAT activity was detected in cell lysates from adherent macrophages transfected with RSV-CAT by calcium phosphate or DEAE-dextran. Cell lysates derived from non-adherent macrophages transfected with RSV-CAT by all three methods did not exhibit CAT activity. Cell lysates from human fibroblasts transfected with RSV-CAT by the three transfection procedures were all positive for CAT activity. The effects of cytokine treatment and cell injury on HIV-LTR activity will be presented.
Conclusion. Transfection of human monocytes/macrophages by lipofectin using the HIV LTR-CAT expression vector will permit us to further understand activation and replication of HIV in this important population.

C.671 EXPRESSION, PURIFICATION AND IMMUNOREACTIVITY OF $pr17^{gag}$ in E. COLI

D. McCabe, D. Tribe, L. Gutshall, Y. Devash, K. Reagan, S. Erickson-Viitanen et al. E.I. Dupont de Nemours and Co., Inc., Medical Products Dept. Wilmington, Delaware, USA

Plasmid pGag17, which specifies the expression in *E. coli* of the mature, unfused $pr17^{gag}$ protein was constructed by extending the gag coding sequence from the Pvu II site at nucleotide 692 of Ratner*et al.* (Nature, 316, 277, 1985) with a synthetic oligonucleotide linker which introduces a stop codon after the TYR codon at the p17-p24 junction of $pr55^{gag}$. In pGag17, the coding sequence corresponding to nucleotides 334 to 729 of the BH10 isolate of HIV-1 is under transcriptional and translational control of the lambda P_L promoter. *E. coli* induced with a temperature shift express $pr17^{gag}$ in soluble form at a level of 5% of total soluble protein. Purification of $pr17^{gag}$ was achieved by ammonium sulfate fractionation, size exclusion chromatography, cation exchange chromatography and reverse phase HPLC. The purified protein has a pI of 6.5 to 7.0 and yields the expected sequence by Edman degradation and carboxypeptidase Y digestion. Sera from normal, healthy sero-positive, ARC and AIDS donors react in ELISA and Western Blot with this $pr17^{gag}$.

C.672 COMPLETE SEQUENCE OF A HIV-1 ISOLATE DETERMINED FROM cDNA CLONES OF VIRAL RNA;

Marleen Vanden Haesevelde, B. Vanderborght, J.L. Decourt, E. Saman, R.J. De Leys, H. Van Heuverswyn. Innogenetics N.V. Antwerpen, Belgium.

Objective: Oligo dT primed cDNA cloning of HIV viral RNA, allows fast analysis of virus variation.
Methods : Supernatant virus from a continuous HIV-1 producing Molt 4 # 8 cell line was pelleted and the precipitate was dissolved in GuHCl solution and centrifuged through a CsCl cushion. The resulting RNA pellet was further purified by phenol extraction and used for oligo dT-primed cDNA synthesis. The resulting DNA was electrophoretically sized and cloned into a plasmid vector. Recombinants were identified using colony hybridization and the inserts were mapped on the HIV-1 genome by restriction analysis and by sequencing both ends and comparison with the BH10 isolate.
Results : Screening of the HIV-1 cDNA library with HIV-1 subgenomic fragments yielded about 20 % positive colonies the inserts of which were scattered over the HIV-genome. A combination of five clones selected from this library contained sequences which covered the entire HIV-1 genome. The abundance of cDNA clones with internal priming at A-rich sequences was striking, indicating preference even over priming at the 3'end. Analysis of several clones covering the same area will allow us to estimate the importance of the variation present in the genome of a virus produced by a continuous infected cell line.
Conclusion : cDNA cloning of HIV-1 viral RNA provides a rapid way to analyze the variability of HIV from a producing cell line.

C.673 CHRONIC ACTIVATION OF THE INOSITOL POLYPHOSPHATE PATHWAY IN HIV INFECTED H9 LYMPHOBLASTOID CELLS

Nye, Keith E; Pinching, A.J.
St.Mary's Hospital Medical School, London,U.K.

Objective. To examine the metabolism of inositol polyphosphates, together with associated calcium changes, in H9 lymphoblastoid cells chronically infected with Human Immunodeficiency Virus (HIV) following stimulation, in order to determine whether any changes found may explain the functional defects seen in these cells.
Methods. Infected and uninfected H9 cells were labelled to equilibrium with myo-$[2-^3H]$ inositol, washed and resuspended in Earles Balanced Salt Solution at 2×10^6/ml with 10mM lithium chloride and stimulated with PHA (2ug/ml) for 10, 30, 60 or 120 seconds. The reaction was terminated by the addition of iced trichloroacetic acid, the cell debris removed by centrifugation and the supernatants extracted into diethylether. The water soluble inositol polyphosphates were separated on a Dowex AG1-X8 formate form anion exchange resin column using the method of Berridge et al.,(Biochem. J. 212; 473-482 1983). Intracellular free calcium levels were determined by the method of Tsien and coworkers (J.Biol.Chem. 260; 3440-3450 1985) using the fluorescent calcium probe INDO-1.
Results. Both inositol trisphosphate, inositol tetrakisphosphate and intracellular free calcium levels were elevated in resting, HIV infected H9 cells. On stimulation the $InsP_3$ level fell while the $InsP_4$ level increased threefold and the calcium level remained unchanged. The uninfected H9 behaved as a normal T-cell, stimulation causing an increase in $InsP_3$ followed by an increase in $InsP_4$ with an associated elevation in calcium level, similar to findings in lymphocytes from patients.
Conclusion. Infection with HIV chronically activates the inositol polyphosphate metabolic pathway and so impairs signal transduction response to receptor mediated activation. This suggests a common pathway whereby HIV can interfere with cellular function.

C.674 HAS THE MAJOR ENVELOPE GLYCOPROTEIN OF HIV-1 A LECTIN -LIKE ACTIVITY ?

Gattegno, L.* ; Clerget-Raslain, B**; Sadeghi, H* ; Fenouillet, E** Gluckman, J.C** and Bahraoui, E.*** . *Laboratoire de Biologie Cellulaire, Faculté de Médecine Paris Nord, ** CERVI - Hôpital de la Pitié 75651 Paris France ***Unité d'Oncologie virale, Institut Pasteur 75724 Paris, FRANCE

Objective. To determine whether gp120/160 expresses carbohydrate binding properties and thus behaves as a lectin. Methods. The effects of various carbohydrates on the binding of HIV-1 or of gp120/160 to CD4+ CEM cells was investigated by indirect immunofluorescence with gp120-specific mouse mAbs or purified human IgG. Binding of 125I-labeled gp120/160 to various affinity matrices was also investigated. Results. β-D-galactosyl, α-D-mannosyl, β-D-glucosyl, β-D-N-acetylglucosaminyl,sialosyl derivatives were devoid of effects on the binding of HIV-1 or of gp120/160 to CEM cells. However, preincubation of HIV-1 or of gp120/160 with β-D-GlcNac47-BSA, 1-33 μM (a gift from D. Bladier) completely abolished the binding (n = 10) of mouse mAb 110-4 (recognizing sequence 303-323 of LAV BRU gp120), but not that of other antibodies specific for other epitopes. Binding of Mab 110-4 was not affected by β-D-Gal-23-BSA and was only slightly decreased by α-D-Man16-BSA. The fact that preincubating CEM cells with β-D-GlcNac47-BSA followed by washing prior to the addition of HIV-1, did not modify labeling with Mab 110-4 further demonstrates that this neoglycoprotein competed with fixation of mAb 110-4 to gp120/160 and did not interfere with gp120/160 binding to the cells. In addition gp120 /160 was able to bind β-D-GlcNac47-BSA Sepharose and this binding was significantly inhibited when gp120/160 was preincubated either with soluble β-D-GlcNac-BSA (10-30 μM) or with asialoagalactoorosomucoid (16 μM), whereas no inhibition occured with α-D-Man-BSA or with β-D-Gal-BSA. Conclusion. Gp 120/160 behaves thus, as a β-D-N acetylglucosaminyl binding protein. This property may be used by HIV to attach to cell membranes independently of CD4, and it may be one of the explanations that HIV can infect CD4-cells under some circumstances.

C.675

SELECTION OF PRIMERS OF MAXIMUM HOMOLOGY FOR THE DETECTION OF HUMAN IMMUNODEFFICIENCY VIRUS SEQUENCES USING THE POLYMERASE CHAIN REACTION.

José Campione-Piccardo*, Arella, M.** and Brousseau, R.***
* Molecular Virology Laboratory, Laboratory Center for Disease Control, Ottawa, Ontario, Canada; ** Centre de Recherches en Virologie, Institut Armand-Frappier, Ville de Laval, Québec, Canada; *** Biotechnology Research Institute, National Research Council of Canada, Montréal, Québec, Canada.

Most of the oligonucleotide primers which have been proposed for the detection of human immunodefficiency virus (HIV) sequences using the polymerase chain reaction (PCR) contain mismatched bases for several HIV strains. This is particularly true for african HIV-1 and HIV-2 strains. Depending on the prevalence of the mismatched strains the use of these primers in PCR of clinical specimens is likely to cause different proportions of false negative results. Our objective was to optimize the design of primers maximizing their degree of homology to all available HIV sequences. In particular we have been interested in designing a pair of primers suitable for the amplification of HIV-1 and HIV-2 sequences.

We developed and implemented algorithms and computer programs not depending on multiple sequence alignement for the detection of the longest regions of homology within groups of related sequences. These tools were then used to detect the longest regions of maximum homology among all complete sequences available for HIV strains.

Based on this information we identified and synthetized a pair of "universal" oligonucleotide primers which in reconstruction experiments have allowed the specific amplification of the HIV sequences flanked by the primers. Work is under way to test the use of this pair of primers for the detection of HIV sequences in clinical specimens.

C.676

USE OF A CASSETTE EXPRESSION VECTOR FOR THE EXPRESSION OF HUMAN IMMUNODEFFICIENCY VIRUS TYPE 1 gp160 IN MAMMALIAN CELLS.

Salas, Teresa*, Arella, M.**, Mandy, F.*, O'Shaugnessay, M.V.* and Campione-Piccardo, J.***.

* Bureau of Laboratories and Research Services, Federal Center for AIDS, Health Protection Branch, Ottawa, Ontario, Canada; ** Centre de Recherches en Virologie, Insitut Armand-Frappier, Laval, Québec, Canada; *** Molecular Virology Laboratory, Laboratory Center for Disease Control, Ottawa, Ontario, Canada.

The surface glycoprotein of the human immunodefficiency virus (HIV-1) has already been expressed in vitro using different expression vectors. We have chosen the pORFEX cassette vector expression system which contains a powerful cytomegalovirus (CMV) promoter to express the entire gp160 in mammalian cells.

Our design required the excision of a Bbv II 2.9 Kbp fragment of HIV-1 DNA from plasmid pBH10R3. This fragment contains the entire open reading frame in the env region of the HIV-1 genome. The Bbv II enzyme cuts the molecule 5 bases before the first ATG in the env region of HIV-1 and 323 bases after the TAA stop codon in the same open reading frame. This 2.9 BbvII fragment was blunt ended by filling-in with Klenow polymerase and EcoR I linkers were added. The new EcoR I fragment was cloned into the EcoR I site in the polylinker of the pORFEX vector such that the first ATG in the open reading frame of the insert was in frame with the first ATG after the capping site of the CMV promoter.

Cells expressing the HIV-1 gp160 are being tested as target cells for immunocytolitic assays.

Acknowledgements. The authors wish to thank Dr. M. Harper (N.I.H, MD, USA) for making available the pBH10R3 construct, Dr. U. Bernard (Singapore University) for providing the pORFEX expression vector system, and Dr. N. I. Matvienko (Institute of Protein Research, Academy of Sciences of the U.S.S.R., Moscow Region) for his kind gift of restriction enzyme Bbv II.

C.677

SYNTHESIS AND PROCESSING OF HIV mRNA IN THE PRESENCE OF ANTIVIRAL AGENTS

Chatis, PA and Crumpacker, CS.
Beth Israel Hospital/Harvard Medical School, Boston, MA, USA.

Objective. Several antiviral agents inhibit the replication of HIV *in vitro*. Ribavirin (RBV) has been shown to interfere with post-transcriptional processing in vaccinia. We examined effects of RBV in combination with other antiviral agents on the size and amount of RNA synthesized in infected cells. Methods. Cytoplasmic (HIV) RNA isolated from infected cells treated with RBV was analysed by northern blot using a ^{32}P labelled DNA env probe. Virus replication was assayed in cultured lymphocytes using the p24 antigen assay. Results. Previous data has shown that RBV treatment of HIV infected T cells suppresses viral protein synthesis and DNA replication (Crumpacker et al. Abs. 1st Int Conf AIDS 1985). Envelope proteins are suppressed by 70% in the presence of 20 ug/ml of RBV. An HIV env gene probe was used to measure the size and abundance of HIV cytoplasmic RNA isolated from infected cells synthesized in the presence of increasing concentrations of RBV. A marked decrease in the amount of 3.5 kb env RNA occurred with increasing concentrations of RBV. In addition, there was a dramatic increase in the 38S genomic RNA species in RBV treated cells as compared to non-treated cells. When ddA was used in conjunction with RBV, a similar decrease in env specific RNA occurred with only 20% the RBV concentration as when used alone. Conclusion. RBV and other drugs may result in altered amount and size of HIV RNA. Direct measurement of viral RNA is useful to study effects of antiviral agents. The combined effects of RBV and other anti-viral agents on transcription and translation of pol and env RNA species *in vitro*, are being studied to better understand the mechanism of action of these agents

C.679

A MOUSE MONOCLONAL ANTIBODY AGAINST THE REV-PROTEIN OF HIV-1

Voll, R.; Aepinus, Christian; Krapf, F.,* Fleckenstein, B.; and Kalden, J.R.*
Institut für Klinische und Molekulare Virologie und *Institut für klinische Immunologie und Rheumatologie der Universitat Erlangen-Nürnberg, D-8520 Erlangen, FRG

The rev-protein of immunodeficiency viruses has an important function in structural gene expression. A β-gal-rev fusion-protein containing the aminoterminal part of β-galactosidase was synthesized in E. coli. It was used to raise a rev-specific immune response in mice. After fusion with the SP2/O cell line stable hybridoma clones were established. Clones were isolated that secreted monoclonal antibodies specifically recognizing the rev part of the fusionprotein. They were identified by ELISA and Western blot. Data demonstrating recognition of the eukaryotic protein and intracellular localisation will be presented.

C.680

CHARACTERIZATION OF AN HIV-1 POINT MUTANT BLOCKED IN ENVELOPE GLYCOPROTEIN CLEAVAGE

Guo, Hong-Guang*; Veronese, F.**; Tschachler, E.*; Pal, R.**, Gallo, R.C.*; Reitz, M.S. Jr.*.
*National Cancer Institute, Bethesda, Maryland, USA
**Bionetics Research Laboratory, Inc., Bethesda, Maryland, USA

The envelope proteins of retroviruses are derived from a polypeptide precursor protein by cleavage adjacent to a cluster of basic amino acids. Site specific mutagenesis was used to construct a mutant of the human immunodeficiency virus type 1 (HIV-1) in which the arginine residue at the carboxy terminus of the gp120 was changed to a threonine residue. This single substitution was sufficient to abolish all detectable cleavage of the gp160 envelope precursor polypeptide. Immunofluorescence assays showed that gp160 was transported to the surface of transfected CD4+ HeLa cells. No envelope proteins of known size could be detected in the media of cells transfected with the mutant virus, suggesting that functional virion release was impaired. Binding of the mutant gp160 to the CD4 receptor molecule was unimpaired. In spite of this and the presence of gp160 on the cell surface, neither growth of virus-transfected CD4+ HeLa cells nor cocultivation of transfected cos-1 cells with H9 cells resulted in significant syncytium formation. The data indicate that the carboxy terminal arginine residue of HIV-1 gp120 is necessary for envelope protein cleavage, and suggest that a lack of cleavage inhibits the virus life cycle at the steps of both virus release and membrane fusion.

C.681

COMPARISON OF REVERSE TRANCSRIPTASE OF HIV-1, HIV-2 AND SIV

Lori, Franco*; Achilli, G.**; Cattaneo, E.**; Sarin, P.S.*** and Bertazzoni, U.*
*IGBE/CNR, Pavia, Italy, **IRCCS Pol. S. Matteo, Pavia, Italy, ***National Cancer Institute, Bethesda, Maryland, USA.

Objective. To compare the structural and biochemical properties of reverse transcriptase of HIV-1, HIV-2 and SIV.
Methods. An activity gel method was used allowing identification of the active components of reverse transcriptase on polyacrylamide gel, after electrophoresis under denaturing conditions.
Results. We have confirmed the presence of three active polypeptides of 165, 66 and 51 kDa in HIV-1 reverse transcriptase (F. Lori et al, AIDS Res. and Hum. Retrov. 4: 393, 1988). A similar three active band pattern was also observed for RT from HIV-2 (with sizes of 175, 75 and 62 kDa) and SIV (with sizes of 175, 70 and 59 kDa). The migration and the band intensity of the high and the low reverse transcriptase forms of HIV-2 and SIV appear to be closer than those of HIV-1.
Conclusion. In all three AIDS related retroviruses a high Mr putative precursor and two lower active peptides of reverse transcriptase are present. The structural properties of reverse transcriptase from HIV-2 and SIV are similar and tend to differ from those of HIV-1.

C.683

HIGH LEVEL EXPRESSION OF HIV PROTEASE IN *E. COLI*

Olsen, M.K.; Rockenbach, S.K.; Tomasselli, A. and Tomich, Che-Shen C.*.
The Upjohn Company, Kalamazoo, Michigan 49007, USA

We have obtained high level expression of the HIV protease in *E. coli* using the trp promoter and a runaway vector. Upon induction of the runaway function to increase plasmid copy number, the protease production results in the accumulation of inclusion bodies. In a pBR322-derived vector, the expression level is greatly decreased. Fusion of the protease to its pro-sequence, to β-galactosidase, or to bovine growth hormone gave only low level accumulation of the product as the fusion form or the auto-processed form. Low level expression was also obtained by fusion of the protease to *E. coli* signal peptides to expression the protease by secretion.

To monitor expression and to test if the HIV protease made in *E. coli* is active *in vivo*, two truncations of the HIV gag protein containing parts of the p24 region were used as substrates. These gag truncations have been expressed to high levels using the trp promoter in a pBR322-derived vector. The sequence coding for protease was placed immediately downstream of the gag sequence in an operon fusion arrangement. Activity of the protease can be directly measured by its ability to cleave the gag protein into the product p24 which is detected by Western analysis.

Inclusion bodies containing HIV protease were dissolved in urea or guanidine-HCl. Upon dilution of the chaotropic agent, the protease is active on synthetic peptide substrates. For comparison, the *E. coli*-derived gag truncations are being tested as substrates.

C.685

C.682

BIOPHYSICAL CHARACTERIZATION OF REVERSE TRANSCRIPTASE(RT) FROM HIV

Schultze, Peter; Filipowsky, M.E.; Kopka, M.L. and Dickerson, R.E.
Molecular Biology Institute, UCLA, Los Angeles, CA 90024, U.S.A.

Objective. In order to find conditions for the growth of single crystals suitable for x-ray structure analysis, various experimental techniques were applied to characterize the properties of RT in solution, especially with regard to dimerization equilibria. Methods and Results. Protein preparations from E.coli cultures carrying a plasmid with the full p66 sequence were analyzed, comparing pure p66 samples with p66-p51 mixtures. Analytical ultracentrifugation shows 2 species at 3.9S and 5.9S in a p66 solution. Chemical crosslinking with Dimethylsuberimidate indicates strong dimer-formation in p51-p66 mixtures, and weaker dimer-formation with more higher aggregates in pure p66 samples. FPLC runs on a size-exclusion column give one peak for p51-p66 samples and 2 clearly separated peaks for pure p66. Both peaks show high activity in a specific assay for reverse transcription activity, and yield a single band under denaturing conditions on PAGE with SDS. Fractions of each of these peaks give the corresponding single peak when reinjected within a few hours at room temperature. Conclusion. In solutions of pure p66 RT homodimers coexist with monomeric species in a slow equilibrium. Under similar conditions, mixtures of p51 and p66 form heterodimers with significantly stronger affinity.

C.684

A GENE FAMILY WITH HIV-LIKE POTENTIAL REGULATORY MOTIFS

Forsdyke, Donald; Blum, S.; Sideris, D.P. and Forsdyke, R.E.
Department of Biochemistry, Queen's University, Kingston, Ontario, Canada K7L 3N6.

Objectives. To understand the molecular basis by which HIV establishes, maintains and escapes from, latency. To identify genes in T-lymphocytes which regulate, are regulated by, or are coregulated with HIV.
Methods. "Latent" peripheral blood lymphocytes in the G0 phase of the cell cycle were activated by culturing with lectin and cycloheximide for 2h. cDNA libraries enriched for G0/G1 switch (G0S) genes were screened by differential cDNA hybridization (Forsdyke, 1985; Biochem. Biophys. Res. Comm. 129, 619-625).
Results. Among the recombinants one, G0S19, is the first identified human homologue of the mouse "activation gene" family (MIP, JE, TCA3; Burd et al. 1988, Cell. Immunol. 115, 481-483) and is identical to LD78 (Obaru et al. 1986; J. Biochem. 99, 885-894). We have identified 3 genes in Lambda Charon 35 libraries which hybridize with G0S19 cDNA. Three of these have been restriction mapped and two sequenced. One has the identical sequence to the cDNA. Of particular interest are two sequences in the 3' non-coding region which are conserved in MIP: (i) TTTTTGTAATTTATTTT which differs only by a purine transition from a 3'HIV pol sequence and (ii) GGGACTCTTC which differs only by 2 pyrimidine transitions from the NFkB-binding HIV 5'enhancer.

Conclusion. We speculate that genes concerned with latency in HIV and in G0 lymphocytes are coregulated by similar transacting factors.
(Supported by the American Foundation for AIDS Research)

C.686

NEEDLE/SYRINGE EXCHANGE SCHEME BASED ON COMMUNITY PHARMACIES, TRONDHEIM, NORWAY

Blystad, Hans; Skjaervold, K; Evjen, L; Hustad, T. Trondheim Health Board, Norway

Objective. To evaluate exchange scheme based on community pharmacies and local Aids clinic during 10 months trial period. Injection equipment could otherwise be purchased by ordinary sales from all pharmacies. Methods. All syringes exchanged or sold carries a label stressing the importance of sterile equipment and use of condoms together with an introduction to the scheme. No. of syringes sold or exchanged were recorded, questionnaires were presented to IVDA and pharmacy employees. Results. Total no. of syringes/needles showed no increase during the trial period, while the return rate increased to 19%. Pharmacies reported no conflicts, IVDA reported a positive attitude to the scheme, but showed no significant change in risk behaviour. No significant change in the incidens of HBV and HIV were reported. No syringes were returned to the Aids clinic. Conclusion. An exchange scheme based on community pharmacies were favoured by IVDA to specialised clinics run by HCW. Only marginal effect on the prevention of HIV and HBV transmission can be expected where syringes are already easily available.

C.687

HIGH LEVEL EXPRESSION IN *E. COLI* OF A TRUNCATED CD4 AND ITS PURIFICATION, REFOLDING AND ACTIVITY

Garlick, R.L.; Kirschner, R.J.; Tarpley, W.G. and Tomich, Che-Shan C.*. The Upjohn Company, Kalamazoo, Michigan 49007, USA

To develop a CD4 molecule as a potential therapeutic agent for the treatment of AIDS, we have produced a truncated sCD4 containing the N-terminal 183 amino acid residues of CD4 preceded by a methionine. The expression of this CD4-183 is in *E. coli* from a pBR322-based vector under the control of a trp promoter for transcription and a ribosome binding site rich in A and T bases for efficient translation initiation. High level expression results in the accumulation of CD4-183 as insoluble inclusion bodies, amounting to greater than 20% of total cell protein.

The aggregated, denatured product does not solubilize well under conditions effective with some other *E. coli*-derived recombinant proteins. Use of chaotropic agents at alkaline pH substantially enhances solubilization. The solubilized material can be renatured and purified with a CD4 monoclonal antibody affinity column followed by gel filtration chromatography. The purified CD4-183 is homogeneous in SDS-PAGE stained with silver, has the predicted amino acid composition, and has one N-terminal amino acid sequence, beginning with met-lys-lys-val--.

This purified CD4-183 appears to have the conformation and disulfide bridges for the native molecule, judged by its ability to bind to 2 CD4 monoclonal antibodies specific for domain 1 or 2 and to purified HIV gp120.

IMMUNOREACTIVITY OF A RECOMBINANT POLYPEPTIDE CONSISTING OF THE AMINO HALF OF HTLV-1 p21E.

Thorn, Richard M.; Braman, V.; Wilde, A.; Seals, J.; Hung, C.-H.; Beltz, G.A.; *et al.* Cambridge BioScience, Worcester, MA., USA

Objective. To determine the immunoreactivity of recombinant polypeptide consisting of the amino half of HTLV-1 p21E.

Methods. A DNA clone was derived that codes for the amino-terminal 132 amino acids of the HTLV-1 p21E protein (307-313 and 331-420). The clone was expressed in *E. coli* using a vector containing the bacteriophage lambda pL promoter. The polypeptide expressed (CBre1) was purified to greater than 99% purity by a variety of chemical and chromatographic methods. The purified polypeptide was employed in a microwell indirect enzyme immunoassay (EIA). 175 samples from geographically diverse, high expected incidence groups were tested with this assay and with one or more of the commercially available EIAs, and some samples were tested by a commercial HTLV-1 blot and a gp46 Western blot.

Results.

		Commercial EIA	
		Pos[a]	Neg
CBre1 EIA	Pos	100	1[b]
	Neg	30[c]	44

[a] Positive by any one of three manufacturers.
[b] HTLV-1 blot positive
[c] 19 HTLV-1 blot negative or no p24
11 HTLV-1 blot not done, negative by gp46 blot

Conclusion. The p21E recombinant antigen reacted with only the clearly positive samples, which may make it useful as an HTLV-1 serological "confirmatory" test.

C.694

CLONING AND EXPRESSION OF HIV-1 AND HIV-2 PROTEASES IN E. COLI

Simmer, Robert L.; Hellrich, R.; Rittenhouse, J.; Albrecht, K.; Hochlowski, J.; Rupprecht, K.R.* et al. Pharmaceutical Products Division and *Abbott Diagnostics Division, Abbott Laboratories, Abbott Park, Illinois, U.S.A.

Objective. To produce active recombinant HIV proteases for the rational design of specific HIV inhibitors.
Methods. A gene representing the region of the HIV-1 *pol* gene up to the start of reverse transcriptase was constructed using seven synthetic oligonucleotides. This region codes for the 11kDa viral protease and an additional 8kDa at the amino terminus. The synthetic gene was inserted into an expression vector behind the bacteriophage lambda pL promoter such that a 45kDa fusion protein was produced upon induction in E. coli cells. During expression, the HIV-1 protease faithfully processed itself away from the precursor. By amino acid sequencing, it was shown that the bacterially expressed protease had the correct amino terminus, and in Western blot analysis it was recognized by antisera raised against a synthetic peptide of the last 13 amino acid residues of native protease. A synthetic gene for HIV-2 protease was similarly cloned and expressed.
Results. Following induction, E. coli lysates of the HIV-1 protease expression system were mixed with lysates of an HIV-1 $Pr55^{gag}$ expression system and incubated at 37°C. The reaction mixture was electrophoresed on SDS/PAGE, Western blotted, and immunostained using monoclonal antibodies to p17 and p24. Faithful processing of the recombinant $Pr55^{gag}$ to p17 and p24 by the bacterially expressed HIV-1 protease was demonstrated. Both the protease and $Pr55^{gag}$ were purified from their respective bacterial expression systems. When incubated together and then electrophoresed on SDS/PAGE, bands apparently representing p15, p17 and p24 were observed by Coomassie staining. This assay has been used to identify inhibitors of the HIV-1 protease.
Conclusion. Recombinant HIV protease can be expressed in E. coli as fusion proteins which may be autoprocessed to produce active, full-length enzyme which faithfully processes a recombinant polyprotein substrate, $Pr55^{gag}$. Assays utilizing $Pr55^{gag}$ and synthetic peptide substrates are being employed to assess HIV protease inhibitors.

C.695

C.696

CHARACTERIZATION OF A MOLECULAR SIVagm CLONE

Cichutek, Klaus; Baier, M.; Werner, A.; Kraus, G.; Kurth, R.
Paul-Ehrlich-Institut, Frankfurt am Main, FRG.

SIVagm is a lentivirus closely related morphologically and genetically to HIV. 40% of African Green Monkeys (AGM) in the wild are found to be seropositive without any signs of disease. We have isolated SIVagm from several naturally infected AGMs harbored in our colony at the Paul-Ehrlich-Institut, FRG.
Molecular cloning of SIVagm was performed by Eco RI digest of Hirt DNA obtained from infected Molt 4/8 cells. After ligation of single cut viral DNA into lambda-gtWES, positive clones were detected by hybridization with an HIV-1 derived gag-pol probe under conditions of low stringency.
The complete nucleotide sequence of a full length clone (pSIVMB1) will be presented. Biological activity was demonstrated by transfection of pSIVMB1 into Molt 4/8 cells and detection of RT activity and viral antigens in the cell supernatant. Infectivity was tested in vitro by cell free infection of Molt 4/8 and in vivo by seroconversion of AGM after inoculation with virus from the transfected cultures.
Reisolation and characterization of SIVagm from monkeys infected by cloned virus will provide us with a valuable model system for lentivirus infection in its natural host.

C.697

A CD4-IMMUNOGLOBULIN FUSION PROTEIN AS A CANDIDATE FOR AIDS THERAPY

Zettlmeissl, Gerd W. *; Gregersen, J.-P. *; Duport, J.-M.* and Seed, B. **.
* Research Laboratories of Behringwerke AG, Marburg, F.R.G.
** Department of Molecular Biology, Massachusetts General Hospital, Boston, Massachusetts, U.S.A.

Objective: An new antibody-like molecule (CD4H23) containing the soluble part of the HIV receptor CD4 coupled to the constant part (Fc) of human IgG1 immunoglobulin was synthesized and tested as an anti-HIV reagent in vitro. The molecule may combine the specific binding properties of CD4 to the virus with functions of an antibody's Fc-part (long plasma half-life, complement and antibody dependent cell toxicity).
Methods: CD4H23 was expressed in BHK cells, purified by affinity chromatography on Protein A-Sepharose and tested for its ability to neutralize HIV and for its action on HIV infected T-cells.
Results: CD4H23 is a disulphide linked dimer with a subunit molecular weight of 80 KDa which binds to HIV gp120. In this fusion protein the binding of the human Fc-part to Protein A as well as to Fc-receptors is retained. When injected intravenously into mice and monkeys CD4H23 has a serum half-life of about 12 hours. The CD4H23 molecule blocked infection of T4-cells with HIV-1 and HIV-2 as determined by reverse transcriptase assays and microscopical cell fusion analysis for at least four weeks. H9 cell cultures containing 10 % virus producing cells were treated with CD4H23: infection of further cells was significantly reduced, giant cells disappeared and reverse transcriptase activity remained low or became negative in the presence of complement.

C.698

SPORULATION PROMOTER *SPO*VG CONTROLED EXPRESSION OF P41 GENE OF HIV-1 IN *BACILLUS MEGATERIUM*.

Ginsburgh, Charles; Spaulding, D.; Robey, G.; Shivakumar, A.; McCall, O.; Vanags, R.; *et. al.* Abbott Laboratories, North Chicago, Illinois, USA.

Objective ... Expression of full length recombinant HIV-1 p41 protein from *E. coli* results in marginal production of a partially degraded protein. Here we describe the successful expression of this full length hydrophobic protein from a gram positive bacteria.
Methods ...The promoter PspoVG for the gene encoding the sporulation protein SpoVG present in a chimeric plasmid pAS5 was placed in phase with the reading frame to direct full length HIV-1 p41 expression in *B. subtilis* and *B. megaterium*. The resultant plasmids pAS14, containing the erythromycin resistance gene for selection or the modified plasmid pOM10 containing the chloramphenicol resistance gene for selection, expressed the p41 gene at detectable levels in *B. subtilis* in the beginning of the stationary phase and at high levels in *B. megaterium* as judged by Western and Dot blot assays.
Results ...When *B. megaterium* was grown in a 10L fermentor under standardized conditions, p41 antigen expression was observed transiently in log phase growth (6-9 hrs.), and for a second time much later during the sporulation cycle (48-72 hrs.). This second peak of p41 antigen activity as determined by both Bead and Dot blot assays was much higher than the first peak. The antigen from *B. megaterium* was found to be of higher quality than that currently available from similar *E. coli* clones and the purfication of the antigen was simplified as the antigen stayed as an insoluble pellet.
Conclusions ... Higher expression levels, ease of growth resulting in higher cell density (4-5 fold over *E. coli*), negligible product degradation, and ease of purification makes *B. megaterium* an attractive system for the production of recombinant DNA derived products.

HISTOPATHOLOGICAL STUDY OF HIV ASSOCIATED NON HODGKIN'S LYMPHOMAS. THE VALUE OF MORPHOLOGICAL CLASSIFICATIONS.

Raphaël M°, Tulliez M*, Menin D°, Berger F°°, Lenoir G°°°, Diebold J**.
° Pitié-Salpêtrière, * Cochin, ** Hotel Dieu Hospitals Paris France.
°° E.Herriot, °°° CIRC. Lyon France.

High grade of malignancies Non Hodgkin's Lymphomas (NHL) are associated with AIDS. Using the international working formulation and Kiel classification, large cell, Burkitt's and Immunoblastic NHL were recognized.
Objectives and methods : to describe NHL in AIDS patients, a multicentric study was organized to obtain slides from NHL cases. 101 cases were registred. For all cases the slides were reviewed by at least three hematopathologists.
Results : In only 57 % of case the histologic concordance were obtained identifying subcategories of NHL : large cell (7 %), immunoblastic (30 %) and Burkitt's (20 %). In 32 % of cases the histologic concordance was not obtained especially between immunoblastic and Burkitt's ; most cases have shown intermediate aspects with pleomorphous proliferation of small non cleaved cells with plasmacytic differentiation or associated with immunoblasts. In some cases histological changes (immunoblastic to Burkitt's or Burkitt's to immunoblastic) were observed.
All cases were B cell type monoclonal or polyclonal CD10 and CD23 were variously expressed - HLA-DR, TrR and Ki 67 mAb were positive in most cases. The EBV genome was not constant in a small series of cases tested.
Conclusion : Thus, morphologic features, immunologic phenotype and molecular biology are necessary to distinguish subcategories of NHL in AIDS patients.

AIDS-ASSOCIATED EARLY STAGE SYNOVIAL KAPOSI'S SARCOMA (KS) OF THE KNEE.

Mesquita,Roberto P.*;Bauer,P.G.*;Basílio,C.A.**;Oliveira,R.L.**;Sion,F.S.**,Sá,C.A.M.**et al. *Virology,FIOCRUZ,Box926,Rio,Brasil.
**Hospital Gaffrée e Guinle,UNI-RIO,Rio,Brasil.

Objective. To describe by optical and ultrastructural techniques a synovial KS with evidences of lymphaticovenous anastomoses.
Methods. Light and electronmicroscopy were applied to synovial biopsy specimens of the knee of a 26 year old HIV infected homosexual man with clinical diagnosis of polyarthritis (knee, ankle and elbow).
Results. In semithin sections,a multifocal proliferation of capillaries and few spindle cells among a discrete mononuclear (lymphocytes, plasma cells) infiltrate, few neutrophils and rare degranulating mast cells were present. Multiple abnormal anastomoses of blood-lymphatic vessels with intense lipid embolisation and venular thrombosis were also observed. Ultrastructurally; bloodless, blood-filled, lipid-filled or blood-lipid-filled irregular vascular spaces were frequently bordered by discontinuous pleomorphic endothelial cells, having few atypical spindle shaped endothelial-like cells in its neighbourhood. Entrapping of matrix elements (e.g. collagen), prominent filament bundles, tubuloreticular structures in enlarged rough endoplasmic reticulum, strongly convoluted nuclei, multiple prominent nucleoli and necrosis of individual cells were features observed in these endothelial cells.
Conclusions. These ultrastructural findings and microcirculatory aberrations provide sufficient cytologic and architectural support to define this new site for KS and recommend ultrastructural examinations of synovial biopsy specimens of HIV-infected patients.

ABSENCE OF ANTIBODIES TO HTLV-I/II IN FRENCH PATIENTS WITH HEMATOLOGICAL MALIGNANCIES

Agius, Gérard*; Vaillant, V.*; Biggar, R.**; Ranger, S.*; Dindinaud, G.* and Castets M.*.
* CHU La Milétrie, Poitiers, France; ** NCI, NIH, Bethesda, Maryland, USA.

Objective. To evaluate 334 (191 males and 143 females) French patients with hematological malignancies for evidence of HTLV-I/II reactivity.
Methods. The leukemia and lymphoma cases included 163 and 132 cases, respectively. None of these patients was diagnosed as having adult T-cell leukemia/lymphoma. Other cases included 16 cases of multiple myeloma, 9 of sarcoma, 6 of macroglobulinemia, 5 of histiocytoma, 2 of mycosis fungoides (MF), and one of agnogenic myeloid metaplasia. Sera were screened by ELISA (DuPont). All reactive sera were confirmed by Western blot (WB) testing (DuPont). Sera from patients with hairy-cell leukemia (HCL; 14 cases) and MF were subjected to WB regardless of the results of the screening test.
Results. Sera from 7 patients with leukemia and 8 patients with non-Hodgkin's lymphoma (NHL) (15/334=4.5%) were positive by ELISA, but none of these results was confirmed by WB. Three of these sera had weak reactivity in the WB on the p19 and p28 bands in a patient with chronic granulocytic leukemia, and on the p55 band only in a patient with NHL and another with Hodgkin's disease. All WB on the sera from patients with HCL and MF were negative.
Conclusion. The absence of HTLV-I/II reactivity in these Caucasian French patients confirms the earlier report from the Federal Republic of Germany that this virus is not associated with hematological malignancies in Western Europeans.

C.703

GENETIC ANALYSIS OF BURKITT'S LYMPHOMA CELLS FROM A PATIENT WITH AIDS

Rasheed Suraiya, Yao K. L., and Zhou J. T.
Laboratory of Viral Oncology and AIDS Research, USC School of Medicine,
Los Angeles, CA, U.S.A.

Objectives: To identify genetic sequences that may contribute to the development of B-cell lymphomas in patients with AIDS.
Methods: B-lymphocytes naturally infected with the Human Immunodeficiency Virus (HIV) were established in vitro from the peripheral blood of patients with AIDS-related lymphomas. Cells were characterized for the cell-surface markers, karyotypes and genetic sequences related to several viral and cellular genes.
Results: All cells established in culture displayed B-cell surface markers, exhibited 8:14 chromosomal translocation and trisomy of chromosome 12, characteristic of Burkitt's-like lymphomas. Although no reverse transcriptase activity or HIV p24 antigen was detected in the culure, Southern blot hybridization of the cellular DNA with HIV, HTLV-1, HIV-2 and EBV molecular probes revealed the presence of EBV-DNA and HIV-provirus integrated in the tumor DNA. No hybridization was detected with HTLV-1 and HIV-2 viral DNA. In addition, we have detected enhanced expression of the c-myc proto-oncogene in the cellular RNA and rearrangements of both the bcl2 and the c-myc genes in the B-cell lymphoma DNA. Moreover, by immunoblot analysis of lymphoma cell extracts, we have identified a protein of about 40,000 dalton that cross-reacts with sera from individuals infected with HIV-1 or HIV-2.
Conclusions: Although no direct involvement of HIV is implicated in the development of B-cell lymphoma in patients with AIDS, integration of the viral genome, chromosomal defects and rearrangement of proto-oncogenes could account for changes in the regulation of cell growth resulting in the progression of the disease. Since no long-term cell line currently exists from the AIDS patients, the availability of naturally HIV-infected B-lymphocytes would be valuable for analysis of genes that may be responsible for the high frequency of malignant B-cell lymphomas in patients with AIDS.

C.704

AIDS LYMPHOMA: REGULATION OF CELL PROLIFERATION

Feigal, Ellen G.*; Brown, N.**; McGrath, M.*; Greenspan, J.S.***
School of Medicine, University of California San Francisco (UCSF); ** North Shore University Hospital, Manhasset, N.Y. ;*** School of Dentistry, UCSF, San Francisco, CA., U.S.A.

Objective: To establish AIDS associated non-Hodgkin's lymphoma (NHL) cell lines in stable culture and determine their clonality with the original tumor tissue. To determine cell surface antigenic phenotype, the role of DNA tumor viruses, the effects of lymphokines and monokines on cell proliferation and whether receptors for growth factors exist on the cell line.
Methods: Single cell suspensions of tumor involved lymph nodes have established long term cultures of AIDS NHL cell lines. Southern blot analysis of immunoglobulin gene rearrangements will be performed to establish that the cell line is a clonal representation of the tumor. Probes for EBV, *c-myc* oncogene rearrangements and Human Herpes virus VI (HHV-VI) will be utilized. T and B cell immunophenotyping on the tumor derived cell lines will be performed. Growth factor requirements and assessment for their receptors will be determined.
Results: Experiments on one of the AIDS NHL cell lines, derived from a patient with Burkitt's lymphoma revealed the presence of cell surface IgM kappa and CD4 by flow cytometric analysis. Suspension from confluent culture using a quantitative ELISA procedure revealed IgM concentrations of 1-3 ug/ml. Southern blot analyses with an immunoglobulin J_H probe on DNA isolated from the original tumor, and on the derived cell line after a double endonuclease digestion with EcoR1 and Hind III revealed identical J_H rearrangement patterns.
Conclusions: Ig gene rearrangement analysis of an AIDS NHL cell line revealed a clonal rearrangement pattern identical to the predominant clonal rearrangement seen in the studies of the patient's freshly excised tumor tissue. These results indicate that the cell line represents an *in vitro* outgrowth of the original *in vivo* tumor and was not an artifact of the culture procedures used to isolate the cell line. The cells secrete and express on their surface Ig molecules IgM K. Additional studies involving this and other AIDS NHL cell lines will be used to assess the role of growth factors in cell proliferation.

LYMPHOKINES IN DIFFERENT STAGES OF HIV INFECTION

Español,Teresa;Figuera,T.;Quer,J.;Garcia,X.;Caragol,I.and Ocaña,I. R.S.Valle Hebrón.Barcelona.Spain.

HIV causes a progressive loss of CD$_4$ cells and their functions,subsequently IL-2 synthesis is decreased with the evolution of the disease.Although monocytes are also infected ther is no cytolysis of this cells,and then we were interested to know the synthesis of IL-1 in different stages of this infection and the relation with other lymphokines.

We have measured the synthesis of IL-1,IL-2 and γ-IFN in 36 HIV + drugaddicts in different stages of HIV infection and 10 controls.Lymphokines were produced by PBL cultures stimulated with LPS/ 24 h.(IL-1) or PHA/ 48 h.(Il-2 and γ-IFN) and measured on the supernatants with ELISA and RIA methods respectively.Lymphocyte subsets,Ig levels and lymphocyte blastogenis responses to PHA and PWM were also studied in these patients.

IL-1 synthesis is very high until advanced states of immunodeficiency,and is also high in unstimulated cultures in the first stages of the infection. There is some correlation between these levels and clinical symptoms.

IL-2 and γ-IFN synthesis decreases more rapidly with the progression of the disease and,toghether with other immunological parameters,has prognostic value.

Therapeutic protocols to modulate lymphokine synthesis must be taken into consideration to improve clinical conditions of these patients.

C.706

HIV-2 CHRONIC INFECTION OF PROMONOCYTIC CELLS

Innocenti, Patricia ; Brion J.P. ; Beccard C. ; Seigneurin J.M.
Virology Laboratory, Centre Hospitalier Universitaire, Grenoble, France

Objective. To establish chronic infection in cells of the mononuclear phagocyte system, with HIV-2,and compare it to HIV-1 infection ; to study the phenotypic variations throughout the infection.

Methods. Two clones of the promonocytic cell line U 937, with 30 % and 90 % CD4 + respectively, were each infected with HIV-2 ROD strain and with HIV-1 BRU strain (multiplicity of infection : 10 000 cpm RT/10^6 cells). Cell cultures were studied for > 30 days in terms of cytopathic effect, and presence of p24 and RT activity in the supernatant. The expression of p24 in cells was assessed by immunofluorescence and, when necessary, viral genome detection was carried out with the polymerase chain reaction. Fluorocytometry was used to measure the expression of CD4.

Results. Data are summarized in the following table :

p24 production (ELISA, O.D.)

U 937	% CD4	HIV-2				HIV-1			
		D1	D7	D21	D42	D1	D7	D21	D42
Clone 1	30	0.0	> 2.5	> 2.5	> 2.5	0.8	> 2.5	> 2.5	> 2.5
Clone 2	90	0.0	0.6	> 2.5	> 2.5	1.3	> 2.5	0.0	0.0

Although a same amount of virus was used to infect cells, a latent period before the production of p24 Ag was only observed with HIV-2. Chronic infection was obtained with HIV-2 whatever the CD4 percentage, as opposed to HIV-1.

Conclusion. This study showed that, in monocytic cells, there was a difference in the pattern of multiplication between HIV-1 and HIV-2, which seemed to be independant of the amount of CD4 in the case of HIV-2.

C.707

SUPPRESSOR EFFECT OF CELL SUPERNATANTS FROM HIV-POSITIVE PATIENTS ON NORMAL LYMPHOCYTE FUNCTIONS.

Estevez, María Elena; Mariani,L.; Goicoa,M.A.; Palacios,F.; Diez,R.A. and Sen,L.
Sección Inmunología Oncológica, Instituto de Investigaciones Hematológicas, Academia Nacional de Medicina de Buenos Aires, Argentina.

Objective.The aim of the study was to determine of ConA can induce an increase of the NK cell activity of HIV-infected subjects (IS) similar to that of normal subjects (NS). Also, we investigated if the factors that normally regulate the NK function, released by cells from IS differ from those released by NS cells.

Methods. We studied 12 IS and 19 NS. Mononuclear cells were incubated with and without ConA (50ug/ml) at 37°C for 18-20hr. The cell supernatants (Sn) were stored; the cells were washed and the NK activity measured by the 51Cr release assay using K562 cells as target.

Results. The NK function and response to ConA of IS cells were similar to NS cells. Sn from IS cells suppressed the normal NK activity, Sn without ConA suppressed ($\bar{x}$ ± SD) 37% ± 24 and Sn with ConA 34% ± 11. On the contrary, Sn without ConA of normal cells did not modify normal NK activity while Sn with ConA increased the NK function (24% ± 8).

Conclusion. The results indicate that NK effector cell function of IS does not differ from NS. However,the mononuclear cells from IS spontaneously release NK suppressor factors and although ConA can increase the NK effector function,it can not modify the release of suppressor factors. The altered release of soluble factors is prior to the decrease of the NK activity observed in IS and may contribute to the development of opportunistic tumors.

C.708

AIDS - PANERGIC IMNESIA AS PATHOGENIC MECHANISM

Ascher, Michael,* and Sheppard, H.** *Viral and Rickettsial Disease Laboratory, Department of Health Services, **California Public Health Foundation, Berkeley, CA, USA.

We propose a model whereby HIV component(s) cause immune dysfunction by mimicry of the physiologic ligands of CD4, molecules of the Major Histocompatibility Complex (MHC), binding to CD4 molecules and causing lymphocyte activation of a generalized and uncontrolled nature (panergy). The symptoms of mediator disease, autoimmune phenomena, lymphadenopathy and hyperglobulinemia are obvious manifestations of such activation. The anergy seen early in HIV infection prior to T cell depletion can be attributed to functional desensitization through this T cell receptor pathway. Continuous activation signals in the form of HIV component(s) finally disrupt T cell homeostasis by the interference with filing of memory cells resulting in clonal deletion and net T cell loss (imnesia). Thus, HIV disrupts immune function by violating the rules of MHC restriction and the adverse result of this interaction establishes the significance and underlying purpose of MHC restriction.

The model can account for the findings of both AIDS-related-complex and frank AIDS without widespread T cell infection, is consistent with a prolonged "incubation period" and provides a role for antigen specific cofactors. In contrast to immunostimulatory approaches, therapy aimed at suppression of aberrant activation via the CD4 molecule and/or the generation of resting cells may have beneficial effects in HIV disease.

C.709

CHARACTERIZATION OF HUMAN B CELL (DK) AND PROMONOCYTE (U937) AFTER HIV-1 EXPOSURE

Yoshitatsu Sei*, J. G. Bekesi**, and Prince K. Arora*
*Laboratory of Neuroscience, NIDDK, National Institutes of Health, Bethesda, MD, U.S.A
** Department of Neoplastic diseases, Mount Sinai School of Medicine, New York, NY, U.S.A.

Objective. Comparison of HIV-1 infection-kinetics among human B (DK), promonocyte (U937), T-B hybrid (CEMx174), and T(H9) cell lines.

Methods. SupT1 (HIV1 susceptible CD4+T) cells were used as targets to analyze syncytia induction capacity of various cell lines. Reverse transcriptase (RT) activity in the supernatant (eRT) and in the cell lysates (iRT) was determined by standard RT activity assays.

Results. CEMx174 and H9 cells indicated strong syncytia inducing capacity against SupT1 and high extracellular RT (eRT). DK and U937 exhibited syncytia inducing capacity at 3 days. Intracellular RT (iRT) became detectable at 12-15 days but eRT appeared much later. The syncytia inducing capacity and inverted e/i RT ratio were also observed in chronically infected DK(DK-IIIB), U937(U937-IIIB) and subclones of U937-IIIB. Further, coculture of H9 with DK-IIIB (which exhibits no detectable eRT) showed remarkable increase in eRT with significant increase of T-B double marker hybrids (H9-DK-IIIB).

Conclusions. Our results suggest that the B cells and/or monocytes may acquire fusing capacity against CD4+ T cells in early stages of the infection, and that these cell to cell interactions may lead to a reduction in the number of CD4+ T cells. Further these T-B and T-monocyte hybrids may serve as temporal sites for viral replication. These in vitro studies may provide clues to the possible immunopathological roles of HIV-1 infected B cells and monocytes and may help in understanding the mechanisms of viral burden on an infected host

C.710

DETECTION OF CD4/CD8 EXPRESSION ON HIV INFECTED T CELL CULTURES

M.F. McLane*; Lee, T.H.*; Ito, S.*; Wolf, A.*; Farrar, G.H.**; and Essex, M.* *Harvard Univ., Boston, MA USA ** PHLS, Wiltshire, UK

Objective: The study describes the expression of CD4/CD8 on T cell culture lines at early and chronic stages of infection.

Methods: We examined T cell cultures by the techniques of dual color immunofluorescence flow cytometry, ferritin labelling for electron microscopy visualization and reverse transcriptase for virus expression.

Results: CD4 expressed markers remained depressed at post-infection as predicted previously and into the chronic stages. RT activity and absolute number of virus particles being generated did not significantly influence the surface markers once the culture was infected. CD8 when co-expressed remained demonstrable.

Conclusion: Using quantitative doses of HIV strains we find the variation of expressed membrane markers can be seperate elements from cell function and maturation of the virus. We are presently using cytokines in modulating surface marker activation and virus induction.

C.711

BIOLOGICAL ROLE OF COCAINE IN THE DEVELOPMENT AND EXPRESSION OF AIDS

Bagasra, Omar*; Forman, L.J.** Department of Microbiology* and Department of Medicine**, University of Medicine and Dentistry of New Jersey, Camden, New Jersey, USA.

Objective. To determine the effect of cocaine on the immune system.
Methods. In order to obtain a better understanding of the effects of cocaine on immune function, inbred male rats were treated daily for ten days with 1.25, 2.5 or 5.0 mg/kg of cocaine. Rats were then immunized with T-helper independent (TI) and T-helper dependent (TD) antigens. Splenic plaque-forming cell (PFC) and serum antibody responses were measured 5 days post-immunization.
Results. The ability of rats treated with cocaine to mount primary PFC and antibody responses to TI were elevated several fold when compared to control animals. The magnitude of the elevation was directly related to the dose of cocaine administered. Antibody responses to TD antigens were increased at lower concentrations of cocaine (1.25 and 2.5 mg/kg) and were suppressed at the higher concentration of the drug (5.0 mg/kg). Exposure of isolated lymphoctes from rats and humans to cocaine in vitro did not result in a stimulation of B-cell populations indicating that a metabolite of cocaine or the release of some other host factor(s) was responsible for the observed immunomodulation.
Conclusion. The prevalence of AIDS in substance abusers is very high. It is also well documented that activation of CD4+ cells in HIV+ individuals also activate proviral (dormant) stage of AIDS. The present studies provide data to indicate that the immune system is stimulated by cocaine.

C.712

CHARACTERISTICS OF HIV-1 IN MONOCYTE-MACROPHAGES

Shunji,Matsuda*; Gidlund,M.*; Nilsson K.**; Fenyö,E.M.* and Wigzell,H.*
*Karolinska Institute, Stockholm, Sweden. **Univ. of Uppsala, Uppsala, Sweden.

Objective. To investigate infectivity and localization of HIV in monocyte-macrophages.
Methods. HTLV-IIIB producing cells, U937 subclones, THP-1 and T cell lines, were used for this experiment. HIV-1 in the cells were collected after mechanical destruction of cells by freezing and thawing. Amount of HIV-1 in the solution was compared between cell lines by measuring reverse transcriptase activity and the amount of p24. Infectivity of HIV-1 in the solution was determined by infecting HIV-1 sensitive T cells, MT-2 and MOLT-4. Infection of the target cells was checked by cytopathic effect and amount of p24 in culture supernatant.
Results. Solution obtained by freezing-thawing of monocytoid lines showed higher reverse transcriptase activity and larger amount of p24 compared with T cell lines. The solution showed high infectivity to T cell line.
Conclusion. Monocyte-Macrophages can harbour large amount of infectious virus inside the cells.
Localization of the virus will be also discussed.

C.713

PRESENCE OF HUMAN IMMUNODEFICIENCY VIRUS (HIV) IN THE ALVEOLAR MACROPHAGES (AM) FROM BRONCHOALVEOLAR LAVAGE (BAL) FLUID OF PATIENTS WITH AIDS.

Linnemann, Calvin C., Jr., Baughman, R.P., Frame, P.T., Floyd, R., Depts. of Medicine, Pathology & Laboratory Medicine, University of Cincinnati Medical Center, Ohio, U.S.A.

Previous work in our laboratory has shown that HIV can be recovered from the BAL fluid of all patients with AIDS, but has only detected p24 antigen directly in the BAL fluid of a patient with lymphocytic interstitial pneumonitis. To determine which cells in the BAL fluid contain the virus, BAL cells were separated into glass adherent (alveolar macrophages) and non-adherent populations and were cultured in random donor peripheral blood mononuclear cell cultures. Five consecutive AIDS patients were cultured and the BAL fluid from all were positive for HIV. Both adherent and non-adherent cells contained HIV, but adherent cell cultures were either positive before non-adherent or had higher levels of p24 antigen on days 6-8. Only one non-AIDS patient has been cultured and, in contrast to the AIDS patients, HIV was not recovered. These studies suggest that HIV appears at levels detectable by culture in the bronchopulmonary secretions of HIV infected patients later in the natural history of the infection, and, even though virus can be recovered from both AM and lymphocytes, it appears to be in higher titer in macrophages. Studies on the effects of HIV infections of AM on macrophage function are underway. Production of tumor necrosis factor (TNF) by HIV infected AM has been evaluated. Spontaneous release of TNF was detected from AM of 2 of 5 AIDS patients, while all 5 released normal amounts of TNF when stimulated with lipopolysaccharide.

C.714

POSSIBLE ROLE OF GENETIC,IMMUNOLOGICAL AND VIRAL FACTORS IN THE ACQUIREMENT AND/OR PROGRESSION OF HIV INFECTION

Purpura Maria*; Rosci,M.A.**; Miceli,M.°; Mirolo,M.°; Pezzella,M.*** and Mannella E.**
* National Centre for Blood Transfusion C.R.I.,**L. Spallanzani,Hospital for Infectious Diseases,***Institute Infectious Diseases,University of Rome,Italy

Objective.To evaluate the role of genetic,immunological and viral factors in the acquirement and/or progression of HIV infection.
Methods. Five seronegative regular sexual partners of HIV seropositive subjects and 5 HIV seropositive patients without HIV infection progression (during the last 5 years, were included in our study. We carried out HLA-A,B, C,DR,DQ antigen phenotypes and surface phenotypes of PBMCs; we also performed "in situ" hybridization, P.C.R. and in vitro response to recall Ag,PHA and PWM.
Results. A higher frequency of HLA-2 Ag in seronegative and in HIV seropositive subjects without infection progression was found; an increase of CD4^{+}M3^{+} cells in HIV seropositive was also observed. All seronegative subjects were positive at "in situ" hybridization and, at performed follow-up, the seronegativity has been lasting for more than one year.
Conclusions. Could HLA-A antigens and CD4^{+}M3^{+}cells play a role in the acquirement and/or progression of HIV infection?

C.715

HIV-1 INFECTION OF HUMAN FETAL THYMOCYTES

Tanaka, Kathryn; Hatch, W.; Rashbaum, W.; Rubinstein, A.; Soeiro, R.; and Lyman, W.D. Albert Einstein College of Medicine, Bronx, NY, USA.

Objective. Some infants with congenital HIV-1 infection are immunocompromised. This suggests that fetal thymocytes may become infected by HIV-1 resulting in immune dysfunction. To examine this hypothesis, normal human fetal thymocytes were established in culture and exposed to HIV-1. The potential for this virus to affect thymocytes was determined by measuring T4/T8 subset ratios and functional assays.
Methods. Fetal thymus was obtained from abortuses with no risk factors for HIV-1 infection. After isolation, untreated fetal thymocytes were analysed by flow cytometry and functional assays. Thymocytes were exposed to either infectious or heat-inactivated HIV-1 isolates. The presence of HIV-1 infection was determined by immunocytochemistry, molecular hybridization and an infectious cell center (ICC) assay using the CEM-SS cell line. Treated cultures were analysed by flow cytometry and functional assays.
Results. Untreated thymocytes responded to T- but not to B-cell associated-mitogens and were comprised of over 90% double (CD4, CD8) positive cells. After 5-7 days in culture, immunocytochemistry revealed the presence of gp41 in the HIV-1 exposed cells and the ICC assay was positive. In addition, there was a significant change in the subset ratios of infected cells. Furthermore, thymocyte infection was dependent, in a dose dependent fashion, upon the titer of the HIV-1 inoculum.
Conclusion. Cultured fetal thymocytes can be infected with HIV-1 and this infection causes significant cytopathology. As a model, this system may permit a better understanding of the pathogenesis of pediatric AIDS.
(Supported, in part, by HL 07060, DA 05583, DA 04583, HS 11920, AI 20671, and the Diamond Foundation).

C.716

AIDS IS A NON-INFECTIOUS "OCCUPATIONAL" SYNDROME

Maurizio Luca Moretti*. *Instituto de Terapia Fisica y Medicina Interna de Venezuela, Caracas, D.F., Venezuela

Objective. To find answers to the following questions: a) Is AIDS an infectious disease? b) Can it be considered a sexually transmitted disease? c) Is HIV the etiological agent? d) What is the prophylaxis for AIDS? e) What is the possible cure for people at high risk for AIDS, with PGL, ARC or AIDS?
Methods. Three years research conducted through: a) study and analysis of more than 5,000 AIDS research studies; b) study and analysis of the U.S. AIDS cumulative statistical official data during the period 1981-1988; c) study and analysis of clinical aspects and results in groups at high risk; d) study and analysis of the components and properties of the clotting factors and heroin and fecal material; e) analysis of the AIDS epidemiology between industrialized and developing countries.
Results. These studies have shown that: a) AIDS is a non-infectious syndrome. b) HIV is not the etiological agent. c) How the cause/effect inversion made possible the misunderstanding of HIV as the etiological agent of AIDS. d) What are the causative factors of AIDS.
Conclusions. a) A new postulate for the AIDS pathogenesis: what are the causative factors and how they work. b) A new postulate for AIDS prevention. c) A new postulate for the cure of PGL,ARC, and AIDS.

C.717

TIME COURSE OF IGG REACTIVITY WITH SYNTHETIC PEPTIDES DERIVED FROM HIV-1 GAG AND ENV IN HIV-1 SEROPOSITIVE INDIVIDUALS.

Jonas Blomberg (1), Per Johan Klasse (1), Rudiger Pipkorn (3)
Bengt Ljungberg (2), Bertil Christensson (2) and Bo Ursing(2)
Section of Virology, Dpt Med Microbiol (1), Dpt Infect Dis(2)
Lund, Sweden, Zentrum f Molekulare Biologie, Heidelberg,FRG (3)

OBJECTIVE: To evaluate the development of the immune response to epitopes simulated by synthetic peptides during the course of HIV-1 infection.

METHODS: EIA:s with synthetic peptides from HIV-1 gag (1-20, 320-338,335-351 and env (503-520,581-599,583-599,586-606,602-622,848-863) were performed on consecutive sera from 39 HIV seropositive persons. A time period of 0.5 - 5 years was covered. Results were correlated with clinical status.

RESULTS: As previously noted by us, the pattern of reactivity with HIV peptides was individual. However, also a temporal pattern of variability was observed. Antibodies to certain peptides increased rapidly after an acute HIV infection, and then declined rather rapidly. Antibodies to some peptides varied more, independently of other HIV antibody parameters. Antibodies to env 583-599 were more frequent in asymptomatic individuals than in patients with HIV-related disease. In individuals with more advanced disease, several peptide antibody parameters, both from gag and env, were low. The independent temporal variability implies epitopes can be both abandoned and recruited during HIV-1 infection. Absorption by antigen probably also contributes.

C.718

PATHOGENESIS NK DEFICIENCY IN AIDS

Maria Caterina Sirianni,F Tagliaferri,F Aiuti
Dept of Allergy and Clinical Immunology.University of Rome.Rome.Italy

Objective To give a model explaining NK defect in AIDS
Methods PBL from AIDS patients were assessed for NK activity on the 51Cr labelled K562 cell line Cytoskeletal tubulin polarization in these conjugates was studied by monoclonal antibodies (MoAb) and immunofluorescence Tubulin is responsible for an effective NK lysis Results from these experiments were compared with those obtained on PBL from normal donors.which were treated.before the assays with an anti/CD16 MoAb
Results NK activity and tubulin polarization were deficient in PBL from AIDS patients as well as in normal controls.pre-treated with anti/CD 16 MoAb
Conclusion Pathogenesis of NK deficiency in AIDS may be explained on the basis of this model.assuming that some HIV-1 env proteins mimick the action of anti/CD 16 MoAb

C.719

A RAPID AND IMPROVED 2',5'A SYNTHETASE ASSAY BY POLYACRYLAMIDE GEL ELECTROPHORESIS.

Nancy C. Kan, Mary Beth Miele, and Dai-Kee Liu.
Department of Pharmacology, The Pennsylvania State University, College of Medicine, Hershey, PA, 17033, USA

Induction of 2',5'oligoadenylate (2,5A) synthetase activity is an accurate and sensitive parameter for viral infection of mammalian cells. It could be used clinically to monitor circulating interferons. The enzymatic assay ideally involves chromatographic separation of 2,5As, which range from di- to oligomers, from each other and from the unincorporated substrate of radiolabeled ATP. However, this procedure is not done routinely, and the enzymatic activity is measured instead by the amount of radiolabeled AMP incorporated into total 2',5'As. We developed a rapid and improved assay using a 0.3-mm denaturing 20% polyacrylamide gel to separate the different species of $[^{32}P]$-labeled 2,5As from each other, and from the substrate $[^{32}P]$ATP. 2,5A species were visualized by autoradiography and the amount of incorporated $[^{32}P]$ can be quantitated. To confirm the 2',5' linkage of the reaction products, the predominant species which comigrated with a trimer standard was shown to be resistant to T2 RNase but readily digested by phosphodiesterase. The current method is sensitive, fast and can assay a large number of samples simultaneously. Most cells we examined, including human T cell lines CEM and H9, had a low 2,5A synthetase activity. HIV infection of H9 cells did not induce this enzymatic activity. This assay will be useful clinically to monitor circulating interferons in AIDS patients before and after therapy.

C.720

KINETICS OF HIV INFECTED CELL-TO-CELL FUSION

Graham, Barney and Rowland, J., Vanderbilt University School of Medicine, Nashville, TN, USA.

Objective. To define the mechanism and timing of the cell-to-cell fusion process important in the pathogenesis of AIDS.
Methods. A cytopathic effect assay to measure serum fusion inhibition activity has been developed that utilizes H9/HTLV-IIIB as fusion effector and the CD4+ cell line, MT2, as target for syncytium formation. Serum is added to wells containing cells in a ratio of 1:5, respectively. Percent protection is determined by neutral red uptake by viable cells = [(Test A540 - virus control A540)/(cell control A540 - virus control A540)] X 100. The kinetics of the fusion process was investigated by adding a dilution of serum known to have fusion inhibition activity to wells simultaneously, and 15, 30, 60, 90, 120, 180, and 360 minutes after cells were mixed. An equivalent dilution of non-immune serum was added to another series of wells mixed by repeated pipetteing at the same intervals. Control wells included non-immune serum without mixing, and immune serum with mixing. Assays were done in triplicate.
Results. Anti-fusion activity of serum was unchanged when added simultaneously or up to 120 minutes after cell mixing. However, at 180 minutes there was a diminished anti-fusion effect and at 360 minutes there was no anti-fusion effect when the assay was terminated at 20 hours. Mechanical disruption of cells retarded the onset of syncytia formation and thereby increased percent protection at 20 hours. The effect of mechanical disruption on fusion inhibition was diminished when performed at the 360 minute time point. Non immune serum had no protective effect.
Conclusion. There is a point in the fusion process at which antibody is unable to inhibit syncytium formation. The data suggest that in the fusion process there are evolving cell-to-cell interactions that attain sufficient stability to diminish antibody interference by 3 hours and to resist mechanical disruption by 6 hours.

C.721

TROPICAL SPASTIC PARAPARESIS: SEROLOGIC AND HISTOLOGIC ANALYSIS

Canavaggio, M.*; Leckie, G.*; Chi, L.*; Madrid, R.E.**; Lee, Helen*; and Valderrama, R.**
*Abbott Laboratories, North Chicago, IL, 60064, USA, **SUNY Science Center at Brooklyn, Brooklyn, NY, U.S.A.

OBJECTIVE. To identify and further characterize by sural nerve biopsies, HAM/TSP in a neurological patient population from New York City.
METHODS. Serum and CSF from 150 patients were assayed for antibodies to HTLV I by EIA. Repeat reactives were confirmed by Western blot and SDS-PAGE RIPA. WB was also performed on paired EIA positive serum and CSF. Sural nerve biopsies were performed on 7 TSP patients; these were analyzed by immunofluorescence, PCR and light and electron microscopy.
RESULTS. 15 patients were HTLV I seropositive; 12 of these had clinical features of HAM/TSP and all except one (black patient from S. Carolina) originated from the Caribbean. No differences in WB banding pattern were observed in matched serum and CSF. Surprisingly, a sensorimotor peripheral neuropathy was observed in 7 of the TSP patients. Two of the nerve biopsies revealed epineural and endoneural inflammatory lesions containing plasma cells, but no giant or multinucleated cells. A mild demyelinating process and abnormal giant axonal mitochondria were observed.
CONCLUSIONS. TSP is prevalent in the U.S. among Caribbean migrants and often associated with peripheral neuropathy. No evidence of intrathecal synthesis of anti-HTLV I Ab was observed when comparing CSF and serum by WB. Nerve biopsies provide the means to assess the role of HTLV I in the pathogenesis of myelopathy.

C.722

HOST IMMUNOGLOBULIN MOLECULES ARE ON THE SURFACE OF PNEUMOCYSTIS CARINII

Blumenfeld, Walter and Griffiss, J. McLeod
Veterans Administration Medical Center, University of California, San Francisco; San Francisco, California, U.S.A.

Objective: To define the organism and/or host factors that explain the pathogenesis of P. carinii pneumonia in AIDS.
Methods: (1) Immunochemical labeling of whole organism preparations of P. carinii in bronchoalveolar lavage fluid sediment with enzyme-tagged polyclonal and monoclonal antibodies to human immunoglobulins and to P. carinii. (2) Analysis of electrophoretically-separated components of density gradient-purified P. carinii from human autopsy lung material by SDS-PAGE and Western blotting with same antibodies as in (1).
Results: Anti-human IgG (but not anti-rat or anti-mouse IgG) labeled whole organisms in 2/2 preparations. Monoclonal antibody to the Fab fragment of human IgG also labeled whole organisms. Anti-human IgG, one of two monoclonal antibodies to the Fc fragment of human IgG, and a monoclonal antibody to P. carinii all labeled a 40k band that was present in: (a) purified preparations of P. carinii, (b) 4/4 bronchoalveolar lavage fluid supernatents from patients with (2) and without (2) AIDS, and (c) IgG purified from 2/2 human sera (1 HIV -, 1 HIV +).
Conclusion: A host-derived IgG fragment is present on the surface of P. carinii. Its role in the pathogenesis of P. carinii pneumonia in AIDS is currently unknown. It may conceivably interfere with the ability of an already compromised immune system to clear the organism or recognize it as foreign.

C.723

INFECTION OF MONOCYTES WITH A T CELL TROPIC CLONE OF HIV.

Justement, Jesse, S., Folks, T.M., Orenstein, J. and Fauci, A.S.
LIR, NIAID, NIH, Bethesda, MD., U.S.A.

Objective. To determine if an HIV clone derived from infected T cells can infect normal human monocytes in vitro.
Methods. The HIV infectious clone (pNL4-3) was developed by combining the 5' GAG-POL region of the NY5 strain construct and the 3' ENV region of the LAV strain construct. The pNL4-3 construct was transfected into SW480 (colon carcinoma) cells, with a subsequent passage onto a T cell tumor line (A3.01). Elutriated monocytes were infected with the passaged pNL4-3 clone. The monocyte passaged pNL4-3 and original clone were equilibrated by reverse transcriptase levels (RT) and titrated onto monocytes and PHA blasts.
Results. The initial passage of pNL4-3 onto elutriated monocytes resulted in RT positivity on day 30 post infection. The culture remained RT positive through day 65 when the experiment was ended. Ultrastructural analysis of these cells revealed virus particles budding intracellularly as well as from the plasma membrane. pNL4-3 showed a much greater ability to replicate in PHA blasts than in monocytes. Of particular note, a single passage onto monocyte culture resulted in an increased (2 log infectious units) ability of the virus to replicate in monocytes. In parallel, a 3 log decrease in ability to infect PHA blasts was noted with this single-passage HIV.
Conclusion. A T cell tropic HIV clone can infect monocytes. Moreover, a single passage of the clone onto monocytes is sufficient to markedly increase the tropism of the virus for monocytes at the same time as it decreases the tropism for T cells.

C.724

MONOCYTE CHEMOTACTIC ACTIVITY IN THE SUPERNATANTS OF IN VITRO INFECTED HUMAN MACROPHAGES.

Janis K. Lazdins*, E. Alteri* and M.S. Meltzer**
*Research Laboratories, Pharmaceutical Division, CIBA-GEIGY Ldt.
CH-4002 Basel, Switzerland.
**Walter Reed Army Institute of Research, WRAIR,WRAMC, Washington DC
20307 USA.

Macrophages (MØ) are an important target for HIV infection and probably play a major role in the establishment and propagation of AIDS. Following infection, the virus is found in tissue MØ and blood monocytes. At present, the mechanism of infection and spreading of HIV in these cells is not known. We present results that address this issue.
Human blood monocytes cultured in presence of 1,000U/ml of Colony Stimulating Factor-1 (CSF-1) differentiate into macrophages and are permissive to the infection with HIV-1 (ADA strain). Following infection, viral replication with minimal cytopathic effect can be demonstrated. When supernatant from infected MØ were examined for their ability to attract freshly isolated not infected blood monocytes, they were found active at levels comparable to those observed with optimal concentration of the standard chemoattractant F-Met-Leu-Phe. Control supernatants obtained from not infected MØ did not show this activity. A 48-microwell chemotaxis chamber was used for the measurements.
These results can be of relevance to explain the initial rapid spread of the virus from primarily infected MØ to circulating monocytes.

C.725

DETECTION OF HTLV-I IN ALVEOLAR LYMPHOCYTES OF PATIENTS WITH TROPICAL SPASTIC PARAPARESIS (TSP) WITH BRONCHOALVEOLAR LYMPHOCYTOSIS.

Claude Desgranges*, Couderc L.J.**, Noraz N.*, Caubarrere I.** and Vernant J.C.***
*INSERM U 271, Lyon ; ** Service de Pneumologie, Hôpital Foch, Suresnes ; *** Service de Neurologie, Hôpital La Meynard, Fort de France, Martinique ; France.

Objective. To specify the type of alveolar cells detaining HTLV I genome in the TSP patients with bronchoalveolar lymphocytosis.
Methods. After bronchoalveolar washing of TSP patients serologically HTLV I associated ,with bronchoalveolar lymphocytosis, the adherent and non-adherent cells were separated,identified and HTLV I genome was detected in the different cell populations
- by Polymerase Chain Reaction (PCR) after cellular DNA extraction of each cell population.
- by coculture of the two alveolar cell populations with lymphocytes of HTLV I seronegative subjects.

Results : PCR was done with two different types of primers in pol and pX regions ; HTLV I genome was present only in lymphocytes and never in adherent cells.
After coculture, we obtained immortalized T cell lines producing complete HTLV I only with the alveolar lymphocytes and never with the alveolar adherent macrophages.
The immortalisation of T cell cultures will be presented and these cell lines will be phenotypically and virologically characterised. The biological properties of the HTLV I isolated from alveolar lymphocytes and from peripheral lymphocytes of the same patient will be analysed.
Conclusion : HTLV I DNA is detected in alveolar lymphocytes and never in alveolar macrophages of these TSP patients, while in HIV infected patients with bronchoalveolar pathogenesis, HIV genome is currently present in the two types of alveolar cells.

C.726

PLASMA VALUES OF FIBRONECTIN (FN) AND ANGIOTENSIN CONVERTING ENZYME (ACE) IN KAPOSI'S SARCOMA (HIV-RELATED AND CLASSICAL)

Janier Michel*, Drouet L.**, Villette JM.***, Scrobohaci ML**, Palangié A.* and Morel P.*
* STD clinic, ** Haemostasis and *** Biochemistry laboratories, Hôpital Saint-Louis, Paris, France.

Objective. To investigate plasma values of FN and ACE as putative markers of endothelial proliferation in HIV-related and classical Kaposi's sarcoma (KS).
Methods : Plasma FN (ELISA, Stago Lab) and ACE (Radiochemical technique of Rohrbach) were determined in patients with AIDS-related KS, classical KS and the lymphadenopathy syndrome (LAS).

RESULTS	FN ng/ml ± SE	P	ACE nmol/ml/min ± SE	P
CONTROLS	138 ± 28 n=30		12.5 ± 3.5 n=30	
LAS	153.5 ± 76.6 n=18	NS	21.4 ± 10.1 n=40	$<10^{-4}$
AIDS - KS	227.3 ± 60 n=21	$<10^{-4}$	16.9 ± 6.1 n=31	$<10^{-2}$
CLASSICAL KS	244 ± 126.9 n= 7	$<10^{-4}$	15.9 ± 5.5 n=15	0,05

The increase in plasma values of FN is highly significant in both HIV-related and classical KS ($P<10^{-4}$). Plasma Von Willebrand Factor (VWF) gave similar results (Janier. J. Invest. Dermatol. 1988, 90, 703). On the other hand, ACE increase is highly significant in LAS patients ($p<10^{-4}$) and moderate in both forms of KS ($p<0.01$ and $p = 0.05$).
Conclusion : Fibronectin and ACE are both partly released by endothelial cells. They are both, besides VWF, markers of endothelial damage or proliferation in KS. Their prognostic significance in LAS patients remains to be ascertained.

C.727

CD4+ CELL HELPER AND SUPPRESSOR FUNCTION IN HIV INFECTED PATIENTS

Weimer, Rolf(*); Daniel, V.(*); Schweighoffer, Th.(*); Schimpf, K(**) and Opelz, G(*).
(*)Institute of Immunology, University of Heidelberg, and (**)Rehabilitation Hospital and Hemophilia Center, Heidelberg, FR Germany

Objective. To investigate helper and suppressor functions of CD4+ T cells in HIV infected hemophilia patients.
Methods. We assessed T cell functions in 61 hemophilia patients (21 HIV-, Group 1; 27 HIV+ without ARC/AIDS, Group 2; 13 ARC/AIDS patients, Group 3). PWM-stimulated allogeneic cocultures of CD4+ T cells and control B cells were evaluated by assessment of immunoglobulin secreting cells (ISC) in a reverse hemolytic plaque assay and by ELISA-determination of IgM and IgG secretion.
Results. We found no significant differences between HIV- patients and controls whereas CD4+ cells of HIV+ patients showed reduced helper activity for generation of ISC ($p<0.01$, Group 2; $p<0.0001$, Group 3), IgM ($p<0.005$, Group 2; $p<0.001$, Group 3) and IgG secretion ($p<0.02$, Groups 2,3). CD4+ cell suppressor activity was enhanced with respect to ISC generation ($p<0.01$, Group 2; $p<0.0001$, Group 3) and IgM secretion ($p<0.02$, Groups 2,3). Preliminary data in 38 patients show that autoantibodies against CD4+ cells were associated with a CD4+ cell helper defect ($p<0.01$).
Conclusion. Considering the central role of CD4+ cells in the immune response CD4+ cell dysfunction may play a role in the development of the immunodeficiency state of ARC/AIDS patients. CD4+ cell autoantibodies might be involved in the pathogenesis of CD4+ cell helper defects.

C.729

On the pathogenesis of severe HIV-related Thrombocytopenia (TP) in intravenous drug abusers (IVDAs).

Landonio Giuseppe; de Cataldo F.; Gargantini L.; Nosari A.M.; Galli M.*; Lazzarin A.* Department of Haemathology, Niguarda Ca'Granda Hospital, Milan and *Clinic of Infectious Disease, University of Milan, Milan, Italy.

Objective.To evaluate the pathogenesis of severe HIV related TP in IVDAs, by kinetic studies of platelet survival.

Methods.Platelet kinetic study was carried out in 20 HIV-positive IVDAs with severe TP (Plt <25x10^9/L) by 111-InOxine labelled autologous platelets (method of Thakur, partially modified). The results were compared with those obtained in classical ITP and hepato-splenic pooling respectively (the statistical significance was measured by a Student's T-test).

The relevant clinical data are summarized in table 1:

Sex	Platelets	Splenomegaly	ALT(>2N)	AntiHBc+
M:15F:5	12±5x10^9/L	5/20(25%)	10/20(50%)	17/20(85%)
25±3y	18/20(90%)	15/20(75%)	3/20(15%)	15/20(75%)
Age	MegakaryoN/>	Hepatomegaly	HBs+	AntiHBs+

Results.Kinetic studies of platelets survival:

	Classical-ITP		HIV-related-TP		"pooling"-TP
n	18		20		16
T/2	1.2±0.3	<0.001	4.1±1.4	<0.001	6.0±1.6
SDI	1.8±0.5	<0.01	1.3±0.3	<0.01	1.1±0.1
HDI	1.2±0.2	ns	1.2±0.2	ns	1.4±0.3
rec%	34.6±14.2	<0.01	26.2±16.6	ns	27.3±13.8

T/2 : platelet survival time ; SDI : splenic destruction index ; HDI : hepatic destruction index.
Rec% : recovery% .

Conclusions.Platelet kinetic data are intermediate between classical ITP and "pooling" TP and indicate that hepato-splenic pooling concurs to induce the TP in IVDAs.

C.732

HIV-2 NEUTRALIZATION EPITOPES ARE LOCALIZED IN THE CARBOXYL TERMINAL PORTION OF THE EXTERNAL ENVELOPE

Jaap Goudsmit*, McKeating, Jane**, Meloen, Rob***, Smit, Lia*, Bakker, Margreet* and Barin, Francis****
*Human Retrovirus Laboratory, Amsterdam, the Netherlands, **Chester Beatty Laboratories, London, UK, ***Central Veterinary Laboratory, Lelystad, the Netherlands, ****Laboratoire de virologie, Tours, France.

Objective. To localize HIV-2 external envelope domains binding neutralizing antibodies.

Methods. Five hundred overlapping peptides that covered the complete amino acid sequence of the external envelope of the HIV-2 ROD strain were synthesized with the antibody-reactive peptide scanning (PEPSCAN) technique. Sera of HIV-2 infected individuals were used as probe for antibody reactivity. Rabbits were immunized with KLH coupled peptides of domains reactive with human sera.
Sera were tested for HIV-2 neutralization.

Results. Fifteen domains were identified that bound serum of HIV-2 infected individuals. The majority of the sera reacted with two regions: one in the amino terminal half (aa 108-132) and one in the carboxyl terminal half (aa 303-507) of the external envelope. Each of the human HIV-2 neutralizing sera reacted with several carboxyl terminal epitopes. Sera of rabbits immunized with peptides covering the extreme terminal part of the external envelope neutralized HIV-2.
Cross-neutraliziation with HIV-1 of these sera is under investigation.

Conclusion. Epitopes localized in the extreme terminal carboxyl part of the HIV-2 external envelope bind natural neutralizing antibodies and immunization of rabbits with these domains results in HIV-2 neutralizing capacity of their serum.

C.733

VARIABLE STRINGENCY HYBRIDISATION OF PCR AMPLIFIED HIV-1 DNA FRAGMENTS

Snart, R., Kolesnitchenko, V., Agius, G., Zagury, J.F., and Zagury D.
Université Pierre et Marie Curie, Paris, France

DNA isolated from the lymphocytes of atypically seropositive individuals has been used for PCR amplification of envelope regions expressing atypical antigens. Eight aliquots of the amplified DNA fragment have been subject to Southern/Dot blot analysis, hybridising with 32P labelled B10 at 45°C using 2ssc medium. This was followed by a low strigency wash in the same buffer at 45°C for one hour. The filters were then exposed to Kodak XAR film and a photographic record obtained of the bound probe radioactivity. The filters were then cut so that each hybridised band/dot could be subject to variable stringency washing using various ionic concentrations (0.05 - 2.0 ssc) at a temperature 55° for one hour. After this time the filter was reconstructed so that the effect of the variable strigency wash might be visualised following a second exposure to a Kodak film. The level of activity for each band/dot was measured by image analysis of the photographic record and by scintillation counting of the 32P in each band/dot on the filter. The results allow a plot to be made of decrease in bound activity against ionic strength from which an equivalent Tm is calculated. By comparison with a standard curve obtained for H9V3 amplified fragments, subject to similar hybridisation and analysis, an estimation of the degree of nucleotide mismatch relative to the B10 DNA probe can be obtained.

C.736

NEUTRALIZING EPITOPE OF HIV-1: ANTIBODY SPECIFICITY, IMMUNOGENEICITY, AND PROTEIN LOCALIZATION

D. Murphy, J.W.-K. Shih, and I. Berkower
Lab. of Molecular Immunology, FDA and Dept. of Transfusion Med., NIH, Betheada, MD. U.S.A.

Antibodies from seropositive patients reduced the number of infectious HIV-1 plaques in a new plaque forming assay. Several HIV-1 isolates (IIIB, RF_{II}, and Z-84) were incubated with sera from asymptomatic seropositive patients and then used to infect a $CD4^+$ HIV susceptable monolayer. Neutralization of IIIB and Z-84 was measured at 99.7%, while RF_{II} was determined to be >95%. These findings indicate that:
(1) Human antibodies recognize a neutralizing epitope on most HIV isolates.
(2) The neutralizing epitope is conserved among many HIV isolates.
(3) The neutralizing epitope is immunogenic in nearly all infected patients.
(4) Antibody resistant variants are quite rare.
Human sera adsorbed with gp120 or gp160 lost neutralizing activity for the homologous isolate, while adsorbtion with p24 or control proteins had no effect on neutralizing antibodies. This indicates that gp120 contains all or nearly all of the neutralizing epitopes recognized by antibodies from infected patients.

C.737

C.738

DIRECT DETECTION OF A NEWLY IDENTIFIED VIRUS-LIKE INFECTIOUS AGENT BY PCR IN BLOOD (PBL) FROM PATIENTS WITH AIDS.

Wang, Richard Yuan-Hu*; Pierce, PF**; Wong, DM*; Hayes, MM*; Shih, JW-K***
and Lo, S-C*. *Armed Forces Institute of Pathology, Wash. D.C. **Dept. of Infectious Diseases, Georgetown University Hospital, Wash. D.C. and ***Clinical Center, National Institutes of Health, Bethesda, MD, USA.

Objective. To study the infection of the recently discovered virus-like infectious agent (VLIA) (Am J Trop Med Hyg, 40(2), 1989) in patients with AIDS, using the highly sensitive technique of selective gene amplification.
Methods. Peripheral blood lymphocytes (PBL) from 23 patients with AIDS and 22 normal healthy donors were isolated from Ficoll gradients. DNA was then purified from these PBL and subjected to 35 cycles of polymerase chain reaction (PCR). A pair of synthetic oligonucleotides (RS47 and RS49) with VLIA-specific DNA sequences were used as primers for selective gene amplification in the reaction. The amplified DNA products were analyzed by hybridization with a p^{32} end labeled oligonucleotide probe (RS48) with VLIA-specific DNA sequences which occurred between the pair of primers. PBL from the patients were also cultured for the isolation of HIV.
Results. Twelve of the 23 patients with AIDS were tested positive for VLIA specific DNA in the PBL, by PCR. In the same assay, none of the 22 normal healthy donors had evidence of VLIA infection. In this study, all AIDS patients were HIV seropositive and 75% of those PBL tested (15 of 20 patients) were also HIV culture positive.
Conclusions. A high prevalence of infection (52%) with the previously unrecognized pathogenic VLIA was detected in the blood of patients with AIDS.

C.739

HIV GENOME IN SERONEGATIVE REGULAR SEXUAL PARTNERS OF HIV INFECTED SUBJECTS

Pezzella Mario+; Mirolo,M.++; Rosci,M.A.+++; Vonesch,N.+; Miceli,M.++ and Mannella E.++
+ Institute Infectious Diseases,Policlinico Umberto I, University of Rome
++ National Center Blood Transfusion C.R.I.; Hospital L. Spallanzani, Italy

Objective. The aim of our research was to evaluate the presence of HIV genome in peripheral blood mononuclear cells (PBMCs) from 15 seronegative (ELISA test Westrn Blot confirmed) regular sexual partners of HIV infected subjects. The T4/T8 ratio, determined by Flow Cytometer, ranged between 0.08 - 2.10.
Methods. PBMCs were "in situ" hybridized with three probes: 1) an SP 64 plasmid containing the 9 kb SstI-SstI viral insert from lambda BH 10 recombinant clone able to regnize both viral mRNA and proviral cDNA; 2) the whole HBV genome, near 3.3 kb, purified from pAO1 plasmid; 3) the pBR 322 plasmid lacking viral insert. The probes were tagged by inserting an antigenic sulfone group in cytosine moieties and visualized by a double antibody immunohistochemical reaction using a monoclonal antibody against the sulfone group and an anti-mouse alkaline phosphatase conjugate antibody (Chemiprobe, Organics). The controls were performed using HIV infected and non infected H 9 cell culture lines and PBMCs from healty blood donors.
Results. The HIV genome sequences were observed in the cytoplasm of mononuclear cells of all the subjects studied as a granular staining and in some cases a nuclear positivity was observed. The number of hybridized cells ranged between 0.01 - 5.0 per cent.
Conclusions. Anti-HIV seronegative individuals, as partners of infected subjects, may be HIV infected.

C.740

SERIAL ANTIBODY (ABY) REACTIONS TO HUMAN HERPESVIRUS-6(HHV-6) IN HIV-1 INFECTION

Kaplan,Mark H*;Hsieh HC*;Coronesi M*;Ablashi D**;
Salahuddin SZ**.*North Shore University Hospital,Cornell University, Manhasset NY.,**National Cancer Institute, Bethesda, Md.

Objective. To study Aby responses to HHV-6 in HIV-1 infection.
Methods. Sera collected serially over the course of 1-4 years from a cohort of HIV infected patients(pt) was tested for Aby to HHV-6 strain Ds. Virally infected HSB2 and uninfected cells were fixed to slides and tested for IgG and IgM antibody using immunofluorescent technology. Radioimmunoprecipitation of 35S methionine labeled viral proteins (RIPA) were analysed using gel electrophoresis (PAGE).
Results. Pattern 1.Stable titers over 2-4 years Sero converter to HIV: 3pts.(<1:20-320),Stable lymphadenopathy: 7 pts. (<1:20-1280), Progressive T cell depletion: 10 pts.(<1:20-1280)
Pattern 2. Rise in IgG Titer without rise in IgM titer initiated with AZT therapy: 3 pts. Case 1. titer rise- <1:40 to 1:320, Case 2. <1:20 to 1:5120, Case 3. <1:20 to 1:1280
Pattern 3.Primary HHV-6 Infection concommittant with primary HIV infection. Pt developed mono like illness and seroconverted to HIV and at same time HHV-6 IgG Aby of 1:10,240 rose to 1:80,000 over 4 weeks with IgM Aby of 1:140 fall to 0 after 1 year.
Patients with Aby rise intensified gp110, and p80 and p8 bands.
Conclusion:Perturbation in HHV-6 antibody occurs in HIV-1 infection especially after initiation of AZT for treatment.

C.741

MACROPHAGES SIMULTANEOUSLY DERIVED FROM VIRUS-CONTAINING PERIPHERAL BLOOD MONONUCLEAR CELLS (PBMC) IN HIV-1 IIIB INFECTED CHIMPANZEES DO NOT CONTAIN VIRUS

Nara, Peter L.*; Hatch, W.**; Kessler, J.***; Kelliher, J.****; Ehrlich, G.*****; Gendelman, H.******; and et al.
*National Cancer Institute, Frederick, Maryland, **Albert Einstein College of Medicine, Bronx, NY, ***Glaxo Research Laboratory, Chapel Hill, NC, ****FDA, Washington, D.C., *****State University of New York, Syracuse, NY, ******Walter Reed Army Research Institute, Silver Spring, MD, USA.

Objective: To extend our previous *in vivo* and *in vitro* studies of the fate and biology of the HIV-1 IIIB virus in persistently infected chimpanzees.
Methods: Various sub-populations of cells were derived from different anatomic sites in persistently infected chimpanzees. These were evaluated for viral expression by co-cultivation/virus isolation, gag/env polymerase chain reaction (PCR), viral-specific immunohistochemistry (VSIH) and in situ techniques.
Results: Proviral DNA was detected by PCR in variable amounts in animals from their PBMC. Virus was recovered from all PHA stimulated PBMC having PCR reactivity. No PCR reactivity or virus re-isolation was obtained from macrophages simultaneously derived from the PBMC cultures or sternal bone marrow aspirates. Rare VSIH and in situ positive "lymphocyte-like" cells and megakaryocytes were found in the lymph nodes, spleen and bone marrow.
Conclusions: Should the absence of virus in macrophages and the absence of an "AIDS-like" disease be an uniform finding among all experimentally HIV-1 infected chimpanzees than understanding the mechanism(s) may give insight into pathogenesis, as well as, interventive therapeutic and vaccine-based strategies.

C.742

CHARACTERIZATION OF HIV VIROSOMES.

Cornet Bernard*; Vandenbranden M.*; Cogniaux J.**; Dekegel D.** and Ruysschaert J.M.*.
* Université Libre de Bruxelles, Belgique.
** Institut Pasteur du Brabant, Belgique.

Objective. Topology of HIV viral proteins in reconstituted systems (virosomes).
Methods. After virus lysis in OGP and addition of exogenous lipids, virosomes were obtained by dialysis of detergent. Virosomes were layered on top of continuous glycerol gradient and ultracentrifuged (120000g, 16h.) in order to remove free proteins and lipid vesicles. Viral proteins and lipids were detected by specific ELISA or ^{3}H radioactivity counting in each recovered fractions. The orientation of viral proteins were determined by trypsin treatment.
Results. Virosomes were detected at the bottom of the gradient whereas liposomes (virosomes without proteins) eluted at the top of the same gradient. ELISA analysis of protein profile along the gradient shows that the two viral envelope glycoproteins (GP120, GP41) and the P17 core protein were associated to the lipidic vesicles. The viral nucleocapsid protein (P25) was not detected in virosomes. GP120 and GP41 were digested after trypsin treatment while uncomplete cleavage of P17 suggests that it is partially oriented to the inner face of virosomes. Preliminary electron microscopy studies revealed virosomes as spherical vesicles of approximately the same size as viral particles but with an empty aqueous internal cavity.
Conclusions. Virosomes mimicking the virus envelope as envisaged as a possible way to get information about the mechanism of the fusion between virus and host cell.

C.743

BIOLOGICAL CHARACTERIZATION OF HIV ISOLATES FROM DIFFERENT BRAZILIAN AIDS PATIENTS

Couto-Fernandez, J.C.; Ivo-dos-Santos, J. and Galvão-Castro, B.. Departament of Immunology, Oswaldo Cruz Foundation, Ministry of Health, WHO Collaborating Centre, Rio de Janeiro, Brazil.

Objective: To evaluate the biological characteristics such as citophatic effect (CPE), syncytium formation and replication rate of five isolates obteined from Brazilian patients with different clinical forms of infection in cells of lymphoid and monocytoid origin.
Methods: Lymphoid (H9, CEM, MT-02, Jurkatt), monocytoid (U937) cell lines, normal peripheral lymphocytes and adherent cells were used. All infected cultures were monitored for the presence of the HIV, using a Organon antigen HIV capture assay, indirect immunofluorescence, electron microscopy and "western blot" of pelleted isolated viruses.
Results: The "Western blot" analysis showed a similar pattern for all isolates, undistinguishable from that observed in HIV-1. It was noted that one isolate showed a high replication capacity, inducing CPE and syncytia in lymphoid cell lines around 7 days of the culture and killing the cells in 15 days. Another isolate also showed a high replication capacity but did not induce a significant CPE or syncytium formation in the cultures. The characterization of three more isolates are underway.
Conclusion: HIV-1 isolates obteined from Brazilian AIDS patients seem to display a different patterns of infectivity, replication, induction of syncytia and CPE in different cell lines. In addition it was observed that the peripheral lymphocytes were more suceptible to infection by HIV isolates.

C.744

C.745

Geographical variation in cross reactivity of HIV2 sera on HIV1 assay

Simon, François*; PEETERS, M*; ANDRADE,D**; THEOBALD,S**; MAIGA,Y***; COT, M.C.****; BRUN-VEZINET,F*.
*Laboratoire de Virologie, Hopital Bichat-Claude Bernard, Paris France. **Hopital A. Neto, Praia, Cabo Verde. ***INSRP, Bamako, Mali. ****Diagnostics Pasteur Paris, France.

Objective : To study the reactivity of HIV2 positive sera on HIV1 antigens according to the geographical origin of the patients.
Methods : We tested HIV2 positive sera collected in subjects from Cape-Verde Islands (n=64) and Mali (n=68). The 64 Cape Verdian sera included all the specimens detected as HIV2 positive in these Islands since 1986. Clinical status of these 2 groups of subjects is comparable (CDC group II, III). HIV2 positivity was assessed by HIV2 Elisa (Diagnostics Pasteur: DP) and HIV2 Western Blot (DP). All these sera were tested on HIV1 assays by :
1) Elisa$_{(s)}$: Elavia 1 DP, Abbott EIA, Vironostika-Organon, Enzygnost-Behring, Wellcozyme-Wellcome, Dupont HTLVIII.
2) Latex agglutination assay, Fujirebio.
3) Western Blot (DP).
4) Transmembrane glycoprotein dot (Peptilav 1, DP).
5) RIPA CEM-HIV$_{BRU}$
Results : The rate of positivity on HIV1 Elisa$_{(s)}$ and latex agglutination assay is significantly ($p < 0.01$) higher in sera from Mali than from Cape Verde Islands. By HIV1 WB, synthetic peptides and RIPA none of the 64 cape Verdian sera reacts on the HIV1 env-products. By HIV1 WB and synthetic peptides, 26/64 of the Malian sera demonstrated an obvious reactivity on HIV1 glycoproteins (gp160-gp120 and transmembrane peptide).
Conclusion : This significative different reactivity between Cape Verdian and Malian sera could be interpreted in different ways. It should be more likely due to HIV2 strain geographical variation but we cannot excluded double infection in Malian sera or differences in host immune responses.

C.746

CHEMICAL INACTIVATION OF PURIFIED SIV WITH B-PROPIOLACTONE AND FORMALIN

Keddie, Elise M; Jennings, Myra B; Carlson, James R
School of Medicine, University of California, Davis; USA.

Objective. B-propiolactone (B-PL) and formalin were tested for ability to inactivate Simian Immunodeficiency Virus (SIV).
Methods. 500 ug lots of sucrose-gradient purified SIV$_{mac}$ were treated with 0.025%, 0.1%, and 0.2% B-PL for 5 hours at 4C. One 500 ug sample was treated with 0.025% formalin at 30C for 48 hours. One 500 ug sample of SIV was first treated with 0.2% BPL as above followed by 0.025% formalin as above. The samples were inoculated onto HuT-78 cells. Culture supernatants were assayed weekly for reverse transcriptase activity.
Results. SIV treated with 0.2% B-PL, 0.025% formalin, or a combination of both was inactivated; 0/12 cultures became positive for SIV in four weeks. Lower concentrations of B-PL, however, were ineffective in inactivating SIV; 12/12 cultures of the 0.025% B-PL treated material and 7/12 cultures of the 0.1% B-PL treated material became positive for SIV in four weeks. Immunoblot analysis of the inactivated SIV preparations revealed greater preservation of antigen following B-PL treatment.
Conclusion. 0.2% B-PL is effective for inactivating SIV and is the method of virus inactivation for a vaccine study currently in progress.

C.747

HBV INFECTION IN HIV INFECTED SUBJECTS

Ferrazzi Mario+; De Rinaldis,M.L.+,Vonesch,N.+; Sturchio,E.+; Mannella,E.++and Pezzella M.+
+ Institute Infectious Diseases,Policlinico Umberto I,University of Rome,
++ National Center for Blood Transfusion C.R.I. Rome, Italy

Objective.The aim of our study was to investigate the concomitant HBV infection in HIV infected subjects.
Methods. We observed 143 simptomatic and asimptomatic anti-HIV seropositive subjects (ELISA test, Western Blot confirmed). All patients were tested for HBV antigens (HBsAg and HBeAg), for antibodies (anti-HBs, anti-HBc, anti-HBe and anti-HBcIgM) and for delta infection (anti-delta) using RIA method. The HBV DNA was performed by dot blot hybridization using a pAO1 plasmid contaiming the whole HBV genome (near 3.3 kb) tagged by inserting an antigenic sulfone group in cytosine moieties and visualized by a sandwich chemical reaction using a specific monoclonal antibody against the sulfone group and an anti-mouse alkaline phosphatase conjugate antibody (Chemiprobe, Orgenics).
Results.67/143 (46.8%) were anti-HBs positive (14 of them 20mIU/ml), 16 were anti-HBc positive only, 13 were affected by chronic active hepatitis (CAH) HBsAg and HBeAg positive (eight of them also anti-delta positive), two by acute B hepatitis anti-delta positive and 45 susceptible to HBV infection. HBV DNA, performed in 93 subjects, was positive in 17 : 13 of them were anti-HBs positive, one affected by CAH and three negative for all HBV markers.
Conclusion. The alterate response to conventional HBV serum markers may be due to the complex HIV-host interaction in patients HBV infected. The HIV infecion may play a role in the pathogenesis of the HBV disease.

C.749

HIV-1 INFECTION OF HUMAN FETAL DORSAL ROOT GANGLIA GLIAL CELLS IS INDEPENDENT OF THE T4A EPITOPE OF CD4

Wigdahl, Brian; Hartle, H.T.; Kunsch, C. and Siever, D.
Department of Microbiology and Immunology, The Pennsylvania State University College of Medicine, Hershey, PA 17033 USA

Objective. To examine the role of CD4 or related molecules in infection of human fetal dorsal root ganglia (DRG) glial cells by human immunodeficiency virus type 1 (HIV-1).
Methods. Monoclonal antibodies directed against the CD4 protein were used to inhibit infection of primary human fetal DRG glial cell cultures by HIV-1. Fluorescence-activated flow cytometry and radioimmunoprecipitation were used to detect the physical presence of the CD4 protein. Ribonuclease protection and RNA blot hybridization analysis with CD4-specific probes were used to detect novel CD4 RNA species in the developing human nervous system.
Results. We have previously demonstrated that treatment of human fetal DRG glial cells with monoclonal antibodies directed against the T4A epitope (but not the T4 epitope) resulted in only a slight reduction of the number of HIV-1 gag-positive glial cells. These cells do not synthesize CD4 or express detectable amounts of CD4 at their cell surface. However, total RNA extracted from human fetal spinal cord and DRG contained CD4 RNA, as demonstrated by ribonuclease protection analysis. RNA blot hybridization with an antisense CD4 RNA probe demonstrated two unique CD4 RNA species of approximately 5.6 and 6.4 Kb in size in addition to very low levels of 3.0 Kb CD4 message. The two unique CD4-related RNA species were not present in human fetal heart or when a sense strand probe was utilized in hybridization analyses. Utilization of CD4 exon-specific probes demonstrated variable hybridization patterns to these two unique CD4-related RNA species.
Conclusion. These data suggest that HIV-1 infection of human fetal DRG glial cells is independent of the T4A epitope of CD4; the functional significance of novel CD4 RNA species in relation to this T4A-independent entry pathway is being explored.

C.750

UTILIZATION OF SYNCYTIUM-FORMATION MICROASSAY FOR QUANTITATION OF INFECTIVE HUMAN IMMUNODEFICIENCY VIRUS TYPE 1 (HIV-1)

Hwang, Michael Y.S.*; Ting, R.C.Y.*; Kaneko, Y.**; Aoki, T.**.
*Biotech Research Laboratories, Inc., Rockville, MD, USA,
**Pharmaceuticals Development Dept., Ajinomoto Co., Tokyo, Japan.

Objective. To describe a method for quantitating infective HIV-1.
Method. Detection of syncytium formation in the infected CEM-SS cells cultured in an adhesive-protein coated, 96-well plate. The syncytium formation was compared with the production of HIV-1 core antigen--p24.
Result. Infective HIV-1 was detected and relatively quantitated in the original sample and in H9 cell cultures inoculated with the sample. The syncytium formation in the test occurred simultaneously with the development of p24.
Conclusion. The syncytium-formation microassay was rapid and accurate in calculating syncytium formation and determining the number of infective HIV-1.

C.752

CONTINUOUS EPITOPES ON GP 120 WITH SPECIAL REFERENCE TO THE CD-4 BINDING SITE.

Anders G. Nygren, Fenyö E-M. and Norrby, E. Department of Virology, Karolinska Institute, Stockholm, Sweden.

Objective To study continuous epitopes on GP 120.
Methods A large panel of sera was obtained from guinea pig immunised with synthetic peptides representing various regions of GP 120. These serawere tested for binding to native ,fully glycosylated GP 120. RIPA, inhibition of of binding between GP 120 and CD-4 and testing of these sera in a fusion inhibition assay was performed.
Results Two out of four sera directed against peptides representing the CD-4 binding site on GP120 was shown to immunoprecipitate native GP 120. Also peptides representing certain other regions of GP 120 i.e. the dominant neutralizing epitope were also shown to be able to immunoprecipitate native GP 120.
Conclusion Some epitopes on the native GP 120 are recognised by sera obtained from guinea pig immunised with synthetic peptides representing various parts of GP 120.

C.753

GROWTH OF HIV IN CELLS FROM VARIOUS DONORS

O. Yamada, T. Matsumoto, R. Sakaoka and T. Kurimura. Department of Virology, Tottori University School of Medicine, Yonago 683, Japan

Peripheral blood mononuclear cell (PBMC) preparations were prepared from 27 individuals and the growth of Japanese HIV isolates, JH/3 and JMH/1, in those PBMC preparations was studied. There was significant diversity in infectious virus yield among PBMC preparations. The virus yield did not correlate with the ratio of CD4 lymphocytes in PBMC or growth ability of the cells. In some PBMC preparations, p24 antigen levels did not correlate with infectious virus yield. When E-rosette forming cells were used instead of whole PBMC, similar phenomena were observed, but the production of p24 antigen was much reduced without decrease of infectious virus yield. These results indicate that each individual donor has lymphocytes with capacity to allow the growth of HIV different from others, and that E-rosette forming cell-depleted PBMC produces excess p24 antigen.

C.754

DETECTION BY POLYMERASE CHAIN REACTION OF HIV-1 DNA IN HOMOSEXUALS, HEMOPHILIACS, AND AIDS PATIENTS IN TAIWAN

R. Guo*, C. Y. Chuang**, M. C. Shen**, H. C. Lin***, Y. C. Ko#, C. H. Chien# and Kenneth S. S. Chang* *National Cancer Institute, NIH, Bethesda, MD, USA; **National Taiwan University College of Medicine, Taipei, Taiwan; ***Center for Venereal Disease Control, Taipei, Taiwan; and #Kaohsiung Medical College, Kaohsiung, Taiwan.

Objective. To detect HIV-1 proviral sequences by polymerase chain reaction (PCR) with DNA samples obtained from seropositive Taiwanese subjects.
Methods. Peripheral lymphoid cells from an AIDS patient, an asymptomatic homosexual male, and two hemophiliacs, as well as formalized spleen tissues from two autopsied AIDS patients were tested. The presence of proviral sequence in the Southern blot was detected by specific probes following PCR-amplification procedures. Results. All of the 6 samples exhibited a positive reaction when primer pairs from *gag* region and gp41 domain of *env* region were used. Primer pairs derived from a relatively conserved region of gp120 domain of *env* region also functioned to produce amplified fragments for all samples. However, when primer pairs covering gp120 through gp41 domains were used, only four samples gave a definite amplified band, and one yielded a faint band. When primer pairs derived from *nef* and 3' LTR regions were used, all were negative. The degrees of hybridization signal intensity for each of the samples PCR-amplified at *gag* region did not correlate exactly with those PCR-amplified at various *env* regions.
Conclusion. The results suggest that these six samples contain various copy numbers of HIV-1 proviral sequences which exhibit heterogeneity in their *env* sequences, divergent from those of HXB2 clone of HIV-1.

C.755

CONSTRUCTION OF A RECOMBINANT RETROVIRAL INTERFERING PARTICLE CONTAINING A DEFECTIVE HIV-1 GENOME

Federico, Maurizio; Taddeo, B.M.R.; Orecchia, A.; Saggio, I.; Carlini, F.; Verani, P.; Rossi, G.B.
Laboratory of Virology, Istituto Superiore di Sanità, Rome, Italy.

Objective. By infecting Hut-78 cells with an RT positive supernatant of PBL from an AIDS patient, we have isolated a non-producer HIV-infected cell clone (F12), which exhibits a viral RNA pattern superimposable with that of productive cell clones, and shows resistance to HIV-1 or HIV-2 superinfection. In order to study the phenomenon of viral interference, the whole genome will be transferred in HIV-sensitive cell lines via transfection of a retroviral vector construct in an amphotropic packaging line.
Methods. From an Sst I genomic library of F12 clone we have molecularly cloned the whole provirus in pUc-19 and then subcloned it in retroviral vectors bearing the G418 resistance gene such as pLJ (MLV LTRs promoter), Ntk (thymidine kinase promoter) and NSV (SV40 promoter).
Results. The pLJ construct has been transfected in an amphotropic retrovirus packaging line (PA 317), in order to recover a recombinant retrovirus containing the provirus originally integrated in F12 clone. More than 30 G418-resistant PA317 clones have been obtained. Indirect IFA analysis using a pool of human positive sera was clearly positive in two PA317 clones also showing an integrated construct by Southern Blot. A more detailed molecular characterization will be discussed.

REPLICATION OF A LETHAL VARIANT OF SIV/SMM IN MACAQUE PBMC IN THE ABSENCE OF EXOGENOUS IL-2 OR ACTIVATION BY MITOGENS

Fultz, Patricia; McClure, H.; Anderson, D.
Yerkes Regional Primate Research Center and Department of Pathology, Emory University, Atlanta, GA, USA

Objective: To identify mechanisms by which SIV/SMM(PBj$_{14}$) replicates in and induces proliferation of PBMC from normal macaque and mangabey monkeys.
Methods: Resting or PHA-stimulated PBMC from normal monkeys, chimpanzees or humans were infected with SMM(PBj$_{14}$) or the parent, SIV/SMM-9; cultures were monitored for RT activity, cell viability, total cell number, percentage of cells expressing the IL-2 receptor, and production of various cytokines.
Results: Infection of PBMC from pig-tailed macaques or mangabeys, but not from chimpanzees or humans, with SIV/SMM(PBj$_{14}$) resulted in as much as 5-fold increases in total viable cells. This phenomenon was not observed in parallel cultures infected with the parent SIV/SMM-9. In addition, SMM(PBj$_{14}$), but not SMM-9, replicated in and induced proliferation of resting macaque PBMC, irrespective of whether exogenous IL-2 was added to the medium. The proliferative response paralleled virus accumulation in culture medium and increases in IL-2 receptors. Experiments are in progress to assess the possible role of various cellular activation pathways in the proliferative response to SMM(PBj$_{14}$).
Conclusions: SMM(PBj$_{14}$) has escaped the requirement that cells be activated before productive infection can occur. Also, the induction of cell proliferation during *in vitro* infection is manifest as lymphoid hyperplasia *in vivo*, leading to the speculation that the *nef* gene product, which has some sequence homology with and functions similar to pp60-*src* and v-Ha-*ras*, has acquired mutation(s) that render it "oncogenic-like." (NIH RR-00165)

C.759

HIV-1 SEQUENCE ANALYSIS OF BRAIN AND BLOOD LYMPHOCYTES FROM NEUROLOGICALLY SYMPTOMATIC AIDS PATIENTS USING PCR TECHNIQUES

Levy, Robert; Gurney, M. and Wolinsky, S.
Northwestern University Medical School, Chicago, IL USA

To determine whether there are specific neurotropic strains of HIV-1 which result in brain dysfunction and the location of possible functional gene loci conferring neurotropism and neuropathogenicity, we have isolated and partially characterized HIV-1 from the brains and blood lymphocytes of six AIDS patients with neurologic dysfunction using the polymerase chain reaction (PCR) technique. PCR permits direct enzymatic amplification of proviral DNA which can then be directly characterized. All neurologically symptomatic HIV-1 infected patients at our institution are treated according to published algorithms; in patients undergoing CT-guided stereotactic brain biopsy, two tissue cores (1.2 X 0.2 cm) are placed on sterile foil and frozen in liquid nitrogen and 10 cc of blood is collected and blood mononuclear cells are then isolated and stored. Histopathologic diagnoses for the six patients include HIV-1 encephalitis (2), progressive multifocal leukoencephalopathy (2), toxoplasmosis (1) and primary CNS lymphoma (1). Four of the six study patients have died (mean survival after biopsy = 2.8 months); the remaining two are stable 2 months after biopsy.

Using oligonucleotide primers which flank a region of the second conserved domain of the envelope gene of the HIV-1 genome (which has been implicated in previous studies as being related to neurotropism), PCR has been used to amplify this region in both neural and non-neural HIV-1 isolates. In phase one of the study, this amplified region has been sequenced for several cloned inserts and we are determining the degree of sequence variation in these isolates and comparing them by source, neurologic diagnosis and clinical findings. Phase two of the study involves the insertion of this region into an infectious "cassette" derived from both LAV and HBX2. Studies are underway to determine whether the product of this insertion has the preferential ability to infect neurons in culture, an in vitro demonstration of neurotropism.

C.760

THE MORPHOLOGY OF A NEW LENTIVIRUS

* MICHAEL G. KOCH, ** Preston A. Marx, *** Albert F. Bykovsky, **** Brur Strandberg, ***** Lennart Nilsson

* Vårdcentralen, S-546 00 Karlsborg, Sweden; ** Primate Center, University of California, Davis, CA 95616, USA; *** Gamaleya Institute, Moscow, USSR; **** Biomedicum, S-751 23 Uppsala, Sweden; ***** Karolinska Institute, S-104 01 Stockholm, Sweden.

HIV is, to the best of our knowledge, the first lentivirus ever to infect mankind. We show the unveiling of its structure by scanning and transmission electron microscopy, by thin section and tilt series, by stroboscopic analysis of surface symmetries under rotation, by cristallographic and computer based strucural analysis using gra-phic simulation of random sections. The results from several laboratories are combined to create a three-dimensional model, which represents today's knowledge about the HIV particle. The structure found for HIV seems to be essentially the same as for the known animal lentiviruses SIV (STLV-3), BIV (BVLV), FTLV (FIV), MVV (Maedi-Visna virus, Zwoegersiekte), CAEV (GLV, CSR) and EIAV. Some morphological details have implications for the virus' life cycle, for its pathogenesis, for possible targeting of therapy, and for the chances to develop a vaccine.

C.761

ANTI-HIV-IgG PRODUCTIONS IN VITRO DURING VIRUSISOLATION.

Bart Vanderborght*, R.J. De Leys*, B. Willems**, P. Nijs**, G. van der Groen**, H. Van Heuverswyn*.
* Innogenetics N.V. Antwerpen, Belgium. ** Institute for Tropical Medicine, Antwerpen, Belgium.

Objective: Influence of anti-HIV production "in vitro" on HIV-isolation.
Methods: Fresh Peripheral Blood Lymphocytes (PBLs) of 45 European ARC patients were collected monthly and cocultivated with PHA-stimulated PBLs from healthy donors. 136 viruscultures were screened for anti HIV-IgG production after 3 and 14 days. Screening was performed with Line Immuno-Assay (LIA) strips (Innogenetics N.V.) which permits screening for gp41, endonuclease p32, p24 and p17 at one time.
Results: From 136 cultures tested 82 % produced IgG in vitro after 3 days. The strongest reactivities were observed with the p24 antigen. 17 % of the cultures were still producing low levels of IgGs after 14 days.
No correlation was seen between IgG production in vitro and the final evaluation of the cultures for virusproduction by antigen detection, reverse transcriptase or immunofluorescence, which suggests that virus production is not significantly influenced by possible neutralizing antibodies which may be secreted into the medium.
It was also clear that the level of antibody production in vitro is patient dependent and remained stable for most patients during the period we tested (up to 6 months).
Conclusions: IgG production in vitro is patient dependent and had no significant influence on virus isolation results.

C.762

VARIANT RETROVIRUS INFECTION IN AFRICAN PRIMATES

Delaporte, Messinger*, Bernard, J *, Ittelet, D.*, Gallo, R.C ** and Zagury, D *

* Université P. et M. Curie, Paris, France ** NCI, Bethesda, USA

Objective: To define the extent of retrovirus infection in the primate population of East Zaire, then to isolate and characterize retroviral variants from seropositive species.
Methods: All available sera from wild monkeys were tested for HTLV1, HIV1 and HIV2 reactivity using Western Blot analysis.
Results: Sera from three species of primates (Cercopithecus l'hoesti, Cercopithecus denti and Cercopithecus hamlyni) show evidence of cross reactivity with HIV1 and/or HIV2.

Species	Total Number	Env pattern of reactivity		
		HIV1 + HIV2 -	HIV1 - HIV2 +	HIV1 + HIV2 +
C. l'hoesti	21	1	4	1
C. hamlyni	15	0	4	2
C. denti	4	1	2	1

Conclusion: Cellular material from these animals is under investigation for isolating primate retroviruses to be compared to HIV.

C.763

HIV-LIKE PARTICLES IN NEURONS OF THE BRAIN.

Bauer, Pierre G.*; Sá, C.A.M.**; Sion, F.S.**; Basílio, C.A.**, Fialho, F.**; Valle, N.A.**. *Virology, FIOCRUZ, Box926, Rio, Brasil; **Hospital Gaffrée e Guinle, UNI-RIO, Rio, Brasil.

Objective. To identify HIV infected neurons by electron microscopy.
Methods. Specimens of brain autopsies of patients which died of AIDS were prepared for routine electron microscopy and systematically analysed.
Results. Investigating several hundred neurons on ultrathin sections we could observe on rare occasions an HIV-like particle inside a vacuole or a multivesicular body in few neurons of the temporal lobe grey matter of a brain with toxoplasma and HIV-related pathologies. Beside a relative high content of neuronal lipofuscin the studied region presented a normal aspect.
Conclusions. The localization of the HIV-like particles was similar to HIV inside endosomes during the endocytotic uptake into culture lymphocytes or to intracellularly produced HIV being stored in vacuoles. The low quantity of detected particles may explain the negative results of other techniques in relation to neuron infection by HIV. The present data may contribute to the knowledge about cell infection and neuropathology of HIV.

C.764

REACTIVITY OF HUMAN HIV-2 ANTIBODIES WITH NATIVE AND SYNTHETIC HIV-1 AND HIV-2 ANTIGENS.

HUSKINS, K.R.; FURNESS, J.N.; REAGAN, K.J.; NEUMANN, J.E.; HU, Y.W.; *KANG, C.Y.* et al, E. I. DU PONT CO., GLASGOW 713, WILMINGTON, DE., 19898, USA, *UNIV. OF OTTAWA, OTTAWA, CANADA.

Objective. To characterize the reactivity of human HIV-2 antibodies with viral antigens and synthetic polypeptides from the gag, env, and pol genes of HIV-1 or HIV-2 as a means to distinguish HIV-2 infection from HIV-1.
Methods. Samples confirmed positive for HIV-2 antibodies by differential response on whole virus Western blots for HIV-1 and HIV-2 were further tested with the various specific antigens in Western blot, ELISA, and RIPA assays.
Results. HIV-2 sera from 15 asymptomatic individuals gave the following reactivities (shown as the number positive/number tested):

ELISA		WESTERN BLOT		RIPA	
HIV-1 LYSATE	11/15	HIV-1 rGAG	12/15	HIV-1 rGAG	12/14
HIV-2 LYSATE	15/15	HIV-1 rGP41	2/15		
HIV-1 rENV	11/15	HIV-1 rPOL	10/10	r-Recombinant Ag	
HIV-2 sGP41	15/15	HIV-1 rP17	4/15	s-Synthetic Ag	

Conclusion. Evidence for reactivity with both conserved and HIV strain specific antigen domains was found. These observations should be useful in the design of both broadly reactive HIV screening assays and more convenient diagnostic tests for serotype confirmation.

C.765

SCREENING ET TYPAGE HIV-1 ET HIV-2 GRACE A UN TEST RAPIDE (3 MINUTES) UTILISANT DES PEPTIDES SYNTHETIQUES (CLONATEC TARGET HIV TEST).

Sylvie Ranger*,G.Léonard*,S.Bettinger**,A.Sangaré***,G.M.Gershy-Damet***,F.Denis*
* Département Virologie, CHU Limoges, France.** Clonatec, Paris, France, ***Institut Pasteur Côte d'Ivoire.

Objectif : Evaluation d'un test Elisa rapide (3 minutes) utilisant des peptides synthétiques HIV-1 et HIV-2 dérivés de la séquence de la glycoprotéine transmembranaire de chacun des deux virus HIV-1 et HIV-2.

Matériels et méthodes :

Sérums : L'étude a porté sur 237 sérums provenant de sujets vivants en Afrique de l'Ouest.

Test : Le sérum dilué au 1/10 est filtré à travers une membrane sur laquelle ont été déposés chaque peptide HIV-1 et HIV-2. Après addition du conjugué (anti IgG humaine conjugué à la peroxydase) et lavage, on ajoute le substrat (TMB). Le résultat (spot bleu) est visible à l'oeil en une minute environ.

Résultats :

WB	TOTAL	PEPTIDES		
		HIV-1	HIV-2	Négatif
1	7	6	-	1
2	72	1	68	3
1+2	12	12	8	-
Neg	146	2	-	-

Conclusion : Les résultats montrent une bonne sensibilité (HIV-1 : 94,7 % et HIV-2 : 90,5 %) et une très bonne spécificité (HIV-1 : 98,6 % et HIV-2 : 100 %). Ces résultats, très intéressants pour un test rapide, sont encourageants, une augmentation de la sensibilité doit pouvoir être obtenue.

C.766

ABSENCE OF P24 ANTIGEN AND ANTI P24 ANTIBODY DECREASING IN AFRICAN AIDS : COMPARISON BETWEEN EUROPEAN AND WEST AFRICAN POPULATIONS.

Guy Léonard*, P.Weinbreck**, M.Mounier*, G.M.Gershy-Damet***, F.Barin****, F.Denis*.*Virology and ** Infectious deseases departments CHU Limoges France, ***Institut Pasteur Abidjan Cote d'Ivoire, ****Virology CHU Tours France.

Objective : to compare virological pronostic factors (p24 antigenemia, anti p24 antibody titer) in European and west African patients

Material and Methods : 508 HIV positive patients from Limoges France (106 sera) and Abidjan Cote d'Ivoire (402 sera) were tested for p24 antigenemia by Abbott HIV-1 antigen p24 assay and for anti p24 by recombinant Envacore EIA Abbott.

Results :

Virus	Area	Cl. Status (Nb)	Anti p24 % compet* 0-50%	50-100%	Ag p24 % positivity
HIV-1	AF	AIDS(100)	7%	93%	9%
		HEALTHY(136)	2%	98%	0%
	EUR	AIDS(18)	50%	50%	50%
		ARC(10)	20%	80%	20%
		HEALTHY(78)	23%	77%	4%
HIV-2	AF	AIDS(19)	42%	58%	0%
		HEALTHY(96)	2%	98%	0%
HIV-1+ HIV-2	AF	AIDS(29)	0%	100%	0%
		HEALTHY(22)	0%	100%	0%

Conclusion : AIDS African patients have higher titers of core antibodies than European individuals. The pronostic value of HIV antigenemia is not the same for seropositive patients in Europe and in west Africa.

C.767

INFLUENCE OF BLOOD VOLUME AND TRANSPORT ON HIV CULTURES IN INFANTS AND CHILDREN

Robb, Merlin L.*, Vincent, J.*, Fowler, A.**, Dilworth, S.**, Zawadsky, P.*, Burke, D.**, the Walter Reed Retrovirus Research Group *Walter Reed Army Medical Center, **Walter Reed Army Institute of Research, Washington, D.C., United States of America

Objective. To determine the influence of blood volume and specimen transport on pediatric HIV cultures.

Methods. Blood cultures for HIV were obtained with 1-3 cc of heparinized whole blood from 28 patients (PO-P2) with an age range of 3 mos. to 11 yrs. Each culture was evaluated with a standard number of the patient's mononuclear cells (10^6) and a lesser number of cells (10^5) using a modification of the method of D. Gallo, et.al. Laboratory personnel were blinded to the patient's status and origin of specimen.

Results. Cultures from 9 children were positive and all symptomatic infants and seropositive children had positive cultures. Eight of 9 had positive culture with 10^5 and 10^6 cells. One child had a positive culture with 10^6 cells only. Most cultures were positive at 7 days incubation and 7 of 8 parallel samples were positive at the same time interval. Six specimens were shipped at ambient temperature (3ml of heparinized blood) and cultured over 24 hrs. after phlebotomy. Cultures from 3 of these 6 patients were positive.

Conclusion. Prompt and reliable diagnosis of HIV infection in infants is a major problem. There preliminary data suggest that HIV cultures may be a valuable diagnostic tool despite a small volume of blood (1-3ml) and delay between phlebotomy and culture processing.

C.768

PRIMARY ISOLATION OF HIV FROM LYMPHOCYTES, MONOCYTES, AND MACROPHAGES WITH A PERMANENT T-CELL LINE AS A MODEL TO STUDY VIRUS REPLICATION AND CELL TROPISM IN VITRO

Baur, Andreas; Ehrmann, U. and Jahn, G.
Institut für Klinische und Molekulare Virologie der Universität Erlangen-Nürnberg, D-8520 Erlangen, FRG.

Objective: To establish a standardized HIV isolation procedure where PMBC can be replaced by a permanent T-cell line in order to study primary HIV replication and transmission of HIV from monocytes/macrophages to T-cells.

Method: Under optimal conditions primary HIV isolation gave an overall positive result in 84%. Using the permanent T-cell line SupT1 as the cocultivating system, instead of negative donor PMBC, HIV isolation was positive in 68% of cases. In contrast to SupT1, negative donor PMBC's showed suppressive influence on primary virus replication in vitro. Direct transmission of HIV from infected patients blood monocytes to SupT1 was observed in 9 out of 20 isolations. However, the monocytes had to be stimulated with GM-CSF. In one case the virus could be isolated directly from alveolar macrophages to the permanent T-cell line.

Conclusion: SupT1 as a cocultivating system in primary HIV isolation are not as sensitive as PMBC, but revealed to be a good model to study virus replication and cell tropism of HIV wild isolates in vitro.

C.769

HUMAN IMMUNODEFICIENCY VIRUS (HIV) MUTLIPLIES IN PRIMARY CULTURES OF HUMAN KUPFFER CELLS

SCHMITT Marie Paule*; STEFFAN, A.M.*; JAECK, D.+; GENDRAULT, J.L.* and KIRN, A.*
* Virus Department and INSERM U 74 ; + General and Endocrinal Surgery Faculty of Medicine, ULP, STRASBOURG, FRANCE

OBJECTIVE. Given their localisation in the liver sinusoid, the Kupffer cells (KC), which represent the largest reservoir of fixed macrophages in the body, are ready candidates for early infection following contamination. However, until now, the role of KC in HIV infection has never been studied and no attempt has ever been made to infect KC in culture.

METHODS. Isolation of KC was carried out according to the method we have previously described (Kirn et al., C.R. Acad. Sci. Paris, 1980, 291, 249). The purity of the cell culture attained 98 %. Primary cultures of 24-to 72-hour-old KC were infected with HIV 1 (isolate LAV 1- Bru).

RESULTS. In 3 different experiments syncytia detectable under optical microscopy appeared between 4 and 10 days. EM observations showed typical viral particles released either in vacuoles or outside the cell as well as characteristic budding figures. Except from the syncytia, no obvious cytopathic effect could be found. Furthermore, a reverse transcriptase activity increasing with the time of infection was demonstrated in the supernatant of the infected KC.

CONCLUSION. Our results, which demonstrate that KC may constitute a target for HIV, suggest that these cells may play a crucial role in the physiopathology of the disease. They may not only constitute a reservoir for the virus but, given their strategic position in the liver lobule, they may also be involved actively in the dissemination of the virions.

C.770

PRODUCTIVE INFECTION OF PRIMARY CULTURES OF HUMAN HEPATIC ENDOTHELIAL CELLS (EC) BY HUMAN IMMUNODEFICIENCY VIRUS (HIV)

STEFFAN, Anne-Marie*; SCHMITT, M.P.*; GENDRAULT, J.L.*; JAECK, D.+ and KIRN, A.*
* Virus Department and INSERM U 74 ; + General and Endocrinal Surgery, Faculty of Medicine, ULP, STRASBOURG, FRANCE

OBJECTIVE. The presence of CD 4 antigen on the surface of human liver EC renders them susceptible to infection by HIV.

METHODS. Hepatic EC were isolated from liver specimens obtained after partial hepatectomy in secondary liver cancer by a method we developed several years ago (Steffan et al., C.R. Acad. Sci. Paris, 1981, 292, 809). The cells were purified by centrifugal elutriation. The well flattened out EC could be easily characterized under SEM by their typical fenestrae.

RESULTS. Primary cultures of 24-hour-old EC were infected with HIV 1 (isolate LAV 1-Bru) for 3, 4 and 5 days and processed for SEM and TEM. Under SEM, a great number of virus particles were detected at the plasma membrane as early as 3 days after infection. One or two days later, the number of viruses in close contact with the plasma membrane or in the vicinity of the cell had considerably increased. Moreover, numerous pictures strongly suggestive of virus budding were observed. TEM observations confirmed these results and demonstrated the presence of typical virus particles as well as the different steps of virus budding.

CONCLUSION. These results demonstrate that liver EC in culture may be infected with HIV and are able to produce large amounts of virions. This suggests that the EC could play an important role in the dissemination of HIV particles.

C.771

A HUMAN MONOCLONAL ANTIBODY AGAINST HIV-1 TRANSMEMBRANE GLYCOPROTEIN GENERATES COMPLEMENT-MEDIATED, ANTIBODY-DEPENDENT ENHANCEMENT (C'-ADE) OF HIV-1 INFECTION *IN VITRO*.

W.E. Robinson, Jr.,[1], M.K. Gorny[2], J.-Y. Xu[2], D.C. Montefiori[1], W.M. Mitchell[1], and S. Zolla-Pazner[2,3].
[1]Dept. of Pathology, Vanderbilt University, Nashville, TN USA 37232
[2]Dept. of Pathology, New York University , New York, NY USA 10016
[3]Veterans Administration Medical Center, New York, NY USA 10010

Objective: To evaluate ten human monoclonal antibodies (mAb) against HIV-1 for their abilities to neutralize or enhance HIV-1 infection *in vitro*.
Materials: Ten human lymphoblastoid cell lines producing mAb against HIV-1 were generated *in vitro* by infection of peripheral blood lymphocytes from HIV-1 seropositive subjects with Epstein-Barr virus. All ten IgG were tested in an MT-2 cell microtiter infection assay for HIV-1 neutralizing and enhancing activities.
Results: Of the ten, 4 reacted with *gag* protein (p24) and 6 reacted with *env* protein (gp41), by radioimmunoprecipitation. None of the mAbs were neutralizing. It was determined that one mAb, 120-16, could enhance HIV-1 infection to a dilution of 1:648 (approximately 25 ng/ml). This mAb is an IgG$_{2\kappa}$ which recognizes gp41 and is directed against an immunodominant region of the virus. Enhanced HIV-1 infections were characterized by increased cytopathic effect, reverse transcriptase release, antigen synthesis, and progeny virus production.
Conclusions: Since only 1 of 6 human mAb tested mediated C'-ADE of HIV-1 infection *in vitro*, this phenomenon probably depends on recognition of one or more specific epitopes. The epitope(s) can be mapped and should, perhaps, be eliminated from recombinant vaccines.

C.772

IDENTIFICATION OF PROTEIN INTERMEDIATES IN THE PROCESSING OF THE p55 HIV-1 gag PRECURSOR.

Shantharaj D. Gowda, B.S. Stein, and E.G. Engleman. Stanford University School of Medicine, Palo Alto, CA 94304, USA.

Objective: To analyze the cleavage pathway of the 55 kDa (p55) HIV-1 gag precursor.
Methods: HIV-1 gag proteins isolated from [^{3}H]leucine labeled, recombinant HIV-1/vaccinia virus infected H9 T lymphocytes by immunoprecipitation with anti-p24, anti-p17 or anti-p6 antibodies were subjected to one- and two-dimensional SDS-PAGE.
Results: SDS-PAGE analysis revealed that the initial cleavage of the p55 gag precursor gives rise to three processing intermediates (p41a, p41b and p39). p41a and p39 proteins contain the p17 and p24 protein segments, and p41b is comprised of p24 and p15 proteins. On two-dimensional gels, these intermediates as well as the mature p24 and p17 proteins migrated as distinct species. [^{3}H]myristic acid labeling of the HIV-1 gag proteins revealed that in addition to p55 and p17, the p41a and p39 intermediates, but not p41b, are myristylated, confirming that myristylation occurs at the N-terminus before cleavage of the p55 precursor.
Conclusion: The myristylated HIV-1 gag p55 precursor is initially cleaved at random either at the p17/p24 junction or at two sites between p24 and p15 proteins, resulting in three intermediates which are subsequently cleaved to yield mature gag proteins.

C.773

EARLY DIAGNOSIS OF HIV INFECTION IN CHILDREN AND NEWBORN BY LYMPHOCYTE CULTURES AND DNA/RNA DETECTION IN THE POLYMERASE CHAIN REACTION (PCR).

Bacaich Sonia*, Philippe N.**, Ritter J.***, Clarisse O.****, Baginski I.*, and Trépo C.*.
* INSERM U 271, Lyon ; ** Debrousse Hospital, Lyon ; *** Rockefeller University, Lyon ; **** E.Herriot Hospital, Lyon ; France.

Objective. In order to diagnose early HIV infection in newborn and children from seropositive mothers, we have looked for HIV in their peripheral blood mononuclear cells (PBMC).
Methods. 16 seropositive children were studied, age one day to 2 years and HIV was detected in lymphocyte cultures by P24 Ag ELISA (Abbott). HIV DNA and RNA in PBMC were demonstrated by PCR.
Results. HIV was isolated from lymphocytes in 5/16 cases (in 2/5 the first day of life). HIV DNA was detected in 13/16 children with two pairs of primers. HIV RNA was found in PBMC in 8/14 cases including the five with a positive HIV culture. Furthermore HIV RNA was present in 6/6 cases of children with clinical and/or immunological abnormalities but only in 2/8 of those with no clinical or biological changes.
Conclusion. PCR appears as the most sensitive method to diagnose HIV infection anytime after birth. Since HIV RNA detection in infected children does correlate with immunological abnormalities and positivity of lymphocyte cultures, it is likely that it may also be a clue in the assessment of active HIV replication and therefore of prognostic value in newborn HIV infection.

C.774

C.775

COMPARISON OF SINGLE AND DOUBLE-LABELLING OF SLB1 AND MT2 CELLS IN THE DETECTION OF HTLV-1 ANTIBODIES BY RADIOIMMUNO-PRECIPITATION ASSAY

Marian T. Sullivan*, A.E. Williams*, and D.J. Slamon**. *American Red Cross, Rockville, MD, USA, **UCLA School of Medicine, Los Angeles, CA, USA.

OBJECTIVE. 1.To determine if the sensitivity to HTLV-1 antibodies can be enhanced by a double-labelled lysate of infected cells. 2.To evaluate Leu as a substitute for Cys in the labelling of viral antigens. 3.To compare RIPA profiles from MT2 cells to a cell line of non-Asian origin (SLB1).
METHODS. Samples known to display various patterns of antibody reactivity were combined with either 5x10^6 cpm of ^{35}S-Cys labelled MT2 or SLB1 lysate, 1x10^7 cpm of ^{3}H-Leu labelled SLB1 lysate, or 5x10^6 cpm of both ^{35}S-Cys and ^{35}S-Met labelled SLB1 lysate. Antigen-antibody complexes were precipitated by protein A-Sepharose. Pellets were electrophoresed by SDS-PAGE and autoradiographed.
RESULTS. No samples displayed any additional antibody reactivities with Cys-Met than with Cys alone, and there was no observable difference in the intensity of bands. Lanes representing double-label treatment had greater non-specific background. Leu, substituted for Cys, did not improve the detection of any viral-specific antibodies, despite the fact that Leu is 5 times as common in the coding sequence. Using SLB1, viral products p24, p40, p55, and gp61 were reliably present. MT2 did not produce detectable p40, but exhibited p24, p55 and gp68. The representation of viral antibodies in 25 positive samples was p24/80%, p40/76%, p55/52%, and gp61/100%.
CONCLUSION. 1. ^{35}S-Cys-labelled-lysate is as effective in the detection of HTLV-1-specific antibodies as is ^{3}H-Leu or Cys-Met. 2. The SLB1 cell line provides better detection of anti-p40x than MT2.

C.776

HIGH CAPACITY DRUG SCREEN FOR INHIBITORS OF HIV TAT TRANSACTIVATION: EFFECT OF INTERFERONS

Lee Bacheler and Bob Nardone, Medical Products Department, E.I.DuPont de Nemours and Co. Inc, Experimental Station, Wilmington De 19880-0400, USA

Transactivation of the HIV LTR by the virally encoded tat protein is an essential step in virus replication. As such, tat transactivation is an attractive target for antiviral therapy. Transfection of HeLa cells with recombinant DNA plasmids expressing the HIV tat protein and linking E.coli beta-galactosidase to the HIV LTR has been used to generate human cell lines which express high levels of E. coli beta-galactosidase activity from a tat transactivated HIV LTR. One such cell line, 3B9, expresses sufficient beta galactosidase to allow the detection of the activity from 2000-5000 cells grown in a microtitre well. A high through put, virus free, microtitre format based drug discovery screen has been devised using the 3B9 cell line, and is being used to search for inhibitors of HIV tat transactivation. Compounds which inhibited HIV tat transactivation of the viral LTR would be expected to reduce B galactosidase expression in this cell line.

Alpha, beta, and gamma interferons are potent inhibitors of beta galactosidase expression in this assay. In order to differentiate between effects of interferons and other active compounds on tat transactivation and other effects which result in reduced beta-galactosidase expression, we derived a control cell line which expresses significant levels of beta-galactosidase from a different promoter, unrelated to HIV and not subject to transactivation by HIV tat. The effects of interferons and other "active" compounds on the expression of B galactosidase in this control cell line, as well as the effect on transactivation of a second LTR linked indicator gene introduced by transient transfection will be described.

C.777

SEROLOGIC ANALYSIS OF PROTEINS ASSOCIATED WITH AND PRELIMINARY SEROPREVALENCE STUDIES OF TWO NOVEL RETROVIRUSES ISOLATED FROM AIDS-ASSOCIATED LYMPHOMAS.

Ng, Valerie L., Khayam-Bashi F, Marsh J, and McGrath MS.
University of California, San Francisco, and San Francisco General Hospital, San Francisco, California, USA.

Objectives: To determine the serologic relationship of the proteins associated with two novel retroviruses, 2F7 and 10C9, isolated from primary AIDS-associated lymphoma tissue to other known retroviruses, and to determine prevalence of exposure to these viruses in various populations at risk for retroviral infection.
Method: Immunoblot.
Results: Purified 2F7, 10C9, HTLV-I (C91/PL), and bovine leukosis viral (BLV) proteins were used as antigen sources for immunoblotting. Antibodies raised against 2F7/10C9 p27 (candidate major virion core proteins) recognized HTLV-I p24, and antisera raised against HTLV-I envelope proteins recognized 50 kd proteins present in 2F7/10C9 virus preparations. A small subset of sera obtained from individuals at risk for retroviral infection (women with PID, pregnant women, intravenous drug users) reacted with 2F7/10C9 viral proteins; this same subset of sera had limited reactivity with HTLV-I virion core proteins and BLV envelope proteins (gp55/31), and did not react with HIV-1 proteins.
Conclusion: These results demonstrate that the 2F7/10C9 viruses are serologically related to oncoviruses, not to lentiviruses, and provide evidence that exposure to these viruses has occurred in individuals in groups at risk for retroviral infection.

C.778

BUDDING FEATURES OF DIFFERENT MORPHOLOGIES OF HIV-1 PARTICLES FROM CELL CLONES ISOLATED FROM HIV-1-INFECTED MT-4 CELLS

GOTO,Toshiyuki[*], IKUTA,K.[**], ZHANG,J.J.[*,***], KATO,S.[**] and NAKAI,M.[*]
[*]Osaka Medical College, Osaka, Japan, [**]Osaka University, Osaka, Japan, [***]Shaanxi Anti-epidemic Station, Xia, China.

Objective. To elucidate the viral maturation process.
Methods. Cell clones were isolated from HIV-1-infected MT-4 cells. Cloned cells were observed by electron microscopy, and immunoelectron microscopy was also carried out using monoclonal antibodies and HIV-1-seropositive serum.
Results. The cell clones produced particles with different kinds of morphologies. Normal particles were produced from the cell surface by a budding process in which crescent shape structures first appeared beneath the cell membrane, and subsequently matured to a complete form with an electron dense core just before being released from the cell surface. Doughnut-shaped and teardrop-shaped particles were respectively produced by budding of the crescent shape with double-layers from the cell surface, and by the budding of a teardrop form with an electron dense core from the cell surface.
Conclusion. The morphological maturation of HIV-1 particles appeared to be completed just before their release from the cell surface in several cell clones producing differently shaped particles.

C.779

NON-SPECIFIC HIV P24 ANTIGEN REACTION DUE TO BACTERIAL CONTAMINANTS

Rangan, SRS[*]; Pirkle, S[*]; Impey, A[*]; Jenney, A[**] and Hyslop, NE[*]
[*]Tulane University School of Medicine, New Orleans, LA, U.S.A.
[**]LSU Medical Center and Charity Hospital, New Orleans, LA, U.S.A.

Objective. To determine the source of HIV p24 reactivity in a sample of tissue culture growth medium (TCM) used as matrix negative control in capture assay.
Methods. A putative microbial contaminant in a macroscopically clear TCM was amplified at 37°C for 48 hrs. The microbe was re-isolated on blood-agar and identified. The isolate was grown in fresh sterile TCM. P24 antigen reactivity was determined with commercial (DuPont) kits in the TCM prior to and after centrifugation (3000g, 30min), and in the filtered (0.45 μM) centrifugate. P24 reactivity was also evaluated in samples from a culture of *Pseudomonas aeruginosa* in TCM. P24 specificity test was as per kit directions.
Results. The contaminant in the original TCM was identified as *Alcaligenes faecalis*. The centrifugate and filtrate derived from the TCM with the microbial growth had p24 reactivities of 326 and 426 pg/ml respectively. P24 reactivity of 110 pg/ml was associated with the centrifugate from TCM with *P. aeruginosa* growth. In specificity tests, the kit confirmatory reagent reduced the p24 reactivity of a known positive control by over 94%. The same reagent, however, had no effect on the p24 reactivities associated with the samples from the bacterial cultures.
Conclusion. False positive HIV p24 reactivity in the antigen-capture assay may be related to microbial growth in test samples. Measurement of p24 antigenemia in samples from HIV-infected patients should be adequately controlled for possible bacterial contamination.

C.780

MACROPHAGE CULTURES DO NOT INCREASE FREQUENCY OF HIV ISOLATION OVER LYMPHOCYTES FROM HEMOPHILIACS

Lemos, Ricardo S.; Rangan, S.R.S.; Andes, A. and Hyslop Jr., N.E.
Tulane University School of Medicine, New Orleans, La, USA.

Objective. To determine whether macrophages (MØ) of hemophiliacs preferentially harbor HIV, since the frequency of virus isolation from hemophiliacs in many studies is lower than that from infected asymptomatic homosexuals.
Methods. Monocytes and lymphocytes from asymptomatic seropositive hemophiliacs and homosexual controls in Ficol-Hypaque fractionated blood mononuclear cells were separated by adherence to plastic culture dishes and panning of the unattached cells. The MØ fraction was subjected to complement-mediated lysis with MAb Leu 5b to remove residual T cells. The two populations of cells were cocultured with GM-CSF treated MØ or PHA-stimulated lymphocytes from seronegative donors. Harvests from the cultures obtained weekly for 4 weeks were tested for p24 by the antigen-capture assay.
Results. Under comparable cultural conditions, HIV recovery from the blood mononuclear cells of 5 homosexual controls and 5 hemophiliacs studied was as shown.

	Monocytes	Lymphocytes
Controls	4+/5 (80%)	5+/5 (100%)
Hemophiliacs	1+/5 (20%)	2+/5 (40%)

Conclusion. The reported lower frequency of HIV recovery from hemophiliacs is unlikely to be due to the virus being preferentially harbored in their monocytes.

C.781

BIOLOGICAL FACTORS AFFECTING TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS

Robertson JR,[*] Skidmore CA,[*] Davidson SJ,[*] Rebus S,[**] Aw D,[**] Peutherer JF[**]
[*]Edinburgh Drug Addiction Study, Edinburgh
[**]Department of Bacteriology, University of Edinburgh
UNITED KINGDOM

OBJECTIVE: To assess biological factors which affect heterosexual transmission of HIV, with particular reference to biological markers of infectivity.
METHODS: 15 couples were identified where one partner (13 male, 2 female) was infected with HIV, and the other confirmed seronegative. The couples had been in a sexual relationship for an average of 23 months (3-84). There was no evidence of barrier methods of contraception. All patients were investigated at least once in the 10 month period. 21 (70%) were tested at least twice. At each visit venous blood samples were drawn and tested for antibody to HIV, p24 antigen and lymphocyte culture. In all cases, tests were carried out using commercial kits.
RESULTS: Virus was detected in lymphocyte cultures from 5 index cases, of whom 3 (60%) also had p24 antigen. One other index case also showed antigen but no virus. Among their sexual contacts 2 seroconverted during the study period 2 and 6 months after virus was first detected in culture. A third patient also yielded virus on culture and later had evidence of HIV DNA on hybridisation but 12 months after the original test is still HIV antibody negative. In 2 out of 3 couples where transmission occurred the index patient was antigenaemic and all 3 index cases yielded virus from lymphocyte culture on two or more occasions. In all 3 cases who showed evidence of infection, virus detection was the earliest marker of infection.
CONCLUSIONS: 2 female partners seroconverted during the study period, and a third showed evidence of infection but a short course of AZT may have delayed seroconversion. Virus isolation was present in all transmitters, p24 antigen in 2 out of 3. The use of virus isolation as an early indicator of infection (before antibody detection) is important, and the implications for subsequent heterosexual spread are discussed.

C.782

EXPRESSION AND TRANSACTIVATION OF HIV PROMOTER IN BACTERIA

Wood, Charles and Kashanchi, F.
Department of Microbiology, University of Kansas, Lawrence, Kansas, 66045 U.S.A.

Objective. To study the expression and transactivation of HIV long terminal repeats (LTR) in a bacterial system.
Methods. A recombinant plasmid containing the HIV-LTR linked to an indicator gene, chloramphenicol acetyl transferase (CAT), was transformed into *E. coli*. The expression and transactivation of the HIV promoter, in the presence and absence of tat, was followed by measuring the level of CAT enzyme.
Results. We have demonstrated that HIV-LTR can also function as a promoter in *E. coli*. The HIV-CAT plasmid can express the enzyme efficiently upon transformation into bacteria. The bacterial transcriptional start site was mapped by mung bean nuclease analysis. HIV-LTR, besides being fully functional in *E. coli*, can also be specifically transactivated by the HIV-tat gene product. Transactivation can be demonstrated by an increase in CAT enzyme activity as well as an increase in the level of CAT mRNA.
Conclusion. This specific transactivation of HIV-LTR by tat protein in bacteria will provide a useful system to further investigate the specific interaction between the *tat* protein with the HIV-LTR and the mechanisms used for transactivation.

C.783

IMPORTANCE OF STRUCTURAL ELEMENTS OF HIV GP120 TO CD4-BINDING ABILITY

Hemming, Anna*; Bolmstedt, A.*; Flodby, P.**; Lundberg, L.*** and Olofsson, S.*.
*Department of Clinical Virology, University of Göteborg, Göteborg, **Department of Immunology, Karolinska Institutet, Stockholm, ***Department of Biochemistry and Biophysics, Chalmers University of Technology, Göteborg, Sweden.

Objective. The CD4-binding region of HIV gp120 has been mapped to a peptide stretch situated between aa 370 and aa 480. The aim of this study is to identify structures within this region, which are important for the ability of gp120 to bind to the CD4-receptor.
Methods. Site-directed mutagenesis was used to introduce mutations within the CD4-binding region of gp120. Target structures were 1) cysteins, which are very conserved among HIV-1 isolates, hence indicating that they could be involved in disulfide bonds important for the three-dimensional conformation of the protein. 2) glycosylation sites, which surround the putative binding loop of gp120, thereby maybe protecting the binding region. Mutants were analysed in vitro by transfecting a gp160 expression vector, containing the mutant gene, onto CV-1 cells. CD4-binding ability was examined in an in vitro assay.
Results. Changing cys₄₀₃ to a serine resulted in a protein unable to bind to the CD4-receptor in the in vitro assay. Moreover, the protein had an altered electrophoretic mobility probably due to intracellular degradation by proteases. If the loss of CD4-binding ability is a direct effect of the mutation or is caused indirectly by protease degradation is currently under investigation.
Conclusion. Cysteins are important for the three-dimensional conformation and thus for the biological function of gp120. Our results show that gp120, which is a very variable protein, is extremely sensitive to changes in its conserved regions, since mutating only one cystein results in a protein susceptible to protease attack.

C.784

HUMAN IMMUNODEFICIENCY VIRUS (HIV) EXAMINED BY NEGATIVE STAINING: MORPHOLOGY AND ANTIGENICITY.

CHRYSTIE, Ian L., ALMEIDA, June D., and BANATVALA, J.E. Department of Virology, United Medical and Dental Schools of Guys and St Thomas's, St Thomas's Campus, LONDON, UNITED KINGDOM

Negative staining EM has proved less rewarding than thin sectioning in the study of HIV morphology and antigenic structure. This may, in part, be due to the close association of HIV with the propagating cell making it difficult to obtain good preparations of isolated virus. However, when HIV-2 infected cells (CB L-20/C8166) are gently homogenised in a Tenbroek-type, glass/teflon homogeniser surface located virus is sheared off and can be concentrated by simple differential centrifugation. The particles so obtained are mostly clumped and very little internal morphology is visible. However the greater number of particles isolated make it possible to visualize the immature virus particle which contains a spherical, doughnut shaped core.
Subsequent treatment of the semi-purified virus with a mixture of detergent (Nonidet P40) and glutaraldehyde both releases and stabilises the internal cone shaped component. Concentrations of both detergent and glutaraldehyde are critical, but when conditions are correct reasonable amounts of antigenically reactive cores are available for immune EM. These HIV-2 cores react positively with their corresponding human antisera, giving rise to classical immune complexes. These complexes contain various aberrant forms of the cone shaped core ranging from a squat triangular form to elongated rods. Their presence within the aggregates establishes that, antigenically, they are similar to, if not identical with, the standard cone shaped internal component. The isolated cores also reacted positively with a mouse monoclonal antibody directed against p24 (HIV-1) which reacts also with p25 (HIV-2).

C.785

C.786

FAILURE TO DETECT HIV-1 PROTEINS AND DNA IN ENTAMOEBA HISTOLYTICA STRAINS ISOLATED FROM PATIENTS WITH HIV-1 INFECTION

Chr. G. Meyer[1], G.D.Burchard[2], F.T. Hufert[1], D. Berzow[1], H. Schmitz[1]
[1]Dpt. of Virology, Bernhard-Nocht-Institut for Tropical Medicine, Hamburg, F.R.G
[2]Clinical Dpt., Bernhard-Nocht-Institut for Tropical Medicine, Hamburg, F.R.G.

Objective: To detect HIV proteins and proviral HIV DNA in Entamoeba histolytica strains, isolated from patients with HIV-1 infection and from E. histolytica cultures fed with HIV-1 infected lymphoblasts.
In order to characterize E. histolytica strains from HIV infected persons, it is important to know, wether these amoebe can transmit HIV. To answer this question, we characterized 3 E. histolytica strains isolated from 3 patients with HIV-1 infection and tried to infect E. histolytica cultures (HM 1:IMSS) by feeding them with HIV-1 infected lymphoblasts (H9). Immunofluorescence microscopy and the polymerase chain reaction for the detection of viral proteins and proviral DNA were applied.
Methods: Isolated E. histolytica strains were cultured in TYSGM-9 medium, HM-1 was cultured in TYI-S-33 medium.
Immunofluorescence microscopy was applied to detect viral antigenetic material in the amoeba.
For the Polymerase Chain Reaction (PCR) DNA was extracted from blood cells and from E. histolytica, both isolated from three HIV-1 infected patients. For the DNA amplification we used different regions of the HIV-1 genome for proviral detection (-gag- region: SK 19, SK 38/39, and -env- region:SK 7o, SK 68/69) according to the probes and primers described by Ou et al.. Amplification was performed within 35 cycles. DNA was denaturated at 95° C, primer annealing was done at 50° C and elongation at 60° C.
Results: By immunofluorescence microscopy viral proteins were not detectable neither in the isolated strains nor in the E. histolytica cultures, fed with HIV-1 infected H9 cells after two weeks of cultivation. Applying the PCR, we could point out, that all three patients were positive using the -gag- (SK 19) and the -env- (SK 7o gene fragment as a target. However, no proviral DNA could be detected in DNA samples extracted from E. histolytica, isolated from these patientsand in the infected E. histolytica cultures.
Conclusion: E. histolytica can be excluded from transmission routes of HIV-1 and concern about a possible HIV transmission by E. histolytica is not justified.

C.787

RELATIONSHIP OF OTHER INFECTIONS TO PROGRESSION OF DISEASE IN HIV INFECTED MEN

Leach, C.; Detels, Roger; Giorgi, J.; English, P.; and Cherry, J. University of California at Los Angeles (UCLA) Schools of Public Health and Medicine, Los Angeles, California, U.S.A.

To determine the relationship of other infections to changes in immune status and risk of AIDS, specimens for isolation attempts for CMV, HSV-2, adenovirus, Ureaplasma urealyticum, and Mycoplasma hominis were collected 6 months apart in 222 HIV-1 antibody positive men participating in a cohort study of HIV-1 infection since 1984. Corresponding antibody titers to CMV (IgG and IgM), HSV-2, adenovirus, EBV, Chlamydia, HBV, and measles are being determined. At baseline, CMV was isolated from 45% of semen specimens, 5% of urine specimens, 0% of rectal swabs, and 0% of buffy coat cells. Isolation of CMV from semen at the baseline visit was associated with receptive anal intercourse, but not with isolations of HSV, M. hominis, U. urealyticum, HSV or adenovirus. The mean number of CD-4 cells and the mean CD-4/CD-8 ratio was significantly lower among HIV antibody positive men who shed CMV in their semen than in men who did not ($p < .0005$), but there was only a weak correlation between the titer of CMV virus in the semen and number of CD-4 cells. Semen excretion of CMV has persisted for six months in most men with positive cultures at baseline. Rates of isolation of HSV-2, adenovirus, U. urealyticum and M. hominis were low. Results of serologic and isolation studies at both visits will be presented in relation to other factors in these men. Implications of the association of low levels of CD-4 cells with isolations of CMV from semen will be discussed.

C.789

REGULATION OF REPLICATION OF HIV-1.

Haseltine, William. Dana-Farber Cancer Institute, Harvard Medical School, Boston, MA USA

Regulated growth of the Human Immune Deficiency Virus Type-1 (HIV-1) is the hallmark of infection with this virus. Prolific replication followed by a prolonged period of controlled replication followed once again by prolific replication is characteristic of most HIV-1 infections. The controlled aspect of the HIV-1 infection represents interactions between the virus and host immune system as well as viral regulatory genes which determine where, when and how much virus will be produced within a particular cell lineage. A systematic discussion of these interactions which occur at the level of control of synthesis and processing of messenger RNA, and of virion assembly and budding, and of the specific infectivity of the viral particle will be presented. Specifically the role of the vif, vpu, tat, rev and nef genes in the control of viral replication will be explored.

M.D.0.1 POPULATION PREVALENCE OF AIDS HIGH RISK BEHAVIORS IN FRANCE, THE UNITED KINGDOM AND THE UNITED STATES

James A. Wells PhD*, Gail R. Wilensky PhD*, Alain-Jacques Valleron DrSc**, Geoffrey Bond ***, Randall L. Sell MA*, Portia DeFilippes BS*
* Project HOPE Center for Health Affairs, Washington, DC, USA ** Universite Paris, Paris, France
*** Central Office of Information, London, UK

Objective: To assess the prevalence of AIDS high risk behavior in France, U.K., and U.S.
Methods: Researchers drew a random probability sample of the population and an oversample from high HIV prevalence areas in each nation. Response is as follows: France (N=2294), U.K. (N=2204), U.S. (N=2263). Interviewers administered face-to-face interviews about AIDS knowledge and self-completed questionnaires about sexual orientation, sexual behavior, and drug use. AIDS risk is based on gay or bisexual orientation, number of partners, practice of anal intercourse, and risk of partners (prostitutes, IV drug users, bisexuals), or IV drug use. Gay/bisexual orientation is defined as intercourse with same sex in past 5 years or self-identification as exclusively homosexual.
Results: Preliminary unweighted results for the U.S. sample are distributed as follows:

	National Cross-Section			High Prevalence	
Personal Risk	Gay,Bi-sexual Men	Hetero-sexual Men	Women	Gay,Bi-sexual Men	Hetero-sexual Men
LOW	50%	91%	86%	8%	85%
MODERATE	22%	2%	9%	13%	5%
HIGH	9%	5%	3%	14%	7%
VERY HIGH	19%	1%	3%	65%	2%

In the population, rates of high or very high risk are: heterosexuals, 6% and gay/bisexual men, 28%. In high prevalence areas of New York, San Francisco, Miami, comparable rates are: heterosexual men, 9% and gay/bisexual men, 79%. Similar analyses for France and the U.K. are forthcoming. Final results will be weighted to the national populations and confidence intervals provided.
Conclusion: In the U.S., AIDS risk behavior among heterosexuals is substantial, gay/bisexual men outside high prevalence engage in risk behaviors less than those in high prevalence areas.

M.D.0.3 SEXUAL BEHAVIOR AND BEHAVIOR CHANGES IN KINSHASA: IMPLICATIONS FOR AIDS COUNSELLING

Moore,Melinda *,**, Doppagne A ***, Hassig SE *,**, Piripiri L *, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire. ** Tulane SPHTM, New Orleans,USA, *** Banq Comm Zaire,Kinshasa,Zaire

Objective. To determine who engages in risky sexual behavior and who has changed their behavior because of AIDS.
Methods. 2516 employees and spouses of a Kinshasa bank were surveyed between 11/87 and 3/88 as part of an annual exam.
Results. For the preceding 12 months, 21% reported >1 sexual partner (SP), including 33% of (monogamous) married men and 1% of married women. Those with >1 SP were primarily males ($p<10^{-6}$); 30-49 years old ($p<10^{-6}$); at higher employee grades (p=.02) or higher educational levels ($p<10^{-6}$); and not in monogamous relationships ($p<10^{-6}$). Half of presumed extra-marital contacts among men were with prostitutes; for only 11% of these were condoms used, only half the time regularly. Thirty-one percent of the total population and 65% of married persons with >1 SP had made appropriate changes in their sexual behavior because of AIDS.
Conclusions. Both HIV(+) and (-) persons are beginning to change their sexual behavior. Men are tending toward more stable sexual relationships, albeit extramarital. Given the low frequency of condom use, further counselling should be directed toward changing the number and type of partners.

M.D.0.5 COMPLIANCE WITH AIDS PREVENTION MEASURES AMONG INTRAVENOUS DRUG USERS: HEALTH BELIEFS OR SOCIAL/ENVIRONMENTAL FACTORS?

Huang, Karen H.C.* ** ***; Watters, J.** ***; Case, P.***
*Stanford University, Palo Alto, California, U.S.A., **University of California, San Francisco, California, U.S.A., ***Urban Health Study, San Francisco, California, U.S.A.

Objective. To examine the relative influence of health beliefs and social/environmental factors as they affect compliance with AIDS prevention behaviors (needle hygiene and condom use) among intravenous drug users (IVDUs).
Methods. Subjects were 578 IVDUs recruited from 3 street sites and 2 drug treatment settings in San Francisco. Respondents were verbally administered self-report instruments which measured: (1) health locus of control; (2) health beliefs (perceived threat, perceived benefits of compliance, perceived barriers to compliance, and perceived self-efficacy in complying); (3) social/environmental factors associated with compliance; and (4) frequency of compliance within the previous 6 months.
Results. In separate stepwise multiple regression equations for men (N=356) and women (N=171), social/environmental factors predicted a statistically significant proportion of variance in needle hygiene (Adj.R^2=0.06,p<.0006). For women, internal health locus of control accounted for an additional 2% of the variance (p<.05). Social/environmental factors also predicted the largest amount of variance in condom use for both men (Adj.R^2=0.21,p<.0001) and women (Adj.R^2=0.24,p<.0001). For men, perceived self-efficacy in using condoms and internal health locus of control each accounted for an additional 1% of the variance (p<.01 and p<.05, respectively).
Conclusion. In our study of IVDUs, compliance with AIDS prevention behaviors was strongly associated with social/environmental factors, and only weakly associated with health beliefs. By implication, further research and intervention with this population should emphasize the social/environmental factors that facilitate or impede "safer sex" and "safer needle hygiene" compliance.

M.D.0.2 BEHAVIORAL DETERMINANTS OF BLOOD DONATIONS AMONG HIV-SEROPOSITIVE PERSONS: A MULTI-CENTER STUDY

Doll, Lynda* and the HIV Blood Donor Study Group**
*Centers for Disease Control, Atlanta GA ** Investigators from 20 Blood Donation Sites throughout the USA

Objective. To assess why HIV-seropositive persons attempt to donate blood.
Methods. Between June-Nov. 1988, 147 seropositive donors from 17 donation sites were interviewed regarding risk behaviors and reasons for donation. Comparisons were made between those who reported no identified risk (N=36), and those whose personal (N=77) or partner's (N=34) behavior put them at risk. Perceptions of risk for HIV infection prior to donation were measured on a scale of 1 to 10 with 10 highest.
Results. 82% of all seropositive donors reported reading self-deferral information provided by the blood bank. Although 17.2% said they didn't know blood would be tested, 88% of these persons said they read the materials. 35% felt pressure to donate, primarily at the worksite. Only 7% indicated donating to be tested for HIV. Mean risk score was 2.9 for those with an identifiable risk and 2.4 for those with no identifiable risk (p>.05). Reasons for low risk perception among the first group included: no recent or few high-risk partners (31%), being healthy (33%) and no drug use (27%). Among the 59 men with same sex contacts, 25% self-labeled as heterosexual, 36% as bisexual, and 39% as homosexual with 23% reporting discomfort with their attraction to men. 25% were married or had a female primary partner.
Conclusions. Self-deferral materials should emphasize that infrequent risk behavior and feeling healthy do not rule out HIV infection. Education programs that do not rely solely on written materials and that help persons counter pressures to donate should be developed.

M.D.0.4 AN ETHNOGRAPHIC SURVEY OF NONPENETRATIVE SEXUAL BEHAVIOR

G.L. Marzo*, B. Porter **, C.M. Cassidy**, B. Feldman**
*AIDSCOM, Washington D.C. **Porter Novelli, Washington D.C.,U.S.A.

Objective: An ethnographic literature survey representing a first step toward identifying existing indigenous 'safer' sex practices that could eventually help form the core of culturally-sensitive interventions to control the spread of AIDS.
Methods: Because sexual behavior is integrated with all other behavior and beliefs in societies, and does no occur in a vacuum, we asked four questions of the available data for each society: What are the 'safer' and 'unsafe' practices? Who has sexual relations with whom? Who teaches whom about sex? What are typical attitudes to sex, and sexual behaviors? The first question addresses the central issue of the research. The second suggests routes of contagion in the society. The third and fourth provide information relevant to intervention planning. Data for this research was collected using computer searches of the National Library of Medicine Medline files, Catline files, Human Relations Area files, and reference lists of published ethnographies and survey texts of sexual behaviors. Additional areas to be searched include Human sexuality journals, unpublished files of organizations such as the Kinsey Institute, unpublished reports of sex behavior research on file in the health ministeries of governments of target countries, and original manuscripts in the Human Relations Area Files.
Results: The concept that sexual practices can be subdivided as 'penetrative' and 'nonpenetrative' and that these roughly also follow the distinction 'unsafe' and 'safe' is uniquely Western and biomedical, a recent construct aimed at containing sexually transmitted diesases. This research shows that variance among sexual habits and attitudes worldwide is extremely broad, and that even neighboring peoples may maintain very different practices. Where the detail of existing data permits, it is clear that safer sex practices exist in all societies, and that many of these are indigenous.
Conclusion: Intervenors must take time and care to understand the cultural meaning of biomedically 'safe' practices in the cultural setting in which they want to encourage them. The fact that a practice is known to a society does not mean that it is acceptable in that society. Or, it may be acceptable but only for strictly delimited groups, such as women (or men), the aged, unmarried youths, infants, or the widowed. Erotic sexual practices vary along a culturally defined contiuum from the egregiously unsafe to the thoroughly safe.

M.D.0.6 THE NATIONAL SURVEY OF HEALTH AND SEXUAL BEHAVIOR: THE PRETEST EXPERIENCE

Cynamon, Marcie L., National Center for Health Statistics, Department of Health and Human Services, Hyattsville, Maryland, USA.

Objective. To describe the numerous survey methods used in the 1989 pretest of the National Survey of Health and Sexual Behavior (NSHSB) and evaluate the the outcomes of the methodological tests.
Methods. This pretest of a nationally representative sample of 2300 respondents was conducted to evaluate methods of collecting detailed data on sensitive topics related to HIV transmission including sexual history and partner characteristics, drug use, and HIV testing. Obtaining accurate data on these topics is critical for modeling the spread of HIV, designing appropriately targeted behavior modification and information programs, and estimating the impact of the AIDS epidemic on society. Personal, telephone, and self-administered interviews were compared as were structured and unstructured lines of questionning. Interviews were conducted either in the home or at a neutral site and gender and race matching of interviewers to respondents was used in half of the interviews.
Results. The relative efficacy of the various methods will be evaluated using tests of validity, reliability, and internal consistency.
Conclusion. Approriate survey methods are critical to producing accurate data especially in the conduct of surveys on sensitive topics. Estimates based on flawed surveys severely hamper research efforts and the development of successful prevention programs.

Les adolescents (partie 1)
Adolescents (Part 1)

M.D.0.7

EPIDEMIOLOGY OF AIDS IN ADOLESCENTS, U.S.A.

Gayle, Helene*, Manoff,S*, Rogers,M*
*Centers for Disease Control (CDC), Atlanta, GA, USA

Objective. To describe the epidemiology of AIDS in adolescents in the United States.
Methods. We analyzed demographic features and transmission categories for adolescents (13-19) with AIDS reported to CDC.
Results. Adolescents 13-19 years of age comprise 0.4% of the total reported AIDS cases; 50% of these cases have been diagnosed since 1986. Most of the adolescent AIDS cases (54%) were reported from 5 states and Puerto Rico and 74% from urban areas with populations greater than 1,000,000 inhabitants. Eighty-two percent of adolescents with AIDS are male and 51% are black or Hispanic. Overall, 56% of cases were attributed to sexual contact or intravenous (IV) drug use, 39% to exposure to blood or blood products and 4% to undetermined exposure. Heterosexual contact was the most frequent route of transmission for females, accounting for 39% of cases. Sexual contact or drug-use accounted for >70% of cases for blacks and Hispanics and 40% for whites. The proportion of cases due to sexual contact or IV-drug use increased from 10% for 13-14 year olds to 56% for 17-19 year olds.
Conclusions. Although adolescents comprise <1% of all AIDS cases, many adolescents may be at risk for HIV infection now and in the future. Our findings suggest that urban youth, particularly minorities may be at highest risk of exposure to HIV infection. Targeting interventions to adolescents with behaviors that place them at high risk of HIV infection is important. Helping all adolescents to develop safe sexual behaviors and avoiding drug use will have a major impact on the future of the AIDS epidemic.

M.D.0.8

ADOLESCENTS AT RISK OF HIV INFECTION

Radford, Joyce*; Warren, W.*; and King, A.*.
*Queen's University, Kingston, Ontario, Canada.

Objective. To describe the AIDS-related knowledge and attitudes, and the risk-taking behaviours, of youth who had dropped out of school and lived on the streets of large Canadian cities.

Methods. Over 1,000 "dropouts" and over 700 "street youth" across Canada were interviewed by telephone and face-to-face, respectively. The data were analyzed to assess the extent to which they were at risk of HIV infection.

Results. Many of these young people were knowledgeable, yet anxious, about AIDS, intolerant of homosexuals, sexually permissive and highly active sexually, and some of them were using illicit drugs.

Conclusions. The high incidence of unprotected sexual intercourse with numerous partners and the sharing of injection-drug needles indicates that these young people are at risk of HIV infection. Persuading them to abandon behaviours that are integral to their lifestyles will be difficult, but must be attempted.

M.D.0.9

THE SIGNIFICANCE OF THE AIDS PANDEMIC FOR HOMELESS ADOLESCENTS

Luna, G. Caietan*; Brown, R.C.* and Eisenstein, E.**
*University of California, San Francisco, California, USA
**Hospital Universitario Pedro Ernesto, Rio de Janeiro, Brazil

Objective. This paper will discuss social epidemiological research on AIDS related attitudes, beliefs, and behaviors among street youth in the Western United States and in Rio de Janeiro, Brazil. This discussion will focus on the risk of HIV infection among street youth in developing countries, within the context of the larger world problem.
Methods. Ethnograpny and participant observation, structured and unstructured interviews with street youth and service providers in natural and institutional settings in Los Angeles, San Francisco, Seattle and Rio de Janeiro.
Results. While the majority of youth in the United States flee abusive or rejecting families, Brazilian youth leave their homes because of extreme poverty and familial misery to make what living they can on the streets - many through prostitution. Street youth in Rio, especially those from the slum areas or favelas, lack the long history of health education in schools, the community, and the media as compared to the United States. They are at risk for HIV infection because of their perception that AIDS is only a homosexual disease, concurrent expense and discomfort they associate with condom use, and subsequent unprotected sexual activity. Bisexual activity and anal intercourse are common among both hetero and homosexual street adolescents in Brazil, while cultural beliefs would dictate otherwise.
Conclusion. International collaboration and emergency economic support can assist greatly in the development of education material and outreach to prevent HIV among the growing number of street youth in the developing world.

M.D.0.10

INFECTION WITH HIV AND HBV IN ADOLESCENTS LODGED IN SECURITY INSTITUTES OF BUENOS AIRES CITY. IVDA AS A RISK FACTOR OF INFECTION.

Casanueva, E*; Hosokawa, R**; Boxaca, M***; Calello, M***; Libonatti, O***; Weissenbacher, Mercedes***.
*National Direction for the Protection of Youth and Family; **National Institute of Microbiology; ***Department of Microbiology, School of Medicine, Buenos Aires. Argentina.

Objective. To determine the prevalence of infection with HIV and HBV in adolescents lodged in Security Institutes and relate it to different risk factors.
Methods. The sera of all adolescents lodged by court order in 3 National Institutes of Buenos Aires City between December 1987 and July 1988 were studied. In every case there was previous consent of the adolescent, as well as from the entity which legally protects them, to detect anti-HIV and HBV antibodies and to fill in the questionnaire about the risk factors. Anti-HIV and HBV antibodies were studied by EIA methods; anti-HIV were confirmed by Western blot.
Results. 156 adolescents (44 females and 112 males) whose ages ranged between 13 and 20 years were studied; 25.6% were positive for HIV and 29.5% for HBV. Among the IVDA of both sexes 53% was HIV positive and 52% HBV positive while there was a prevalence of 2.3% for HIV and 10.5% for HBV among non-addicts or non-intravenous addicts. Of all the adolescents studied, 14 stated they were homo-bisexuals of which one was HIV positive and 2 HBV positive.

	Number	HIV+/ Total	%	HBV+/ Total	%
IVDA	71	38/71	(53.5)	37/71	(52.1)
Non-addicts or non-IV DA	85	2/85	(2.3)	9/85	(10.5)
TOTAL	156	40/156	(25.6)	46/156	(29.5)

Conclusion. HIV antibodies were detected in 1/4 and HBV in 1/3 of the adolescent population in Security Institutes. Of the total population 45% was IVDA and this was, by far, the main risk factor found for infection with HIV and HBV.

M.D.0.11

Sex, Drugs and AIDS: Two Innovative Approaches to HIV/AIDS Prevention Education and Outreach for Minority Adolescents.

Troutman, Adewale*, Hall, J.Y.**.
*Newark Department of Health & Human Services, Newark, N.J., USA; **NYC Health and Hospitals Corp . New York, NY & Greater Brownsville Youth Council, Inc., Brooklyn, NY, USA.

Objective. To provide HIV/AIDS educational and outreach services to minority adolescents and to determine their knowledge, attitudes, behaviors and beliefs concerning sex, drugs and HIV/AIDS through two innovative programs in Newark, New Jersey and Brooklyn, New York.
Methods. The Newark Department of Health program has four components. Three directly involve adolescents which are: (1) a citywide "Rap Off" contest on sex, drugs and AIDS with educational sessions for all entrants required: (2) a teen theatre company who will perform an original scripted production on AIDS for adolescents and adults; and (3) peer counseling will be provided for adolescents. The fourth component, a professional video rpoduction will document the prior 3 components. The Brooklyn-Brownsville program trains 10 peer educators in sexuality, substance abuse, HIV/AIDS information and risk reduction strategies, and improvisational theatre techniques. Peer educators present role plays and skits on sex, drugs and HIV/AIDS to yout groups, organisations, community centers and parent associations. KABB surveys are distributed by both programs.
Results. Initial results indicate that minority adolescents: (1)are concerned about their risks of HIV/AIDS; (2) have some AIDS specific knowledge but also have misinformations; and (3) want to help educate their peers.
Conclusions. Culturally sensitive and relevant HIV/AIDS information for minority adolescents must use innovative approaches to educate them on risks.

M.D.0.12

THE DEVELOPMENT OF A STREET BASED OUTREACH PROGRAMME TO REACH YOUNG MALE, FEMALE AND TRANSSEXUAL, STREET BASED PROSTITUTES IN SYDNEY, AUSTRALIA

Griggs, L., Toomey, M., Alan, D.L., Gold, J., Turbitt, P., Anns, M., McElwee, P.R..
Albion Street (AIDS) Centre, Sydney Hospital, Sydney Australia

Objective. (a) To ascertain the prevalence of HIV infection within a group of street based male, female and transsexual prostitutes; and (b) To develop an intervention programme to minimise transmission of HIV by this group. Methods. In November 1985 a mobile outreach bus program was established to provide HIV screening, counselling, education and the provision of free condoms and needles and syringes to street based prostitutes. The programme operates 365 nights a year, early evenings to early mornings on the streets of Sydney's "red light" districts. The outreach service is staffed by nurses and counsellors. Results. As at December 1988, 313 clients had been screened for HIV. 19 were HIV antibody positive (15 male prostitutes; 1 female prostitute; 3 transsexual prostitutes). 187 had used IV drugs, 152 were current users, 17 were HIV antibody positive. Five clients seroconverted during the 3 year period. An average of 2,000 condoms and 1,500 needles/syringes are given out per week. This paper will examine the risk factors associated with the client group and highlight educational issues raised by the seroconversions. Conclusion. A street based outreach project is an effective way of minimising transmission to and from its client group, who are otherwise disenfranchised from existing health services due to, illiteracy, low socio-economic grouping and general alienation from established health services.

Travailleurs de la santé
Health Care Workers

M.D.0.13 THE IMPACT OF AIDS ON ACUTE CARE HOSPITALS: A SURVEY OF INFECTIOUS DISEASE TEACHING HOSPITALS IN THE UNITED STATES

Joseph R. Thurn*†; S. Campbell* and K. Henry*†
*Department of Medicine, St. Paul-Ramsey Medical Center, St Paul, Minnesota; †University of Minnesota Medical School, Minneapolis, Minnesota U.S.A.

Objective. To determine the hospital-wide impact of AIDS at key hospitals in the U.S., as follow-up to a previous survey (JAMA 1988;259:1819-22), and to assess differences related to geographic variation in AIDS incidence.
Methods. In February 1988 surveys were sent to the infectious disease departments at the 200 U.S. hospitals which conduct infectious disease (I.D.) fellowship training. For analysis, responses were placed into one of three groups: hospitals located in high AIDS-incidence states ($>200/10^6$); medium AIDS-incidence states ($50-199/10^6$); or low AIDS-incidence states ($7-49/10^6$).
Results. Response rate was 45% (90/200); response rate did not vary significantly in relation to geographic variation in AIDS incidence. Eighty-nine percent of the respondents were MDs. Problems experienced in relation to HIV testing include: MDs ordering HIV tests without patient consent (68%); employees demanding patient testing (61%); MDs refusing to care for patient if not tested (28%); threat of lawsuit by patient (11%). Twenty percent felt that AIDS issues had adversely affected house staff and medical school recruitment at their hospital; ANOVA showed that this effect increased as the AIDS incidence category of the hospital increased ($p < .05$). Nineteen percent of the respondents reported that hospital personnel had resigned due specifically to AIDS-related fears and frustrations; ANOVA also showed a tendency for this activity to increase with the AIDS incidence category ($p = .067$). The level of staff morale within ID departments varied in relation to category of AIDS incidence; ANOVA showed a stepwise decline in the estimated morale level as the AIDS incidence category increased ($p < .05$). One-third (36%) felt that AIDS issues had created an adversarial relationship between ID staff and hospital personnel. It was estimated that ID department personnel devote an average of 36% of their time to AIDS-related activities; 55% of the respondents believe that their department's AIDS-related activities are underfunded. Risk reduction counseling in conjuction with HIV testing was estimated to occur 57% of the time; only 13% of the ID departments are reimbursed for the provision of patient HIV counseling services.
Conclusion. Numerous effects on staff recruitment and morale have occurred due to AIDS issues. A large proportion of missed opportunities for AIDS education and risk reduction counseling at hospitals may be due to lack of reimbursement.

M.D.0.14 PREDICTORS OF INTRAOPERATIVE BLOOD EXPOSURES

Gerberding, Julie Louise; Littell, C.; Brown, A.; Tarkington A.; Schecter, W.; Sande, M.A. University of California, San Francisco & San Francisco General Hospital; San Francisco USA

OBJECTIVES: 1) Describe intraoperative exposures to blood/body fluids in surgical personnel (SP), & 2) Identify factors predictive of exposure.
METHODS: Observation of 1307 consecutive OR procedures in 2 months at SFGH by trained OR circulating RNs to obtain: procedure data (type, service, elective vs emergent, blood loss, duration, etc.), patient data (dx/high risk HIV vs no risk HIV; dx/high risk HBV vs no risk HBV), & exposure data (personnel exposed, protection, source, site, mechanism, & magnitude).
RESULTS: SP sustained 110 exposures to blood in 84/1307 (6.4%) cases. Parenteral exposures (10 needlesticks, 5 cuts, 7 mucosal & 3 open wound splashes) were less common (1.9% of cases) than cutaneous exposures (22 glove leaks, 21 saturated clothing, 42 splashes). Blood loss > 300cc & duration > 4 hours predicted exposure. Parenteral exposure rates did not differ between services, but overall exposure rate was highest during ortho cases (10.7%). HIV was dx/suspected in 29% of cases; exposure rate (7.8%) was not decreased in these cases compared to exposure rate (5.8%) when no risk for HIV was apparent.

CONCLUSION: Parenteral exposure to blood occurred in less than 2% of OR cases at SFGH; the majority of intraoperative blood exposures due to cutaneous contamination (glove leaks, saturated clothing, splashes) are potentially preventable by improved barrier precautions. Suspicion of HIV infection did not decrease exposure to surgical personnel in this cohort.

M.D.0.15 *IMPROVING THE CARE OF AIDS PATIENTS: ROLES OF PROVIDER GENDER AND SPECIFICITY OF TRAINING*

Joseph M. Merrill; Laux, L.; Wente S. and Thornby, J.
Baylor College of Medicine, Houston, Texas, USA.

Objective. To identify mechanisms at work in Health Care Professionals' (HCPs) desire to avoid AIDS patients.
Methods. In four sequential studies we have surveyed 343 senior medical students, 140 college undergraduates, and 87 HCPs to assess their AIDS knowledge, attitudes, beliefs and practices. Primarily we used a Likert-type scale with responses factor analyzed to derive scales as linear functions using unit weights of items with factor loadings > 0.40 in absolute value. For analyses, derived scales (alpha > 0.89) were used either as dependent variables or covariates.
Results. Fear of infection is the principal cause of these respondents' desire to avoid an AIDS patient. But, important gender differences were also found that have relevant implications for improving AIDS patient care. Males express more homophobia ($p > 0.0002$), more fear of infection ($p > 0.0003$), and more antipathy toward AIDS patients ($p > 0.01$) than do females. Antipathy toward AIDS patients was associated with other maladaptive attitudes (homophobia [+0.56], thanatophobia [+0.45], authoritarianism [+0.39], positive self-image [-0.38] and psychological-mindedness [-0.44]). Medical students planning careers in internal medicine scored 30% higher on the homophobic scale than future psychiatrists ($p < 0.02$). We next investigated if the socialization that occurs among specific HCP occupations can reduce HCPs' sex dysphoria. By comparing attitudes of female MDs, nurses and midwives, ANOVA revealed that midwives were more at ease discussing birth control practices than either female MDs ($p > 0.01$) or nurses ($p > 0.01$).
Conclusion. More attention, both to gender differences in how HCPs perceive AIDS patients and to the desensitization that can be induced during health professions training, should produce better care for AIDS patients.

M.D.0.16 AIDS-RELATED KNOWLEDGE, ATTITUDES AND BEHAVIOR OF NURSES AND PHYSICIANS: A COMPARATIVE ANALYSIS

Campbell, Scott*, Maki, M.** and Henry, K.†
Department of *Medicine and **Infection Control, St. Paul-Ramsey Medical Center, †University of Minnesota Medical School, St. Paul, Minnesota U.S.A.

Objective. To describe differences and similarities of AIDS-related knowledge, attitudes, and behaviors and other variables between registered nurses and physicians located at one hospital.
Methods. In September 1987 an anonymous survey was delivered to all physicians and nurses at a 455-bed acute care teaching hospital. The survey included scales measuring AIDS-related knowledge, attitudes, behaviors, homophobia, and homosexual bias, and items related to other variables.
Results. Responses were obtained from 174 MDs and 629 RNs. Demographically, the two groups did not differ significantly in age (mean age = 37.2 years); race (97% caucasian) and sexual preference (97% heterosexual). Other comparisons revealed that MDs tended to report more desirable attitudes ($p < .001$) and behaviors ($p < .001$) in relation to AIDS patients, and demonstrated a higher level of knowledge about AIDS transmission ($p < .001$). No difference in level of homophobia was noted, but MDs tended to be less biased in their opinions regarding homosexuality ($p < .001$). MDs were more likely to know an HIV-infected person ($p < .00001$), more likely to have cared for an AIDS patient at work ($p < .01$), more likely to be confident in the AIDS information given to the public ($p < .0001$), and less likely to be willing to attend a 1-hour AIDS educational program at the hospital ($p < .000001$).
Conclusion. Differences in educational background between MDs and RNs may account for much of the differences noted in AIDS-related knowledge, attitudes and behaviors. Other factors that may also contribute include whether or not one knows an HIV-positive person or has previously cared for an AIDS patient at work, and one's level of confidence in the AIDS medical information provided to the public. Since nurses provide much of the direct care given to AIDS patients, those who develop AIDS-related curricula for health care workers might consider these findings in order to maximize the effectiveness of AIDS educational programs.

M.D.0.17 SEXUAL BEHAVIOR AND PERCEIVED AIDS RISK AMONG 3500 ZAIRIAN HEALTH WORKERS

Moore, Melinda *,**, Hassig SE *,**, Lusakulira N *, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire
** Tulane University, New Orleans, USA

Objective. To describe risky behavior, perceived risk and factors related to risk among Zairian health workers (HW).
Methods. We surveyed 3462 physicians, nurses, health facility workers, community HW and traditional healers.
Results. Extra-marital sexual relations (EMR) were reported by 54% in 1987 and 40% in 1988 ($p<10^{-4}$). EMR were more commonly reported by males ($p<10^{-4}$) and by younger personnel ($p<10^{-4}$). Forty-six percent use condoms for their EMR, 51% of these regularly. Only 60% who would counsel the use of condoms for AIDS actually use them for their own EMR. Nearly half of HWs (43%) view their own risk for AIDS as very high or high, in particular those who are: nurses ($p<10^{-4}$); in an urban environment ($p=.00037$); younger ($p=.0002$); less educated ($p<10^{-4}$); female ($p=.0203$); from Shaba or Equateur Region ($p<10^{-4}$); had attended a course on AIDS ($p=.00087$).
Conclusions. (1) HWs in Zaire engage in risky sexual behavior, though behavior may be changing because of AIDS. (2) Nearly half of HWs view themselves at high risk for AIDS. (3) AIDS courses may prove useful in further educating HWs, who can in turn educate the general public.

M.D.0.18 PREVENTING HIV INFECTION IN ENGLAND AND WALES: WHAT HAS PRIMARY CARE TO OFFER?

Tim Rhodes, Senga Bond, Morris Gallagher, Chris Foy, Peter Philips and John Bond. UNIVERSITY OF NEWCASTLE UPON TYNE

General practitioners and community nursing staff are excellently placed to provide health education and advice in relation to HIV infection and AIDS. However, there may be obstacles that prevent the utilizing of opportunities that exist in primary care for the prevention of HIV infection and AIDS.
This paper will present findings from the first two United Kingdom national studies of HIV Infection and General Practice (sample of 5,359) and HIV Infection and Community Nursing Staff (sample of 5,243) undertaken in mid 1988. The findings, which include qualitative data from interviews, cast light on the preparedness of general medical practitioners and nursing staff who work in the community to undertake health education about HIV infection.
Findings will be presented that relate to the extent of contact that practitioners and community nursing staff have with people with HIV infection, people with AIDS and people with worries about HIV or AIDS.
Findings relating to medical practitioners' and community nurses' difficulty in discussing sexual behaviour, sexuality and injecting drug use, and in dealing with gay or bisexual men and women and with injecting drug users, will be discussed in the light of obstacles that exist to the effective provision of HIV-related health education and prevention. Strategies to overcome these obstacles will be discussed.
The paper will conlcude by discussing the implications of our findings for primary health care in Britain and for health education and prevention on HIV infection and AIDS.
Both studies funded by the Department of Health.

Détenus : contraintes et défis
Prisoners: Constraints and Challenges

T.D.0.1

HIV IN PRISON : A TEST CASE FOR HUMAN RIGHTS

T.-W. Harding
University Institute of Legal Medicine, Geneva,
Switzerland.

The AIDS epidemic has revealed grave deficiencies in prison health care. Prisoners are a vulnerable group, subject to an authoritarian regime and with little public sympathy. In over half the countries surveyed in a European study, inappropriate management of HIV-infected prisoners was described as routine: segregation, limited access to work places, lack of confidentiality. Compulsory screening of prisoners is also carried out in many countries, and results are frequently communicated to prison administrations without the prisoner's consent or knowledge.

Prisoners have a right to preventive and curative health care on the same level as in the community.

All prisoners should (i) receive adequate information on HIV/AIDS, (ii) be free to request or refuse HIV-testing, after counselling, (iii) benefit from pre-release education and guidance.

HIV carriers should (i) receive appropriate psychosocial support, (ii) be housed and treated as other prisoners, (iii) benefit from normal parole procedures.

Prisoners with AIDS should (i) receive adequate care, (ii) be considered for early release, (iii) be allowed to die in dignity.

The degree to which prisoners' human rights are respected will demonstrate the authenticity of governmental committment to human rights promotion in AIDS-related activities.

T.D.0.2

RISK BEHAVIOUR IN PRISON: SEXUAL ACTIVITY

Gravier, Bruno. Service Médico-psychologique régional, Lyon Cédex, France.

T.D.0.3

AIDS AND INTRAVENOUS DRUG USERS: THE CHALLENGE FOR THE JAIL ADMINISTRATOR

THOMAS, STEVEN G., DEPARTMENT OF CORRECTION
NEW YORK, NEW YORK

An administrator of a correctional system is confronted with a difficult challenge: to provide appropriate AIDS prevention and treatment services to a large number of inmates with a history of IV drug abuse, without compromising the operation of a secure correctional setting.

Over 80% of New York City's jail population abuses illicit drugs and/or alcohol regularly, and about 50% of them have used drugs intravenously. Given these extraordinary rates of drug abuse and addiction, an estimated 25% of the inmates are infected with HIV.

The New York City Department of Correction has implemented an extensive range of AIDS and drug prevention and treatment services, which reflects a willingness to respond to this epidemic in a creative and flexible manner. The use of illicit drugs in the jails is prohibited and strict enforcement measures are used to ensure compliance by both staff and inmates. But, in addition, the Department offers methadone detoxification and methadone maintenance programs for opiate addicts and an array of intervention programs (including acupuncture) for crack/cocaine abusers.

Although significant, the services for intravenous drug users provided by the New York City Correctional system are only as effective as the long-term treatment and other services available in the community. Most inmates leave jail and return to the same high-risk activities because no substantive treatment and other preventive services are available.

T.D.0.4

CONSTRAINTS ON IMPLEMENTATION OF PREVENTIVE MEASURES IN PRISON

Hynes P J, Deputy Director of Prison Medical Services, England and Wales, Home Office, London,

The factors which influence AIDS prevention strategies for prison systems, and how they are implemented, will be discussed by reference to experience in England and Wales.

The environment.

The population.

Attitudes of prisoners (uninfected and infected) to AIDS/HIV.

Attitudes of staff.

Attitudes and preoccupations of management.

Limits to confidentiality.

Credibility of information and education.

The law and the prison discipline code.
The closed single sex institution.

T.D.0.5

APPROACHES TO THE SEROPOSITIVE PRISONER
Kantor, Elizabeth, Medical Director, San Francisco County Jails; University of California, San Francisco, USA

OBJECTIVE To review current practices in the identification and management of seropositive prisoners. To suggest a rational, safe and humane approach.
METHODS A review of current policies in United States correctional facilities of screening and testing inmates for HIV antibody will be undertaken with reference to National Institute of Justice and American Civil Liberties Union surveys. Policies and procedures for special management of identified seropositive prisoners will be reviewed, with the rationales forwarded for policies of segregation. A review of the San Francisco Jail policy and procedure will be presented.
RESULTS In the prison environment, limited resources tend to be directed either towards procedures of testing and segregated housing, or towards education and counselling. Rationales for policies of segregation are frequently correctional rather than medical. Proper correctional classification and supervision of prisoners are essential for a safe prison environment.
CONCLUSION The essential information which AIDS education programs impart: HIV infection may be prevented by safe behavior, HIV is not casually transmitted, are contradicted by policies of segregation. Policies should be based upon medical rather than correctional reasoning.

Recherches sur le comportement (partie 2)
Behavioural Research (Part 2)

T.D.0.6

PERCEIVED NEED FOR BEHAVIORAL CHANGE: DISTINGUISHING BETWEEN GROUPS AT RISK OF HIV INFECTION IN A LONGITUDINAL COHORT OF GAY AND BISEXUAL MEN. Cohn, David*; Bartholow, B.*; O'Reilly, K+; Judson, F.* Denver Disease Control Service*, Denver CO., Centers for Disease Control+, Atlanta, GA., USA.

Objective: In a longitudinal cohort study of gay and bisexual men, to assess the relationship of perceived need for behavioral change with knowledge, attitudes and beliefs (KAB), and with actual modification of high-risk behaviors.
Methods: A questionnaire assessing HIV risk behavior and KAB was administered to study participants at initial visit and six month intervals. From December 1986 through December 1988, 996 men were enrolled, of whom 254 had returned for at least 3 visits. Subjects were grouped according to their perceived need for change at each of 3 time points, and those falling in the extreme categories (persistent need to change [PNC] versus no need to change [NNC]) were selected for analysis. Between group comparisons were made regarding risk-related behaviors and discriminant function analysis was used to determine the discriminating KAB characteristics of each group.
Results: The PNC group had 2.7 times as many sexual partners at each time point (p<0.001) and used condoms less frequently than did the NNC group (p<0.05). Discriminant analysis of KAB successfully classified 88% of subjects into the PNC or NNC groups. Factors which discriminated PNC over NNC included lack of perceived validity of education from local gay organizations, difficulty meeting one's sexual needs, absence of assertiveness and communication regarding safe sex practices, concerns over drug/alcohol use, and need for condoms during anal intercourse.
Conclusion: Gay men are able to correctly assess personal risk of HIV infection and it is possible to predict those who need to change their high-risk behavior by assessment of KAB systems. Specific behavioral interventions regarding negotiation, communication skills, and coping should address issues that predispose to high-risk sexual behaviors.

T.D.0.8

RISKY SEX RELAPSE, THE NEXT CHALLENGE FOR AIDS PREVENTION PROGRAMS: THE AIDS BEHAVIORAL RESEARCH PROJECT
Ekstrand, Maria L.; Stall, R.D.; Coates, T.J.; and McKusick, L.
Center for AIDS Prevention Studies, U.C., San Francisco, CA., U.S.A.

Objective. Research on other health-related behaviors such as smoking, drinking and weight loss has shown that initial health behavior change is often followed by relapse. This study was designed to examine the stability of individual behavior change following initial adoption of safe sex as well as psychosocial predictors of relapse.
Methods. A sample of 453 gay and bisexual men were followed anually from 1984 to 1987. High risk sex was defined as unprotected anal intercourse with multiple partners. Predictor variables included social support, personal efficacy, sexual self control, knowledge of health guidelines, and openness about one's sexual orientation. These were examined in a multiple logistic regression comparing subjects who relapsed to those who were able to maintain low risk behaviors over time following initial behavior change.
Results. The individual behaviors over time were grouped into the following behavior patterns:

BEHAVIOR PATTERN	PERCENT
Stable low risk throughout the study	50.8%
Changed to and maintained low risk behaviors	29.8%
Relapsed after initial behavior change	15.7%
Stable high risk throughout the study	3.8%

Subjects who relapsed reported lower levels of self efficacy and less social support for safe sex behaviors than did subjects who were able to maintain safe sex behaviors.
Conclusion. It is clear from these data that future AIDS prevention programs need to include relapse prevention components to increase the likelihood that behavior change will be maintained over time. The predictor analysis suggests that it may be beneficial to address social support and self efficacy issues in these interventions.

T.D.0.10

TENSION REDUCTION EXPECTANCIES UNDERLIE THE EFFECT OF ALCOHOL USE ON AIDS-RISK BEHAVIOR AMONG HOMOSEXUAL MALES
McKirnan, David J.*:Peterson, P.L.**
*University of Illinois at Chicago, **University of Alabama at Birmingham,USA

Objective. Alcohol use is associated with AIDS-risk sexual behavior. Alcohol "disinhibition" is cited as underlying this association, but has not been well defined. We found tension reduction expectancies of alcohol effects to induce risk for abuse among homosexual males. We hypothesized that such expectancies would also underlie the sexually disinhibiting effects of alcohol. Our objective was thus to assess the co-occurrence of alcohol and high risk sex, and to examine expectancies as an explanatory mechanism.
Methods. A large (n=2600) diverse sample of homosexual men were given an anonymous survey regarding alcohol use, sexual behavior, and psychosocial variables. This was accompanied by a smaller (n=87) in-depth interviewing sample.
Results & Conclusions. 54% of respondents reported some unsafe sex. A majority of these respondents reported alcohol disinhibition, an inducement that was independent of "passion" or other factors. Alcohol problems, intoxication rates, alcohol use in sexual contexts, and tension reduction expectancies consistently predicted number of sexual partners and unsafe sexual practices. Tension reduction expectancies were strongly related to alcohol use in sexual contexts, with either habitual or new partners. Finally, alcohol use variables significantly interacted with expectancies in predicting unsafe sex, consistent with the hypothesis. These findings suggest a mechanism of alcohol disinhibition, and an avenue for prevention or intervention.

T.D.0.7

SITUATIONAL FACTORS ASSOCIATED WITH, AND RATIONALIZATIONS EMPLOYED TO JUSTIFY UNPROTECTED INTERCOURSE IN GAY MEN.
Gold, R*, Skinner, M*, Grant P** and Plummer, D***.
*Deakin University, Victoria, Australia, **Victorian AIDS Council, Melbourne, Victoria, Australia, *** Monash University, Melbourne, Victoria, Australia.

Objective. Investigated (a) the situational variables that distinguish between sexual encounters in which gay men (i) engage in, (ii) refrain from, unprotected anal intercourse; and (b) the rationalizations these men employ at the time to justify unprotected intercourse.
Methods. Gay men were asked to recall two sexual encounters in the past year: one in which they had unprotected intercourse ("unsafe encounter" or UE) and one in which they resisted a strong desire to do so (the "safe encounter" or SE). For each encounter the respondent was asked when it took place and with whom. Each encounter was then divided into (a) when the "evening" (or morning, etc.) began; (b) when the respondent met his partner; (c) at the start of sex; (d) during sex. For each of these, the respondent was asked about location, his desires, alcohol and drug consumption, and whether the question of safe sex was raised. For UE the respondent also identified any rationalizations he used for unprotected intercourse.
Results. Key findings were: (a) For respondents who described both SE and UE (n = 181) the latter was more likely with a lover, the former with a casual partner. (b) With the difference controlled (n = 108), factors which distinguished UE from SE were: in UE there was a greater desire for unprotected sex from the start of the "evening", greater feeling of being alert and relaxed but restless and desiring excitement, greater physical attraction and less communication about safe sex. Consumption of alcohol and drugs did not distinguish UE from SE.
(c) Respondents reporting UE (n = 219) employed many rationalizations, the most common being the thought that intercourse would take place without ejaculation.
Conclusion. The findings can be used to inform AIDS education strategies.

T.D.0.9

PSYCHOLOGICAL STATUS AND RISK BEHAVIOR IN MEN SEEKING HIV TESTING
Bobo,John; Fishman,B.; Perry,S.; Jacobsberg,L.; and Ryan,J.
Cornell University Medical College, New York, NY USA

Objective. To examine the hypothesized relationships between HIV risk behavior, psychological variables and effects of HIV testing.
Methods. 154 physically asymptomatic gay/bisexual men voluntarily sought HIV testing and were evaluated with clinical ratings of psychiatric diagnosis (SCID,PDE), and self-report measures of risk behavior, hardiness, social support, attributional style and distress (Beck Depression, Brief Symptom, and Spielberger Anxiety Inventories). Risk behavior and distress measures were repeated 9 weeks after notification and counseling.
Results. 132 subjects (86%) reported no Unprotected Anal Sex (UAS) in the month prior to HIV testing; of 79 subjects seen 9 weeks later (25% HIV+), 75 continued to abstain from UAS. 22 subjects (14%) engaged in UAS in the month prior to testing; of 11 subjects seen 9 weeks later (27% HIV+), all had abstained from UAS in the past month. Psychological variables and serological status did not distinguish the two behavior groups at either measurement point.
Conclusion. Most participants ceased high risk behavior at least one month prior to HIV testing. This "floor effect" impeded determining the relation between risk behaviors, psychological variables, and effects of HIV testing and counseling. This study documents the need for prospective studies to determine if risk reduction surrounding HIV testing is sustained over time, and how psychological factors and known HIV status predict possible relapse.

T.D.0.11

HIV RISK BEHAVIOR SCREENING: CONCORDANCE BETWEEN ASSESSMENTS THROUGH INTERVIEWS AND QUESTIONNAIRES
Aral SO*; Magder LS*; Bowen GS*
*Centers for Disease Control, Atlanta, Georgia, USA

Objectives: To determine level of agreement between assessments by self-administered questionnaires and face-to-face interviews, of HIV risk behaviors in groups and individuals.
Methods: A sample of 334 women attending a family planning clinic responded to the same questions through a self-administered questionnaire and a face-to-face interview. For each item, interviewer coded reasons for discrepancies between the two responses were recorded.
Results: 1. Prevalence of HIV risk behaviors in the group, as determined by the two methods were remarkably similar; the maximum difference between the two estimates for any risk behavior was 1.5 percentage points, for the proportion of individuals reporting more than 5 partners in the last 10 years. 2. Individuals' risk behaviors were assessed with less agreement between the two methods; 12 women (4%) reported risk behaviors on the questionnaire which they denied during the interview; 6 women (2%) did the reverse. Also, twice as many women (8%) reported greater numbers of sex partners during the interview compared to those who reported greater numbers on the questionnaire (4%). 3. Discordance between assessments did not vary by demographic characteristics and education.
Conclusions: Prevalence of HIV risk behaviors in a group are similarly assessed by self-administered questionnaires and face-to-face interviews. However, these two methods can yield highly discrepent findings in assessments of individuals' risk behaviors.

T.D.0.12 IDENTIFICATION, RECRUITMENT AND RETENTION OF BLACK AND LATIN COMMUNITY LEADERS IN AIDS PREVENTION RESEARCH

Morales, Edward* and Fullilove, M.** Bayview Hunter's Point Foundation and Center For AIDS Prevention Studies, University of California-San Francisco, CA, USA; **Multicultural Inquiry and Research on AIDS, Bayview Hunter's Point Foundation and Center For AIDS Prevention Studies, University of California-San Francisco, CA, USA.

Objective. This presentation examines the issues related to identification, recruitment and retention of Black and Latin community leaders in a research effort designed to evaluate the impact of AIDS education on the AIDS-related activity level of those leaders.
Methods. A list of Black and Latin community leaders in San Francisco was compiled consisting of elected officials, directors and administrators, appointed officials, clergy, and persons who were acknowledged as community leaders by two or more persons of the other categories. Subjects were contacted by letter with a follow-up telephone call to solicit participation. Reasons for not participating were recorded. Those agreeing to participate were randomly assigned to one of two conditions, a four session workshop on AIDS in their respective communities (Black or Latin) or receiving an AIDS information manual.
Results. Of the 168 leaders identified, 84 (50%) agreed to participate; of those 46 (27%) formally entered the trail, of whom 22 were Black and 24 were Latin. Reasons for non-participation were examined and included: reluctance to be involved with an AIDS activity, "burnout" from AIDS work, bias against people with AIDS and reluctance to commit time to the research activity.
Conclusions. While it is widely agreed that increased involvement of Black and Latin community leaders would improve AIDS treatment and prevention activities, this study identified major obstacles to their involvement. Minority community leaders may not see AIDS as a pressing issue and may have biases against people with AIDS. These attitudes require recognition in developing AIDS prevention activities.

T.D.0.13 AMERICAN INDIANS/ALASKA NATIVES: ARE THEY AT HIGHER RISK OF HIV INFECTION?

Rowell, Ronald M.; Tafoya, T.; Beaulieu, L.; Green Rush, A.
National Native American AIDS Prevention Center, Oakland, CA, USA

Objective: To highlight the risk factors which make American Indians and Alaska Natives particularly vulnerable to HIV infection.

Method: The National Native American AIDS Prevention Center has gathered secondary data from the U.S. Centers for Disease Control on rates of primary and secondary syphilis and gonorrhea and conducted knowledge, attitudes and behavior surveys of Native people in substance abuse programs, at national pow-wows and other venues; and conducted structured interviews concerning sexual behavior among Native Americans and of Native American people with AIDS.

Results: Sexually transmitted disease rates are from 2 to 10 times higher for Native Americans in some geographical areas than for the non-Indian population as a whole. Interviews with substance abuse providers, tribal officials and youth indicate a growing but unmeasured problem with intravenous drug use. Although comprehensive sexual behavior research has not yet been done, preliminary findings indicate a higher rate of bisexuality than among any other American ethnic group.

Conclusions: American Indians/Alaska Natives are at high risk for infection.

T.D.0.14 INVOLVEMENT OF NATIVE HEALTH-CARE PROVIDERS IN DEVELOPING AN AIDS PREVENTION STRATEGY FOR NATIVE PEOPLES

Wortman, J.*; Rekart, M.**; Mearns, D.**
*Division of STD Control, Province of British Columbia, Vancouver, British Columbia, **Vancouver Indian Centre Society, Vancouver, British Columbia, CANADA

Objective To develop an AIDS prevention strategy for Native population of the province of British Columbia.
Methods A representative Planning Group of Native health-care and human service providers from around the province was convened to develop a proposal for an effective AIDS program for the Native community. A "non-political" approach was taken in choosing Native providers rather than Native policy-makers to develop the program. A strategy was developed through meetings of the Planning Group. Funding, logistical and advisory support was provided by the provincial and federal governments.
Results Consensus was reached on several general principles to be established as a basis for the strategy. The program would be 1) Native developed, implemented and owned, 2) designed to reach all Natives irrespective of status or place of residence, 3) generic in graphic design while remaining recognizably Native, 4) focussed on AIDS while also addressing other forms of social malaise in the Native community and, 5) followed by a sustained AIDS prevention resource. Based on these guidelines a proposal was developed that included videos, posters and pamphlets, community presentations and workshops, and a large conference.
Conclusions Giving the task to health-care providers from the Native community is an effective way to develop AIDS prevention strategy for the Native population.

T.D.0.15 A VIDEO AIDS PREVENTION TRAINING PROGRAM FOR PEOPLE WHO ARE MENTALLY RETARDED/DEVELOPMENTALLY DISABLED

Samowitz, P.; Levy, P, Ph.D.; Levy, J.; Jacobs, Raymond, Young Adult Institute, New York, N.Y.,U.S.A.

Objective. To teach adults who are mentally retarded/developmentally disabled (MR/DD) to better protect themselves from AIDS through the practice of safer sex.
Methods. A video training program with a staff training manual was developed by the Young Adult Institute to change sexual behaviors for people who require a multi-sensory mode of learning due to their impaired learning abilities. Participants who functioned in the mild and moderate range of MR were taught in small groups: 1.What AIDS is; 2.How it is sexually transmitted; 3.How to put on and take off a condom; 4.How to negotiate safer sex when pressured to have unsafe sex.
Results. The video training program was presented to 113 of our clients in small groups. Staff conducted a survey 3 months after their clients were educated, which revealed that 82% of our clients in the mild range of MR retained crucial information taught in the session. Additionally, before the training, our clients were not using condoms. Subsequently, 52% of those clients who are sexually active asked for condoms now being supplied in their program.
Conclusion. This study indicates that people with MR/DD do need protection from AIDS and can learn through education specifically designed for their learning needs.

T.D.0.16 DEAF OUTREACH PROJECT ON AIDS

Upton, K.*; Kerr, Dr. G.**; Perreault, Y.***
* Ontario Association of the Deaf, Toronto, Ontario, Canada
** Canadian Hearing Society, Toronto, Ontario, Canada
***AIDS Committee of Toronto, Toronto, Ontario, Canada

Objective: To describe the formation and development of a joint project on AIDS and Deafness established to enable the deaf community to access AIDS information.
Method: Information gathered during the initial phase of the project revealed: 1) the 28,000 profoundly deaf persons in Toronto whose primary language is Americal Sign Language generally have limited english skills, usually below grade 4 level. Thus, current AIDS materials are inaccessible. 2) AIDS information is passed socially from 1 deaf person to another rather than through mass media. Misconceptions are spread quickly and are extremely difficult to challenge withour direct access to deaf social networks.
3) Models of community development used by most AIDS organizations are not appropriate for the deaf community. Evaluation with key deaf leaders led to the restructuring of the project design.
Results: The service delivery model developed is congruent with the structure and process of the deaf community and utilizes a cross-cultural approach of mediation, advocacy and culture-broking. 14 deaf men and women from a variety of social groups (deaf gay networks, sports groups, clubs and informal groups based on ethnicity, communication modality and educational background) are trained as paid consultants to provide actual services.
Conclusion: Consistent leadership from the deaf community is critical to the development of a culturally-relevant, cost-effective and efficient AIDS and Deafness Program.

T.D.0.17 AN AIDS EDUCATION PROGRAM FOR BLACK AND LATINA WOMEN

Flaskerud, Jacquelyn H.; Nyamathi, A.M.
University of California, Los Angeles, CA, United States

Objectives. To test the effects of an AIDS education & prevention program on the knowledge, attitudes & practices of low income Black & Latina women.
Methods. The study used a pretest-posttest nonequivalent control group design with a 2-3 month retest of the experimental group. The sample consisted of 256 experimental & 105 control Black women & 250 experimental & 101 control Latina women who were clients of the Public Health Foundation Nutrition Program for Women, Infants & Children in Los Angeles. The program consisted of a slide-tape presentation, educational and resource brochures. Knowledge, attitudes, sexual & drug use practices were measured using a structured pretest, posttest & retest that was developed in both English & Spanish languages. Content validity of the questionnaire was established & it was pilot tested on each group. Reliability was determined using Cronbach's alpha.
Results. Using a 2-way repeated measures ANOVA, there were significant differences in pretest-posttest knowledge, attitudes & practices for both racial/ethnic experimental groups that were retained on retest. Control groups did not show significant pretest-posttest differences. Blacks & Latinas differed on pretest knowledge & attitudes but not practices. Blacks had more knowledge & positive attitudes on pretest. The posttest improvements for both knowledge & attitudes were greater in Latinas then in Blacks. A multiple regression analysis revealed the best predictors of knowledge, positive attitudes & practices.
Conclusion. A didactic audio visual program can positively affect the knowledge, attitudes & practices of participants that are retained over time.

T.D.0.18

THE WORRIED WELL: IDENTIFICATION BY SIMPLE CHECKLIST

Hedge, Barbara*; Acton, T.**; Miller, D.** et al.**
*St. Mary's Hospital, London, England, ** Middlesex Hospital London, England.

OBJECTIVE: The "Worried Well", who misattribute somatic symptoms to HIV infection despite repeated negative clinical and serological investigations, can benefit more from appropriate congnitive-behavioural intervention than from further medical investigations and reassurance. The development of a checklist to aid identification of the "Worried Well" for alternative intervention is described.
METHODS: Patients presenting to a genito-urinary medicine clinic seeking counselling with respect to anxiety about having contracted HIV infection were scored on items relating to presenting symptoms, style of presentation and psychosocial history. Differences between those accepting the negative results of clinical and serological investigations and those continuing to believe they are infected were examined. A checklist based on these differences was constructed and its ability to predict the "Worried Well" assessed using a further sample of forty similar patients.
RESULTS: The "Worried Well" were found to be characterised by a number of items, particularly presentation of symptoms and psychosocial history. The checklist developed using these items demonstrated a high predictive ability, high test-retest reliability and good inter-rater reliability.
CONCLUSION: It is possible to identify the "Worried Well" accurately and reliably using a simple checklist. The potential usefulness of early identification is discussed.

T.D.0.19

SOCIAL SUPPORT, HIV SYMPTOMS AND DEPRESSION AMONG GAY MEN

Hays, Robert; Turner, H.; Catania, J.; Mandel, J.; and Coates, T.
Center for AIDS Prevention Studies, University of California, San Francisco, California, USA

Objective. To examine the impact of objective HIV status, knowledge of HIV status and AIDS-related symptomology on depression among a community sample of gay men and identify which of three types of social support (emotional, informational, practical) most effectively buffered that depression.
Methods. Longitudinal questionnaire data come from 455 gay and bisexual men who participated in 1986 and 1987 waves of the San Francisco Men's Health Study, a population-based sample drawn from the census tracts with the highest incidence of AIDS in 1984 .
Results. The number of AIDS-related symptoms experienced significantly predicted depression cross-sectionally (*r*= .25) and one year later (*r*= .17). Objective HIV status and knowledge of one's status were not significantly associated with depression. The three types of social support all showed significant negative correlations with current and later depression (all *r*s ranged from -.25 to -.37). Multiple regression analyses showed a significant interaction between symptoms and informational support, suggesting that men with high symptom levels benefitted most from informational support.
Conclusion. Gay men are at highest risk for depression when they begin to experience AIDS-related symptoms. While all types of social support are associated with reduced depression, informational support may be especially beneficial for those in early stages of disease progression.

T.D.0.20

MODIFICATIONS OF SEXUAL BEHAVIOUR DUE TO AIDS IN FRENCH HETEROSEXUAL "AT RISK" POPULATION.

Moatti Jean-Paul (1),Tavares J. (2) Durbec J.P. (3), Bajos N. (2), Ménard C.(2), Serrand C. (2).
(1) INSERM Unit n° 240, Paris, France - (2) French Committee for Health Education (CFES) - (3) INSERM Unit n° 31 , Marseille, France-

A survey has been carried out in France by CFES in a national sample (n = 1 000, Sept. 1988) of "sexual multipartners" : identification of individuals recognizing a priori that they had more than one sexual partner during the last six months was done using a random walk procedure ; a questionnaire was then submitted to them through personal interview.

46.9 % of the sample declared use of condoms (10,3 % declaring systematic use) ; *38.7 % of users were new users of the last six months, mainly motivated by fear of Aids*. 33.3 % of sexual multipartners declared that they made some change of sexual behaviour because of Aids but 41.7 % of these only quoted "being more careful in choice of partners" without any condom use. Condom use was significantly more frequent for men (52,3 %) than women (41,6 %) (p < 0,01), and for individuals under 35 years of age.

Multivariate analysis (using logistic regression model) shows that the following factors are the main predictors of condom use in that population : *high school level of education* [OR = 1.32 - 95% IC = 1,00 - 1,74], *being single* [OR = 1.42 - 95% IC = 1.10 - 1.85], *sex* [OR for women = 0.64 - 95% IC = 0.49 - 0.83], *knowing a HIV carrier in personal relations* [OR = 2.04 - IC = 1.55 - 2.69], *having voluntarily undergone a HIV test* [OR = 2.91 - 95% IC = 1.90 - 4.44].

Although interpretation of results is limited by the absence of data on the real degree of exposure to sexual transmission of HIV in such French population of sexual multipartners, conclusions will be drawn for information campaign about condoms and screening policies.

T.D.0.21

THE PREVALENCE OF AIDS-RISK-RELATED SEXUAL BEHAVIORS AMONG WHITE, MIDDLE-CLASS, URBAN AMERICAN ADULTS: A SURVEY OF RESEARCH FROM KINSEY TO THE PRESENT

J.M. Reinisch, Stephanie A. Sanders, and M. Ziemba-Davis
The Kinsey Institute for Research in Sex, Gender, and Reproduction, Indiana University, Bloomington, IN USA

Objective. To provide a comprehensive view of sexual behavior patterns among American men and women, data from selected studies were combined to provide estimates of the prevalence of behaviors implicated in the transmission of Human Immunodeficiency Virus (HIV).
Methods. Drawing from 17 of the most thoughtfully designed scientific investigations and the largest, most comprehensive commercial studies published between 1948 and 1988, we derived estimates of the prevalence of AIDS risk-related behaviors for White, middle-class, relatively well-educated, primarily urban Americans between 20 and 50 years of age. These estimates are conservative. They represent weighted means derived by multiplying the results from each of the relevant studies by the sample size, summing across studies, and dividing this sum by the total number of subjects across all studies.
Results. Results indicate that a substantial proportion of the participants in the studies reviewed had engaged in (a) extramarital sexual interactions, (b) anal intercourse, (c) sex with prostitutes, (d) sexual interactions across nominally distinct sexual orientation groups, and (e) sexual contacts during visits to cities with a high prevalence of HIV.
Conclusion. Accurate data on sexual behavior and the attitudes related to these behaviors are essential to the development of behavior change programs vital to stemming the tide of AIDS. In the absence of sufficiently large and unbiased samples, our estimates based on 17 scientific and commercial studies provide important insight into the prevalence of sexual behaviors which place Americans at risk for infection with HIV.

T.D.0.22

HIV-POSITIVE GAY MEN: SEXUAL DYSFUNCTIONS

Meyer-Bahlburg, Heino F.L., Ehrhardt, A.A., Gorman, J.M., and Goetz, R.R., Jr.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, N.Y., USA.

Objective. To evaluate HIV positive men for sexual functioning expected to be impaired because of the emotional, systemic, and/or neurological effects of HIV disease.
Methods. 120 HIV-positive gay men with no or few symptoms and 80 HIV-negative gay men (all mostly white, middle class, age range 19-59 years) underwent a detailed semi-structured interview, the Sexual Risk Behavior Assessment Schedule (SERBAS-A-HOM-1, Meyer-Bahlburg et al., 1988).
Results. Preliminary analyses show high interindividual variability in frequency and practices of sexual behavior. Two-fifths of the men reported diminished sexual satisfaction, more than half some degree of negative feelings during sex, and about one-sixth some degree of sexual aversion. As to classical sexual dysfunctions as listed in DSM-III-R, about one-fifth of the men reported the presence of hypoactive sexual desire, two-fifths some degree of erectile failure, one-half some degree of retarded orgasm, one-fifth some degree of premature orgasm, and one-quarter other sexual dysfunctions.
Conclusions. The prevalence of sexual dysfunctions among HIV-positive gay men with no or few symptoms of HIV disease appears to be relatively high.

T.D.0.23

CHANGES IN LYMPHOCYTE PHENOTYPE AND FUNCTION IN HIV SEROPOSITIVE HOMOSEXUAL MEN FOLLOWING THE DEATH OF A PARTNER

Kemeny, Margaret E.*, Durran, R.**, Weiner, H.*, Taylor, S.E.**, Visscher, B.*, and Fahey, J.L.*. *UCLA School of Medicine and **UCLA Department of Psychology, Los Angeles, CA, USA.

Objective: To determine whether immune parameters relevant to HIV progression were altered in HIV+ homosexual men following the death of an intimate partner. HIV- homosexual men were studied as a comparison group.
Methods: 25 subjects whose intimate partners had died over the past year were selected from among participants in the UCLA Multi-Center AIDS Cohort Study (MACS). Blood samples drawn prior to and following the death of the partner were compared. Age- and HIV serostatus-matched non-bereaved subjects provided blood samples over an equivalent time period. Immune parameters relevant to HIV progression were evaluated (e.g., CD4 cell levels, measures of immune activation such as the percent of CD8 cells expressing DR).
Results: Preliminary results from phenotypic analyses indicated that there was a significant increase in the percent of CD8 cells expressing DR following the death of the partner among HIV+ subjects; this change over time was not seen in the non-bereaved subjects. This change was also not seen among HIV- bereaved subjects.
Conclusion: The loss of a partner in HIV seropositive homosexual men was associated with increased evidence of immune activation. This pattern was not seen among the HIV- men who had lost a partner. Immune activation is relevant to progression of HIV infection.

Les adolescents (partie 2)
Adolescents (Part 2)

T.D.0.24 Do Health Belief Model Beliefs About HIV Infection and Condoms Predict Adolescent Condom Use?

Ralph Hingson, L. Strunin, Boston University School of Public Health, U.S.A.

OBJECTIVE: To test whether beliefs about HIV and condoms outlined in the Health Belief Model predict adolescent condom use.
METHODS: In August 1988, 1,762 Massachusetts 16-19 year olds were surveyed using anonymous random digit dial telephone interviewing: response rate, 82%. Logistic and multiple regression analyses tested whether after social and demographic characteristics were controlled, perceived susceptibility to HIV infection, severity of HIV if infected, effectiveness of condoms in preventing infection, and barriers to condom use such as reduction of sexual pleasure, embarrassment or difficulty obtaining condoms predict condom use. Whether school education or medical counseling predict use was also assessed.
RESULTS: Respondents who believed condoms are effective in preventing AIDS and worry they could get AIDS were 3.1 and 1.8 times more likely to use them all the time. Those who believed condoms reduce pleasure and who would be embarrassed were 3.1 and 2.4 times less likely to use them. Respondents who carry condoms with them and those who discussed AIDS with a doctor were 2.7 and 1.7 times more likely to always use condoms. Average daily alcohol consumption and frequency of other drug use were also independently associated with less condom use. One-fifth of the variation in condom use was predicted by the Health Belief Model.
CONCLUSION: Those trying to persuade sexually active adolescents to use condoms should discuss with them beliefs in the Health Belief Model. Beliefs about pregnancy, other sexually transmitted diseases, partners preferences, alcohol and drug use should also be assessed.

T.D.0.25 PREDICTORS OF CONDOM USE AND STDS IN A GROUP OF SEXUALLY ACTIVE ADOLESCENT WOMEN

Greenblatt, Ruth M.*; Catania, JA.*; Kegeles, SM.*; Schachter, J.*; Miller, J.**; Coates, TJ.*; et al. *University of California, San Francisco,** Planned Parenthood of Santa Cruz, California, USA.

Objective. To identify correlates of condom use and morbity related to sexual activity among 115 adolescent women who attended a family planning clinic. Methods. A cross-sectional study comparing historical, physical and laboratory findings, and self-reports of sexual behavior, attitudes, and beliefs. Results. Ages ranged from 14 to 20 years (mean 17.9), 92% were Caucasian and 65% lived with parents. Fifty-seven percent had >1 sexual partner during the preceding year, 76% had ever used condoms; only 12% used them consistently. Thirty-two percent had a prior history of an STD (gonorrhea, chlamydia, syphilis, genital herpes or warts, trichomoniasis, abnormal PAP smear or bacterial vaginosis), 16% unplanned pregnancy, and 26% had an STD presently. Condom users were younger than nonusers (mean of 17.3 vs. 18.2 years; p=.007) and had less frequent vaginal intercourse (p=.008). The consistent use of condoms was associated with the practice of always asking partners to use condoms (p=.017). More frequent use of condoms was associated with the perception that peers supported their use (p=.021). Most (65%) believed that use of condoms reduced the risk of AIDS, yet this belief was not associated with greater condom use (p=.22). Anal intercourse (AI), reported by 10%, was associated with a prior history of STD (p=.04), and marginally associated with unplanned pregnancy and total morbidity (p=.06 and p=.05 respectively). The number of morbid outcomes attributable to sexual activity was significantly associated with AI (p=.035). Those with a history of STD or pregnancy reported greater concern about AIDS (p=.036, p=.0006 respectively) but neither were associated with greater use of condoms.
Conclusion. Experience with an STD or unplanned pregnancy was not correlated with subsequent condom use among this group of adolescents; greater communication skill and peer support were. STD and pregnancy morbidity was correlated with the practice of anal intercourse.

T.D.0.26 PEER EDUCATION PROGRAM REACHES HIGH RISK ADOLESCENTS WITH AIDS INFORMATION AND PREVENTION

Arnold, Wendy*, Barnes, F.
*Adolescent Treatment and Education Alliance, Los Angeles, CA., USA.

Objective: To reduce the transmission of HIV in high risk youth with the use of AIDS-trained volunteer teenage peer educators in small group settings and direct street outreach. Methods: Multi-cultural teenagers are recruited from highschools, group homes and runaway shelters, and youth organizations. After an intense training on basic AIDS information and communication strategies, the young peer educators set up small group discussions and do direct street outreach to homeless and runaway youth in Los Angeles. AIDS issues that are specific to the needs and concerns of adolescents are addressed. As co-speakers, persons with AIDS (PWAs) emphasize the urgency of modifying risk-taking behaviors associated with HIV transmission and bring a 'human element' to the AIDS information-exchange. Conclusions: Youth speaking directly to youth is an effective means for penetrating intergenerational barriers of AIDS prevention through education messages. Post-test questionnaires document an increase in AIDS knowledge and behavioral intentions. Including personal testimonies from PWAs stresses the responsibility of taking precautions to prevent exposure; the PWA's presence not only heightens compassion for those diagnosed but is also empowering and rewarding for him/her. The Adolescent Alliance Peer Education Program is a culturally adaptable model for teenage populations. It is inexpensive and easy to implement and evaluate.

T.D.0.27 AN EVALUATION OF AN AIDS RISK REDUCTION EDUCATION & SKILLS TRAINING (ARREST) PROGRAM FOR ADOLESCENTS

Kipke, Michele, Boyer, C., and Hein, K.
Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, New York, USA

Objective. To evaluate an AIDS Risk Reduction Education & Skills Training (ARREST) program developed to (a) increase knowledge about HIV transmission and prevention, (b) build decision making, communication and assertiveness skills, and (c) modify HIV risk-related behaviors.
Methods. Sixty-five adolescents (13-16 yrs,mean=14) were recruited from 3 after-school community programs in New York City. All subjects completed self-report measures and videotaped role-play simulations. Subjects were then randomly assigned to an intervention group that received 3 ARREST sessions, or a control group that received no training. All subjects were reassessed 5 weeks later.
Results. The ARREST program is being evaluated using a repeated measures between and within group experimental design. The sample reported a high frequency of unprotected sexual behaviors at baseline; 38% (25/65) were sexually active, of which 56% (14/25) reported a mean of 4.4 (SD± 3.4) sexual encounters and 1.9 (SD± 0.9) partners during the 30 days prior to the study. Preliminary findings suggest increased knowledge and behavioral skills for refusing to engage in high-risk behaviors and negotiating alternative low-risk behaviors among those subjects who received ARREST.
Conclusion. Innovative interventions that provide skills training such as ARREST, and methodology for evaluating their effectiveness are needed to reduce the risk of HIV infection among adolescents.

T.D.0.28 STEPS IN DEVELOPING A SEX EDUCATION, STD AND AIDS PROGRAM FOR ADOLESCENTS IN BRAZIL

L.G.M. RODRIGUES, R. CAVALCANTE, B. SILVEIRA,

Divisao Nacional de Donças Sexualmente Transmissfuets/AIDS, Brasilia, Brazil

The onset of the AIDS epidemic in Brazil has made evident how scanty our knowledge is about sexuality.
AIDS has open the opportunity for the population at large, adolescents, parents, school teachers to talk about their own sexuality and find ways to approach the issue.
The objectives in developing such a program were: (1) to assess the needs of the teenagers independent of the social economic status and, (2) to address sex and sexuality as an important part of the human life emphasizing responsability and love as component of it.
Methods: In order to prepare a program with the participation of adolescents we used 7 different strategies: (1) survey with different teenagers derived from different social, economic background; (2) debates using topics suggested by adolescents and having as facilitators adolescents elected by them; (3) establishment of an award for the group of teenagers presenting the best way for implementation of the program; (4) definition of the multiplier profile through research; (5) preparation of the manual for multipliers; (6) training for multipliers and (7) manual for adolescents.
Contents: The most interesting topics suggested by the adolescents were:
Biological: anatomy/physiology of the sexual response
unplanned pregnancy
abortion
contraception
sociocultural: sexual preference
violence sexual
homosexualism
bisexualism
Physiologicals: orgasm
masturbation
others sources of satisfaction
The content for STD's and AIDS were based in answering some questions:
What is ?
How to get it ?
What are the major sing and symptoms ?
How to prevent ?
Where to get help and treatment
How to avoid prejudice ?
How to talk to parents about it ?
Conclusion: For the first time we put together governmental institutions, private sector and Fundations to develop an unique and standardized educational material.

T.D.0.29 YOUTH AT HIGH RISK FOR HIV: KNOWLEDGE, SEXUAL PRACTICES, AND INTENTIONS TO INFORM SEXUAL PARTNERS OF HIV STATUS

Temoshok, Lydia*; Ellmer, R.M.*; Moulton, J.M.*; Baxter, M.**; Shalwitz, J.**; *University of California School of Medicine, San Francisco, **San Francisco Deptartment of Public Health, San Francisco, CA., U.S.A.

Objective. Because youth who come into contact with the juvenile justice system are typically sexually active, prone to drug experimentation, and often have STDs, they are at particularly high risk for HIV infection and transmission. Our aim was to examine their knowledge of behaviors that transmit HIV, their level of risky sexual behaviors, and their stated intention to communicate a positive HIV status to sexual partners.
Methods. 184 juvenile offenders (mean age = 16) at the San Francisco Youth Guidance Center completed anonymous self-report questionnaires. Actual HIV status was not determined.
Results. While 78% of the Ss expected to be told if their sexual partner were HIV+, only 60% would tell their regular, 35% their occasional, and 36% their prospective sexual partners. Ss who reported that they would not inform regular, occasional, or prospective sexual partners if they were HIV+ were significantly less accurate (p < .05 to .005) in correctly identifying unsafe sexual practices than those would. Ss who said they would not tell prospective sexual partners if they tested positive for HIV were more likely (p < .01) to have had sex in exchange for money, drugs, etc. over the last 12 months.
Conclusion. Informing sexual partners of positive HIV status is a crucial behavior in curtailing HIV transmission. Our data suggest that youth most at risk for contracting or transmitting HIV report the least willingness to inform sexual partners of their HIV status. These findings suggest an urgent need to target interventions for specific information and behavioral change in this particularly high risk group.

Counseling
Counselling

T.D.0.30

TRAINING INMATES AS HIV PEER SUPPORT COUNSELLORS IN GAOL

Lyons, S.*; Begley, K.**; McCallum, L.**; Conolly, L.***.
* Bathurst Gaol, **Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia, ***NSW Department Corrective Services.

Objective. To develop a programme to train inmates as HIV peer support counsellors and educators and establish a network of inmates throughout gaols who are available for HIV peer counselling and education.
Methods. Inmates collaborated with HIV workers in the design and implementation of the programme. Topics covered medical, counselling and psycho-social issues. Topics were presented by visiting specialists and information delivered in a variety of ways including lectures, group discussions, role plays and videos. The course was evaluated using interviews and by questionnaire.
Results. The evaluation process involved collecting qualitative and quantitative information. Questionnaires were used to compare participants' AIDS knowledge with that of inmates who had attended general information sessions offered by the gaol. Course participants showed a higher general AIDS knowledge ($p<.001$) and higher positive attitude scores ($p<.005$). As a result of the course, inmates produced an educational play and video on safe needle use for the internal television network of the gaol and were involved in HIV peer education and counselling of other inmates.
Conclusion. The success of the programme is directly attributable to the active involvement of the inmates in its planning and implementation. The programme demonstrates the practical and economic value in using inmates as HIV peer educators and counsellors in gaols.

T.D.0.31

OPTIMIZING INNER CITY PRENATAL AIDS COUNSELING (AC)

Mendez, C. Teresa*; Lischner, H.W.*; Raphael, S.A.*; Olson, H.M.*; Cohen, A.W.**; Steinberg, F.***; et al. *Temple Univ.; **Univ. of Pennsylvania; ***Episcopal Hosp., Philadelphia, PA, USA.

Objective. To compare the effectiveness of 4 approaches to pregnant women to maximize acceptance of preventive AC and HIV antibody testing (AbT), minimize client stress and permit the gathering of risk-behavior data.
Methods. The 4 approaches to AC were pilot-tested in 2 clinics serving predominantly Black and Hispanic women who have an average incidence of perinatal HIV infection of about 0.3% by anonymous umbilical cord blood screening.
Results. 1) Of 97 women who received flyers which described AIDS risk activities and offered AC, 29% requested AC and 16% requested AbT. 2) Out of 149 women interviewed directly by a social worker (SW) for consent to join a research program for anonymous risk assessment and AbT, 36% agreed. 3) Out of 42 women interviewed by the SW with initial focus on the danger of HIV infection to the infant without prior mention of risk behaviors, 57% requested AbT and less distress was verbalized. 4) Out of 34 additional women approached as in method 3 but asked for verbal permission to complete an anonymous risk assessment form, 35% requested AbT. Regardless of the initial approach, confidential risk-assessment interviews were permitted during post-test AC and the resulting data were more complete than, though sometimes discrepant from, those from anonymous questionnaires.
Conclusion. As proposed by Minkoff, et al (New Engl J Med 319:1018, 1988), the initial focus in prenatal and perinatal AC should be on the danger of HIV infection to the infant and not on risk behavior. The consensus of observing professionals, soon to be tested, was that this AC would be most effective if conducted as part of multifocus SW or nursing interviews.

T.D.0.32

PROBLEMS WITH COUNSELING UNDEREDUCATED PEOPLE REGARDING HIV-1 SEROLOGIC RESULTS

Brutus, Jean-Robert*; Adrien, M*; Boulos, R*; Halsey, N**; Abellard, M*; Kissinger, P*
*Centers for Health and Development, Port-au-Prince, Haiti; **Johns Hopkins University, Baltimore, MD, USA

Objective. To describe the difficulties in counseling undereducated men and women in an impoverished Haitian slum about HIV-1 infections and AIDS.
Methods. Women attending prenatal clinics were tested for HIV-1 by ELISA and WB. Men with signs and symptoms suggestive of HIV-1 infections were tested in an STD clinic. Counseling was provided by physicians and social workers.
Results. Of 2952 women, 49.7% had received no formal education and 75% had attended primary school for 4 or fewer years. Of 14 to 19 year old pregnant women, 6% to 9% have been HIV-1 seropositive each year during 1986 through 1988. Adverse reactions to learning that they were HIV-1 seropositive included destruction of household goods, physical threats to the STD clinic physician, hopelessness, anger, despair, and confusion.
Conclusion. Undereducation, illiteracy, and lack of general information about AIDS in the community make counseling regarding serologic status and the complex aspects of HIV-1 infections very difficult. Adolescent girls are acquiring HIV-1 infections soon after becoming sexually active. Education programs and changes in sexual behavior are urgently needed.

T.D.0.33

ARE PATIENTS GETTING THE AIDS EDUCATION THEY WANT FROM THEIR PHYSICIANS?

Gerbert, Barbara; Maguire, B. and Coates, T. University of California at San Francisco, San Francisco, California, United States.

Objective. Physicians are positioned in the health care system to counsel patients about AIDS risk reduction. We completed a population-based survey of United States residents to find out the extent to which physicians talk to them about AIDS and to assess their desire for AIDS prevention counseling during their medical visits.
Methods. Telephone interviews were conducted in July and August 1988 with 2000 English-speaking, United States adults using a representative national sample generated by random digit dialing. A 75% response rate was achieved.
Results. Only 15% of respondents had talked with their physicians about AIDS, and in most instances (72%) the patient had initiated the discussion. Most respondents (79%) had never been asked by their doctor about their sexual behavior. Among those who had not discussed AIDS with their physician, only 17% did not want such a discussion. Physicians were rated as the most credible source of AIDS prevention information.
Conclusion. AIDS prevention is not routinely discussed by physicians with their patients. Because patients are not averse to such counseling, we suggest additional research to identify barriers to AIDS prevention counseling in the medical encounter and strategies to increase such counseling.

Funded by NIMH & NIDA Center grant #MH42459 and the Universitywide Task Force on AIDS.

T.D.0.34

SPECIAL PROBLEMS INVOLVED IN COUNSELLING OF HIV-INFECTED HOMOSEXUALS AND HEMOPHILIACS

Reisbeck, Günter*; Ermann, M.*; Hutner, G.**; Seidl, O.*; Schneider, M.M.*/***; Schramm, W.***
* Dept. of Psychotherapy and Psychosomatics at the Psychiatric Hospital, University of Munich, Munich, Federal Republic of Germany,
**Dermatological Hospital, University of Munich, Munich, Fed.Rep.of Germany,
*** Dept. of Hemostaseology at the Medical Hospital "Innenstadt", University of Munich, Munich, Federal Republic of Germany.

Objective: Description of special problems involved in counselling of HIV-infected homosexuals and hemophiliacs.
Methods: The coping behaviour of HIV-infected homosexuals and hemophiliacs is descriptively analysed, resulting from records of over 2000 counselling contacts over a period of 3 years.
Results: It was observed that an important prerequisite for an adequate coping with the HIV-infection (minimizing denial, guiltfeelings, depression, feeling victimized and isolation) is the person's successful coping with his groupspecific stress factor: homosexuality or hemophilia. For clients who demonstrated a deficiency in this coping ability, sensitive and non-confronting counselling led in many cases to greater self-acceptance and more ease in dealing with the HIV-infection.
Conclusion: In counselling HIV-infected homosexuals and hemophiliacs the task is, with a large number of clients, to help them accept themselves as homosexuals or hemophiliacs as well as to cope with the HIV-infection in the narrow sense. But equally harmful as ignoring the personal and social implications of homosexuality and hemophilia is forced confrontation with these themes at the wrong time.

T.D.0.35

CONDOM USE AND ASSOCIATED HIV SEROCONVERSION FOLLOWING INTENSIVE HIV COUNSELLING OF 122 MARRIED COUPLES IN ZAIRE WITH DISCORDANT HIV SEROLOGY

Kamenga, Munkolenkole*; Jingu, K.*; Hassig, S.*; Ndilu, M.*; Behets, F.*; Brown, C*/**; Ryder, R.*/***. *Projet SIDA, Kinshasa, Zaire; **NIH, Bethesda, MD; ***CDC, Atlanta, GA, U.S.A.

Objective: To prospectively determine condom use and subsequent HIV incidence in discordant couples (one spouse HIV(+), the other HIV(-)=DC) after serostatus notification (Sero-Ntf).
Methods: Following Sero-Ntf of DC, condoms have been promoted, utilization/sex act quantified, and immunologic and clinical profile monitored in 122 DC (80% initially asymptomatic) identified at 2 Kinshasa businesses.
Results:

DC HIV status before Sero-Ntf(n)		M+F-(n=67)	M-F+(n=55)
Mean age in years (M/F)		38.4/30.5	36.4/28.7
Mean years married		12.8	9.2
Mean duration(mos.) of follow-up (FP)		8.4	7.8
Mean T4 count in HIV(+)	Before Sero-Ntf	492	556
	End FP	406	509
Mean No. sex acts/month	Before Sero-Ntf	8	8
	During FP	3	4
% Practicing abstinence	Before Sero-Ntf	1.4	0
	After Sero-Ntf	6.0	7.3
% Sex acts with condoms	Before Sero-Ntf	<10%	<10%
	During FP	99.3%	96.6%
No. Divorcing(%)	End FP	1(1.5%)	1(1.8%)
No. Seroconverting(%)	End FP	0(0)	3(5.4%)

Conclusion: Despite widespread skepticism concerning the acceptability of condoms in sexually active African couples, an intensive counselling program has achieved sustained success with consistent condom use by 112 of 122 DC (2 divorces, 8 practicing abstinence) now followed during 83 couple-years of follow-up. Serostatus notification was not disruptive to most DC and led to marked salutary changes in sexual behavior.

Women

W.D.0.1 HIV INFECTION AMONG WOMEN ATTENDING WOMEN'S HEALTH CLINICS IN THE UNITED STATES, 1988-89

Sweeney, Patricia*; Allen, D.*; Onorato, I.* and State and local Health Departments. *Centers for Disease Control, Atlanta, GA, USA.

Objective. To evaluate HIV seroprevalence in women attending family planning, prenatal care and abortion clinics in the United States.
Methods. In 1988 and 1989, blinded surveys are being conducted in clinics providing services to women of reproductive age. After testing blood for routine purposes, individual identifiers are removed and consecutive sera are tested for antibodies to HIV. Age group, race, ethnicity, and type of clinic will be collected on over 100,000 women from 137 clinics in 30 metropolitan areas.
Results. Preliminary results for 10,161 women in 8 areas indicate that the highest seroprevalence rates are in prenatal and family planning clinic clients in densely populated cities. HIV seroprevalence ranged from 0-3.6% (median 0%) in prenatal, 0-4.5% (median 0%) in family planning and 0-0.56% (median 0.19%) in abortion clinics. Rates were 1.0% in black compared to 0.11% in white and 0% in hispanic women. Seroprevalence was highest in the 25-29 year age group and lower among adolescent and older women.
Conclusions. These results suggest that HIV seroprevalence rates in women attending family planning, prenatal, and abortion clinics vary, but are generally low. Rates are higher in black women and in more populated areas. Surveillance of HIV seroprevalence in women of reproductive age is essential in directing programs to prevent perinatal and heterosexual transmission and to evaluate the effectiveness of such programs. These programs may need to focus on educating minority and adolescent women.

W.D.0.2 RELATIONSHIP BETWEEN HIV AWARENESS, PARTNER SELECTION CRITERIA, AND EARLY RELATIONSHIP FORMATION IN TWO GROUPS OF SAN FRANCISCO BAR PATRONS

McKusick, Leon; and Hoff, C.C.
Department of Medicine, Center for AIDS Prevention Studies, University of California San Francisco, USA.

Objective. To investigate the interaction between awareness of HIV and interpersonal relationship seeking and formation in adult heterosexual women and homosexual men.
Methods. San Francisco bar patrons were chosen, bars being places where awareness of HIV is likely to be high and where a sexual encounter with an HIV antibody seropositive may occur. 50 heterosexual women and 50 homosexual men filled out questionnaires and were interviewed. Twenty five of each group were in an early relationship and 25 were single. Data was gathered on three HIV aware behavioral strategies: 1) assessment of partner characteristics and behavior, 2) safe sex practice, and 3) determination of HIV antibody status of partner Additional data was gathered on partner selection and relationship criteria, awareness of AIDS, sexual behavior, and relationship history and satisfaction.
Results. Single heterosexual women were more likely than single homosexual men to assess surface characteristics of potential partners as an HIV avoidance strategy. Homosexual men were more likely than heterosexual women to know their own HIV antibody status and, for those in early relationships, to know the antibody status of the partner. Single homosexual men were also more likely to engage in safe sex practice than single heterosexual women. Those women who practiced safe sex early in relationship formation suspended the practice upon the establishment of trust that their partner was monogamous.]
Conclusion. Psychosocial factors associated with relationship formation can interfere with effective HIV protection strategies, particularly in single heterosexual women.

W.D.0.3

W.D.0.4 GENDER RULES AS BARRIERS TO RISK REDUCTION FOR BLACK WOMEN

Fullilove, Mindy; Fullilove, R.; Haynes, K. and Gross, S.A.
Multicultural Inquiry and Research on AIDS of the UCSF Center for AIDS Prevention Studies and the Bayview-Hunter's Point Foundation, San Francisco, CA, USA.

Objectives. This study was designed to examine gender rules that affect black women in their adoption of risk reduction behaviors. In particular, the study compared drug-using and non-drug-using women's comments about rules for sexual behaviors, drug use, and authority within relationships.
Method. In order to examine the attitudes, beliefs and practices of women in the drug-using world, we conducted 12 focus groups with 75 black teenage and adult women, drug-users and non-drug-users, representing middle-, working- and underclass black women residing in Bayview-Hunter's Point , a black ghetto in San Francisco. The focus groups asked women participants to discuss sexual practices and drug-related behaviors.
Results. The women in our focus groups were able to state explicitly what they believed to be the rules of their environment. The rules for behavior reflected an awareness of strict gender roles in which women were subservient to men and had fewer privileges than men. The gender rules varied with age, socioeconomic status and drug use. Of the women who participated, those addicted to crack cocaine appeared to face not only the highest risk for infection with HIV, but also the most severely limited options for behavior change.
Conclusion. Risk reduction must take into account black women's perception of acceptable gender behaviors. To the extent that these rules support subservience to men, women may be limited in their ability to initiate and maintain prevention activities. The degree to which this perception reflects reality, and the corresponding views of black men, deserve further study.

W.D.0.5 BARRIERS TO AIDS INTERVENTIONS AMONG SEXUAL PARTNERS OF IV DRUG USERS

Sterk, Claire E*; Friedman, SR*; Sufian, M*; Stephenson, B*; Des Jarlais, DC**
*Narcotic and Drug Research, Inc., New York, NY, USA;**NY State Div of Substance Abuse Services, New York, NY, USA

Objectives. (1) To develop strategies to locate sexual partners (SPs) of IV drug users so they can receive AIDS education and be enrolled in research studies. (2) To determine barriers to sexual partners' participation in these activities.
Method. Under the direction of an ethnographer, a team of outreach workers attempted to locate and recruit SPs. Barriers to recruiting SPs were identified through (1) conducting in-depth interviews with SPs who were recruited about the reasons that tended to deter them or that had deterred their friends; and (2) constant feedback between the ethnographer and the outreach workers about what obstacles they discovered in their attempts to recruit SPs.
Results. Most SPs are women. The key barriers to their participation are denial, dependency, social isolation, and opposition from their drug-using partners: Many SPs deny their partners' drug use and hope they will eventually stop using drugs. They are emotionally, and sometimes economically, dependent on their drug using partner. Thus, they want to hold on to the relationship, especially if they have children. SPs often lose contact with friends whom they do not want to have know about their partner's drug use. The drug users do not want the SPs to talk with outsiders about their drug use because they are ashamed of their drug use or because they fear these conversations may give the SPs social support to break the relationship.
Conclusion. Outreach based on ethnography facilitates locating sexual partners and identifying barriers to participation. Efforts to reduce HIV infection of SPs can use network techniques to locate SPs. Ways to overcome dependency, denial, and social isolation of female SPs, and to neutralize their drug using partners' opposition, must be developed. Theoretically promising ideas include group processes and counseling that lead to empowerment and collective identity.

W.D.0.6 CONTRACEPTIVE UTILIZATION AND REPRODUCTIVE DESIRES IN A GROUP OF HIV-POSITIVE WOMEN IN KINSHASA.

Hassig, Susan E*,**, Doppagne A***, Piripiri L*, Moore M *,** Ryder RW****, Bertrand WE*,**, Kashala TD*
* Zaire School of Public Health, Kinshasa, Zaire; ** Tulane University, New Orleans, USA; *** Banque Commerciale du Zaire, Kinshasa, Zaire; **** Projet SIDA, Kinshasa, Zaire.

Objective: To determine contraceptive utilization and future reproductive desires of women identified as HIV-positive.
Methods: A working population and their spouses were tested for HIV and contraceptive/reproductive data collected.
Results: Fifty-eight (4.5%) of the 1293 women tested were HIV+. Ninety-one % of HIV+ women were married, and 7% currently use modern contraception. No differences in age (33.0/33.2 years), number of children (3.9/4.4) or condom usage (3%/1%) were found between HIV+ and HIV- women. HIV+ women were significantly more likely to use "rhythm" for contraception (26% vs 9%, $p=0.0003$). Of HIV+ women, 71% wanted more children within the next two years (mean desired family size = 5.2), and 5% were pregnant. A majority of women expressed a desire for more accessible contraception options.
Conclusions: Counselling services for HIV+ women in Kinshasa must be prepared to address the current low level of contraceptive usage and the definite pro-natalist sentiment in the population reflected by the high levels of desired and actual completed fertility.

Injection Drug Users: Changing Realities and Persisting Myths

W.D.0.7 CULTURALLY CONDITIONED BELIEF SYSTEM

Olin, Robert. National Health and Welfare, Stockholm, Sweden.

W.D.0.8 DRUG INJECTING AND SEXUAL BEHAVIOUR

Giovanni Rezza* and Manuel Carballo**
* Italian Ministry of Health, and WHO Consultant, SBR/GPA, Geneva
** Chief SBR/GPA, WHO, Geneva

In the context of the AIDS epidemic, drug injecting has become one of the most dominant public health problems. Drug injectors in North America, Western Europe and, increasingly, parts of Asia and South America represent an important risk group with respect to their own potential infection with HIV and its transmission to other groups. Among drug injectors needle sharing is one of the principle routes of HIV transmission, but sexual transmission also plays an important role, especially with regard to the spread of HIV to the larger community.

A number of studies among drug injectors have found consistent associations between selected indicators of sexual behaviour and HIV seropositivity. HIV positive drug injectors are more likely than HIV negative ones to have had a known seropositive sexual partner and/or to have engaged in male-to-male sex. HIV seroprevalence rates have also been shown to be higher among female than male drug injectors. The sexual transmission of HIV also appears to play a role among non-injecting drug users such as cocaine smokers.

The heterosexual transmission of HIV to non-drug users has also been documented with regard to regular partners, casual encounters, and as a result of sex for money exchanges involving drug injectors.

Studies on the response of drug injectors to the AIDS epidemic, however, suggest that drug injectors are less likely to modify their patterns of sexual behaviour than they are drug injecting practices. Patterns of sexual activity including multiple partners and the consistent use of condoms with casual and regular partners appear more resistant to change than sterilising of injecting equipment and non-needle sharing.

These findings highlight the urgent need to emphasise HIV sexual transmission initiatives among and from drug injectors. They also highlight the inherent problems involved in modification of sexual behaviour especially when associated with risk taking. Information, education, counselling, and other innovative approaches are needed for risk reduction among sexually active drug injectors.

W.D.0.9 IMPACT OF IMPROVED NEEDLE ACCESSIBILITY ON DRUG USE PATTERNS AND DEMAND FOR TREATMENT

Coutinho, Roel A. Municipal Health Service, Amsterdam, The Netherlands.

W.D.0.10 THE PREVENTION MESSAGE: AIDS AND INITIATION INTO DRUG INJECTION

Des Jarlais, Don C.*; Casriel, C.**; Friedman, S.R. **; Rosenblum, A. **; Frank, B.***; Khouri, E.****et al.
*Beth Israel Medical Center, New York, N.Y., U.S.A., **Narcotic and Drug Research, Inc., New York, N.Y., U.S.A., ***New York State Division of Substance Abuse Services, New York, N.Y., U.S.A., ****New York Hospital, New York, N.Y., U.S.A.

Objective: To assess the impact of the AIDS epidemic in New York on recruitment into IV drug use. In particular, does fear of AIDS prevent persons from starting to inject drugs.

Methods: New York City is an excellent location for assessing effects of the AIDS epidemic on recruitment into illicit drug injecting. There have been over 7000 cases of AIDS among IV drug users, and knowledge that drug injection carries a risk of AIDS has been widespread in the city since at least 1984. Intranasal use of cocaine and heroin, and smoking of cocaine (crack) are readily available alternatives to illicit drug injection. A variety of methods were used to assess possible reductions in initiation into IV drug use: data on persons entering drug abuse treatment programs, observational data from street outreach workers, and a cohort study of persons who were using heroin intranasally.

Results: The available data do not support a conclusion that the AIDS epidemic has led to a decrease in the number of new IV drug users in the city. Smoking of cocaine/crack has not replaced injection of cocaine. Street workers report that it is easy to make contacts with new drug injectors. In the cohort study of persons using heroin intranasally, over 20% went on to injecting within the 8 month follow-up.

Conclusion: In previous research, "scare" tactics have not been effective in preventing persons from starting to use illicit drugs. The same appears to hold for AIDS and injecting illicit drugs. The long time frame from initiation into drug injection until possible development of AIDS, and the social networks within which drug injection starts, appear capable of neutralizing deterrent effects of AIDS on illicit drug injection.

W.D.0.11 AIDS AMONG DRUG USERS IN DEVELOPING COUNTRIES: THE THAI EXPERIENCE

Sakuntanaga, Pratlon. Bangkok, Thailand.

Les femmes dans les pays industrialisés : Questions et options
Women in Developed Countries: Issues and Options

W.D.O.12

Women Injection Drug Users: Issues and Strategies Experiences in New York City - ADAPT
Serrano, Yolanda*; Johnson, P.
*Association for Drug Abuse Prevention and Treatment, Inc.

Objective. To describe the issues and strategies intravenous drug using women encounter in their attempt to reduce risk of HIV infection to themselves, their sexual partners and their children. To examine risk taking lifestyles, needle sharing and sexual behavior, attitudes and beliefs.
Methods. Data was collected through a variety of ways; First, through direct observation and educational intervention of intravenous drug using women, in specific high drug trafficking areas in the City of New York, over a four year period. The women were observed by teams of Ex-users outreach workers and workers referred to as facilitators. Most women were primary opiate injectors using heroin as their main drug, but also injected cocaine and smoked crack. Entrance was made into the women's informal networks (via street corners, shooting galleries, crack houses, shelters, "strolls",). Rapport was established, through incentives, ie. kits containing daily living items such as toothbrush and toothpaste, underwear, condoms), bleach kits, movies, dinners, manicure/facial sessions and provided them with intensive street level AIDS prevention and risk reduction skills (cleaning needle and syringes and proper condom use). Second, by working with addicted women (The Invisible Women), who are forced to engage in "Survival Sex" (sex for drugs) to maintain their drug habit. These women were approached in their environment, the street, the "stroll", the drop in storefront, in cars and other areas. A questionnaire was applied to a group of the women as well as a condom survey to determine the number of clients served and the number of condoms used per day.
Results. The mechanism available to IV drug using women to support their drug habits are limited. They must engage in survival sex to procure money for drugs, resulting in unsafe sexual behavior. Addicted women rarely seeking counseling, do not plan pregnancies, have no regular medical doctor, rely on our emergency rooms for medical treatment, many do not engage in birth control, most do not realize they are pregnant until the fourth or fifth month of pregnancy, restricting the options available to them and delaying pre-natal care.
Conclusion. Through community organization women IV drug users can be motivated to modify their behavior. Appropriate strategies for interventions and reaching women who are IV injectors who are not in touch with other services is a major problem in trying to curb the spread of HIV among IV drug using women. In summary, the evidence appears to be that addicted women are in dire need of specific interventions that will allow them to survive the HIV epidemic. This will involve massive street outreach in their particular environment by individuals who are knowledgeable about their lifestyles.

W.D.O.15

PSYCHOSOCIAL FACTORS THAT HINDER HEALTH CARE IN HIV-INFECTED WOMEN. Ribble, Denise; Bellevue Hospital/ Community Health Project; NY, NY, USA.

At the Community Health Project, a primary care HIV/AIDS clinic, it has been our impression that women experience difficulties in entrance into care and follow-up services. As a result of this observation, we conducted interviews with women to ascertain what some of these difficulties were. Material gathered from these interviews suggested that psychosocial factors hindered care in women. Women cited as hindrances lack of awareness of risk, lack of knowledge about health care resources, lack of knowledge about accessing treatment protocols, caretaker roles, lack of transportation to health care and lack of childcare. Women more often stated concerns about partners refusing safer sex and anticipated illness and death. Women stated concerns about employment, financial resources and stress as did men.

Publications by Fischl and Harder have suggested that women present with more advanced disease than men. Since it is possible that the psychosocial issues outlined above contribute in part or significantly to the presentation of more advanced disease, it raises serious questions on whether our models of clinical care, which were largely develped for gay male populations can adequately address the special needs of women patients.

W.D.O.16

ACCESS TO SERVICES FOR WOMEN WITH AIDS IN POOR MINORITY COMMUNITIES
Melinda Cuthbert. Yale University, USA.

Objective. To conduct an organizational assessment of services for women with AIDS in New York City, 84% of whom are Black or Hispanic.
Methods. Data was gathered in structured interviews with 60 key respondents from 33 government, voluntary and community based organizations. Data was collected regarding the administrative structure and programs, and their relationship with other organizations in their organizational network.
Results. Four factors limit the access of women with AIDS to services. First, most poor minority women are outside the information networks about AIDS services and research projects. Second, the provision of AIDS services has been centered around hospitals and most poor women are limited in access to public hospitals which are overextended and underfunded. Third, due to a shortage of primary care physicians who accept medicaid, these women often utilize emergency rooms for primary care. Fourth, advocates for these women have received little government funding, and faced difficulty utilising networks in minority communities to mobilize community based resources and support.
Conclusion. Community based services form the backbone of AIDS service delivery in the U.S. Limited funding and competing community priorities has prevented the development of a community based infrastructure to service women with AIDS.

Consommateurs de drogues par voie intraveineuse (partie 1)
Injection Drug Users (Part 1)

Th.D.0.1

WHAT THAI INTRAVENOUS DRUG ABUSERS (IVDA) SAY ABOUT THEIR BELIEFS AND BEHAVIOR:REPORT OF A SERIES OF FOCUS GROUP DISCUSSIONS.W.Pokapanichwong*,D.Douglas*, N.Wright**,S.Vanichseni***,K.Choopanya***,*Prog.Approp.Tech.Hlth., **Div.Epid.,Min.Pub.Hlth.,***Bangkok Metropolitan Admin.,Thailand.

Objective. To develop qualitative information on IVDA's knowledge and attitude toward AIDS and their sexual and drug use behaviors. Methods. Focus group discussions were conducted with 235 volunteer IVDA(94% male)from 6 detoxification clinics.Respondents were given token compensation for their participation.For about 1-2 hours, moderators encouraged a free exchange of views organized around a discussion guide.A notetaker recorded verbal and non-verbal reactions.
Results. A rich store of anecdotal responses and reactions documents that Thai IVDA believe that AIDS is transmitted mainly by sexual contact,and that AIDS carriers can be identified by outward appearance and symptoms.Many respondents felt that stopping the sharing of injection equipment(a widespread practice)is less important in preventing AIDS than avoiding close contact.Injection equipment is rarely cleaned adequately,and the use of condoms is not favored by those who remain sexually active.
Conclusion. An intervention program giving accurate information on the transmission and natural history of AIDS,and the risk of equipment sharing and appropriate cleaning is needed urgently.More persuasive condom education also is necessary to help reduce sexual transmission from the more than 44% of male IVDA already HIV+.

Th.D.0.3

EFFECTS OF CHANGES IN DRUGS INJECTED ON DRUG USING ENVIRONMENTS AND ON RISK REDUCTION AMONG IV USERS
Friedman, Samuel R*; Sterk, C.*; Sufian, M.*; Des Jarlais, D.C.**
*Narcotic and Drug Research, Inc., New York; **New York State Division of Substance Abuse, U.S.A.

Objectives. To determine how increases in cocaine injection affect the environments in which drugs are used and AIDS risk behavior.
Method. Data were gathered through ethnographic observation of 125 active IV drug users in six "shooting galleries" in New York City. In-depth interviews were done with 35 of them. Comparisons were made between those injecting heroin only; cocaine only; and those injecting both drugs in a combination (speedball) or sequentially. Data were also gathered about changes in drugs injected over time and in injection practices in shooting galleries.
Results. Speedballing and cocaine injection are becoming increasingly popular, and the injection of heroin alone has become less prevalent. Since use of different substances engenders different moods, tensions arise that make it difficult to be in the same environment. Thus, different types of shooting galleries are developing: (1) galleries where the primary drug is heroin; (2) galleries for cocaine users and speedball injectors. Interpersonal tension is much higher among cocaine and (frequent) speedball injectors, so heroin users and incidental speedball injectors avoid cocaine galleries. AIDS risk behaviors differ among these groups: cocaine and speedball users often inject many more times a day than heroin users, have more difficulty in remembering who owns which syringe, and find consistent bleach use to decontaminate equipment more difficult.
Conclusion. Field observation can be very useful in assessing how changes in drug scenes affect the value of interventions. Strategies such as bleach use as a decontaminant need to be modified for cocaine injecting environments. If these strategies to encourage bleach use among cocaine injectors fail, then large scale increases in the availability of syringes may be necessary.

Th.D.0.5

METHADONE MAINTENANCE AND BEHAVIOR CHANGE IN SEROPOSITIVE DRUG ABUSERS: THE SAN FRANCISCO GENERAL HOSPITAL PROGRAM FOR AIDS COUNSELING AND EDUCATION (PACE)
Sorensen, James L; Batki, SL; Gibson, DR; Dumontet, R; Purnell, S.
Center for AIDS Prevention Studies, UC San Francisco, CA, USA

Objective. To analyze the impact of methadone maintenance (MM) on needle use and sexual activity of seropositive drug abusers in a San Francisco program.
Methods. In an ongoing prospective study, 42 seropositive drug abusers were assessed before entering PACE and at 3-month and 12-month interviews to understand behavior changes associated with MM. Self-report measures were supplemented with physical exams for puncture marks and weekly drug screens.
Results. Heroin use decreased from a mean of 28 days in a month before PACE admission to 7 days in a month before the 3-month interview (p=.001), as did the number of days injecting drugs (p=.001) and cocaine use to a lesser degree (p=.02). Those using needles reported cleaning them with alcohol or bleach 68% of the time. Interviews at 12 months were similar to the 3-month results. Drug and puncture mark exams corroborated the reductions in drug use but indicated smaller decreases than subjects' self-reports. Vaginal intercourse was the most frequent sexual activity, and it decreased by the 3-month interview (p=.04). Subjects used condoms about half the time in vaginal or anal intercourse.
Conclusions. Seropositive opiate addicts reduce their drug use early in MM treatment but make less dramatic changes in sexual behaviors. MM for seropositive drug abusers merits further exploration as a public health intervention.

Th.D.0.2

TEMPORAL PATTERNS OF COCAINE USE AND AIDS IN INTRAVENOUS DRUG USERS IN METHADONE MAINTENANCE (MM). Hartel Diana, Schoenbaum EE, Selwyn PA, Drucker E, Wasserman W, Friedland GH, et al. Montefiore Medical Center/Albert Einstein College of Medicine Bronx., New York, USA.

Objective. To examine the relationship of IV cocaine use over time to HIV infection and AIDS among methadone maintenance (MM) patients in the Bronx, NYC.
Methods. Demography, urine toxicology results and AIDS mortality were examined in 2242 patients in MM treatment from 1972-1988. Drug history, HIV seroprevalence and AIDS incidence were gathered prospectively in 701/2242 beginning in 1985. Data were analyzed using Cox proportional hazards models and log-linear trend models.
Results. Cocaine detection in urine samples increased from 24% of patients in 1981 to 67% of patients by 1988. Polydrug use increased in parallel but no single drug other than cocaine corresponded to this pattern. Cocaine use was associated with dropout from MM (p<.05) and continuing IV injection (P<.05) and was higher in blacks (80%) and Hispanics (72%) than whites (53%) by 1988 (p<.02). Patients enrolled in MM prior to 1981 (early cohort) used less cocaine throughout the study but a significant % changed habits to more closely resemble groups entering MM after 1981 (late cohort). In 1981 18% of the early cohort used cocaine vs. 30% of new 1981 entrants whereas by 1988 59% of the early cohort were using cocaine as were 63% of the late cohort. As of 1988 AIDS incidence in the early cohort lagged behind the late cohort, 8/1000 person-yrs. vs. 21/1000 person-yrs. (p<.001) but seroprevalence in the early cohort (30%) approached that of the late cohort (44%), p<.05.
Conclusions. Temporal patterns of cocaine use among intravenous drug users in MM have substantially increased and are associated with continuing IV injection, race, treatment dropout and increasing rates of AIDS. Treatment stategies and AIDS prevention must focus on cocaine use.

Th.D.0.4

ENDOCARDITIS, SUBCUTANEOUS ABSCESSES, AND OTHER BACTERIAL INFECTIONS IN INTRAVENOUS DRUG USERS AND THEIR ASSOCIATION WITH SKIN-CLEANING AT DRUG INJECTION SITES
Herb, F.*; Watters, John K.* **; Case, P.**; and Petitti, D.*.
*University of California, San Francisco, California, U.S.A., **Urban Health Study, San Francisco, California, U.S.A.

Objective. To examine the relationship between skin cleaning at drug injection sites and history of prior episodes of endocarditis, subcutaneous abscesses, and hospitalizations for other bacterial infections.
Methods. Subjects (N=110) were active intravenous drug users (IVDUs) recruited at an inner-city field site in San Francisco's Mission District using a modified chain-referral method. A standardized interview including questions on skin cleaning, injection practices and medical history was conducted.
Results. 44% reported cleaning injection sites at least part of the time (n=48). 10% had prior history of endocarditis (n=11). Risk of endocarditis among those who never cleaned injection sites was higher than for those that did (O.R.=3.9, 95% C.I.=0.72, 23.9). 38% of the sample had prior history of subcutaneous abscess (n=42). History of subcutaneous abscess was higher among those who reported never cleaning injection sites (O.R. 2.8,95%C.I. 1.1,7.0). Hospitalization for other bacterial infection was slightly lower for injection site cleaners than non-cleaners (21% vs. 24%). Women had a higher risk than men of having at least one abscess regardless of injection site cleaning behaviors (O.R. 3.8,95%C.I. 1.5,9.6). Higher risk for women was also reported in hospitalizations for other ingections (O.R. 2.695%C.I. 1.1,6.6). Whites were more likely than blacks to have history of abscess (O.R. 3.6,95%C.I. 1.1,11.9).
Conclusion. Our data suggest that skin cleaning at injection sites may help prevent a variety of bacterial infections in IVDUs. Moreover, female IVDUs may have fewer usable injection sites than men. When these sites are frequently used, risk of infection is increased due to greater exposure to bacteria. Skin-cleaning guidelines should be incorporated into injection hygiene messages disseminated by health education, drug treatment programs, and health professionals. This may be particularly important for HIV infected persons due to associated immunosuppression and increased susceptibility to bacterial infections. A substantial proportion of IVDUs in our study (44%) report at least occasional skin cleaning at injection sites suggesting that this is a behavior which can be promoted with some success.

Th.D.0.6

INTRAVENOUS DRUG USERS AND MAINTENANCE OF BEHAVIOR CHANGE
Don C. Des Jarlais*, Tross, S.**, Abdul-Quader, A.**, Kouzi, A.**, Friedman, S.R.**.*New York State Div. of Substance Abuse Services, New York, NY, U.S., **Narcotic and Drug Research, Inc., New York, NY, U.S.

Objective. To identify the predictors of maintenance of behavior change among intravenous drug users. Historically, obtaining behavior change has been relatively easy for IV drug uses, but relapse to previous behavior has occurred in up to 90% of various groups studied.
Methods. 401 IV drug users recruited by outreach workers in the lower east side of Manhattan were interviewed on AIDS risk activity, behavior changes, and components of the health belief model. Regression analyses were used to identify determinants of maintaining behavior change.
Results. 317 subjects reported reducing their risk of developing AIDS by changes in their drug use and/or sexual behavior. 203 (64%) of these subjects reported maintaining the change(s) completely, while 114 (36%) relapsed. Determinants of maintaining drug injection risk reduction and sexual risk reduction were similar, so both types of risk reduction were combined in the analyses. Ethnicity (being Hispanic), having a greater number of sexual partners, and believing that the behavior change would successfully protect against HIV infection (the efficacy component of the health belief model) were all associated with maintenance of behavior change (p's<.05). No differences in maintaining behavior change were found for gender, being in drug abuse treatment, or having friends who made behavior changes.
Conclusion. Over a third of the subjects who reported that they had changed their behavior because of AIDS also reported that they had not maintained AIDS risk reduction. Since social desirability would lead subjects to over report maintenance of behavior change, this one third must be considered a minimum estimate of relapse from risk reduction. Ethnic differences in AIDS risk reduction among IV drug users have been reported previously, though they are not yet well understood. That a greater number of sexual partner was related to maintaining behavior change suggests that those with the greatest need to change behavior were having more success at maintenance and also that changing behavior within a long term dyad is relatively difficult. The efficacy finding indicates the need not only to educate IV drug users on how to change behavior, but also to realistically convince them that the behavior change will be effective in preserving health.

Prostitution
Prostitution

Th.D.0.7 THE IMPACT OF AN EDUCATIONAL PROGRAM ON HIV INFECTION AMONG PROSTITUTES.

James R. Foreit**; A. Tejada*; J. Alarcon*; J. Piscoya*, and L. Varela**.
*Universidad Nacional Mayor de San Marcos, Lima, Peru.
**The Population Council, Lima, Peru.

Objective. To determine the impact of a reproductive health program on the prevention of AIDS among registered prostitutes in El Callao, Peru.
Methods. A reproductive health program with an educational component was implemented in a STD clinic serving almost 800 prostitutes. The program's impact is being evaluated through succesive surveys, program participation, changes in condom use and lab tests to detect serconversion to HIV and infection with other STD's.
Results. To date 783 women have participated in program activities, 483 of them consistently. In the average every woman has attended 4 educational sessions. Changes in attitudes towards condoms have taken place. For instance, higher fees for sex when condoms are used are no longer charged, and condoms are now used in oral sex. More women participating in the program know the correct use of condoms (77% VS 22% among those not participating). The demand for condoms has increased from 1,010 in August 1988 to 32,445 in December of 1988. HIV infection has remained low with two seroconversion between April and November of 1988. In the same period prevalence of gonorrhea decreased from 2.7% to 0.17% and candida infections from 8% to 3%.
Conclusions. The program has had an impact on the sexual behavior of prostitutes, reflected mainly in an increased demand for condoms, low and stable HIV seroconversion risk, and reduction of gonorrhea and candida infection.

Th.D.0.9 WOMEN WORKING AS PROSTITUTES: PARTICIPATORY/CONSENSUS-BASED PLANNING FOR PROVISION OF MOBILE PREVENTION, RISK REDUCTION, AND SEROPREVALENCE ACTIVITIES

Stephens, P. Clay; Hayes, B.J.; Adams, R.; Gross, M.;
AIDS Office, Massachusetts Department of Public Health, Boston, MA USA. 02111

Problem: Provision of educational and risk reduction services and seroprevalence studies within the community of women working as prostitutes raises ethical, scientific, and political concerns. Women in general and sex workers in specific have little trust in the "good intentions" of outsiders. Public Health Departments (PHD's) and community-based organizations (CBO's) often lack credibility with prostitutes. Client distrust may lead to difficulty in reaching target populations, low utilisation, and biased outcome.
Model: Participatory/consensus-based planning minimises conflict and increases cooperation among clients, project staff, and funding agent.
Application: The AIDS Office of MDPH received funding from CDC for a mobile outreach, education, and risk reduction project for women working as prostitutes to be conducted by a CBO at two sites. Consensus groups were formed consisting of AIDS/IVDU service providers and women sex workers. Meeting jointly and separately, the groups seek consensus on program design and procedures, sites, hours of operation, and staffing. The providers and the AO staff seek consensus concerning contractual obligations and political concerns.
Conclusion: The participatory/consensus model offers an alternative to traditional planning and design. This model insures clients a strong voice; CBO's input into issues of local concern; resolution of criminal justice issues; and increased access to technical support and funding. In partnership, this model meets most needs without sacrifice of client anonymity, ethical considerations, or scientific quality.

Th.D.0.11 EVALUATION OF KEY MESSAGES TO INCREASE THE USE OF CONDOM IN SEX WORKERS. A QUASI-EXPERIMENTAL STUDY.

Valdespino José*, Izazola J.A.*, Sepúlveda J.*, Ramah M.**, Garcia L.*
*General Directorate of Epidemiology, Ministry of Health. Mexico.
**AIDSCOM

Objective.- To identify and evaluate key messages and channels of distribution of educational strategies in prostitutes in Mexico to rapidly increase the use of condoms.
Methodology: The study took place in Tijuana, Mexico (border city with California, USA) where approximately 15,000 prostitutes live. A randomly selected survey was undertaken, which investigated sociodemographic characteristics, sexual practices, use of condom and attitudes; a blood sample for HIV-1 was also drawn. Upon the data of the survey, key messages and adequate channels of distribution were identified. Educational material (tryptics, posters, and comics) was pre-evaluated through focal studies with prostitutes. The final material was distributed to 15,000 prostitutes, with their active participation. Six months after the first survey, a second survey in a random sample was undertaken to evaluate changes.
Results. Women under study have an average age of 27 years, with a second grade elementary school level, 88% have children, no IVD use was reported, 97% are afraid of acquiring AIDS, and only 48% used condoms. The image of themselves is as: attractive women, prostitutes for social reasons and mothers worried for their children's health. Key messages were: 1)HIV is a STD; 2) Condom prevents infection; 3) When avoiding sexual transmission, perinatal transmission is prevented; 4) Prostitutes who use condoms are responsible mothers. The use of condom increased 69% ($p<0.05$) after 6 months; its use was associated to the messages received through the educational material. Seroprevalence of infection by HIV-1 was <1.0% in both serosurveys.
Conclusion: The identification of adequate key messages and channels of distribution improves the efficiency of educational programs of AIDS on female sex workers. This strategy must be evaluated in an educational program for prostitute clients.

Th.D.0.8 YOUNG MALE PROSTITUTES: SAFE AND UNSAFE SEX AND AIDS KNOWLEDGE

Pleak, Richard R. and Meyer-Bahlburg, H.F.L.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University. New York, New York, United States.

Objective. To assess sexual behavior and AIDS awareness in young male prostitutes, a group at potentially great risk for acquiring and disseminating infection with the etiologic agent of AIDS.
Methods. 50 New York male prostitutes (for men), aged 14-27, were recruited in their operating locales (streets or bars and theaters) and systematically interviewed for 2.5 hours using semi-structured instruments to assess demographics, detailed sexual behavior, and knowledge and attitudes about AIDS/HIV.
Results. Preliminary results show an average age of 20.7 years. In erotic fantasy, 50% were predominately homosexual, 20% bisexual, and 30% predominately heterosexual. Only one reported being HIV antibody positive. The subjects' sexual behavior with their male customers for pay included rates of condom use of 50% with fellatio and 85% with anal intercourse. With their non-paying male partners these rates fell to 20% with fellatio and 55% with anal intercourse, and fell further with their (non-paying) female partners to 2% with fellatio and 12% with vaginal intercourse. The safety of their sexual behavior did not appear to be related to their knowledge and awareness of AIDS/HIV, which was quite high overall. Differences between the street and the bar/theater hustlers exist, with street hustlers being younger, less knowledgable about AIDS/HIV, less likely to use condoms with women, and more likely to use drugs.
Conclusion. Male prostitutes' sexual behavior is safest (use of condoms, abstinence from cert higher-risk activities) with their male customers, where perceived threat is highest, and most unsafe with female partners where perceived threat is lowest. Knowledge of AIDS, while quite high, appears unrelated to safeness of sexual behavior.

Th.D.0.10 THE AGGLUTINATING APPROACH TO JOINT STD/AIDS PREVENTION AND CONTROL IN FEMALE SEX WORKERS IN THE DOMINICAN REPUBLIC

Rosario, S; Guerrero, Ernesto; De Moya, E.A; Vólquez, C; Alcántara, R.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To describe and analyze the conceptual approach to STD/AIDS prevention in Dominican female sex workers (FSW), as well as the detection, diagnosis and treatment strategies and their results from 1987 to mid 1989.
Methods. On the basis of an agglutinating approach that incorporates FSW leaders elected by their peers to the National Struggle against AIDS, sex workers receive educational preventive training, at-cost monthly physical exams, laboratory tests and treatment for STD, in 12 new sentinnel posts in the Dominican Republic. FSW receive 30 condoms gratis in each visit.
Results. As of December 1988, 22,000 medical exams have been delivered to 5,000 FSW; 12% have been treated for syphillis and 10% for gonorrhoea. Out of 3,000 voluntary HIV tests, 2.6% have been seropositive.
Conclusion. Aggressive control of genital ulcer disease (GUD) through joint peer/professional intervention provides an unique opportunity for educating sex workers, detecting STD at an early stage, treating these diseases opportunely, and reducing the risk of HIV infection.

Th.D.0.12 THE DEVELOPMENT OF MICRO-ENTERPRISES AS WORK ALTERNATIVES FOR FEMALE SEX WORKERS IN THE DOMINICAN REPUBLIC

Abenia, M.C; Rosario, S; Guerrero, Ernesto; De Moya, E.A.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To describe the approach to HIV seropositive female sex workers' (FSW) counselling and provision of training for profitable work alternatives through the Ministry of Public Health and a specialized Catholic Congregation of nuns.
Methods. FSW who voluntarily demand HIV testing and result seropositive are offered counselling services by State psychólogists, who refer these women to the "Hermanas Adoratrices", an international Catholic Congregation of nuns specialized in developing work alternatives for female sex workers.

Results. From the start of this program in 1988, 56 HIV positive FSW have been enrolled for psychological counselling, social support, and training for low risk work alternatives. Twenty-one of them have been able to support themselves and their children without resuming sex work.

Conclusion. HIV seropositive FSW in the Dominican Republic, when provided with appropriate professional counselling, social support and technical training have developed work alternatives capable of providing an income to support themselves and their children without resorting to sex work.

Consommateurs de drogues par voie intraveineuse (partie 2)
Injection Drug Users (Part 2)

Th.D.0.13 DRUG USE TRENDS AMONG PARTICIPANTS IN THE TACOMA SYRINGE EXCHANGE

Holly Hagan*, D.C. Des Jarlais**, D. Purchase***, T. Reid*, S. R. Friedman****.
*Tacoma Pierce County Health Dept, Tacoma, WA, **New York State Division of Substance Abuse Services, New York, NY,***Point Defiance AIDS Project, Tacoma, WA,****Narcotic and Drug Research, Inc., New York, NY.,U.S.A.

OBJECTIVE To examine the relationship between frequency of drug use and participation in a syringe exchange (SE). One of the arguments against SE programs has been that they will promote drug abuse and that the availability of equipment will cause injecting drug users to inject more often. METHODS Retrospective data were collected regarding drug injection frequency on 46 randomly selected SE users, using a standardized interview. Comparisons between the time periods just prior to first using the SE (PRE-SE), and since starting to use the SE (POST-SE) are reported as mean numbers of times each drug was used per month.
RESULTS The majority of participants had been using the SE for 3 months. T-tests show no differences in the frequencies of injection of heroin and cocaine together (PRE-SE 56, POST-SE 69, $p=0.2$), heroin (PRE-SE 56, POST-SE 53, $p=0.3$), cocaine (PRE-SE 45, POST-SE 48, $p=0.5$), or amphetamines (PRE-SE 3.3, POST-SE 3.7, $p=0.4$). Looking at drug use that did not involve injection, no changes were noted in the rate of sniffing heroin (PRE-SE 0.01, POST-SE 0.3), sniffing cocaine (PRE-SE 0.3, POST-SE 0.4), smoking crack (PRE-SE 9.2, POST-SE 9.9), or in the use of non-prescription methadone or marijuana (all $p > 0.2$). Overall, 50% of SE users report injecting less, 15% the same and 35% inject more frequently since using the exchange. The mean age of SE users is 33, and 4 (9%) first injected drugs less than 2 yrs ago, 11% 2-5 yrs ago, and 80% first injected more than 5 yrs ago. No subjects had begun injecting during the time since the SE began.
DISCUSSION Clearly, the majority of SE users have a long history of drug use, and the availability of clean equipment is not recruiting individuals into intravenous use. No immediate effects can be found on the frequency of use of injected or non-injected drugs. The finding that more SE users decreased than increased drug injection is consistent with earlier data from the same and other SE programs, but long-term study is needed to determine trends in drug use with prolonged SE use.

Th.D.0.15 REDUCING HIV TRANSMISSION AMONG RECOVERING FEMALE DRUG USERS

Schilling, Robert*; El-Bassel, N.*; Gordon, K.**; and Nichols, S.***.
*Columbia University School of Social Work, New York City, U.S.A. **Albert Einstein Medical College, Bronx, New York, U.S.A. ***Beth Israel Medical Center, New York City, U.S.A.

Objective: To study the effects of a skills-building approach to reducing risks of HIV transmission among recovering IV drug users. Methods: Drawing on extant research and findings of an earlier descriptive study, the authors developed a multi-session group approach to reducing high risk behavior among a cohort of 83 methadone maintained women enrolled in New York City area clinics. A controlled trial carried out by social workers in drug treatment settings involved random assignment to information-only and skills-building conditions. Results: Outcome analyses demonstrated that participants in an information-only condition regularly available in the clinics made fewer gains than skills-building participants in behavior related to HIV transmission. Participants in the skills-building condition were significantly more likely to carry condoms, talk about and initiate discussions around safer sex, and feel comfortable talking about discussing safer sex. From pretest to posttest, skills-building participants reported significant decreases in sex with IV drug users. Discussion: As follow-up data have not yet been collected, these modest preliminary findings must be viewed with a degree of caution. Nevertheless, reported outcomes lend support to the viability of skills-building strategies to reduce relapse and AIDS risks associated with sexual activity and drug use.

Th.D.0.17 HIV IN PRISONS. A DISCRIPTION AND EVALUATION OF A PROJECT DESIGNED SPECIFICALLY FOR WORK WITH IVDA'S IN PRISON.

Ragnar Kverness, Randi Ervik, Marit Skogstad, Sylvia Svensen
Finn Jensen, Dep. of Aids Prevention, Oslo City Health and Environment Dep.
NORWAY

OBJECTIVES: IVDU's constitute a large proportion of the prison population in Norwegian prisons. There is a need for new methods in preventive and supportive work among this group. In august 1987 the Department of Aids Prevention employed a doctor, a psychologist, a registered nurse and a pedagogue, two of them with previous experience from work in prisons, in a project to answer the following: - How do you give adequate information? - Under what circumstances can change of risk behaviour take place? - How do you give adequate psycho-social support in a prison? -How you best run support groups in a prison? The project works in the four prisons in the Oslo area, with a total of 780 inmates.
METHODS: The project is, and is percieved by the inmates as, independent of the regular health service and authorities of the prisons, and information received from the inmates is kept confidential. Notwithstanding this separation from the prison system, contact with, and education of, prison employees has been an essential part of the work. The methods employed with the IVDA's are: - Individual counselling, psychological support and medical examinations - Counselling of the inmates' sexual partners - Support groups where former IVDA's take part as paid leaders - Information meetings. The methods are continuously evaluated, and the activities give in themselves knowledge about the "anthropology of prison life".
RESULTS: The project has been in contact with 48 hiv positive inmates. This constitutes 20% of the registered hiv positive IVDA's in Norway. A qualitative evaluation of the methods used will be presented in the paper.

Th.D.0.14 THE PREVALENCE OF HIGH RISK SEXUAL BEHAVIOR IN MALE HETEROSEXUAL IV DRUG USERS

Lewis, Diane K.*; Watters, J.K.** ***; Case, P.***.
*University of California, Santa Cruz, California, U.S.A., **University of California, San Francisco, California, U.S.A., ***Urban Health Study, San Francisco, California, U.S.A.

Objective. To determine the prevalence of high risk sexual behavior in male intravenous drug users (IVDUs) with regular female sexual partners.
Methods. One hundred forty-nine IVDUs (70 whites and 79 blacks) with stable partners were interviewed in early 1987.
Results. During the previous year, 63% had more than 1 female partner and 31% had 4 or more female partners. The median number of female sexual partners was 3 for whites and 2 for blacks. Eleven percent (16/149) had sexual contact with males, with no significant difference between whites and blacks (7% or 5/70 vs. 14% or 11/79, respectively, $P=.14$). Heterosexual anal intercourse was reported by 38% (56/149), with whites more likely than blacks to report this behavior, i.e. 46% (32/70) vs. 30% (24/79) respectively ($P=.04$). Reports of never using condoms were given by 73% (108/148), a proportion similar for the 2 groups of men. Of the 128 men who reported whether their steady female partners injected drugs, 40% (51/128) said their partners were not IVDUs. Blacks were more likely than whites to have non-drug injecting sexual partners, i.e. 54% (37/68) vs. 23% (14/60) ($P<.001$). Blacks were also more likely than whites to report no enrollment in drug treatment programs during the previous 5 years, i.e. 49% (39/79) vs. 20% (14/70) ($P<.01$).
Conclusion. This study demonstrates that educational outreach programs in sexual risk reduction are urgently needed for both IVDUs and their sexual partners. The need for culturally relevant programs is particularly important for black IVDUs and their sexual partners in San Francisco.

Th.D.0.16 IMPACT OF AIDS ON MORBIDITY AND MORTALITY AMONG INTRAVENOUS DRUG USERS (IVDU) IN A METHADONE MAINTENANCE TREATMENT PROGRAM (MMTP)

Selwyn,Peter A; Hartel,D; Wasserman,W; Drucker,E.
Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, NY, USA.

Objective. To examine the impact of the AIDS epidemic on morbidity and mortality in a defined population of IVDU's in a longterm outpatient MMTP in New York City.
Methods. We studied trends in overall and cause-specific death rates, AIDS incidence, and medical hospitalizations among IVDU's in a Bronx MMTP for 1984-1987. The midyear population each year was used to calculate crude incidence; incidence rates were also derived by person-time analysis. Outcomes were identified by active surveillance and confirmed by review of hospital and autopsy records.
Results. The midyear population each year ranged from 828 to 891; median age of the entire population as of 1/1/84 was 32 yrs. Population demographics did not differ between study years. Total deaths increased from 13.3/1000 in 1984 to 44.2/1000 in 1987 ($P=.0001$). Deaths from AIDS increased from 3.6 to 14.7/1000 ($P=.009$), and deaths from bacterial pneumonia/sepsis from 3.6/1000 to 13.6 ($P=.018$). Deaths from cirrhosis, overdose, trauma and other causes showed non-significant or no increases over the four years. AIDS incidence rose from 6/1000 in 1984 to 20.4/1000 in 1987 ($P=.007$). Person-time analysis yielded similar results. Hospitalizations for AIDS, pneumonia, tuberculosis, and endocarditis/sepsis increased from 84.9/1000 in 1986 to 144.8/1000 in 1987, with minimal or no increase in other diagnostic categories.
Conclusion. Results indicate that AIDS has had a profound impact on morbidity and mortality among IVDU's in our MMTP, reflected not only in AIDS diagnoses but also in secondary bacterial infections. Data suggest that MMTP's may be important sites for targeting clinical services for HIV-infected IVDU's, which will require expansion of existing resources to meet the growing need for AIDS-related care.

Th.D.0.18 AIDS PREVENTION THROUGH THE CRIMINAL JUSTICE SYSTEM (CJS): REFERRAL OF INTRAVENOUS DRUG ABUSERS (IVDAs) TO DRUG ABUSE TREATMENT

Leukefeld, Carl; Battjes, Robert; Pickens, R.
National Institute on Drug Abuse, Rockville, MD, USA

Objective. To explore the potential contribution of the CJS to AIDS prevention through referral of IVDAs to drug abuse treatment.
Methods. Data from a recent study of IVDAs admitted to methadone treatment were examined, criminal justice and drug abuse treatment literature were reviewed, and relevant experts were contacted.
Results. Drug abuse treatment has proven effective in helping IVDAs stop drug injection, and, thus, is an important AIDS prevention strategy. Yet, only 1 in 7 IVDAs in the US is in treatment. The CJS provides access to encourage IVDAs to enter treatment. A national study found that approximately 80% of all arrestees had used illicit drugs at arrest. Rates of CJS involvement among IVDAs are high. Yet, only about 20% of IVDAs in treatment were CJS-referred. A study of treatment admissions in 5 cities found that 22.1% were CJS-involved, with rates of involvement ranging from 9.5% in New York City to 37.6% in San Antonio, TX. HIV infection rates within each city were similar for CJS-involved treatment admissions and those with no current CJS involvement, suggesting similar risks for HIV infection.
Conclusion. The CJS provides ready access to large numbers of IVDAs for treatment referral and other AIDS prevention programs. Yet, this resource is underutilised. Potential for expansion of treatment referral initiatives is high, especially in cities such as New York where HIV rates are high and CJS-involvement is low.

M.D.P.1

HIV INFECTION IN DISADVANTAGED ADOLESCENTS IN THE U.S: FINDINGS FROM THE JOB CORPS SCREENING PROGRAM

St. Louis, Michael E.*; Hayman, CR**; Miller, C**; Anderson, JE*, Petersen, LR*; Dondero, TJ*. *Centers for Disease Control, Atlanta, Georgia, and **Office of Job Corps, Dept. of Labor, Washington, D.C., USA.

Objective: To evaluate the distribution of HIV infection in a nation-wide sample of socioeconomically disadvantaged adolescents.
Methods: Review of findings from HIV-1 screening of entrants into the Job Corps. Standardization of seroprevalence rates from Job Corps and military recruits according to age, sex, and race composition of the U.S. population.
Results: From October 1987 to November, 1988, 270 (3.9/1000) of 69,233 Job Corps entrants aged 16-21 years were seropositive for HIV-1. Standardized HIV-1 seroprevalence varied sharply by race and region:

	Northeast	Central	South	West	All U.S.	M:F Ratio
White	1.4	1.2	1.4	1.9	1.4	7.8
Black	10.2	4.9	6.6	8.2	7.0	1.2
Hispanic	7.7	-	2.8	0.5	2.4	5.3
All races	2.7	1.6	2.6	1.9	2.2	2.7

The male-to-female (M:F) ratio in HIV seroprevalence differed greatly by ethnic group, and was 1.0 for all Corps entrants aged 16-18 years but 4.1 for all Corps entrants aged 19-21 years. Overall, seroprevalence in Job Corps entrants was 3 times greater than in military recruits of the same age.
Conclusions: The low M:F ratio suggests an important role for heterosexual transmission and/or IV drug use in black adolescents. Seroprevalence among Hispanics is strongly dependent on geographic region. Current infection rates predict a changing future pattern of AIDS cases. Disadvantaged adolescents are a critical target group for AIDS prevention activities.

M.D.P.2

YOUNG PEOPLE'S LAY BELIEFS ABOUT HIV INFECTION AND AIDS

Ian Warwick, Peter Aggleton, Department of Education, Bristol Polytechnic, Bristol, England.

Objective - To report on findings from the Young People's Health Knowledge and AIDS projects - a study of lay beliefs of HIV infection and AIDS held by young people.

Methods - 1000 young people between the ages of 16 and 21 in schools, training schemes, colleges of further education, full-time employment, lesbian and gay youth groups and undifferentiated youth provision were sampled. Data was collected through semi-structured, in-depth interviews as well as self-completion questionnaires.

Results - During preliminary in-depth work, young people made reference to miasmatic, serendipitous, endogenous and exogenous lay theories when making sense of AIDS and HIV infection. There was a contrast between explanations given by young people in lesbian and gay youth groups and young people in undifferentiated youth provision. Data from questionnaires developed following this earlier qualitative work confirmed that young people have constructed a range of beliefs informed by both bio-medical and non-medicalised sources.

Conclusion - To produce meaningful results, future research methodologies need to consider how young people actively construct their understandings of HIV infection and AIDS. Research agendas overdetermined by bio-medical considerations are unlikely to be able to access the variety of lay beliefs young people share.

M.D.P.3

AIDS RISK BEHAVIOR AMONG SEXUALLY ACTIVE HISPANIC AND CAUCASIAN ADOESCENT FEMALES

Kegeles, Susan; Greenblatt, R.; Catania, J.; Cardenas, C.; Gottlieb, J.; Coates, T.; et al. University of California–San Francisco, California, USA.

Objective. To describe AIDS risk behavior among teenage females attending a family planning clinic and variables associated with risk behavior.

Methods. Adolescent women (N=104) completed self-administered surveys while attending the clinic.

Results. The adolescents ranged in age from 15-21 years (mean = 18 years); 50% were Caucasian and 43% Hispanic. The majority (65%) were from working class or lower socioeconomic status backgrounds. Eleven percent had more than one sex partner in the previous two months, and 19% had more than 5 partners in their lifetime. Nearly half (44%) had never used condoms, 12% had anal intercourse, 2% had injected drugs, and 21% had a primary partner who had or may have used I.V. drugs. When having intercourse, condoms were used only 27% of the time with primary partners, and 9.4% with secondary partners. Condom use increased with better sexual communication abilities and the perception that unprotected intercourse increased risk for HIV infection adn decreased with the belief that condoms take the fun out of sex, that unprotected intercourse was more fun, and that using condoms would cause relationship problems. Ethnic differences will be described.

Conclusion. It is incorrect to assume that teens attending birth control clinics are also engaging in AIDS protective behavior. Interventions to reduce AIDS risk behavior must be targeted at heterosexual adolescents in general, and towards teens attending family planning clinics in particular.

M.D.P.4

PREDICTORS OF CONDOM USE AND MULTIPLE PARTNERED SEX AMONG HIGHLY SEXUALLY ACTIVE ADOLESCENT WOMEN

Catania, Joseph*; Coates, T.*; Greenblatt, R.*; Dolcini, P.*; Kegeles, S.*; Corman, M.** et al.
*University of California, San Francisco, Center for AIDS Prevention Studies, **Planned Parenthood of Santa Cruz, U.S.A.

Objective: The development of AIDS interventions for adoescents is hindered by the lack of data on the conditions that influence high risk sexual behavior. We examined psychosicial correlates of condom use and multiple partnered sex for a sample of sexually active heterosexual adolescent women.

Methods: Self-administered questionnaires were completed by 114 adolescent women at a family planning clinic. Measures will be described.

Results: Respondents reported higher levels of vaginal intercourse than the "average" U.S. adolescent. Ten percent were engaging in anal intercourse. Greater condom use was associated with higher levels of perceived enjoyment of condoms, "condom" self-efficacy beliefs, and communication skills. Fewer numbers of sexual partners was associated with higher levels of perceived susceptibility, restrictive social norms, and good sexual communication skills. Knowledge of HIV transmission routes did not predict either outcome.

Conclusions. The findings support the general observation that AIDS interventions with adolescents should build sexual communication skills, address motivational issues, and facilitate enjoyment of safe-sex activities.

M.D.P.5

TITLE: BEHAVIORAL SURVEY AMONG HIGH RISK ADOLESCENTS

AUTHORS: *Huscroft, S., *Morris, R., *Baker, C.J., Roseman, J., Aslanivatan, E., *Re, O.
*Juvenile Court Health Services, Los Angeles County, California, USA

OBJECTIVE: To establish baseline information concerning sexual behavior, medical history, drug abuse habits and state of knowledge of AIDS/risk factors in adolescents.

METHODS: A questionnaire was administered on a one-to-one basis interview. Appropriate counseling was implemented depending on each individual's circumstances and needs.

RESULTS: A total of 417 youngsters, aged 15 to 17 were interviewed. Sex and ethnic distribution were representative of the entire population. More than 90% of the minors were sexually active with small percentages occasionally engaging in rectal or oral sex. Casual sex was common, condom use was rare. One half of the minors admitted to drug abuse with a 10% for I.V. drug use. Awareness of AIDS was high (]90%). 50% of the minors considered themselves at risk and a high percentage (62% to 75%) wished to be tested for HIV infection.

CONCLUSION: This population proved to be universally engaged in sexual activity at an early age. The high incidence of casual sex with multiple partners, low condom use and I.V. drug use places these minors at higher risk for HIV infection. We believe that educational/counseling programs should be intensified in our population to protect/modify high risk behavior.

M.D.P.6

AIDS PREVENTION IN JUNIOR HIGH SCHOOL STUDENTS IN AN AIDS EPICENTER: RESULTS OF A BASELINE SURVEY

Siegel, D*, Lazarus, N*, Durbin, Meg*, Krasnovsky, F*, Chesney, M* and [illegible], D§.
*University of California, San Francisco, California, U.S.; §Oakland Unified Schools, Oakland, California, U.S.

Objective: To describe the interactions of knowledge, attitudes, and self-reported behaviors relevant to AIDS prevention in an ethnically diverse group of junior high school students from a major AIDS epicenter, as background for a new 12 - hour educational curriculum currently being implemented.
Methods: In June 1988, 1,540 students in 3 junior high schools (grades 7 - 9) in Oakland, California completed an anonymous written questionnaire regarding their AIDS knowledge, attitudes and high risk behaviors.
Results: Age ranged from 11 - 16 years; 48% were male. Five % were White, 31% Black, 24% Latino and 33% Asian. Factual knowledge about AIDS varied little by ethnic group or gender, eg. knowing that others beside homosexual men get AIDS (89%), there is no cure (74%), and it is likely to get AIDS from sharing needles (85%) or through sexual intercourse without condoms (85%). Misperceptions included thinking it likely to get AIDS from giving blood (51%), insects (36%), or public toilets (28%). Only 55% felt that persons with AIDS should attend school, with those holding misperceptions about casual contact more likely to hold this opinion. Eight-nine % wanted AIDS education in school. Concerning high risk behaviors, more boys (42%) than girls (18%) engaged in sexual intercourse. Fifty- three % agreed that "Sex doesn't feel as good" with condoms and 56% felt that condoms are "embarrassing to buy." Among sexually active individuals, more who though that condoms work "perfectly" (79%) or "pretty well" (65%) in preventing AIDS reported using condoms "always" (79%) or "sometimes" (65%) during sexual intercourse v. those who thought condoms work only "a little" (47%). Few students (5%) reported using street drugs, but of these, more girls (21/31) did so than boys (31/56).
Conclusions: Junior high school students have substantial factual knowledge about AIDS but harbor misperceptions about casual contact. Those with misperceptions are more likely to engage in high risk behaviors and to express intolerance toward those with HIV. Early and middle adolescents should be taught about AIDS, with emphasis on preventing or modifying high risk behaviors, improving tolerance, and correcting false impressions.

M.D.P.7 SEXUAL ABUSE IN CHILDREN AND HIV INFECTION

Uribe Z.P.*, Ornelas H.G., Valdespino J.L., Palacios M.M.
*General Directorate of Epidemiology, Ministry of Health. Mexico

Objective: To describe socio-psychological characteristics in HIV seropositive adolescents.
Methodology: A socio-psychological and epidemiological analysis of twelve male sexually infected adolescents under 18 attending the HIV detection center in Mexico City. Risk factors, sexual behavior, medical and psycological histories were investigated.
Results: Three groups were identified: 1)Homeless children. 119 minors were studied and 5 children were found infected. This population includes abandoned children and orphans, presenting problems such as: family disintegration, pharmacodependency, sexual abuse and occasional male prostitution. Their age ranged from 13 to 18, second grade elementary level, and all dedicated to eventual activities and ocassionally to male prostitution, characterized by a bisexual behavior with homosexual practice among themselves, and no condom use, having an average of 22 sexual partners. 2) Adolescents prostitutes. 2 HIV positive cases were found: 15 and 18 years of age with elementary level, bisexuals, male prostitutes with anal receptive practice without condom use, referred from 2 to 4 sexual contacts daily. 3) Teen-agers living with parents. This group is integrated by 5 individuals of 16-18 years of age, all students, with integrated family, homosexuals with anal coitus practice mostly without condom, having an average of 7 partners in their whole life. These adolescents referred sexual abuse at 12-14 years of age.
Conclusions: Our country registers 5 AIDS cases and 10 HIV infected in sexually abused minors. Although this kind of transmission in children is being reported in other countries, in Mexico we lack information because this situation is usally kept as a secret by the adolescents and their families.

M.D.P.8 DEVELOPMENT AND EVALUATION OF COUNSELING AND INFORMATION-ORIENTED AIDS PREVENTION INTENTIONS FOR ADOLESCENTS AND YOUNG ADULTS

Quirk, Mark; Godkin, M., and Schwenzfeier E.
University of Massachusetts Medical Center U.S.A

Objective. To assess the relative effectiveness of counseling and information - oriented AIDS prevention interventions. To date 101 high risk adolescents and young adults (14-24 years) in an inner city health center and in a community center in a low income urban housing project have been studied
Methods. In the health center subjects are assigned to counseling by family practitioners (N = 25) or to individual observation of an educational videotape (RAP) which includes information about AIDS prevention (N = 37). In the community center subjects are assigned to counseling by trained peers (N = 16) or to a group information session (N = 23). Pre and post questionnaires are being used to assess knowledge and attitudes. MANOVAs with repeated measures are used to assess differences between groups and change over time
Results. At the family health center subjects showed significant (.05) increases in the following knowledge areas: 1. casual transmission; 2. modes of transmission; and 3. methods of prevention. At the community center significant increases were observed in knowledge about modes of transmission and methods of prevention. In addition, in this site significant changes in attitude were observed. Specifically, after the interventions, subjects felt more scared about AIDS and attached greater importance to learning about it. There was also evidence that, relative to the information-oriented intervention, counseling was associated with a significantly greater increase in knowledge of transmission, fear of AIDS and importance attached to learning.
Conclusion. Counseling interventions by health care providers or by peers, and information based interventions, can have significant positive impact on knowledge and attitudes about AIDS.

M.D.P.9 EVALUATION OF THE AIDS INFORMATION PROGRAM IN WEST-BERLIN SCHOOLS

Oswald, H.; Lukas, H.; Suess, K.-U.; and von Salisch, Maria
Freie Universitat Berlin, Berlin, West Germany

Objective. In order to evaluate the government sponsored AIDS information program for grades 9 to 11 in West-Berlin schools, 981 students were exämined before and after they had received the program. At the time of the post-test a control group of 591 students who had not received the program were examined as well.
Results. (1) After having received the information program students knew significantly more about the ways in which AIDS is transmitted than before. Learning was especially apparent in girls.
(2) Sons and daughters of turkish immigrant workers make up about 17 % of the sutdent population. Before the program started these turkish girls and boys knew significantly less about the transmission of AIDS than their german peers. After the program they had cought up, but still did not reach the information level of the german students.
(3) Students in the control group whose teachers had spent no time or less than two class hours on AIDS knew significantly less than the students in the program.
Conclusion. The Berlin AIDS information program is effective, especially when teachers are not willing or able to include AIDS in their classroom teaching. Subgroups such as the turkish students merit the attention of special information programs.

M.D.P.10 HIV INFECTION IN ADOLESCENTS: CAN WE PREDICT WHO IS AT RISK

D'Angelo, Lawrence*, Getson, P.*, Luban, N.*, Stallings, E.*, Gayle, H.**
* Children's Hospital Nat. Med. Cntr., Wash., D.C., U.S.A. and
**Centers for Disease Control, Atlanta, GA., U.S.A.

Objective. To determine if HIV screening of adolescents, based on their health care providers' predictions of risk, correctly identifies the patients who are shown to be HIV seropositive.
Methods. An anonymous, blinded seroprevalence study(using EIA screening and Western Blot (WB) confirmation) was conducted for 15 months at an urban referral teaching hospital. All patients ≥ 13 years were included who presented for care to the general adolescent clinic or the emergency room and who had had blood drawn for other reasons. Simultaneous informed screening of a sample of these patients was also conducted, based on a provider's suspicion or knowledge of their risk status. Comparisons were made of seropositivity in each group and between groups.
Results. Of 3520 adolescents tested in the seroprevalence study, 13 or 3.7/1000 were positive. The seropositive rate was higher in females (4.7/1000) than in males (1.7/1000) ($p \leq .05$), and in older adolescents;(15-18, 6.9/1000) than in younger adolescents (<15, 1.1/1000) ($p \leq .05$). Seropositivity did not very significantly by location of service (Clinic, 3.5/1000; ER, 4.7/1000) Based on a provider's suspicion or knowledge of risk, 6(49/1000) of 122 screened patients were found to be positive. This represented only 46% of all positive adolescents seen during this period.
Conclusion. Although HIV infection is present in our population of urban adolescents, strictly clinical identification of those at risk is inadequate. There is need for development of enhanced criteria for informed screening of adolescents.

Comportement (partie 1)
Behaviour (Part 1)

M.D.P.11 PREDICTION DE L'INTENTION D'UTILISER UN CONDOM COMME MOYEN DE PREVENTION DES MALADIES TRANSMISSIBLES SEXUELLEMENT.

Lavoie, Michel*, Godin, G.**
* D.S.C. de l'hôpital du St-Sacrement, Québec, Québec, Canada.
** Université Laval, Québec, Québec, Canada.

Objectif: Identifier les déterminants de "l'intention" d'utiliser un condom lors des relations sexuelles avec une nouvelle ou un nouveau partenaire.
Méthodes: La théorie de Ajzen a servi de cadre de référence. Les données nécessaires à l'application de cette théorie ont été recueillies par questionnaire auto-administré auprès de 69 jeunes adultes de sexe masculin.
Résultats: Les analyses de régression ont permis d'expliquer près de 70% de la variance de l'intention relative au comportement à l'étude. L'attitude ($p < .001$), la norme subjective ($p < .001$), la perception de contrôle à réaliser le comportement ($p < .05$), la perception des barrières au comportement ($p < .05$) et l'usage antérieur du condom se sont révélés les prédicteurs de l'intention. En outre, les analyses MANOVA ont mis en évidence des différences significatives entre les sujets dont l'intention est faible et ceux dont l'intention est élevée, en regard de la force des croyances comportementales ($p < .001$) et des croyances normatives ($p < .01$), de même que pour la perception des barrières à réaliser le comportement ($p < .05$).
Conclusion: Cette étude montre l'utilité de la théorie de Ajzen pour comprendre l'intention d'utiliser un condom. Il ressort qu'un programme visant la promotion de ce comportement auprès de jeunes adultes devrait accorder plus d'importance au sentiment de sécurité et de confiance associés à l'usage du condom qu'aux dangers pour la santé pouvant résulter de sa non-utilisation. Un tel programme devrait également s'intéresser à la pression sociale et à certaines barrières perçues associées à l'usage du condom.

M.D.P.12 KNOWLEDGE OF RISK FACTORS AND AVOIDANCE OF AIDS IN THE GAMBIA, WEST AFRICA

Oelman, Bruce*; Jaiteh,KO*; Cham, MK**; Njie, ABH**; Baldeh, S***; Wilkins, HA****.
*Epidemiology and Statistics Unit, Banjul, The Gambia. **Medical and Health Department, Banjul, The Gambia. ***Social Welfare Department, Banjul, The Gambia. ****Medical Research Council, Fajara, The Gambia.

Objective. To establish the level of awareness of AIDS and the level of knowledge of basic risk factors and avoidance measures in a predominantly rural and illiterate West African population.
Method. 1704 people (796 males and 908 females) aged 15 and over attending a sample of 12 health facilities throughout The Gambia were questioned on their knowledge of AIDS, risk factors and methods of avoiding infection. The subjects were randomly selected and did not include just those attending for treatment but also women attending ante-natal and infant welfare clinics.
Results. 696 (87%) males and 423 (47%) females claimed to have heard of AIDS. About 20% and 45% respectively of these males and females were unable to identify any methods of transmission or any means of avoiding infection. Thus only 70% of males and 30% of females had any real knowledge. Virtually all those with knowledge were able to correctly identify heterosexual intercourse as the major mode of transmission. Very few could identify other means. Prostitutes/others with many partners were seen as high risk groups. Not associating with them was understood as the best way of avoiding AIDS.
Conclusion. Although some effort has been put into health education in The Gambia there still remains a relatively low level of awareness of AIDS and associated risk factors - females had much less knowledge than males.

M.D.P.13 KNOWLEDGE REGARDING AIDS AMONG EMPLOYEES AND SPOUSES AT A BANK IN KINSHASA, ZAIRE

Moore, Melinda *,**, Doppagne A ***, Nassig SE *,**, Lusakulira N *, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire ** Tulane SPHTM, New Orleans, USA *** Bank Comm Zaire, Kinshasa, Zaire

Objective. To determine the level of AIDS-related knowledge in this population for purposes of educational programming.
Methods. 2516 employees and spouses were interviewed between 11/87 and 3/88 as part of an annual medical exam.
Results. In general, female employees and their spouses were better educated/informed than were male employees, followed by female spouses. Over 90% spontaneously cited (hetero)sexual relations as a source of transmission. Over 95% of both men and women recognized the 4 main sources of transmission when directly asked. Incorrect sources of transmission included mosquitoes (66%) and routine household contacts (16-35%), with women significantly more likely to give these incorrect responses. AIDS is considered treatable by 70% of men and 44% of women and preventable by virtually everyone. Men were more likely to cite reductions in number of sexual partners or avoiding prostitutes as ways to prevent transmission; women were more likely to cite faithfulness to a single partner.
Conclusions. This population is aware of AIDS and its principal modes of transmission, though serious misconceptions persist. These results should be used to plan AIDS messages.

M.D.P.14 POPULATION-BASED SAMPLE OF AIDS KNOWLEDGE, ATTITUDES AND BEHAVIORS AMONG CALIFORNIA RESIDENTS

Moore, Melinda*; Jang, Michael; Day, Noel; URSA INSTITUTE, San Francisco, California, USA

Objective: To assess baseline AIDS knowledge, attitudes and behaviors among a population-based sample of 753 California residents
Methods: 753 California residents were contacted by telephone during a two-week period in October 1988. Previously derived attitudes scales and cluster analyses techniques were used to develop four typologies or respondent types.
Results: Attitude scales (response efficacy, condom comfort level, and empathy) were all found to be positively related to AIDS knowledge and behaviors.

KNOWLEDGE, ATTITUDES AND BEHAVIORS BY CLUSTER

	NON-BELIVERS	UNEDUCATED	HIGHLY EDUCATED	NON SKILLED
KNOWLEDGE	Medium	Low	High	Medium
BEHAVIORS	Medium	High	Low	Medium
PERCEIVED RISK	Low	Low	Low	Low
EMPATHY	Medium	Low	High	Medium
COND. COM.	High	Low	High	Low
RESPON. EFFIC.	Low	Low	High	High

Conclusions: Knowledge level regarding AIDS prevention and transmission is relatively high, mean score for all respondents types was 10.8 out of 14 questions. However, evidence suggests there are attitudes regarding sexuality, efficacy of prevention measures, and condoms which create barriers to the adoption of risk reducing behaviors. Data also suggest that AIDS education programs must focus much more heavily on attitudes and behavior change rather than relying on knowledge acquisition alone to drive desired risk reduction behaviors.

M.D.P.15 HIGH RISK SEXUAL BEHAVIOUR AND CONDOM USE IN A SAMPLE OF HOMOSEXUAL MEN IN ENGLAND

Boulton, Mary*, Fitzpatrick, R.**, Hart, G.***, Dawson, J.**, McClean, J.*
*St Mary's NHS, London, UK, **Oxford University, Oxford, UK, ***University College and Middlesex School of Medicine, London, UK

Objectives To determine the frequency of high risk sexual behaviours and condom usage in a group of homosexual men in four different areas of England in 1988.
Methods Three hundred and fifty seven homosexual and bisexual men were recruited for a prospective study in London, Oxford, Northampton and Manchester. Confidential interviews included questioning about sexual behaviour in the previous month.
Results One hundred and fifteen (32%) men had had passive anal sex in the previous month. Men more frequently had passive anal sex with a regular (94) than with a non regular partner (33). One hundred and thirteen (32%) had had active anal sex in previous month. Active anal sex was more frequent with a regular (96) than with a non regular partner (30). Men having sex with non regular partners only were less likely than men having sex with regular partners only to have unprotected passive anal sex ($p<0.005$) and unprotected active anal sex ($p<0.005$).
Conclusion Major behavioural changes amongst homosexual men have occurred at least partly because they may now regard anal intercourse as more risky if it involves a partner whom they do not know well.

M.D.P.16 Appropriate AIDS Knowledge But Negative Attitudes of College Students

Smith, M. U.*, Katner, Harold P.*, Couch, K.W.*, Tripp, J. N.*, and Young, E. H.*
*Mercer University School of Medicine, Macon, Georgia, USA

Objective. To assess the knowledge of and attitudes toward AIDS issues among university students; to determine whether or not knowledge about AIDS is associated with positive attitudes toward persons with AIDS (PWA's) and AIDS-related issues.
Method. One week after listening to a lecture on the biology of AIDS, 332 of the individuals enrolled in an introductory biology class at a major Southern (US) public university completed a carefully constructed anonymous survey of AIDS-related knowledge and attitudes.
Results. Knowledge: 49% of the respondents did not know that "scientists are quite sure that they know what causes AIDS." 14% believed that condoms guaranteed safety from AIDS, and 10% thought that "wearing gloves during sex decreases your chances of getting AIDS." 36% maintained that AIDS can be acquired from mosquitoes, from giving blood (15%), or from kissing (10%). 17% did not know that "there is practically no risk of getting AIDS from blood transfusions today." 43% indicted they believed that they could "get AIDS regardless of what you do to protect yourself."
Attitudes: 61% of the respondents reported they were afraid of getting AIDS and 28% wanted to be tested for AIDS. 10% worried about getting AIDS in public restrooms although 94% knew AIDS could not be contracted from toilet seats or doorknobs. 15% agreed that the media have "overblown" the issue, and 15% do not trust what public officials say about AIDS. 33% agreed that they would be scared to be around a PWA in spite of the fact that 96% knew that AIDS is not passed by casual contact. 54% would be afraid to kiss a friend with AIDS even though 84% knew there had been no proven cases of AIDS from kissing.
Conclusions. Most students in this sample knew much accurate information about AIDS with areas of notable exception. In several areas this knowledge was not translated by these students into positive personal attitudes about PWA's and AIDS-related issues.

M.D.P.17 HIV - ASSOCIATED HEALTH BELIEFS OF ARMY BASIC TRAINEES

Alexander, Linda*; and Overton, H.**
*Walter Reed Army Institute of Research, Washington, D.C. 20307 USA
**College of Nursing, University of Tennessee, Knoxville, TN 37916 USA

Objective. The U.S. Army is currently engaged in HIV education efforts to curb further transmission of the disease in military populations. The purpose of this study is to investigate health beliefs in relation to decisions to practice preventive personal behaviors to reduce the risk of HIV infection.
Methods. An ex post facto/correlational design study using the Health Belief Model as a theoretical and conceptual framework is underway. A 42- item instrument to assess trainees' perceived susceptibility, perceived severity, benefits of preventive behaviors, barriers to personal preventive behaviors, and motivation to reduce risk of HIV transmission was administered during trainee in-processing at a large Army regional training center. These soldiers were all negative for HIV - Ab and had not received any form of Army HIV education prior to completing the survey. Participation was voluntary and confidentiality and anonymity were assured.
Results. In a six month time period 1000 trainees were surveyed. Preliminary analysis indicates that these soldiers are a representative group and of similar age, ethnicity and education to both military and civilian populations. Findings indicate that many trainees are not currently practicing preventive personal behaviors and do not perceive themselves as susceptible to HIV. Trainee responses assessed indicate that susceptibility to, and consequences of, HIV infection are underestimated.
Conclusions. Education is an important modality to influence the transmission of HIV. It is imperative that Army HIV educational efforts be tailored to the specific needs of soldiers. This project demonstrates that Army HIV education should address individual susceptibility and severity, in particular, as well as benefits, barriers and motivation for preventive personal behaviors.

M.D.P.18 "LES PRATIQUES ET MOEURS SEXUELLES AU SENEGAL (CONTRIBUTION A LA CONNAISSANCE DU SIDA)

GUISSE Y. MB. IFAN CH. A. DIOP DAKAR-SENEGAL
D'ALMEIDA L. "PLURALE BP. 5356 DAKAR-SENEGAL
BIENVENU E. S/C LAB. BACTERIOLOGIE H. LE DANTEC DAKAR

OBJECTIFS: Elle s'interroge sur: la nature des pénétrations sexuelles (vaginale, rectale , orale); les natures des produits utilisés; les idéologies et représentations liées aux moeurs sexuelles.
METHODES: Des entretiens semi-directifs auprès de prostituées, de matrones, de maîtres et maîtresses de cérémonies rituelles sont entrepris dans 4 grandes régions du pays. Un questionnaire centré autour de 14 thèmes relatifs à la sexualité est passé auprès de 1.575 personnes.
RESULTATS: L'étude analyse leur rapport à la contamination du SIDA et tente des propositions de prises en compte de ces réalités dans la prévention des MST. et du SIDA.
CONCLUSIONS: Cette étude permet d'apréhender leur part hautement significative comme mode de contamination du SIDA.

M.D.P.19 DEMOGRAPHICS AND SEXUAL PRACTICES OF MALE BAR WORKERS IN BANGKOK

WERASIT SITTITRAI, PHANUPHAK P, SATIRAKORN N, WEE EKWEERA E, RODDY RE*. Center for AIDS Research and Education, Bangkok, Thailand, *Family Health International, North Carolina, USA.

Objective- To determine risk factors for directing intervention programs.
Method- We surveyed 141 male bar workers in 5 bars in Bangkok.
Results- 73% of the men were between 17 and 21 years old and 86% were born outside of Bangkok. 49% were living with friends who worked in similar bars. 31% had only primary school education. 6% were rarely or never exposed to the mass media. 55% had never worked in a bar before. 50% had worked in bars for 2 months or less. 82% had chosen bar work to solve their unemployment problem. 51% were introduced to this job by their friends and 36% by reading job advertisements. Only 50% stayed in the bar longer than 2 months. In the 2 week period prior to the interview 100% had sex with male customers, 23% with female customers, 13% with non-customer males, and 50% with non-customer females. In the same period the men averaged 5.8 male customers. 53% of the men did not use a condom the last time they had insertive anal sex. The last time the bar worker had receptive anal sex, 63% of the bar workers' insertive partners did not use a condom. 72% had both insertive and receptive anal sex. 35% had used condoms for oral sex. 99% of the men had not used IV drugs in the last 5 years.
Conclusion- The sexual activities of these young men with little education and rural backgrounds place them at high risk for HIV infection. The potential for rapid HIV spread is high because they have sex with both men and women as customers and non-customers.

M.D.P.20 Peer and Partner Influence and Self-confidence as Correlates of AIDS Preventive Behavior (APB) in a Low Prevalence State

Landis SE, Earp JA, Univ North Carolina, Chapel Hill, NC U.S.A.

Objective. To examine the effects of social influence and self-efficacy on a) knowledge and b) the self-reported practice of AIDS preventive behaviors in a heterogeneous sample in a low prevalence state.
Methods. Over a 6-month period in 1988 questionnaire-interviews were conducted with 235 adults tested for HIV antibodies at 2 Counseling and Testing Sites in North Carolina. Emphasized were: perceptions of network behaviors; respondents' own, as well as peers and partners', beliefs about practicing safer sex; and confidence in the ability to alter negative social network influences.
Results. In this largely rural state, our sample was 44% black, 32% female, 67% heterosexual, 12% IV drug users, 10% positive for HIV-1, with a median age of 26. Almost the entire sample (96%) knew that having only one steady sexual partner was protective; however, a third had more than 1 partner in the past month and believed "safe sex" was a "turn off"; over half (54%) believed their peers also had more than 1 partner while 60% felt "safe sex" was hard to practice "in the heat of passion". Over two-thirds (68%) believed their peers engaged in "unsafe sex" and 62% were not certain they could adopt safer sexual practices. Those who believed their peers and sex partners practiced or encouraged safe sex perceived fewer social barriers to change (r=40), reported more preventive behaviors (r=18) and were more confident they could change their behavior (r=31).
Conclusions. In a heterogeneous but predominantly heterosexual, highly aware population in a low prevalence, rural state, imaginative counseling should try to reinforce perceptions of positive social influence, elicit network barriers, emphasize peer support and enhance self-confidence.

M.D.P.21 THE IMPACT OF COMMUNITY-BASED BEHAVIORAL GROUP INTERVENTION TO HELP PERSONS REDUCE HIGH-RISK SEXUAL BEHAVIORS

Kelly, Jeffrey A.*; St. Lawrence, J.S.*; Brasfield, T.L.*; Hood, H.V.**; & Betts, R.*
*Univ. of Mississippi Medical Center, **FL. Dept. of Health & Rehab. Services U.S.A.

Objective: Many individuals still have difficulty implementing and maintaining adequate change in high-risk sexual patterns. Behavioral skills training principles can be used to assist persons reduce high-risk behavior.
Method: In Study 1, 104 men who engaged in risky behavior with multiple partners were randomly divided into experimental and control groups. Experimental subjects participated in 12 group sessions of risk education and self-management, assertion, and cognitive skills training specifically tailored to sexual risk reduction. In Study 2, a second cohort participated in a similar 6-session program. Behavior change was assessed using multiple self-report, self-monitoring, and sexual assertiveness skill measures. Followup data through 24-mos. postintervention were obtained.
Results: Multivariate analyses revealed significant reductions in unprotected anal intercourse to near zero levels and greatly increased use of condoms, risk knowledge, and sexual assertiveness behavioral skills as a result of this training. Change was well-maintained even at long-term followup and was corroborated by change across the measures.
Conclusion: Behavioral principles derived from other areas of health promotion can be adapted for use in AIDS risk reduction. These findings identify a model to help persons acquire the skills to implement and maintain behavior change recommendations. This model is of practical importance for ~~some~~ clients seen in AIDS prevention programs, health and STD clinics, and schools.

M.D.P.22 PSYCHOLOGICAL AND DEMOGRAPHIC CHARACTERISTICS OF GAY MEN WHO DO OR DO NOT ENGAGE IN UNSAFE SEX

Kelly, Jeffrey A.*; St. Lawrence, J.S.*; Brasfield, T.L.*; Smith, J.E.*; Hood, H.V.**; Lemke, A.L.***; et al.
*Univ. of Mississippi Medical Center, **Fl. Dept. of Health & Rehab. Services, ***Univ. of Washington,U.S.A.

Objective: To determine differences between gay men who still engage in unprotected anal intercourse, a behavior of particular interest because it is strongly predictive of HIV seroconversion even at low rates of occurrence.
Methods: 526 men who patronized 8 gay bars in 3 different American cities (Seattle, Tampa, & Mobile) completed a survey measure eliciting information on sexual practices over the past 3 months and AIDS risk knowledge, beliefs, attitudes, and perceived sexual norms. Over 75% of all men entering these bars on survey nights completed the measures.
Results: 17% of the entire sample reported engaging in receptive or insertive unprotected anal intercourse in the preceding 3 months; 87% did not. Multivariate analyses confirmed significant differences ($p < .0001$) between men who engage or refrain from this activity. Men who engaged in anal intercourse were more likely to attribute AIDS risk to chance/luck and "powerful other" external factors. They scored lower in AIDS risk knowledge, were younger, and had less education than men who did not engage in the activity. Similar patterns were found regardless of whether subjects were insertive or receptive partners.
Conclusion: Some gay men still engage in high-risk sex. In addition, to continued education, there is a need to stress efficacy themes that one's own behavior (rather than chance or others) determines risk for AIDS. Efforts targeted toward young and less educated gay men are now especially needed.

M.D.P.23 PERSISTENCE OF HIGH-RISK SEXUAL BEHAVIOR IN HOMOSEXUAL/BISEXUAL MEN: A MULTI-CENTER STUDY

Doll, Lynda*; Byers, R.*; Bolan, G.**; Douglas, J.***; Moss, P.****; Weller, P* et al. *Centers for Disease Control, Atlanta, GA; **San Francisco Public Health Dept., ***Denver Disease Control Service; ****Howard Brown Clinic, Chicago, IL, USA

Objective. To describe and predict high-risk sexual behavior in homosexual men attending 3 STD clinics.
Methods. 483 men who engaged in unprotected anal or oral sex in the previous 4 months were interviewed from April-Dec. 1988. Risk was assessed by calculating: 1) absolute #'s of unprotected anal and total (anal and oral) exposures and 2) ratios of unsafe to total exposures for the 4-month period. Principal component and cluster analyses were used to arrive at groups of men; regression techniques were used to predict levels of risk.
Results. Preliminary cluster analyses identified 5 subgroups: 1) a relatively-closeted group (N=32) who self-defined as hetero/bisexual; 2) a somewhat-closeted group (N=110) of older, self-defined bisex/homosexuals; 3) a younger, openly-homosexual group (N=109) with male steady partners; 4) an older, openly-homosexual group (N=195) with higher incomes and nonsteady male partners; and 5) a small, openly-homosexual group (N=37) with large numbers of sex partneres and higher cigarette and drug use. regression analyses showed having sex with a primary partner, younger age at first sex, isolation from gay organizations, bisexually, IV-drug use, and "hustling" were related to higher levels of unprotected exposures.
Conclusions. Relatively discrete subgroups continue to have unsafe sex; each subgroup will require targeted education to effect behavioral change.

M.D.P.24 CONDOM USE CAN OCCUR DESPITE USE OF ALCOHOL AND DRUGS

Harrison,Janet,S.*;Doll,L.S.*;Weller,P.;*Bartholow,B.**; Joy,D.***;Moss,P.****;et al. *Centers for Disease Control, Atlanta GA;**Denver Disease Control;***San Francisco Health Dept;****Howard Brown Clinic, Chicago IL USA.

OBJECTIVE:To examine the use of alcohol and drugs during high and low risk sexual contacts of homosexual and bisexual men attending 3 STD clinics.
METHODS:Enrolled homosexual and bisexual men who had engaged in unprotected anal or oral sex during the previous 4 months. Using a critical incident technique, men were asked to describe the circumstances under which they last engaged in unprotected and/or protected anal sex. Compared the alcohol/drug use of 190 men during their last instance of unprotected anal sex versus their last instance of protected anal sex.
RESULTS:Preliminary analyses (using the McNemar Test for Significance of Change) indicated no significant differences (p.>.05) in alcohol/drug use before or during unprotected and protected anal sex. Percentages of men using were:

	ALCOHOL	MARIJUANA	POPPERS	STIMULANTS	OTHER DRUGS	ANY ALC/DRG
UNPROTECTED(N=190)	45%	23%	20%	7%	4%	64%
PROTECTED (N=190)	43%	20%	19%	5%	2%	60%

In response to a question on reasons for not using a condom during unprotected anal sex, only 9.2% listed alcohol/drugs as the major cause.
CONCLUSIONS:Among high risk homosexual/bisexual men, alcohol/drug use is associated with sexual behavior in general, not exclusively with unprotected sex. Men can and do use condoms when they are drinking and using drugs The role of substance use in high-risk behavior should not be overemphasized to the exclusion of other motivating factors.

M.D.P.25 CASUAL SEXUAL CONTACTS OF SWISS TOURISTS IN TROPICAL AFRICA, THE FAR EAST, AND LATIN AMERICA

Steffen, Robert; Stricker, M.; Eichmann, A.; Gutzwiller F.
Institute of Social and Preventive Medicine, University of Zurich, Switzerland

Objective. To determine the frequency and characteristics of casual sexual contacts and the risk of infection with HIV, Hepatitis A, and T. pallidum in Swiss short term visitors to developing countries.
Methods. In 1987/88 future travelers were selected for the high risk group at the Zurich University Vaccination Center if it appeared that they might have casual sexual contacts while abroad. A control group was chosen from respondents having completed a malaria questionnaire during their journey home from Kenya. Within two weeks after their return, these travelers were invited to return to our Center, to sign an informed consent, to be interviewed and to supply a blood sample. The travelers were asked to return for a second interview and blood tests three months later.
Results. In the high risk group 64 travelers accepted our invitation, and 18 consented at least to a telephone interview (total response rate 71%). In the control group 112 plus 54 were investigated (74%). Casual sexual contacts were reported by 55 of 82 (67%) respondents of the high risk and 6 of 166 (4%) of the control group. Of the 44 heterosexual men, 6 women and 5 homosexuals, 14 (25%) had >3 encounters, 27 (49%) had contacted prostitutes, 26 (47%) other autochthones, 2 (4%) other Europeans. Men aged 20-39 y used condoms regularly in 67%, those ≥40y in 27%, women in 0%. No HIV, and no recent HAV or T. pallidum infections were detected.
Conclusion. At least a proportion of "sex tourists" can be identified during pre-travel advise. Within this group, particularly >40y/o men and all women need to be instructed about safer sex.

M.D.P.26 CHANGES IN AIDS KNOWLEDGE ATTITUDES, AND BEHAVIORS IN SAN FRANCISCO'S LATINO COMMUNITIES: 1987 to 1988

Payne, Susan F.*; Lemp, GF*; Bregman, G**; Sandlin, G***; Sabogal, F****; Rutherford, GW*. *San Francisco Department of Public Health; **Fairbank, Bregman, and Maullin; ***Mission Neighborhood Health Center; ****Univ.of California, San Francisco, CA., U.S.A.

Objective. To measure changes in AIDS knowledge, attitudes, and behaviors in the Latino communites of San Francisco (SF).
Methods. 329 adult Latino residents of SF were randomly selected and interviewed in person between September and December, 1988, using a door-to-door cluster block design. Results were compared to a 1987 baseline survey of 319 adult Latino residents interviewed using the same methodology. We defined high-risk sexual behavior (HRSB) as sex with multiple partners, IVDUs, bisexual men, prostitutes, or people who have AIDS.
Results. The prevalence of HRSB decreased in 1988 compared to 1987 (5% vs 11%, p<.001). IVDU or needle sharing was unchanged (2% vs 1%). More respondents in 1988 reported changing their sexual behavior since becoming aware of AIDS (29% vs 17%, p<.001). Persons reporting HRSB or IVDU in 1988 were more likely than persons who did not report such behavior to be single (p<.01), male (p<.05), speak English rather than Spanish or both languages (p<.01), and have a higher income (p<.001). Persons reporting HRSB or IVDU did not differ by age or educational level from those who did not.
Conclusion. A smaller percentage of Latinos in SF in 1988 were at increased risk for AIDS as a result of potentially unsafe sexual or drug behaviors when compared to 1987. High-risk behavior occurred more often in single, male, English-speaking respondents.

M.D.P.27 COGNITIVE DIFFERENCES BETWEEN BOYS AND GIRLS RELATING TO THE USE OF CONDOMS.

Otis, Joanne*; Godin, G.**; Lambert, J.***; Pronovost, R.*
* DSC de l'Hôpital Charles LeMoyne, Greenfield Park, Québec, Canada;
** Université Laval, Sainte-Foy, Québec, Canada; *** Université de Montréal, Montréal, Québec, Canada.

Objective. The purpose of this study was to assess the cognitive differences between female and male teenagers relating to the use of condoms in the context of sexual intercourse with a new partner.

Methods. A sample of 151 adolescents (49 girls, 102 boys) were asked to complete a questionnaire investigating belief strenght; outcome evaluation; normative beliefs; motivation to comply and perceived barriers relating to the use of condoms.

Results. For each of these constructs (except for motivation to comply), Hotelling'T^2 tests showed significant differences between boys and girls. Regarding specific items within these constructs, analyses (t-test) indicate that boys think more strongly than girls that the use of condoms will diminish their sexual pleasure ($p < .002$). Girls beleive less strongly than boys in the contraceptive efficiency of condoms ($p < .01$) and give more value to the notion of "feeling safe" during sexual intercourse ($p < .001$). Boys perceive girls to be more in agreement with the use of condoms than the girls perceive boys to agree ($p < .002$). Finally, girls give more weight to a number of others barriers than do boys: embarrassment to buy ($p < .003$); fear of breaking during intercourse ($p < .007$) and not being familiar with use ($p < .004$).

Conclusion. Thus, the importance of several cognitive elements relating to the use of condoms seems to be different for boys when they are compared to girls. In our opinion, planners of future persuasive strategies should consider these potential differences and segment their target population appropriately.

This study was funded by the Quebec Council on social research (RS-1453 M88).

M.D.P.28 PREDICTORS OF HIGHER RISK SEXUAL BEHAVIORS AMONG GAY AND BISEXUAL MEN ATTENDING AN STD CLINIC

Joy,Dan M.*; Bolan,G.**; Harrison,J.***; Doll,L.***; Geoghegan,C.**; Lore,V.**; et al. *University of California, SF,**Dept. of Public Health, SF, CA,***Centers for Disease Control, Atlanta, GA, USA.

Objective. To compare two groups (lower and higher risk sexual behaviors) of gay and bisexual men attending an STD clinic in 1988.
Methods. 198 gay and bisexual men seeking services at the SF STD clinic between April and July 1988 were interviewed and divided into 2 groups based on sexual behaviors; 33 men engaging in safer sex (unprotected oral sex without ejaculation and no unprotected anal sex) and 165 men engaging in higher risk sex (unprotected oral sex with ejaculation and/or unprotected anal sex). Demographic and psychosocial factors, AIDS knowledge, drug use, and partner status were compared.
Results. The median age was 33 years in both groups. The higher risk group had a higher proportion of nonwhites than the lower risk group (41% non-whites vs 23%, p=.05). The only factor other than race associated with higher risk behavior was exchanging sex for money and/or drugs. (24% higher risk group vs 0%, p=.03). Although only 10% (n=21) of the study population used crack, all were among the unsafe group. AIDS knowledge and duration of residence in the SF area were not significantly different between the two groups.
Conclusions. While all gay and bisexual men seeking services at STD clinics need risk reduction counseling, additional prevention programs may be needed for higher risk subgroups such as minorities and prostitutes. Crack use among gay and bisexual men needs further study.

M.D.P.29 FACTORS AFFECTING RETENTION IN A LONGITUDINAL AIDS RISK REDUCTION STUDY OF GAY MEN

Freeman, A.C.; Petty, B.A.; Diehl, D.W.; Haley, Charles E.
Dallas County Health Dept., Dallas, TX, USA

Objective. To identify characteristics of participants that contribute to continuing participation in a longitudinal study in order to plan methods of increasing retention. Methods. Dallas County, along with 5 other areas is participating in a longitudinal study of HIV infection risk reduction of gay men. Men are enrolled through the antibody test site, and asked to complete a detailed survey, participate in risk reduction counseling, and have an antibody test. Each man is to return every six months to repeat the process. The registration is anonymous so no reminders can be used. Results. Of a total of 525 men eligible to return for a second visit, 287 (54.7%) had returned. A number of demographic, risk behavior, and opinion variables plus antibody status were entered into a stepwise linear regression. The variables that contributed to retention rate (r^2= .173) were previous negative antibody test, initial visit negative antibody test, education level, and trust in information from the Federal government. Perceived sensitivity of local gay organizations to concerns of the gay community was inversely related to retention. Conclusions. The study has enrolled 141 persons who were HIV antibody positive at the first visit and 40 with previously positive results. These men require additional encouragement to return. Neither level of risk behaviors or desire to change behaviors contributed to retention.

M.D.P.30 AIDS KNOWLEDGE AND UNSAFE SEXUAL PRACTICES AT AN STD CLINIC

Kohn, Robert; Gibson, P.M.; Bolan, G.
Department of Public Health, San Francisco, CA, USA

Objective. To examine knowledge about AIDS transmission among patients seen at an STD clinic, and determine whether differences in knowledge correspond with sexual practices.
Methods. A consecutive sample of 712 patients seen at the San Francisco STD clinic in March of 1988 was obtained using an anonymous, self-administered questionnaire (90% response rate). Overall knowledge was defined by percentage of 27 true/false AIDS questions answered correctly. Multivariate ANOVA was used to compare knowledge score among groups, and the partial F statistic was used to assess significance after controlling for other factors.
Results. Overall knowledge was high (mean for all respondents=67.7%). Knowledge was found to be higher among whites (mean=74.0%) than minorities (mean=63.5%), and higher among homosexuals and bisexuals (mean=73.4%) than heterosexuals (mean=65.9%). After controlling for these differences, no association was seen between knowledge level and consistency of protected intercourse of any type or use of drugs with sex.
Conclusions. For these STD patients, knowledge of AIDS has not translated into behavior changes. Further efforts should focus on behavior modification and not simply on AIDS awareness.

M.D.P.31 PREVALENCE AND CHANGE OF AIDS HIGH RISK SEXUAL BEHAVIOR AMONG BISEXUAL MEN IN SAN FRANCISCO: THE SAN FRANCISCO MEN'S HEALTH STUDY

Ekstrand Maria L.*,**; Coates, T.J.*, Lang, S.*; Guydish, J.*
*Center for AIDS Prevention Studies, U.C. San Francisco, CA, U.S.A.
**Fellow, American Foundation for AIDS Research

Objective. To describe and compare prevalence and change in homosexual and heterosexual behaviors in a cohort of bisexual men in San Francisco.
Methods. All men who identified themselves as bisexual (n=58) were selected from a probability sample of single men in the area of San Francisco hardest hit by the AIDS epidemic in 1984. Prevalence and change in sexual behaviors from 1985 to 1987 with both men and women were examined. Data from 1988 will be reported at the meeting.
Results.

BEHAVIOR	1985	1986	1987
Had sex with men	91.3%	62.1%	41.4%
Had sex with women	34.5%	20.6%	18.9%
Unprotected vaginal sex	29.3%	8.9%	5.2%
Unprotected anal sex (men)	53.4%	20.7%	0%
Multiple male partners	70.1%	41.4%	37.9%
Multiple female partners	12.1%	3.4%	3.4%

Conclusion. It appears that bisexual men in San Francisco have reduced both their homosexual and heterosexual high risk sexual behavior. The heterosexual changes are much more drastic than has been seen among heterosexual men in the same sample. The fact there is still some reported unprotected sex with women may reflect the belief that this is a somewhat less risky activity than unprotected male-to-male anal sex.

M.D.P.32 INTENTIONS TO CHANGE BEHAVIOR, PERCEIVED CHANGE AND REPORTED CHANGE: DO THEY CORRELATE?

Higgins, Donna L.*, Galavotti, C.*, O'Reilly, K.R.*, Sheridan, J.**, The AIDS Community Demonstration Projects*, *Centers for Disease Control, Atlanta, GA, USA, **Professional Management Associates, Rockville, MD, USA

Objective: To examine the correlation between reported intentions to change, perceptions of change, and actual reported behavior change in a cohort of gay men.
Methods: 209 gay men completed a baseline (T1) and a six month follow-up (T2) questionnaire on their HIV risk behavior, knowledge, attitudes, and beliefs. Intended behavior change at T1, perception of behavior change at T2, and actual reported behavior at T2 were cross-tabulated to see whether subjects who intended to change at T1 and perceived that they had changed at T2, actually report behavior change.
Results: Subjects reporting the intention to decrease their number of sex partners at T1 and a perception of decrease at T2 had actually decreased partners by T2 based on self-report ($z=3.22$, $p<.05$). Subjects reporting no intention to change at T1 but a perception of change at T2 did not report fewer sex partners at T2 ($z=1.71$, n.s.).
Conclusion: Individuals' perceptions that they have changed their behavior may be inaccurate measures of actual behavior change. Intentions to change, however, are consistently correlated with reported behavior change, suggesting that interventions aimed at changing stated intentions may be useful first steps in influencing behavior change.

M.D.P.33 CHANGES IN HAITIAN IMMIGRANTS' KNOWLEDGE, ATTITUDES AND PRACTICES ABOUT AIDS IN MONTREAL, CANADA

Adrien, Alix*; Tousignant, Y.**; Hankins, C.A.*; Boivin, J.F.*.
Community Health Department, Montréal General Hospital, and *McGill University, **Université de Montréal; Montréal, Québec, Canada.

Objective. To measure changes in knowledge, attitudes and practices related to AIDS in Haitian immigrants in Montréal.
Methods. In the first year (Oct.87-Sep.88) of an ongoing study, 206 Haitian subjects aged 15-39 years were interviewed on their knowledge, attitudes and practices related to AIDS. At the mid-point of the second year of the study (Oct.88-May 89), 100 subjects had answered the questionnaire. Results from the first year were compared to those from the second year. The significance level was set at 0.001 because of the large number of comparisons being made.
Results. In the second year, study subjects identified more accurately behaviors or experiences that are not associated with HIV transmission, such as mosquito bites. Attitudes towards persons infected with HIV were more positive in the second year. Also, more subjects knew the correct meaning of the acronym S.I.D.A. (AIDS in French) in this second year. Subjects from the second year were less worried about themselves or somebody close getting AIDS and thought it less probable that AIDS would become epidemic in all segments of the Canadian population. There was no significant change in reported sexual behavior.
Conclusion. There has been a slight improvement in knowledge related to AIDS and attitudes towards HIV-infected persons in the Haitian population of Montréal, Canada, from 1987 to 1989. Haitians are better informed about behaviors not associated with HIV transmission. We do not know if this increased knowledge is directly related to the fewer worries and the improving positive attitudes towards persons infected with the HIV in this population. We have not been able to document changes in risk behaviors. HIV risk-reduction interventions will need to focus on specific risk reduction practices.

M.D.P.34 SAFE AND UNSAFE SEX AMONG HOMOSEXUAL MEN IN THE NETHERLANDS

Tielman, Robert A.P. * and Polter, S. *.
Gay and Lesbian Studies Department of the University of Utrecht, The Netherlands.

Objective. To investigate sexual behavior of homosexual men in the Netherlands, their knowledge about HIV and AIDS, and their attitudes concerning safer sex and AIDS prevention.
Methods. A cohort of readers of the largest Dutch gay paper 'De GAY Krant' and activists of the gay movement was investigated at the beginning of 1986, 1987, 1988 and 1989. 522 men returned at least three questionnaires. A multiple regression analysis was made on having anogenital sex.
Results. No significant differences were found between the activists and non-activists in knowledge, attitudes and behavior related to AIDS. Those investigated are very well informed about AIDS and safer sex guide lines. In 1986 (and 1988) the safer sex guide lines were followed always by 28% (became 49%), in most cases by 52% (became 39%), and sometimes or never by 21% (became 12%). Having receptive anal intercourse with orgasm without using a condom at least once during the last six months before returning the questionnaire went down from 48% in 1986 to 26% in 1988. The main factors correlated with continuing having anogenital sex in 1986 and 1988 are: having a steady monogamous relationship (0.23, $p<0.001$) or a steady open relationship (0.13, $p<0.01$), looking upon anogenital sex to be 'the real sex' (0.17, $p<0.001$), and being homosexually active for a shorter period (0.10, $p<0.05$). Conclusion. Dutch homosexual men are well informed aboutsafer sex and tend to act accordingly. Those continuing having anogenital sex tend to have steady relationships.

M.D.P.35 PREDICTING HIV RISK BEHAVIORS AMONG GAY MEN

Robert Wood*, L. Krueger*, P. Diehr**, K. O'Reilly***. The AIDS Project, Seattle King County Department of Public Health*, University of Washington**, Seattle, WA, Centers for Disease Control, Atlanta, GA***; USA

Objective: To identify persons who will continue sexual risk taking despite basic safe-sex counseling, in order to target supplemental interventions.

Methods: We analyzed initial and 6 month followup data from AIDS counseling and testing clinic clients who participated in a longitudinal cohort study of men who have had sex with men. Data collected include recent sexual behavior and indications of attitudes, knowledge and beliefs surrounding sex, drugs and AIDS.

Results: Data from 517 men who completed both questionnaires are included. We found that 20% of respondents were practicing unprotected anal sex at followup. (We eliminated those in monogamous relationships with like serostatus partners). Five independent predictors of this risk taking we identified are shown below. Initial unsafe behavior was the strongest predictor, but the other predictors were significant after controlling for initial risk. These significances held up in a split sample analysis.

Predictor	Odds Ratio	95% CI
Initial unsafe behavior	3.06	1.93, 4.81
Perceives risky sex as low risk	1.93	0.32, 11.7
Believes AIDS will be curable	1.85	1.19, 2.87
History of drug or alcohol abuse	2.14	1.43, 3.20
History of unsafe sex with drugs or alcohol	2.63	1.65, 4.19

Conclusions: Clinical strategies to induce sexual behavior change in gay men should focus additional counseling efforts on individuals with a profile matching the predictors of continued risk taking. These include individuals who initially practice high risk sex, and believe that unsafe sex is not risky, those who believe a cure for AIDS will soon be found, and those with a history of drug or alcohol abuse or who report risky sex associated with drug and alcohol use.

M.D.P.36 KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR ABOUT AIDS IN THE 14TO20 AGE GROUP. EVALUATION OF AN EDUCATIONAL PROGRAM

Böhm W.*, Heckmann W.**, Michel S.***, Seyrer Yann****
Sen.f.Schulw.Berlin*,**BGA-AIDS-Zentrum , ***uni.****WHO-Centre Paris, FRANCE

Objective: To assess the KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR of N=770 Students from a vocational schoolcenter in Berlin-W. They are involved in a special schoolprogram to inform on AIDS by special trained physicians or biology teachers.
Methods: Knowledge about transmission, risk factors, use of condoms, attitudes, beliefs and former sexual education were collected by a questionnaire with standardized and open questions before(n=770), four weeks(n=572) and six month(Sept.88) after(n=431) the lessons.
Results: After six month there was a higher acceptance of using condoms, and still very high level of information about ways of transmission and risk factors. Coping with fear, confidence, stable partnership, communication and the competence of using condoms are most important factors to prevent HIV-Infection. Only 11% proposed instead of enlightenment, measures of repressive control. Although >90% of the students had sexual education <2% had learned to speak about feelings and emotions related to sexuality. Students would not isolate HIV+persons.
Conclusions: Six months after the AIDS information lesson students still have a high level of AIDS related information and competence. They are interested in more lessons about sexuality and partnership, and about AIDS as a social problem. The approach of 'personal prevention' is necessary, because it is closing the gap between the preventive information - given by the mass media('medial prevention') - and the necessary preventive acting of adolescents. This approach can induce short- and longtermed preventive effects.

M.D.P.37 SEXUAL BEHAVIOUR AND HIV RELATED KNOWLEDGE AMONG A RANDOM SAMPLE OF YOUNG POPULATION OF ITALY.

Marasca Giuseppe*, D'Arcangelo E**., De Candido D.***, Della Giusta G.**, Liseo B.**, Pezzotti P. , *et al.*
*Istituto Superiore di Sanità, Rome Italy, **University of Rome, Rome, Italy, ***Pragma-INRA, Rome,Italy.

Objectives. To quantify sexual activity and behaviour and to determine HIV related knowledge.
Methods. A random sample of young population (age 16-30) was selected using a nested sampling procedure. Nine local authorities (Comuni), three each for Northern, Central and Southern Italy and, for each area, one for each of the following population size (10,000-50,000; 50,001-500,000; >500,000) were randomly selected in order to be representative of metropolitan, urban and rural areas. A random sample, proportional to the population size of the selected local authorities (LA), was than selected from the Residents Register. An official letter, mentioning the broad scope of the research and the support given by the LA to the initiative was sent to the selected individuals. Each individual was then contacted by specially trained interviewers who handed him out a structured questionnaire for self completion. The key questions were: age at first sexual intercourse, numbers of sexual partners in different time periods, use of condoms, knowledge about HIV transmission and use of IV drugs.
Results. 1,450 individuals were contacted. Valid questionnaires were obtained in 1,044, with an overall response rate of 72%. Analysis is not yet completed and will be presented at the Conference.
Conclusion. The good response rate suggests that the population in Italy is prepared to answer questions about their sexual lifestyle.

M.D.P.38 PEER NORMS FOR SAFER SEX AS A PREDICTOR OF SEXUAL RISK BEHAVIORS IN A COHORT OF GAY MEN

Exner, Theresa M., Meyer-Bahlburg, H.F.L., Gruen, R.S., Ehrhardt, A.A., and Gorman, J.M.
HIV Center for Clinical and Behavioral Studies; New York State Psychiatric Institute; Columbia University, New York, NY, USA.

Objective. Recent evidence suggests that positive peer norms for safer sex are associated with sexual risk reduction. This study looked at sexual risk behaviors as a function of perceptions of peer norms for safer sex in a sample of gay men. Subjects are primarily white and middle class; target ages: 19-60 years.
Method. Subjects provided a detailed sexual history, and completed a self-report measure evaluating peer norms regarding safer sex, modeled after Fishbein's theory of reasoned action.
Results. Preliminary analyses (N=70) indicate that approximately 74% of the cohort engaged in sex with multiple partners. Rates of at least one occasion of unprotected sex were: 56% (receptive anal); 41% (insertive anal); and 80% (active oral). Subjects' perceptions of positive peer norms for safer sex were associated with having fewer sex partners (p<.025), with being monogamous (p<.005), with fewer sex occasions (p<.05), and with lower incidence of unprotected active oral sex, but not with incidence of unprotected insertive or receptive anal activity.
Conclusion. Perceptions of peer norms for safer sex mediate at least some sexual activities, even in a sample of gay men from a highly organized community. Failure of peer norms to predict unprotected passive anal activity may be related to greater incidence of such activity among monogamous men (p<.025).

M.D.P.39 GAY IDENTIFICATION INFLUENCES THE EFFECTS OF ALCOHOL USE ON AIDS RISK BEHAVIOR

Peterson, Peggy L.; *McKirnan, D.J.
University of Alabama at Birmingham, *University of Illinois at Chicago, USA

Gay males' shift toward safe sex is often attributed to their identification with an active community which promotes safe sex, in contrast to IV drug users. Our data, however, show that many gay males slip from safe sex and that this is often related to alcohol use. Given the importance of the gay bar, we reasoned that identification with the community, while providing safe sex norms, may also induce risk via exposure to alcohol settings. This process may differ by levels of gay identification.
Objective. To examine the complex relationships among gay identification, involvement in the gay community, alcohol settings, and AIDS risk behavior.
Methods. A structured interview among a sample of 87 gay men from a large urban area.
Results. For all respondents, alcohol use, both by the individual and their primary social network, increased risk for unsafe sex. However, for highly gay identified respondents, alcohol use increased risk behavior via alcohol use in multiple gay settings, and not primarily the bar. In contrast, for low identified respondents, AIDS risk behavior was stongly related to bar-going.
Conclusion. Alcohol continues to be an important risk factor for unsafe sex among gay men. Further, such risk factors operate differently for those with different levels of gay identity. Thus, understanding and/or preventing AIDS risk behavior requires that specific cultural features of the gay community be examined.

M.D.P.40 KNOWLEDGE, ATTITUDE AND PRACTICE RELATING TO AIDS AMONG A RANDOM SAMPLE OF STUDENTS AT A PARIS UNIVERSITY.

Juan Manares*, P. Echevarria*, V. Massari*, F. Lapont*, J. Chwalow**, S. Lesieur* et al. *INSERM U263, Université Paris 7. 2, pl. Jussieu, 75251 PARIS, Cedex 05, FRANCE. ** INSERM U21, Villejuif, FRANCE

Objective: To provide a database on perception and reaction of beginning university students with regard to the AIDS epidemic in ordre to develop a continuously adapted program of information.
Methods : A one in five random sample including 671 male and female, 17-22 year old students answered a self-administered anonymous questionaire exploring, through 140 items, knowledge, attitudes and practice with regard to health in general, sexually transmitted diseases and AIDS.
Results: The response rate was 98%. Less than 5% of questions were unanswered. Questions concerning sexual practice have the same response rate as those concerning knowledge and attitudes. Students are concerned by the quality control of condoms. While 58 % say that they know that condoms, without reference to quality, reduce the risk of getting AIDS, this frequency rises to 92% when the condom proposed has the quality control seal. While 72% of the students actually plan to use condoms, only 49% of questions concerning the practical use of condoms were correctly answered by those students having sexual intercourse and only 40% of students say that they really use it (26% sporadically, 14% systematically). These latter figures do not differ between males and females nor between students with a single sexual partners and those with more than three sexual partners.
Conclusion: A proposed program of information should include a wholly explicit explanation about the practical use of condoms. A pilot program is to be proposed for adoption after discussion with students about specific sensitization and motivation.

Travailleurs de la santé
Health Care Workers

M.D.P.41 DECENTRALIZED SERVICES: GLOBAL NETWORK-TYPE APPROACH

BOUCHARD, ANDRÉE, MORISSETTE, M.R.
PREVENTION AND TESTING TEAM, QUEBEC CITY, Qc, CANADA

Objective: To make accessible medical and psychosocial services in order to provide persons concerned by HIV infection and AIDS with quality services.
Methods: 1. Setting up of a general practitioner/physician network working in the public and private sectors. Selection according to interest, geographical distribution, accessibility and operation methods (confidentiality). Main approach: pre and post-test counselling, coded on-site sampling, medical follow-up, psychosocial referral. 2. Setting up of a network of psychosocial professionals working in the public and private sectors. Priority interventions: individual consultations, support groups for seropositive persons, case management. Professional expertise: social workers, psychologists, sexologists. 3. Training of medical and psychosocial intervening parties, information to target groups, interventions among media, health education. Access to services through Info-Health (24 hr. hot line).
Results: After one year: 1. Staff: 35 physicians, 7 social workers, 2 sexologists, 2 psychologists, 3 nurses, distributed across 18 service points. 2. Achievements: 237 referrals to the medical network by Info-Health, 22 group meetings (seropositive persons), 85 interviews (psychotherapy, sex education, support), 47 communications made to the media, 33 presentations (lectures, conferences).
Conclusion: The "network" team is operational. Offered services aim at reaching target groups to help them to reduce their risk factors and to support them in what they are experiencing.

M.D.P.42 OVERESTIMATIONS OF RISK FOR OCCUPATIONAL HIV TRANSMISSION AS A FACTOR WITHIN AIDS-HIV EDUCATION AND CARE

Grade, Margaret M., Bernad, H.S., Ficarrotto, T.J., Zegans, L.S., Ziegler, J.L., University of California, San Francisco School of Medicine, USA

Objective. To assess the perceptions of personal and occupational risk for HIV infection as they potentially function as co-factors in the capacity of professional health care students to assimilate AIDS-HIV information and provide related care. Method. Having determined by previous study that an apparent lack of knowledge about HIV was frequently reflective of opinions/perceptions (versus knowledge) about occupational risk, a measure was developed specific to related beliefs. Incoming medical and nursing students at a major university training center were asked to estimate the consequent risk of engaging on a single occasion in a number of occupational behaviors [e.g. performing CPR (including mouth-to-mouth resuscitation) on an AIDS patient] and in a number of personal behaviors [e.g. French kissing (deep mouth-to-mouth) with a person with AIDS]. Items were formulated both for their common place within medical and nursing practice and in specific instances because consequent risk had been scientifically estimated (e.g. accidental needle stick, unprotected genital intercourse). A 6-point Likert-type scale was utilized as follows: 'No Risk' (0); 'Very Low Risk' (<1 in 200,000); 'Low Risk' (1 in 50,000); 'Moderate Risk' (1 in 3,000); 'High Risk' (>1 in 300); 'Very High Risk' (>1 in 3). Students were administered the scale as part of a larger questionnaire inclusive of three sections: Risk Perception, Attitudes; Knowledge. A nonequivalent control group design was employed. Questionnaires were administered at two points in time: upon matriculation and following a 10 week, 19 hour AIDS elective course. Results. The majority of students surveyed significantly overestimated risk for HIV infection as compared to both scientific estimates and the informed opinions of experts. Determinant factors in addition to the type and extent of contact included: whether or not there existed visual testimony to illness (e.g. K.S. lesions); whether or not an individual was seropositive and symptomatic versus asymptomatic; and at a pilot point of survey, whether or not the patient (described as having bitten the provider) was demented. Of note, is that those persons who were less knowledgeable were also more likely to overestimate risk (and unfortunately, less likely to take the aforementioned course). It was likewise the case that those persons most likely to endorse attitudinal items considered counter to optimal care were most likely to overestimate risk. In fact, results from multiple regression analyses indicated that the best predictor of negative AIDS attitudes (including professional resistance to providing care) was overestimation of risk for HIV infection. Finally, despite a positive trend, perceptions of risk were not significantly altered by traditional educational interventions. Conclusions. Importantly, further administration and revision is indicated in order to substantiate the validity of the measure itself, in particular to ascertain whether or not numerical anchor points are correctly interpreted by respondents. Available results do suggest that attendance to the topic of personal and professional risk for HIV infection is of particular importance within the context of AIDS education. Of import is not only attendance to biomedical findings and fact but perceptions which may preclude the assimilation and application of such knowledge. Effective education would assumedly be of a multimodal sort inclusive of direct attention paid to those issues germane to fear of contagion.

M.D.P.43 JOB-RELATED STRESS AMONG HIV-ANTIBODY TEST COUNSELORS

Fuss, D.*, Schulz, Susan Lloyd*, Fagan, R.*, Rhodes, F.**
*Centers for Disease Control, Atlanta, GA, USA,
**California State University, Long Beach, GA, USA

Objective. To assess determinants and levels of stress among counselors. Methods. In July 1987, a questionnaire designed to measure AIDS/HIV-related knowledge, attitudes/opinions, counseling behavior, counselor stress, and demographic factors was self-administered by 78% (201) of all HIV counselors in counseling and testing sites in California. Results. Respondents tended to be female (62%), white (82%), college educated (97%), and generally scored well on knowledge questions. Gender, professional training or degrees, and volunteer versus paid status were not associated with differences in knowledge about HIV/AIDS. Psychometric properties were evaluated for the knowledge questions (Chronbach's alpha = 0.58) and stress items (Chronbach's alpha = 0.87). In factor analysis of the stress items, three distinct factors emerged: burnout (Eigenvalue = 9.4), time pressure (Eigenvalue = 1.8), and helplessness/hopelessness (Eigenvalue = 1.7). ANOVA and correlation analyses showed no significant associations between levels of stress and counselor age, counselor gender, sexual orientation, ethnicity, years of education, or score on the AIDS knowledge test. More stress was reported by counselors who perceived less choice in determining their role (r = -.3, n = 169, p = .002). Also, the lower the level of support from the administrator, the higher the level of reported stress (r = -.03, n = 166, p = .005). Conclusion. Counselors experience varied types of stress, moderated by choice in counseling and perceived support from administrators, suggesting stress mediators which may be used to target interventions.

M.D.P.44 PRIMARY CARE PHYSICIANS' KNOWLEDGE, ATTITUDES AND WILLINGNESS TO TREAT AIDS PATIENTS

Fordyce E. James*; Stoneburner, R.*, Gamson, D**, Colombotos, J.**, and Elinson, J.**.
*New York City Dept. of Health, **Columbia University, New York, New York U.S.A.

Objective. To examine the relationship between physician knowledge, attitudes, personal characteristics and AIDS prevention and treatment practices. Methods. Telephone interviews of a representative sample of 473 primary care physicians in New York City were taken during 1988 about knowledge, attitudes and clinical practices toward AIDS prevention and treatment. Results. Among physicians surveyed 61% had AIDS patients in their practice, and 77% had offered or recommended the HIV antibody test to a patient. Thirty-six percent of physicians would refer an HIV+ patient elsewhere rather than manage alone or in consultation. Stepwise logistic regression analysis estimated the adjusted odds ratios between physician characteristics and willingness to treat AIDS patients shown below.

Characteristic*	Adjusted Odds Ratio	95% C.L.
Age <= 40 years	3.27	1.95-5.47
Practice Internal Medicine	2.29	1.53-3.42
High AIDS Knowledge	3.22	1.59-6.51
Liberal Political Orientation	1.74	1.15-2.65

*Physicians' race and attitudes towards homosexuals were not retained in the final logistic model when controlling for variables shown above.

Conclusion. Preliminary data suggest that physician age, specialty, level of knowledge and political orientation are associated with willingness to treat AIDS patients.

M.D.P.45 COLLABORATIVE EVALUATION STUDY OF AIDS TRAINING PROGRAMS FOR WOMEN'S HEALTH PROVIDERS

Duke, Sharen I.*; Drucker, E.**; Gillette, P.***; Sacks, H.****
*NYC Dept. of Health, NYC, NY, USA, **Montefiore Medical Center, Bronx, NY, USA, ***SUNY Health Science Center at Brooklyn, NY, USA, ****Mt Sinai Medical Center, NYC, NY, USA.

Objective. To develop, implement and evaluate AIDS training programs for health care providers of inner-city women, so that AIDS education, prevention and counseling can be incorporated into routine women's health services. Methods. Three NYC teaching hospitals have been selected to conduct training programs for a total of 750 women's health providers using three distinct models: (1) a competency-based, teaching symposia model; (2) a multi-modality model; and (3) a training-of-trainers model. Using a quasi case-control study method to evaluate training effectiveness, pre- and post-training questionnaires were developed to measure changes in provider knowledge, attitudes and medical practices. As a further assessment of provider trainings, patients are being asked to report on the AIDS prevention services they receive. Results. Changes in provider knowledge, attitudes and medical practices before and after the AIDS trainings will be described and analyzed across the three hospitals. Differences in outcome will be reported. Conclusion. As a result of provider training in AIDS education, prevention and counseling, most women's health providers now incorporate these services into their routine health care. As a next step, it is important to ascertain whether provider training has an effect on the knowledge of AIDS and risk reduction practices among inner-city women who voluntarily seek health care.

M.D.P.46 THE NEEDS OF PERSONS LIVING WITH AIDS

Nena Nera, M.Sc.S.W., C.S.W., Social Services Advisor, Federal Centre for AIDS, Health and Welfare Canada, Ottawa, Canada

A needs assessment study was conducted across Canada to identify and prioritize the major palliative care needs of persons living with AIDS. A two-part questionaire was developed to gather both quantitative and qualitative information on eight core issues considered to be critical in the care of AIDS patients. A targeted sampling approach was used to ensure that within four categories of potential respondents, Canadians who had varying amounts of experience in caring for persons living with AIDS were included. The respondents were drawn from every region of the country which included 27 hospitals, 28 palliative care programs, 15 home care/visiting nurse services and 13 community AIDS groupr. This presentation will present the results of this study and describe how Canadians who care for persons living with AIDS have spoken about the resources they require to provide an effective and a humane response to this devastating disease. This study has major implications in the development and expansion of Canada's present health care system.

M.D.P.47 THE KNOWLEDGE AND UNDERSTANDING OF HUMAN IMMUNODEFICIENCY VIRAL (HIV) INFECTION AMONG HEALTH CARE WORKERS (HCW) IN TEACHING AND NON-TEACHING HOSPITALS IN JAMAICA.

Fitzroy A. Orrett; P. Prabhakar
Department of Microbiology, University of the West Indies, Mona, Jamaica, W.I.

The Acquired Immune Deficiency Syndrome (AIDS) is now evolving into a global epidemic affecting a wide cross section of the world's population. Public education on AIDS in Jamaica began in April 1987. No known case of HIV infection in Health Care Workers (HCW) has been reported in Jamaica or in the Commonwealth Caribbean and neither has any study been undertaken to assess the understanding of HIV infections in Health Care Workers in Jamaica.

The aim of this study therefore, was to assess the knowledge and understanding of H.C.W. on HIV transmission and isolation and precaution to be instituted for control of HIV infection and also, to ascertain whether any differences in knowledge existed between H.C.W. of teaching and non-teaching hospitals. A total of 650 questionnaires were sent to H.C.W. in four hospitals - (3 non-teaching and one teaching), of which 509 were returned, a response rate of 79%. Questions on AIDS transmission via blood transfusion and sexual intercourse and proper disposal of sharps received highest scores (85-100%), embracing all groups at both teaching and non-teaching hospitals. The greatest area of misunderstandings and misconceptions were reflected in responses obtained on isolation precautions which received low scores (< 30%) for both teaching and non-teaching hospitals.

Our study demonstrated that there was no difference in the knowledge of HIV infection among HCW in teaching and non-teaching hospital, and a urgent need for a comprehensive approach to education of HCW on prevention and control of HIV infection in Jamaica.

M.D.P.48 IMPACT OF AIDS WORKSHOP ON KNOWLEDGE AND ATTITUDES IN HEALTH CARE WORKERS

Christie, Grania; Zazayokwe, M.; Sher, R.; Metz, J.
AIDS Training and Information Centre, South African Institute for Medical Research, Johannesburg, South Africa.

OBJECTIVE. To determine the state of and change in health care workers (HCW) knowledge and attitude towards HIV infection and AIDS after attending a workshop.
METHODS. Ten two-day workshops were held for HCW from different population groups in 1988. The workshops addressed the natural history, transmission and prevention of infection, psycho-social aspects and counselling. The information was presented using a combination of didactic sessions, audio-visual material, role plays, group activities and discussion. 200 participants completed a pre and post-test questionnaire designed to ellicit attitudes towards knowledge of the disease. The questionnaires were analysed comparing (1) knowledge before and after the workshop, and (2) the correllation between knowledge and attitude.
RESULTS. Significant differences were found in knowledge and attitudes before and after the workshop. The majority of respondents lacked basic knowledge prior to the workshop. In addition, attitudes changed with more knowledge and anxiety decreased significantly.
CONCLUSION. The results of this study confirm that workshops promote knowledge, improve attitudes and thereby assist HCW in providing optimal care to patients and dissemenating education for prevention of HIV infection and AIDS.

M.D.P.49 EXPERIENCE WITH AIDS AMONG 3500 ZAIRIAN HEALTH WORKERS, 1987-1988

Moore, Melinda *,**, Hassig SE *,**, Lusakulira N *, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire
** Tulane University, New Orleans, USA

Objective. To determine the current level of AIDS experience among health workers (HW) throughout Zaire.
Methods. We surveyed 3462 physicians, nurses, health facility workers, community HW and traditional healers.
Results. A total of 42% reported personally knowing someone with AIDS, and 18% had cared for an AIDS case. Cases were reported from urban and rural areas of all regions. Half of these personnel (especially physicians) favor informing a patient of his HIV(+) or AIDS status, and 62% favor informing the family. However, only 8% of AIDS cases and 22% of their families were in fact informed. These percentages increased greatly between 1987 and 1988, when national policy permitted informing cases of their AIDS status. One-third of personnel favor isolation of AIDS cases, and 3% recommend killing them.
Conclusions. 1) This is the first report suggesting that AIDS can be found throughout Zaire. 2) Patients and families are generally not informed of the AIDS diagnosis. 3) Negative attitudes of HW toward AIDS cases must be addressed to ensure a more positive role of HW in AIDS education activities.

M.D.P.51 GENERAL PRACTITIONERS AND MANAGEMENT OF HIV INFECTION

Massari Véronique*, Landman R.**, Fagnani F.***, , A-J. Valleron*
* INSERM U263, Paris, France, ** Service des Maladies,Infectieuses, Hôpital Bichat, Paris, France, *** INSERM U240, Paris, France.

Objectives: To survey current practice and attitudes among GPs in relation to screening for the presence of HIV and in relation to the management of HIV infection in asymptomatic, seropositive patients.
Methods: A questionnaire was mailed to all sentinel GPs (n-500) of the French Communicable Diseases Network (1% sample, representative of GPs in France). Questionnaire components included: demographic data and attitudes towards HIV screening and follow-up of patients, personal methods for obtaining information about the disease, HIV antibody testing and their strategies for the management of HIV infection.
Results: The response rate was 78%. Within the context of their medical practice, 57% said that they were affected by the subject of HIV infection, while 29% were already caring for an infected individual. 97% of these GPs thought that it was useful for them to follow infected patients. 88% considered these patients to be a normal part of the practice of medicine for a GP. 38% complained that they did not have enough information to do this. 20% of these GPs had reservations about caring for an infected patient and 3% expressed fear of contagion. There was a positive relationship between having reservations about treatment and the perception of the lack of information ($p < 0.05$). 9% of GPs had no systematic attitude toward HIV screening and always waited for patients to request the test. HIV testing was systematically proposed by 52% of the GPs in the case of premarital screening, by 45% for prenatal patients, by 37% for IV drug users, by 30% for homosexual patients.
Conclusion: The better informed a GP is, the more likely he is to have a positive attitude towards prevention and care of HIV infection. HIV testing is more often proposed by GPs when the subject is not 'a priori' at risk (i.e. premarital or prenatal screening).

M.D.P.53 ACCESS TO DENTAL CARE IN THE SAN FRANCISCO AIDS BEHAVIORAL RESEARCH COHORT.

Gerbert, Barbara; Maguire, B.; Sumser, J. and Coates, T.
University of California, San Francisco, California, United States.

Objective. Press accounts in recent years have reported cases of dentists refusing to provide care for people with AIDS and HIV infection. These reports have raised doubts about whether such patients have full access to dental care. We wished to learn the extent to which a cohort of men with HIV disease or at high risk for HIV disease has been denied dental treatment.
Methods. The San Francisco AIDS Behavioral Research Cohort were surveyed in November 1988. This group of gay men has been surveyed annually since 1984 to track their reactions to the HIV epidemic. The response rate was approximately 70% (n=326).
Results. Only 3 respondents (1.5%) reported having been rejected from a dental practice in the past 3 years because of their HIV status. Only 16% said they would not inform their dentist if they were HIV positive. Over half (56%) indicated they would freely volunteer the information to .their dentist. The remainder said they would disclose their status under certain conditions, e.g., if oral manifestations of the disease were present.
Conclusion. The low prevalence of denial of care suggests that dentists in this community have responded well to the needs of this population. The relative willingness of patients to disclose highly sensitive medical information may be a reflection of the positive response of dentists. It may also reflect strong state and local laws safeguarding confidentiality and prohibiting discrimination and the relatively positive response of San Francisco to the epidemic.
This study was supported by NIMH & NIDA Center grant #MH42459.

M.D.P.50 A KAP SURVEY OF HEALTHCARE WORKERS IN BANGKOK ABOUT AIDS

Phanuphak, Praphan*, Sittitrai, V.** and Veerasukont B.***
*Chulalongkorn University Hospital, **Center for AIDS Research and Education, Thai Red Cross Society, ***National Statistical Office Bangkok THAILAND

Objective. To assess the knowledge, attitude and practice concerning AIDS among Thai healthcare workers (HCW) in order to find out the basis for their fears and the means to minimize such fear.
Methods. Questionnaire survey was conducted in 274 HCW in 3 hospitals in Bangkok during August-September 1988. Twenty-eight percents of the subjects thought that they have already had some exposure to HIV patients.
Results. 1. Knowledge: Almost a quarter of the HCW admitted that they knew very little about AIDS. The misunderstanding was mainly the risk of HIV transmission with body fluids and the uncertainly about the efficacy of HIV inactivation procedures.

2. Attitude: More than half of the HCW stated that they rather preferred staying away from HIV patients because of the fear of contracting the disease which they partly blamed the inadequate facility provided by the hospital.

3. Practice: To make the HCW feel more comfortable in caring for HIV patients, they requested more frequent lectures and information distribution, particularly the measures to prevent nosocomial infection. They also requested free anti-HIV screening for themselves as well as better patient care facilities.

Conclusion. Results from this study can be used as the background informations for every effort to improve the attitude and the quality of patient care in countries where HIV infection just emerges and resources are limited.

M.D.P.52 WOULD PATIENTS SWITCH PHYSICIANS IF THEIR DOCTOR WERE HIV POSITIVE?

Gerbert, Barbara; Maguire, B.; Hulley, S. and Coates T.
University of California at San Francisco, San Francisco, California, United States.

Objective. To ascertain patients' perceptions of HIV in physicians' offices, including their reactions to physicians with HIV disease.
Methods. Telephone interviews were conducted in July and August 1988 with 2000 English-speaking, United States adults using a representative national sample generated by random digit dialing. A 75% response rate was achieved. The denominator for the data reported below is all those who received medical care from a physician in the past five years (n=1880; 94% of sample).
Results. Thirty-three percent of the respondents considered it likely that patients could get AIDS from an HIV infected physician. Forty-five percent believed that HIV positive physicians should not be allowed to continue to work (compared to 23% who believed HIV positive school teachers should not work). Fifty-six percent of respondents said they would find another physician if they believed their doctor were HIV positive. Twenty-five percent of the respondents said they would find another physician if they believed their doctor were treating people with HIV disease. Patients who said they would find another physician tended to believe that the virus could be transmitted from an infected physician to patients.
Conclusion. Patients are concerned about the presence of HIV in their doctors' offices and have misconceptions about the likelihood of transmission which should be addressed by public education programs.
Funded by NIMH & NIDA #MH42459 and the Universitywide Task Force on AIDS.

M.D.P.54 FEAR OF CONTAGION IN HOME HEALTH AIDES: A COMMUNITY SURVEY

Meisenhelder, Janice Bell, New England Deaconess Hospital, Boston, MA, U.S.A.

Objectives: to determine the potential for scarcity of home health aides (HHA) willing to care for persons with AIDS (PWA), and perceived reasons for this deficit.

Methods: A community telephone survey was conducted to the majority of proprietary agencies in one metropolitan area. A total of 31 agencies qualified for the survey and fully answered the questions. The person in charge of assigning HHAs, usually a nursing supervisor, was asked three questions: 1) Are you having difficulty or do you anticipate having difficulty finding HHA willing to care for PWA's? 2) If so, why are HHAs refusing to go into the homes of PWAs? 3) Would a continuing education program for HHAs on HIV infection be useful to your agency?

Results: Difficulty finding HHA willing to care is outlined below:

Agencies	YES	NO	DON'T KNOW
experiencing difficulty	18	1	
anticipating difficulty	9	2	1

Thematic analysis of answers to second question showed a high fear of contagion among HHA's. Contributing factors commonly identified included ethnic and cultural backgrounds of HHA, family pressure, and ignorance. Five of the supervisors felt strongly that education alone was not the answer. The interviews suggested an "agency atmosphere" which either contributed to or ameliorated fear, which coincides with known theory on group anxiety.

Conclusion: Home health agencies may have difficulty meeting increasing needs of PWA's for personal home care due to the cultural, social, as well as educational factors which contribute to fear of contagion among home health aides.

M.D.P.55 HEALTH WORKERS AND AIDS: KNOWLEDGE, ATTITUDES AND EXPERIENCES AS DETERMINANTS OF ANXIETY.

Fouchard, Jan*; Krasnik, A.**, Bayer, T.** and Keiding, N.**.
* Statens Serum Institut, Copenhagen, Denmark, ** University of Copenhagen, Denmark.

Objective. Research and case reports have demonstrated insufficient knowledge, negative attitudes and anxiety related to HIV/AIDS among health professionals. This study has been carried out to identify possible determinants of anxiety in order to establish educational programmes focusing on factors relevant for reducing anxiety and improving professional behaviour.
Methods: A random sample consisting of 2561 Danish medical doctors, nurses and nurse aids received a mailed questionnaire on anxiety related to AIDS care and experiences, knowledge and attitudes regarding gay men and HIV/AIDS.
Results: The responses (74%) have been analysed by multiple logistic regression based on a model suggesting a hierarchy of causal dependencies where anxiety is assumed to be a response to all the 11 remaining variables. The results of the analysis demonstrating a major influence of attitudes towards HIV-infected persons and gay men on anxiety will be presented. Implications for education and psycho-social support of health care workers will be discussed.

M.D.P.56 KNOWLEDGE OF HIV TRANSMISSION AND ATTITUDES ABOUT AIDS AMONG 629 REGISTERED NURSES AT A MINNESOTA HOSPITAL.

Campbell, Scott*; Maki, M.**; Willenbring, K.* and Henry, K.*†
Department of *Medicine and **Infection Control, St. Paul-Ramsey Medical Center; †University of Minnesota Medical School, St. Paul, Minnesota, U.S.A.

Objective. To determine the level of AIDS transmission knowledge among registered nurses practicing at a hospital located in a mid-range area of incidence for HIV infection.
Methods. In September 1987 an anonymous survey was delivered to all registered nurses at a 455-bed acute care teaching hospital and its associated clinics. The survey included a 40 point, 9-item scale which quantified the level of knowledge about AIDS and transmission of HIV infection.
Results. A total of 629 RNs responded. Of all respondents, 78% agreed with the statement "AIDS is easily spread by needlesticks"; specifically, 40% believe the risk of HIV infection after incurring one needlestick injury from an AIDS patient is at least 25%, and 22% believe the risk is at least 50%. While 87% correctly indicated that HIV cannot be spread through the air by a cough or a sneeze, 30% stated that they would wear a gown or mask if they had to enter the room of an AIDS patient. Though only 15% believe HIV infection is more common among hospital workers than other workers, 52% think at least weekly about "catching AIDS" at work, and 25% think daily about this possibility. One-half (47%) favor mandatory HIV testing for hospitalized patients. A third (35%) have received hepatitis B vaccine; 7% of the non-vaccinated gave "fear of AIDS" as a reason for declining the vaccine. While 86% hope their hospital plays an active role in caring for AIDS patients, 25% indicated that they try to avoid caring for AIDS patients, and 55% believe hospital employees should be able to refuse to care for AIDS patients. One-third (33%) indicated they do not have confidence in the AIDS medical information given to the public.
Conclusions. As nurses play a pivotal role in health care delivery, including community education, their knowlege and attitudes regarding AIDS is crucial. The above results demonstrate that among RNs there is a considerable level of misinformation, mistrust and fear regarding AIDS. Education for RNs should address specific issues regarding the occupational risk for HIV transmission and build their level of confidence in this information in order to optimize the quality of nursing care given by RNs to AIDS patients.

M.D.P.57 THE AIDS-RELATED KNOWLEDGE, ATTITUDES, AND BEHAVIOR OF INTERNISTS AND SURGEONS: A COMPARATIVE ANALYSIS

Henry, Keith*; Campbell, S.*; Eyer, S.** and Willenbring, K.*
Departments of Medicine* and Surgery**, St. Paul Ramsey Medical Center and University of Minnesota Medical School, St. Paul, Minnesota, U.S.A.

Objective. To identify factors accounting for differences and similarities of AIDS-related knowledge, attitudes, and behaviors between surgeons and internists.
Methods. In September 1987 an anonymous survey was delivered to all physicians at a 455-bed acute-care teaching hospital. Included in the survey were scales measuring AIDS-related knowledge, behaviors, attitudes, homophobia, and homosexual bias.
Results. A total of 68 internists- IM(68/98; 69%) and 34 surgeons- SG(34/69; 49%) responded. Three of the IMs and one SG identified themselves as homosexual. The IMs had a lower mean age (38.1 vs 40.0; p = .062), and were more likely female (84% vs 65%; p = .059). The only gender related difference in the parameters studied was a higher level of homophobia among male MDs (p =.014). The IMs were less biased in their attitudes towards homosexuality (p = .048) but were not significantly less homophobic than SGs. The IMs reported more favorable behaviors in hypothetical situations with AIDS patients (p < .001) and had slightly higher AIDS knowledge scores (p = .088) than SGs. IMs more frequently reported knowing someone with HIV infection (45/67; 15/34; p = .030) and they had more often cared for someone with AIDS (61/67; 22/34; p = .005). SGs were much more concerned about acquiring HIV through work exposure (p < .001) and reported a much greater level of contact with patients (p < .001). A majority (25/34; 73%) of surgeons were in favor of mandatory HIV testing of all hospitalized patients, while a minority (11/66; 17%) of IMs favored this (p < .01). Forty-seven percent (16/34) of the SGs and 29% (19/67) of the IMs desired a secret HIV test for themselves (p=.09).
Conclusions. SGs may exhibit less desirable behaviors towards PWAs compared to IMs due to more homosexual bias and more concern about at-work exposure. Education programs need to innovatively address these issues.

M.D.P.58 KNOWLEDGE, ATTITUDE AND CONCERNS OF HOSPITAL STAFF ABOUT AIDS

Gallop, Ruth; Taerk, G.; Lancee, W.J.; Coates, R.; Fanning, M. and Keatings, M. University of Toronto, Toronto, Canada

This paper will report on phase I of a study of hospital staff designed to test various interventions directed at improving the empathic care of staff working with AIDS patients. In phase I, a 52 question survey (Pringle et al, 1986) of approximately 1050 staff was conducted (200 physicians [DR], 700 nurses, technologists and related clinical services [NU] and 150 administrative staff[AD]. Data was analysed within 5 factors: Knowledge; attitudes about homosexuality; screening; concerns about contagion; and the need for isolation. On average health professionals knew the correct answers for 68% of the knowledge questions (DR-71%, NU-65%, AD-68%). All groups appeared comfortable with homosexuality, although findings within specific items question this espoused comfort. For example, 26% of DR, 29% of NU and 21% of AD indicated they would prefer to take care of a patient who had contracted AIDS by a transfusion. Twenty percent of DR, 34% of NU and 26% of AD expressed concern about their ability to be empathic to a gay AIDS patient. Attitudes towards isolation were mixed. Half of the nurse group supported isolation, 38% of DR and 24% of AD. Over half supported screening for AIDS: 63% of NU, 54% of DR and 53% of AD. Forty percent of NU, 37% of DR and 17% of AD believed staff should have the right to refuse to care for a patient with AIDS. Higher knowledge levels are significantly associated with lower levels of concerns re isolation and contagion. It can be conjectured that the consistently higher proportion of NU in the concerned groups is a reflection of the more direct care or contact component of the subjects work. Finally findings will be compared with 2 other hospital surveys conducted by this research team.

M.D.P.59 KNOWLEDGE AND ATTITUDES OF RURAL GEORGIA PHYSICIANS CONCERNING AIDS

Smith, M. U.*, Godeau, R. E.**, and Katner, Harold P.*
*Mercer University School of Medicine, Macon, Georgia, USA., **Central Georgia Rehabilitation Hospital, Macon, Georgia, USA.

Objective. To assess the AIDS-related knowledge and attitudes of the active physician and non-physician employees of a rural tertiary care hospital in the Southern US; to identify correlates of negative feelings toward AIDS patients and AIDS care.
Method. All 280 physicians and a randomly selected 10% (n=340) of the non-physician hospital employees were asked to complete an anonymous mail questionnaire regarding their knowledge about AIDS, fear of contagion, and responses to and attitudes toward AIDS patients. Physician response rate was 81%; non-physician rate 57%.
Results. Of individuals who are involved in direct patient care, 87% of both physicians and non-physicians reported that they disliked caring for AIDS patients either moderately or intensely. 93% of both groups felt they have a right to demand that they be informed when a patient has AIDS or is suspected of having AIDS. 64% of physicians agreed that "doctors should have the option of refusing to care for AIDS patients without penalty." 45% of MD's / 38% of non-MD's agreed that they would not touch an AIDS patient if they could easily avoid it. 13% of MD's a/17% of non-MD's reported being "afraid to go in an AIDS patient's room." 38% of MD's (50% of residents) and 35% of non-MD's reported having friends or family express concern about getting AIDS from them. 30% of the physician respondents disagreed or were unsure whether AIDS transmission through casual contact has not been documented. 21% of physicians indicated that knowing more about AIDS had not made them more comfortable in working with AIDS patients. Fear of contagion was significantly correlated with negative attitudes toward AIDS patients (r=.53; p=.0001), and employees who are involved in direct patient care were significantly less likely to report fear of contagion (Chi square, p=.04).
Conclusions. Strikingly negative attitudes toward AIDS patients and their care were held by both physicians and non-physicians in spite of generally good knowledge about AIDS. Fear of contagion was correlated with negative attitudes toward AIDS patients, and direct care givers reported less fear.

M.D.P.60 STAFF DISCOMFORT IN WORKING WITH HIV SPECTRUM PATIENTS

Enck, Michael D.; Dow, M.G.
University of South Florida, Tampa, Florida, USA

Objective. To determine levels of staff discomfort and reasons for discomfort in working with various types of patients, including those within the HIV spectrum.
Method. 643 workers in Florida community mental health centers and drug abuse programs were surveyed regarding their attitudes and knowledge about AIDS. The questionnaire included a section on level of discomfort and reasons for discomfort in working with 11 different types of patients.
Results. The study found that 55% of staff would prefer to avoid working with HIV positive individuals. Statistical analyses demonstrated that hesitance was greater among mental health staff, compared with drug abuse staff. In particular, mental health staff indicated relatively greater discomfort working with homosexuals and IV drug users. For both staff groups, working with HIV-infected patients resulted in greater discomfort than working with homosexuals. Providing services to AIDS patients was viewed as more discomforting than working with any other group except child molesters. Results indicate that fear of contagion may be the primary concern in treating HIV spectrum patients, followed by discomfort with terminal illness, IV drug use and homosexuality.
Conclusion. Significant discomfort among these staff members, and its primary basis in unrealistic fears, point to the need for additional training in AIDS/HIV issues for mental health and substance abuse caregivers.

M.D.P.61

"ANALYSIS OF NURSE-AIDS PATIENT VERBAL INTERACTION BY THE SAVI"

Gir,Elucir* ; Moriya, T.M.* and Carvalho, E.C.
* University of São Paulo, Ribeirão Preto - São Paulo - Brazil

Objectives: To determine the time nurses spend with an AIDS patient and to identify the categories predominantly uttered by the pair using the System of Analysis of Verbal Interaction. (SAVI).
Method: Three nurses and 3 AIDS patients admitted to a large Brazilian hospital were observed over 15 sessions of 6 hours each. All the verbal episodes of the pair were recorded with paper and pencil and the recordings were submitted to 3 referees trained to divide the episodes into units and classify them into one of the 28 categories of the SAVI.
Results: During the 5400 minutes of observation, the nurses werepresent for 183 minutes(3.38%), other members of the nursing team were present for 1141 minutes (21.13%), and no member was with the patient for 4076 minutes (75.48%). From the 366 interaction units uttered by nurses, the 5 most frequent were: Description 93 (25.41%); Topic Questions 86 (23.50%); Maintenance Question 36 (8.84%); Command 34 (9,29%) and Positive Reinforcement 21 (5,74%). The patients utterred 1378 units,in interaction with nurses and other professionals of nursing. The most used were: Response Narrow 327 (23.73%); Quiet 228 (16.55%); Personal Sharing 151 (10,96%); Description 148 (10.74%); Topic Questions 128 (9.29%).
Conclusion: The nurse spent little time with the patient, considering the multiplicity of her functions. The categories uttered by nurse and patient during this period showed a clear interaction with openings for a dialogue and without negative categories indicating hostility, affect, defense etc.

M.D.P.63

Assessment of Nursing Home Preparation for Long-Term Care of Persons with HIV Infection

M. Linsk, Midwest AIDS Training and Education Center, University of Illinois at Chicago, U.S.A.

Objective: Areas with increasing incidence of HIV and AIDS require a continuum of community based and residential services, yet nursing homes have been slow to respond to the epidemic. This study investigated activity of long-term care facilities regarding admission policies, staff education efforts and perceived problem scare for persons with HIV infection.
Methods: Anonymous mail questionnaires using forced-choice and open-ended questions sent to all Chicago and a sample or surrounding facilities.
Results: 65 homes completed anonymous mail surveys about attitudes and activities related to AIDS/HIV. While 10% reported applications of persons discussions of prospective AIDS residents, with forty percent reporting sending staff to AIDS education programs. Identified difficulties in serving HIV infections were ranked, with reimbursement rating as the greatest problems followed by staff cooperation. A quarter of the homes reported they would admit PWA's to their facility if reimbursement was improved.
Conclusion: Findings suggest that although a number of existing facilities engage in preparatory activities related to care for PWA's, there is a dearth of receptive facilities. Education and social policy interventions are indicated to improve the available resources for long-term care of PWAs.

M.D.P.65

MEASURING ATTITUDES ABOUT AIDS AMONG PUBLIC HEALTH PERSONNEL USING THE SEMANTIC DIFFERENTIAL TECHNIQUE

Tousignant, Yves[A,B]; Adrien, A.[A,C]; Ste-Marie, L.[B].
[A]Community Health Department, Montreal General Hospital, [B]Université de Montréal, [C]McGill University; Montréal, Québec, Canada.

Objective. To develop a questionnaire measuring attitudes about AIDS and related phenomena and to evaluate such attitudes in public health personnel.
Methods. Twenty-eight adjective pairs were selected to represent 5 dimensions: evaluative, potency, activity, fear and respect. Five categories of objects were evaluated: AIDS, persons with AIDS or carrying the virus, mandatory anti-HIV screening test, means of protection against HIV transmission, behaviors associated with HIV transmission. The questionnaire was completed by 79 subjects working in a Montréal community health department. Adjective pairs with low variance were eliminated and factor analysis identified salient dimensions and corresponding adjectives.
Results. Two correlated ($r=+0,385$) dimensions were identified: one evaluative and one representing "perceived responsibility"; each was composed of 3 adjective pairs and Cronbach's alpha was 0,862 for the first dimension and 0,872 for the second. Possible results ranged from 3 (negative) to 21 (positive) with 12 being the neutral point. More negative affects were associated with AIDS itself (5,0) or sexual abstinence as a means of protection (7,2). Positive affects were noted only for sexual faithfulness (14,5). Perceived responsibility was positive for all protection means (mean of 17,2) and slightly negative for behaviors associated with HIV transmission (mean of 9,0).
Conclusion. Results show that the questionnaire is reliable and that it discriminates well between attitudes towards risk behaviors and protective behaviors. The semantic differential is thus a valid method for measuring attitudes towards issues related to AIDS.

M.D.P.62

COUNSELING PROFESSIONALS WITH HIV NEEDLE STICK INJURIES

de Caprariis P.J., M.D.*, Dansky S., C.S.W.**, Rodriguez G., C.S.W.*, Lavicna L., Phd.*, Madera Inez, R.N., B.S.*, Visconti E., M.D.**, Ditchek A., M.D.* Mirenberg R., R.N., B.S., C.I.C.**, Cohen C., B.S.**, Shea K., B.S.N.**
* Sunset Park Family Center of the Lutheran Medical Center, Brooklyn, N.Y., USA
** Lutheran Medical Center, Brooklyn, N.Y., USA

Objective: To establish an effective counseling service specifically developed for medical professionals who have had significant blood or body fluid exposure to the HIV virus. They should quickly be linked to a comprehensive counseling session which not only addressed scientific questions but also allays fears and resentments which could jeopardize their care of patients. By exploring knowledge, value systems and concerns, we help ameliorate anxiety as well as other psychosocial stressors that may affect functioning in the health care setting. Pre and post HIV test counseling guidelines were developed specifically for the health care professional.
Methods: Employee Health Services is notified of all blood and body fluid exposures in the hospital setting. Health Service has been educated as to exposures which are or are not significant. The health professional worker is questioned as to the extent of blood exposure. Those who have been significantly exposed are then seen by a certified HIV counselor for an in-depth session. An HIV blood test is offered, and a post HIV session is scheduled with the same counselor. A medical specialist is on call to answer any scientific questions which cannot be answered by the counselor.
Results: Professionals as a result of this program are able to reassess and improve relevant coping mechanisms. They reduce irrational thinking and replace it with a manageable perspective. They become knowledgeable concerning HIV testing procedures and develop greater sensitivity on confidentiality issues.
Conclusion: This program seems to reduce fears and appropriately adjust relevant value systems. Infection control guidelines are strengthened and reasonable cautions are reinforced with regard to future patient care.

M.D.P.64

AIDS MINI-SURVEY ON ATTITUDES, BELIEFS AND KNOWLEDGE AMONG DENTAL PROFESSIONALS IN METROPOLITAN MONTREAL

Soto,J.; Levy,M.; Allard, R. and Pérès,E. Department of Community Health, Saint-Luc Hospital, Montréal, Québec, CANADA

This preliminary study was conducted to assess current concerns regarding AIDS among dental professionals. A 74 items questionnaire was distributed to a sample of 25 dentists, 13 denturologists and 13 hygienists. Response rate was 92 %. The average age of the study group was 35.9 (range 23 to 65). 70.2 % of respondents believed that they have a responsability to treat people with AIDS. Only 8.5 % of respondents said they do not want to treat persons at risk for AIDS. 72.3 % thought that there exists some risk of being infected by working with a colleague who has AIDS. On a 21 item knowledge scale the average score was 11.5. The perceived ability to identify AIDS oral lesions on a 6 point scale was : 2.6 for dentists, 2.3 for hygienists and 1.4 for denturologists. Participants stated that 3.7 % of their patients are at risk of HIV infection. AIDS changed the practice of 68.1 % of respondents (use of gloves was privileged). 42.6 % of the study sample was not vaccinated against hepatitis B. Hygienists and denturologists showed lower rates of HBV vaccination than dentists ($p=0.01$ X^2test). Among dentists, non vaccination to HBV was associated to lower utilisation of gloves ($p=0.03$ Fisher's exact test). This survey shows that dental professionals are concerned with AIDS, however some deficiencies on AIDS knowledge and the application of infection control measures are apparent. A larger survey involving a representative sample from the province of Quebec is being conducted.

M.D.P.66

HIV-PATIENTS' PERCEPTIONS OF THEIR GENERAL PRACTITIONERS.

Michael H. Kochen*, J. Hasford** and the Munich/Berlin Clinical AIDS-Group.
*General Practitioner, **Biometric Center for Therapeutic Studies, Munich/W-Germany.

Objective. As the number of people infected with the Human Immunodeficiency Virus (HIV) grows general practitioners (GPs) are increasingly involved in their care. We studied patients' perceptions of their GPs'attitudes towards and services provided for HIV-infection with special emphasis on problems of confidentiality.
Methods. We interviewed unselected HIV-patients in 3 hospitals, 3 outpatient clinics and 1 self-help group in Munich and West-Berlin. With the help of an anonymous structured questionnaire patients were asked for their and their GPs' demographic data, place of HIV-testing, GP's knowledge of and attitude towards the patient's HIV-status, rejection of treatment, reception in the GP's office and perceived level of the doctor's knowledge about HIV and AIDS. Until today 161 patients were approached and 153 agreed to interview.
Results. 87% of the patients were male, 13% female; 65% were between 20 and 40 yrs of age. 60% of the patients were homo- or bisexual men, 16% intravenous drug abusers (IVDA), 12% hemophiliacs. One third of these HIV-infected persons suffered from AIDS. 83% were registered with a GP whose specialty was internal medicine in 42% and family medicine in 32%. Only 20% were tested in the GP's office, 38% in the clinic and 16% in anonymous test-sites of the public health service. 6% of the patients said that their GPs were unaware of their HIV-infection but almost 18% did not answer this question. 32% trusted their GPs most, 43% their clinic doctors. Confronted with physical problems 59% would consult with their GP and 30% with a clinic physician. However, in emotional troubles only 16% would go to a doctor at all. Two thirds of the patients stated that their GP had enough time for them, 70% that the reception by the office-personnel was friendly or at least neutral. 14 patients were rejected at least once by a doctor (20 by a dentist) because of HIV-infection. 58% perceived their doctors' HIV-knowledge as excellent or good, 9% as bad. 71% were generally satisfied with their GP but 21% asked for more engagement of the doctor with the patients' problems.
Conclusion. Patients' perception of the level of their GPs' attitude, knowledge and management was surprisingly good. Although the GP-office does not seem to be a popular place for initial HIV-testing, many HIV-infected persons feel themselves in good hands with their family doctors.

M.D.P.67

HIV-RELATED PROBLEMS FACING GENERAL PRACTITIONERS (GP)IN BELGIUM.

Dirk Avonts*, Buntinx F.** and Sweetlove P.**
* Institute of Tropical Medicine, Antwerp, Belgium and ** Scientific College of General Practitioners in Flanders, Belgium.

In November 1988 a telephone survey was conducted among a representative sample of 195 GP's (2.8% of the total number) in Flanders (Belgium). The items studied were : the proportion of GP's caring for seropositives or Aids patients, the indications for HIV-testing and the measures taken to avoid infection during medical practice. Eight percent of the GP's have at least one known seropositive patient and 1.5% take care of an Aids patient. All physicians with HIV-infected patients follow them, whereas only 15% of the GP's without HIV-experience feel for providing this medical care.

Number (%) of physicians asking HIV-test on different indications and number (%) of physicians informing the patient about the demand for analysis.

indication	asking for HIV-test no./total (%)		information of the patient no./total (%)	
physical fatigue	21/195	(10.8)	14/21	(67)
pregnancy	56/195	(28.7)	41/56	(73)
STD	166/195	(85.1)	111/166	(67)
"health check-up"	46/195	(23.6)	35/46	(76)
on the request of the patient	136/195	(69.7)	-----	----

One third of the physicians say to have changed their medical practice to avoid infection. Ninety seven percent use gloves while examining mucosae. In their office 60% use a needle-box for used injection equipment, whereas during home visits 75% of the GP's leave the used needles and syringes unprotected with the patient visited.

Specific training for GP's is needed to be familiar with the skills of counseling seropositives and more information and education is desired to implement the HIV-test in a more appropriate way.

M.D.P.68

EVALUATION DE QUATRE DISPOSITIFS DE RECUPERATION DES AIGUILLES USAGEES POUR LA PREVENTION DE L'INFECTION HIV CHEZ LES PERSONNELS DE SANTE ET PROPOSITION DE CRITERES DE CHOIX

Vincent-Ballereau,F*, Fisch,A.**,Malkin,J.E.**, HAROCHE,G**
* Centre Hospitalo-universitaire, Angers, France ; ** Centre Hospitalier, Villeneuve St Georges, France.

Objectifs. Plusieurs dispositifs visant à éviter les piqûres accidentelles des personnels de santé sont aujourd'hui disponibles ; ceux-ci sont hétérogènes dans leur conception et leur utilisation pratique. Nous avons testé quatre d'entre eux selon des critères rationnels et mesurables.

Méthodes. 80 infirmières de 7 services différents de notre CHU ont testé 4 dispositifs couramment utilisés : Sharps Container (Sherwood), Sharpsafe (LSA), Recup-aiguille (Amedis) et Securoject (Astrium). Dix critères quantitatifs ou qualitatifs furent cotés: 1.Facilité de désolidarisation de l'aiguille de la seringue ou du corps de pompe.2.Possibilité d'évacuation d'autres matériels (bistouris, trocarts...). 3. Risque de reflux.4. Résistance physique et chimique du container. 5. Incinérabilité.6.Stabilité.7.Herméticité après usage. 8. Adaptabilité aux différents usages (chariot de soins, plateau...)9.Présence ou non d'un désinfectant.10.Rapport qualité/prix.

Résultats. Ils sont globalement satisfaisants pour les 4 dispositifs, mais il existe certaines disparités, en particulier pour les critères 3,4,5,9.

Discussion. Les critères retenus apportent une ébauche de méthodologie pour une évaluation objective des différents dispositifs mis sur le marché ; ils sont utilisables dans chaque structure de soins et devraient permettre une acquisition raisonnée fondée sur un ensemble de critères objectifs et mesurables. Il conviendrait cependant, pour une meilleure utilisation, d'affecter chacun de ces critères d'un coefficient qui reste à déterminer.

M.D.P.69

MYTHS AND STIGMAS ABOUT AIDS IN HEALTH PERSONNEL IN A LATINAMERICAN COUNTRY.

Garcia ML*, Izazola JA*, Valdespino JL*, Alanis L*, Cravioto ML*, Basañez R*, Sepúlveda J.*
*General Directorate of Epidemiology, Ministry of Health. Mexico

Objective: To obtain information about knowledge and attitudes of health personnel towards AIDS and the influence of communication media over them.

Methodology: A survey was done on a randomized sample of 896 health workers (h.w) (598 doctors and 298 nurses) working in care areas in institutional hospitals in 6 cities in Mexico.

Results: Although most h.w. identify the disease as produced by HIV (91%), 34% identify it as a cancer and 36% as a disease of homosexuals . 15% associate it to casual contact, and 17% to blood donation; more than 95% identify correctly sexual, blood and perinatal transmission and preventive measures. 29% consider that general population should be HIV tested. 51% are afraid of being infected, 51% would reject an infected person, 93% would feel ashamed if a relative becomes infected, and only 23% would provide financial assistance. 51% would have sexual relations with an infected partner. 8% would refuse taking care of an infected patient and 57% would request another person to do it. 63% consider homosexuality a mental illness, 16% a sin, 60% a sexual aberration; 51% would not have homosexual friends. 49% consider prostitution inmoral, 23% a sin and 51% socially condemned. No significant difference was found between attitudes in nurses and doctors. Their contact with information media is adequate, they consider that the messages are of good quality but incomplete.

Conclusions: Results show discordance between having received information and the level of knowledge and attitudes. This was consistent and regardless of having received information about AIDS. Information is not enough to modify deeply ingrained attitudes. Educational campaigns must design specific educational strategies that influence social and psychological areas and not only cognitive aspects.

M.D.P.70

HIV-1 KNOWLDEGE, ATTITUDES AND RISK PERCEPTION IN BIOMEDICAL RESEARCH FACILITY EMPLOYEES

Gershon, Robyn; Vlahov, D.; Curbow, B.
Johns Hopkins University School of Hygiene and Public Health, Baltimore, MD, USA

Objective: To identify and characterize HIV-1 knowledge, fear and risk perception among employees at a biomedical facility active in AIDS research. Methods: A questionnaire was self-administered by a random sample of 274 employees stratified into occupational groups: 1) custodial/maintenance, 2) clerical/administrative, 3) technical, 4) scientific. Information on potential occupational exposure to HIV-1 was available. The response rate was 64% (n=174). Results: Knowledge scores were high and not significantly different between groups except on a subset of questions dealing with casual modes of transmission. On this section groups 1 and 2 scored significantly lower than groups 3 and 4 ($p < .05$). Fear levels were similar across groups; 36% of custodial, 15% of clerical, 26% of technical and 10% of scientific staff reported moderate to high levels of fear. Surprisingly, despite high knowledge levels and wide differing levels of actual risk of exposure, approximately 40% of each occupational group felt themselves to be at occupational risk of HIV-1 infection; approximately 30% of workers assigned their odds of infection to 1/10,000 or greater. Conclusion: Although potential actual risk of occupational exposure to HIV-1 varied greatly among a group of research facility workers, similar levels of fear, concern and risk perception were noted. The relatively high levels of fear in low exposure groups may be the result of misunderstandings regarding HIV-1 exposure in the workplace.

M.D.P.71

MEDICAL STUDENTS' KNOWLEDGE AND CONCERNS ABOUT HIV INFECTI

Strunin, Lee and Culbert, Arthur
School of Public Health, School of Medicine, Boston Univ.
U.S.A.

Objective: to examine the knowledge, concerns and attitudes of medical students about HIV, treatment of AIDS patients, and affect on careers.
Methods: In May 1988 124 1st year and 103 2nd year medical students at Boston University School of Medicine completed an anonymous questionnaire.
Results: All students were knowledgeable about casual, anal/vaginal and drug use transmission of HIV. Significantly more 2nd year than 1st year students reported knowing a great deal about transmission of HIV; risk behaviors, and risk groups. Less than 25% of either year reported knowing a great deal about the legal or ethical obligation to treat AIDS patients, or the cost to patient and society; and less than 10% reported being taught about these issues. Over 50% of both years said yes or did not know whether prostitutes, IV drug users, pregnant women, people getting married, and immigrants should be tested for HIV. 95% of 2nd years and 89% of 1st years worried about being infected as medical students, and 45% of 2nd years and 58% of 1st years wanted or were not sure if they should be allowed to refuse to treat AIDS patients. 45% of 2nd years and 37% of 1st years reported that the epidemic will influence their decision to practice clinical medicine.
Conclusion: Medical students' concerns about becoming HIV infected may influence their decision to practice clinical medicine. Their unwillingness to treat AIDS patients has implications for patient care. Curricula should address HIV transmission, implications of testing and other AIDS-related policies, and legal, ethical and patient/societal issues.

M.D.P.72

RISK OF OCCUPATIONAL EXPOSURE TO HIV INFECTED BODY FLUIDS AND TRASMISSION OF HIV-I AMONG HEALTH CARE WORKERS:A MULTICENTRE STUDY

Ippolito,Giuseppe; Cadrobbi,P.; Carosi,G.; Episcopo, F.; Finzi,G.; Puro,V.; Ranchino,M.; Vlacos,D.
The Italian collaborative study group on HIV occupational risk, ITALY

Objective. To evaluate the risk of occupational exposure to blood and other potentially infected body fluids and the risk of trasmission of HIV infection.
Methods. Nine italian hospitals (7840 beds) have been enrolled in a multicentric study on occupational risk among health care workers (HCW). The study is supported,in part, by the italian Ministry of Health (AIDS Project). All partecipant hospital have started, between 1985 and 1987, a prospective surveillance of occupational exposures. The risk of exposure, per person/month of work, has been calculated.
Results. As of december, 1988, 255 occupational exposures to HIV infected blood or body fluids (parenteral 71.7%, mucous-membrane exposure 28.3%) have been observed, on a total of 2520 exposures to potentially contaminated materials. All HCWs exposed to HIV, were prospectively followed and none of them seroconverted after a median follow-up of 13 months (range 2-34 months). The HIV at risk exposures by occupational group were: nurses 62 %, phisicians 20.7%, housekeeping 9.8%, laboratory technicians 7.5%. The risk of exposition per month of work (on a total of 345891 person/month of work) and employment category was: Physicians .0006, Nurses .0009, Housekeeping .0004, Laboratory technicians .0001.
Conclusions.Despite massive information, the risk of occupational exposure to HIV contaminated materials continue to be high, but the risk of infection is low.

M.D.P.73 ADVERSE EXPOSURES TO BLOOD AND BODY FLUIDS AMONG PRACTICING MIDWIVES IN THE UNITED STATES

Willy, Mary E.*; Dhillon, G.**; Loewen, N.**; Wesley, R.* and Henderson, D.K.* *Clinical Center, N.I.H., Bethesda, MD., U.S.A.
**Georgetown University School of Nursing, Washington, D.C., U.S.A.

Objectives. To 1) assess the frequency and intensity of adverse exposures to blood and body fluids and 2) assess the attitudes toward and practice of Universal Precautions (UP) among practicing midwives in the United States.
Methods. Detailed questionnaires requesting demographic data, knowledge and use of infection control procedures, and frequency and types of adverse exposures to blood and body fluids were distributed to certified nurse midwives in the U.S.
Results. 1784/2963 (60%) returned completed questionnaires. 1562 (88%) of the 1784 respondents provide patient care. Of those providing care, 65% have completed masters level training. With respect to knowledge and use of UP, 55% reported using UP in their practices. Of those not using UP, 10% reported unfamiliarity with UP; 38% felt UP unnecessary; and 79% reported that UP interfere with the patient-midwife relationship. Only 54% perceive a high risk for occupational infection with hepatitis B virus; and 43% perceive a high risk for occupational infection with HIV-1. 49% have received hepatitis B vaccine. Of the 1562, 375 (24%) reported 923 needlestick exposures and 792 (51%) reported 2159 instances of facial splashes with blood or amniotic fluid in the past 6 months.
Conclusion. This national sample of a small, but well-educated population of health-care workers demonstrates a high frequency of exposures to blood and body fluids. Although only a small percentage were unfamiliar with UP, almost half do not use UP in practice. These data emphasize the need for effective UP education, stressing both the presence of occupational risk as well as appropriate measures to minimize this risk.

M.D.P.74 THE IMPACT OF AIDS ON HEALTH CARE PROVIDERS: AN ANNOTATED BIBLIOGRAPHY AND INTERNATIONAL SURVEY

Eakin, J.M., Kelner, Merrijoy, Taylor, K.M.
Physician Behaviour Research Unit, Department of Behavioural Science, University of Toronto, Toronto, Ontario, Canada, M5S 1A8.

To understand further the impact of AIDS on health care providers, two international projects have been commissioned by the Global Program on AIDS of the World Health Organization.

(1) Annotated International Bibliography. Drawing on health care and social science literature from around the world, the bibliography will focus on the psychosocial impact of AIDS for the providers of health care on factors associated with this impact, and on the implications of providers' response for the health care system and for quality of care. The bibliography will be based on a theoretical model of health care provider behaviour. Each citation will include a summary and an analytical commentary.

(2) International Survey. Approximately 161 countries will be surveyed to identify: 1) the range of health care providers in each country who are currently caring for AIDS and seropositive individuals; 2) the major problems faced by these providers, and strategies to deal with them; 3) the settings in which care is being given, the sources of funding, and the role of government in providing care; 4) ongoing research that focuses on the behavioural impact of AIDS on health care providers; 5) services and strategies that will be required in the future and 6) people who are interested in participating in future studies of health care providers and their response to AIDS.

M.D.P.75 THE ROLE OF HOMEMAKER/HOME SUPPORT SERVICES IN AIDS CARE IN CANADA

Jacobson, Kathleen*; Fietz, M.**
* Canadian Council on Homemaker Services, Toronto, Ontario, Canada
** Family Service Centre of Ottawa-Carleton, Ottawa, Ontario, Canada

Objective: To report the results of the Canadian Council on Homemaker Services' AIDS training needs assessment study and describe service care delivery issues in the homemaker industry in Canada and Europe.
Methods: Preliminary data from the 1989 C.C.H.S. Study on Homemaker Services & Training Needs for AIDS care and from the 8th International Congress of the International Council on Homemaker Services (May 7 - 12, 1989) will be presented to identify the issues affecting the delivery of homemaker/home support services to persons with HIV/AIDS and their partners/families. A comparison of the predominant issues in Canada with those in Europe will be made based on the information presented in a workshop on "Palliative Care and AIDS care" at the 8th International Congress of I.C.H.S. by Margaret Fietz, Canada and Doris Frank, Switzerland.
Results: Homemaker services to persons with AIDS are now being provided in Europe and Canada through various Home care models. Results will be available prior to June, 1989 indicating preferred models, training and support required, client-directed coordination methods, etc.
Conclusion: Participants will increase understanding of factors influencing effectiveness of home support/homemaker service for persons with HIV/AIDS in Canada, with similarities to European care models noted.

M.D.P.76 THE DOCTOR-PATIENT RELATIONSHIP: IS IT WORKING FOR PEOPLE WITH HIV INFECTION?

Roland, Michelle and Temoshok, L.
University of California School of Medicine, San Francisco, CA., U.S.A.

Objective. While many articles have been written from the physician's point of view about the doctor-patient relationship, there are few data-based studies from the patient's perspective. The aim of this study is to document the patients' perceptions of their experiences with their health care providers.
Methods. 103 seropositive homosexual men with at least one HIV-related symptom were recruited from the UCSF AIDS Clinic and administered a semi-structured interview inquiring about stressors and coping, at 3 time points about 6 months apart.
Results. Data are presented on the frequency and nature of stressful and supportive interactions with HCPs over time in the following areas: (a) communication/ information regarding symptoms, treatments, test results, diagnosis, and medical procedures, (b) HCP attitudes about treatment, (c) diagnostic skill, (d) treatment efficacy, (e) hospital stays, (f) clinical drug trials, (g) financial concerns, and (h) appointments. Responses are also tabulated according to type of health care provider and facility, as well as diagnostic status of the subject at the time of the interview. Most subjects reported one or more significant stressors in their relationships with their HCP and/or staff at the clinic, office or hospital; however, many also cited seeing their HCP as a way of dealing with various stressors. Patterns of doctor-patient relationship stressors and coping changed over time.
Conclusion. A comprehensive understanding of patients' changing needs for information, support, and guidance in the context of the doctor-patient relationship over time and the course of disease will permit HCPs to respond more effectively to these needs or to make appropriate referrals.

M.D.P.77 AIDS/HIV INFECTION: KNOWLEDGE, ATTITUDES, AND BELIEFS OF DENTAL HEALTH FACULTY AND STUDENTS

Shin, Diana M.* and Wong, A.Y.**
*Center for Interdisciplinary Research in Immunology and Disease (CIRID) at University of California at Los Angeles (UCLA), USA **University of California at Los Angeles (UCLA) School of Dentistry, USA

Objective: To assess the current knowledge, attitudes, and beliefs of dental health faculty and students relative to AIDS/HIV infection in an area of high prevalence of HIV infection.
Methods: Knowledge of AIDS/HIV infection, attitudes, and beliefs relating to the care of those with AIDS, HIV infected, or at risk were measured by anonymous questionnaires at a school of dentistry in Los Angeles, Fall 1988. Responses received from 63 faculty members, 161 preclinical (year 1 and 2), and 173 clinical (year 3 and 4) students were analyzed.
Results: Preliminary data demonstrated AIDS knowledge (measured by 20 items) was generally high, yielding a high mean correct score for all three groups [17.2, 17.7, and 16.9 for the faculty (F), clinical students (C), and preclinical students (PC), respectively]. However, there were a number of people who incorrectly answered questions relating to the belief that HIV transmission could result from: the water supply (22% F, 19% C, 18% PC); food handlers (19% F, 17% C, 21% PC); airborne transmission (22%F, 16% C, 22% PC); and donating blood (19%F, 26% C, 32% PC). Many dental faculty and students had a negative attitude regarding the dental professional's obligation to treat the AIDS/HIV infected individual; contributing to the reluctance by all three groups to treat was the fear of becoming infected and the potential loss of other patients. Although both dental faculty and students felt that AIDS patients had a right to quality dental care (94%F, 94%C, 87%PC), many felt dental professionals should be allowed to refuse care to AIDS patients (24%F, 44%C, 34%PC; $p<.05$) and/or refer such individuals (30%F, 54% C, 47%PC). Among the three groups there were differences in perceived skills to diagnose and treat AIDS/HIV infected patients: 42% of the clinical students, 70% of the preclinical, and 27% of the faculty believed their skills to be less than adequate. Both faculty and students expressed a desire to learn more about AIDS/HIV infection and infection control.
Conclusion: Preliminary data suggest that lack of knowledge regarding AIDS transmission, lack of skills, and concerns about the risk of contagion may be deterrents to treating AIDS/HIV infected patients. Education is indicated for both dental health faculty and students and should address these specific factors to promote treatment of HIV infected patients by present and future dental health professionals.

M.D.P.78 PHYSICIANS' PERCEPTION OF PERSONAL RISK FROM AIDS (HIV VIRUS)

Taylor, Kathryn M., Skinner, H.A., Eakin, J.M., Kelner, M.J., Shapiro, M.
Physician Behaviour Research Unit, Department of Behavioural Science, University of Toronto, Toronto, Ontario, Canada, M5S 1A8.

This research reports on physician perception of personal risk as a key element of their response to AIDS. Using a measuring instrument we developed, the Physician AIDS Profile, we surveyed 440 physicians from a variety of specialties with a range of exposure to AIDS and seropositive patients. We obtained a 61% (N=267) response rate from the mailed survey.

The concept of personal risk was differentiated into: 1. physical risk of contagion and 2. social risk (such as professional burn-out) in caring for HIV positive patients. Separate indices were derived for each type of risk and statistical analyses were conducted. The significant findings included: (1) perceived physical risk was moderately but not highly correlated with perception of social risk (Pearson's $r=.49$, $p<.001$), (2) primary source of income (fee for service vs. salary), not medical specialty, was the most significant demographic variable in predicting physician perception of physical and social risk, and (3) perception of social risk tended to decrease as physicians were exposed to more seropositive patients in their practice, whereas there was no linear relationship between perception of physical risk and number of seropositive patients. Physicians' perception of personal risk is a key factor in understanding their complex response to AIDS.

M.D.P.79

PRACTICES AND ATTITUDES OF HEALTH CARE WORKERS (HCW) TOWARDS HIV-INFECTED PATIENTS IN A LARGE ACUTE CARE HOSPITAL.

Schlech, Walter*; MacDonald, S.**; Fanning, C.**, Lefort-Jost, S.**
* Dalhousie University Faculty of Medicine and Victoria General Hospital
** Victoria General Hospital, Halifax, Nova Scotia Canada

Objective. To determine the attitudes and practices of HCW towards HIV-infected patients (HIV pts) in an 800-bed university hospital.
Methods. A 60-item anonymous questionnaire was distributed to 2,425 HCW Dec. 1988-Jan.88. Standard demographic data, occupation, compliance with hospital guidelines, knowledge and attitudes about HIV, hepatitis B and sexuality were assessed.
Results. 1,137 responses(47%) have been analyzed to date. 44% of physicians and 56% of nurses had cared for HIV pts. 56% nurses vs 30% physicians wore gloves for blood drawing or line placement (p<.001). 77% nurses vs 42% physicians wore gloves to move HIV patients from stretcher to bed (p<.001). Both groups thought it more likely that they could acquire HIV from work-related activities than non-work-activities. Both groups took more inappropriate precautions for HIV pts vs HepB pts (p<.001). 33% of physicians and 50% of nurses thought they should have the option to refuse care for HIV pts. 80% felt that gay men should be screened for HIV on admission; 40% felt that hospital staff should be screened. 50% felt HIV(+) staff should not be permitted to give direct patient care.
Conclusions. Despite intensive HIV education in our hospital, significant personal fear and misinformation still exist. Comparison of attitudes toward HepB and HIV suggest some fears are based on attitudes rather than risk.

M.D.P.80

AIDS AND DENTAL HEALTH PROFESSIONALS:KNOWLEDGE,ATTITUDES AND INFECTION CONTROL PRACTICES

Sy,Francisco*,Steplight,N.**,Kronenfeld,J.*,Daniel,J.** and Jackson,K.*.*University of South Carolina School of Public Health,**South Carolina Department of Health and Environmental Control,Columbia,S.C.,USA.

Objective. To determine the knowledge,attitudes and infection control practices related to AIDS among dental health professionals.
Methods.694 dentists and dental hygienists responded to a survey.The questionnaire contained 54 multiple choice questions on knowledge,attitudes and infection control practices. Scores for knowledge,attitudes and infection control practices were calculated. Data were analyzed using chi-square tests, two sample T-tests,analysis of variance and Pearson correlation matrix.
Results.Respondents were quite knowledgeable about AIDS and HIV transmission. 75% knew the oral manifestations of AIDS.Dentists had a higher mean knowledge score than dental hygienists.Dental hygienists scored higher on infection control practices than dentists.57% of the dentists felt safe in treating AIDS patients.Older dental professionals had lower levels of knowledge about AIDS and infection control practices.There was no correlation between perceived risks and infection control practices.
Conclusion. Despite their high level of knowledge about AIDS,only 57% of the dentists were willing to treat AIDS patients and 43% perceived that they were at risk for HIV just like other health care workers.Only 64% of the dentists reported always using gloves. More educational efforts should be aimed at dental professionals with emphasis on allaying their fear of AIDS and improving their infection control practices.

M.D.P.81

A METHOD FOR IMPLEMENTATION OF UNIVERSAL PRECAUTIONS

LaCharite, Christopher Marino, S. Nottebart-Finn, V. Sniffen, J. Platt, R.
Brigham & Women's Hospital, Boston, Massachusetts USA

Objective Develop a method for simple and objective determination of protection required by universal blood and body fluid precautions which are recommended by the CDC.
Method A form was designed that allows identification of representative procedures, the types of exposure to potentially infectious material, and the probability of exposure. Specification of risk of exposure and type of fluid automatically indicates the barrier precautions required.

				Exposed Body Parts						Contamination of Clothing					
				Hands			Face			Soiling			Saturation		
				Probability						Probability					
				High	Low	None	High	Low	None	High	Low	None	High	Low	None
	Body Fluid			Gloves			Masks & Goggles			Cover-ups			Impervious Gowns		
Tasks	Blood	Other	None	Req	Avail	None	Req	Avail	None	Req	Avail	None	Req	Avail	None

Body Fluid
blood = blood, visibly bloody fluids, genital secretions, tissues, CSF, synovial, amniotic,pleural, peritoneal, pericardial
other = saliva, sputum, wound drainage, urine, feces, etc

Probability
High = blood exposure >1%, other exposure >50%
Low = blood exposure <1%, other exposure <50%
None = Never

Results Supervisors used these forms to classify activities in their departments. Thirty-two managers identified an average of 35 tasks. After review, these forms formed the basis of departmental infection control guidelines. They were used for inservice education programs and are maintained in each work area for reference by hospital personnel.
Conclusion This task worksheet simplified development of standardized barrier techniques. It improved understanding by hospital personnel of the requirements of blood and body fluid precautions, and facilitated compliance with required procedures.

M.D.P.82

A SURVEY OF KNOWLEDGE AND ATTITUDES CONCERNING HIV INFECTION AND AIDS AMONG FACULTY AND STUDENTS AT THREE UNITED STATES DENTAL SCHOOLS

Cottone, James A.*; Dove, S. B.*; Bebermeyer, R.**; Molinari, J. A.***.
*University of Texas Dental School at San Antonio; **University of Texas Dental Branch at Houston; ***University of Detroit School of Dentistry,U.S.A.

Objective. Compare knowledge and attitudes concerning HIV infection and AIDS among dental faculty and students in different U.S. cities. Methods. A questionnaire was distributed at 3 dental schools in 3 different cities (Detroit, Houston, and San Antonio). Frequency distribution was determined for all questions. General knowledge scores were obtained and subdivided. Avoidance characteristics, personal infection concern, and professional self confidence were determined. Results. The 580 survey participants scored a 75% correct response rate although areas of weakness were noted. Faculty and student knowledge was comparable in all areas except for infection control (faculty 64%, students 54%). About half of respondents felt a positive anti-HIV test was diagnostic for AIDS. Faculty were twice as knowledgeable about agents which inactivate HIV. About 3/4 of respondents felt they should have the right to refuse treatment to a patient with AIDS/ARC and about 50% would refer such patients. All participants expressed a high index of personal infection concern, although the faculty expressed more professional self confidence. Conclusion. The majority of participants were reluctant to treat HIV positive and diagnosed AIDS patients as indicated by high response rates concerning referral, although they felt an obligation to treat these patients. The greatest knowledge deficit was use of virucidal chemical disinfectants and universal precautions for contaminated items.

M.D.P.83

HIV-RELATED RISK, WORRY AND BEHAVIOR CHANGES AMONG EMERGENCY MEDICAL WORKERS: PERSONAL AND JOB-RELATED FACTORS

Bolon, T; Zimmerman, Rick,S; Rodriguez, M; Patrone-Reese, J.
University of Miami, Miami, Florida, USA.

Objective. To evaluate the relationship in job-related and sexually transmitted risks for HIV infection to worry and behavior changes among emergency medical workers.
Methods. A voluntary, anonymous, self-administered questionnaire with 149 items related to HIV infection, job-related functions, sexual practices, and demographic variables was completed by 268 Emergency Medical Technicians, Paramedics, and Firefighters.
Results. 64% perceived themselves to be at high risk for contracting HIV infection through job-related activities and 7% related to sexual behaviors (paired t=19.68,p<.0001). Perceived job-related risks included needle sticks and negative attitudes toward AIDS patients (p<.01). 75% indicated worry about contracting HIV infection from patients; 31% from sexual activity (paired t=14.24,p<.0001). Predictors of job-related worry included marital status (B=.17,p<.01), worry related to sexual transmission of HIV (B=.28, p<.0001), and self-perceived high occupational risk (B=.44, p<.0001). 80% changed job-related behavior according to recommended CDC infection control guidelines. 6% used condoms regularly. Predictors of job-related behavior changes included a negative attitude towards AIDS patients (B=-.20,p=.01) and worry about contracting HIV infection from patients (B=.21,p<.03).
Conclusions. Among emergency medical workers, perceived job-related risks for HIV infection increased worry to motivate job-related behavior changes. In contrast, perceived sexual-related risks increased worry but minimally motivated sexual behavior changes.

M.D.P.84

ATTITUDES AND PRACTICES OF GENERAL INTERNISTS REGARDING CARE OF PEOPLE WITH HIV INFECTION

Makadon,Harvey J.* **, and Phillips RS.*.
*Beth Israel Hospital, Harvard Medical School, **Center for Policy and Education, Harvard AIDS Institute, Boston, MA, USA.

Objective. To understand the attitudes and practices of primary care physicians concerning the care of people with HIV infection.
Methods. We surveyed the membership of the Society of General Internal Medicine in 1987. Of 1755 surveys mailed, 755 were returned; 569 respondents indicated they had no subspecialty. Their median age was 35; twenty percent were women. Forty-eight percent cared for more than two AIDS patients.
Results. When general internists were asked about their care of people with HIV infection, 89% felt it most appropriate to counsel patients on AIDS risk reduction, 69% felt it most appropriate to evaluate and diagnose HIV infection and 55% felt they should follow people with HIV infection using subspecialty consultations when necessary. Only 6% felt it was most appropriate to refer AIDS patients to a specialist for primary care. When asked what would be effective ways to expand the role of primary care physicians in caring for those with HIV infection, 85% requested education on medical aspects of care, 85% wanted information about community services, and 38% sought help confronting fears and/or negative feeling about high risk individuals.
Conclusion. Most general internists surveyed feel their role includes providing primary care for people with HIV infection. However, strategies must be developed to provide ample education and emotional support in order to maximize the role played by these physicians.

M.D.P.85 EVIDENCE FOR THE BENEFITS AND NEED FOR ONGOING AIDS-HIV (A-H) CURRICULUM REVISION FOR MEDICAL, NURSING, PHARMACY AND DENTISTRY STUDENTS (MNPD) AT THE UNIVERSITY OF CALIFORNIA, SAN FRANCISCO SCHOOL OF MEDICINE

Bernol, Harvey S.*, Papadakis, M.*, Grade, M.M.*, Koenig, B.A.*, Zegans, L.S.*, Ziegler, J.L.* *School of Medicine, University of California, San Francisco, CA, United States

Objective. To describe the effects of and need for AIDS-HIV curriculum revision at a major university health science center. Methods. After a 1985 needs assessment of students and pilot elective, an AIDS-HIV elective course was instituted in 1986 and modified for 1987, -88, and -89, based on faculty input and student evaluation data. The 1989 curriculum is presented in comparison to the prior four years. Pre-and post-knowledge and attitude changes are described for those medical students who did and did not enroll, in addition to evaluation data for all students. Results. Evaluation forms from 173 MNPD students who attended the 1988 course led to the following curriculum for 1989 (43 % medical, 30 % nursing, 23 % pharmacy, 2 % dentistry; 29% were male, 71% were female); course curriculum hours increased 240% from 1985 to 1989 and included 28 A-H topics and 31 AIDS speakers with expertise. 92% of enrolled students completed evaluation forms in 1988; mean topic importance was rated as 4.22 (unimportant=1; extremely important=5). Topics rated as needing more time led to an increase in topic-specific hours for 1989. These included: organ-system and/or disease-specific diagnosis and treatment; ethics; and persons with AIDS panel. Course outline and syllabus will be displayed. 75% of course time was biomedical; 25% social-psychosocial. After the course, 98% agreed or strongly agreed (AOSA) that they had a professional responsibility to treat AIDS patients; 89% AOSA they had more confidence in interacting with PWAs; 97% AOSA that the course content was relevant to clinical practice. 81% AOSA that 23 individual AIDS lecturers was more desirable than 1 or 2. Medical students who completed the course showed a statistically significant positive shift in attitudes germane to AIDS (p<.05) compared to those who did not complete the course. There was a positive shift in A-H knowledge which was marginally significant (p<.08). Conclusions. Our findings indicate that optimal A-H education for MNPD must include a broad assimilation of A-H knowledge and appropriate attitudes necessary for clinical interaction with HIV-spectrum illness patients. Such education is best facilitated by: time sampling of students who did and did not enroll in the A-H curriculum; ongoing evaluation of the A-H curriculum; including a breadth and interplay of A-H biomedical and psychosocial topics, selection of speakers with AIDS expertise, high credibility and communication skills; provision of updated traditional and novel written and visual materials; and representation of persons with HIV-spectrum illnesses. Our impression is that at this time, this A-H education model curriculum could be well applied to other MNPD, other health professionals, and others elsewhere in a variety of settings.

M.D.P.86 THE ATTITUDE OF PWA'S TO THEIR PRIMARY CARE PHYSICIAN

Dr Surinder Singh*; Dr S J Mansfield**;
*St Stephen's Hospital, London UK;
**London Lighthouse, London UK.

Objective To analyse the attitude of patients with AIDS to their general practitioner (primary care physician).
Method One hundred consecutive patients attending two of the three largest AIDS units in London were interviewed using a semi-structured questionnaire. An exhaustive history of general practice registration was carried out and replies to attitudinal questions were recorded verbatim and subsequently categorised.
Results All 100 patients were gay men and 4 were also intravenous drug users. 77% of those interviewed were registered with a general practitioner and 14% expressed a desire to register. Of those registered, the doctor knew of the patients diagnosis in 47 cases, 30 patients thought their general practitioner did not know. Thus 53% of patients either could not consult a general practitioner or had an uninformed GP. The major factor dissuading patients being frank with their doctor was confidentiality (60% of 79 responses when a sub-group were interviewed). Qualities patients would rate highly in a GP they would consult were understanding and expertise (56% of 181 responses from 97 of the patients interviewed).
Conclusion An understanding of the attitudes of the client group to their general practitioner may be the first step in facilitating care of patients in the community in a country where primary care is well tested, largely approved of and cost effective.

M.D.P.87 "VERBAL INTERACTION BETWEEN THE NURSING TEAM AND THE AIDS PATIENT"

Gir,Elucir* and Moriya,T.M.*
* University of São Paulo, Ribeirão Preto - São Paulo - Brazil

Objective: To determine with priority the pattern and areas of verbal behavior that occur between AIDS patients and nursing team according to the SAVI. To determine variability in verbal interaction.
Methods: The sample consisted of 90 hours of observations involving 3 nurses, 10 nursing auxiliaries, 4 nursing attendants and 3 patients admitted to a 600-bed Brazilian general hospital. Four trained and calibrated observers took turns so that one of them was always present on the ward. The observation techniques used were cursive report and recording with paper and pencil. Three referees judged the verbal units on the basis of the theoretical assumptions of the System of Analysis of Verbal Interaction of Simon and Agazarian (1967) and elaborated 53 matrices. The data were analyzed in terms of simple and percent frequency and also submitted to an electronic processing program for the calculation of the amount of information transmited.
Results: From the 3336 verbal behaviors occurred, 1688 (50.60%) were in area E (Potential approach and/ or avoidance of topic); 686 (20,56%) in F (Potential approach and/or avoidance of topic and/or personal maintenance, 684 (20,50%) in H(approach to interpersonal topic); 250(3,73% in J (approach to interpersonal maintenance and topic). The remaining ones distributed among all other areas. The interactive pattern was E-F-H-J areas. The matrix that most retained behavior was Team-Team (receptor), followed by Patient (utterer) - Team (receptor); Team (utterer) - Patient (receptor), and finally Patient (utterer) - Patient (receptor). The maximum amount of information transmitted was 0.3065 and the minimum 0.0405.
Conclusion: Verbal behaviors ranged from relative ambiguity in terms of message clarity to clean and noncontradictory messages. There were no withdrawal messages (obscure messages). The interactions tended to move away from stereotypy. These positive results may be attributed mostly to the inservice training received by the team, but there is room for further improvement.

M.D.P.88 ASSESSMENT OF RISK FOR OCCUPATIONAL/NOSOCOMIAL TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS, TYPE I IN HEALTH CARE WORKERS

Fahey, Barbara J.*; Schmitt, J.M.*,Saah, A.J.**; Lane, H.C.* and Henderson, D.K.* *Clinical Center, N.I.H., Bethesda, MD., U.S.A., **Johns Hopkins University, Baltimore, MD., U.S.A.

Objective. This longitudinal study is designed to measure the risk for occupational/nosocomial transmission of HIV-1 among health-care workers (HCW).
Methods. Since 1983 we have been prospectively following more than 1200 HCW who have provided care to more than 1250 HIV-1-infected patients. Exposure information regarding frequency, intensity and types of occupational exposures to HIV-1-infected patients and to blood/body fluids from these patients has been sought in periodic questionnaires.
Results.

1. 483 adverse exposures (AE) have been reported during this study. Of these, 143 have been percutaneous injuries and 340 have been mucous membrane exposures. All AE have been followed for ≥ 6 months (range 6 - 71 months)
2. Eight HCW in this study have positive serologies. Of these, 7 were seropositive at study entry. Of these 7, none reported AE and all reported community behavior associated with increased risk for HIV-1 infection. One HCW seroconverted following a percutaneous exposure.
3. Combining our results with 9 other prospective studies assessing risk for occupational/nosocomial transmission of HIV-1: the risk associated with a single percutaneous exposure is 0.36%; (95% confidence intervals = 0.12%, 0.84%)(Poisson).

Conclusion. Although small, the risk for occupational/nosocomial HIV-1 transmission is not insignificant and may be decreased further by establishment and maintenance of Universal Precautions.

M.D.P.89 AIDS-RELATED KNOWLEDGE, ATTITUDES, AND BEHAVIOR OF INTERNISTS AND FAMILY PHYSICIANS: A COMPARATIVE ANALYSIS

Henry, Keith*†; Campbell, S.* and Willenbring, K.*
*Department of Medicine, St. Paul-Ramsey Medical Center and †University of Minnesota Medical School,St. Paul, Minnesota, U.S.A.

Objective. To identify factors accounting for differences and similarities of AIDS-related knowledge, attitudes and behaviors between internists (IM) and family physicians (FP).
Methods. In September 1987 an anonymous survey was delivered to all IMs and FPs at a 455-bed acute care teaching hospital. Included in the survey were scales measuring AIDS-related knowledge, behaviors, and attitudes, homophobia, and homosexual bias.
Results. Thirty FPs (30/42; 71%) and 68 IMs (68/98; 69%) responded to the survey. Mean age of respondents was 36 years; 96% white; 75% male; and 96% heterosexual. IMs tended to be male more often than FPs (55/66; 83% vs. 18/30; 60%: p < .05). Gender differences were not significant except that the 23 female MDs had significantly more desirable attitudes towards AIDS patients (p<.05) and were significantly less homophobic (p< .001) than the 73 male MDs. There were no significant differences between IMs and FPs regarding the following: homosexual bias, homophobia, self-reported behaviors and attitudes towards AIDS patients, or personally knowing a PWA. IMs were slightly more knowledgable about HIV transmission (p =.061) while FPs demonstrated more concern about acquiring infection at work (p = .069) possibly due to a higher level of patient contact (p = .01). IMs more frequently had cared for AIDS patients than FPs (59/66 vs. 21/30; p <.05). Overall, 22% of the physicians surveyed favored mandatory HIV testing of all patients, 34% desired an anonymous HIV test for themselves, and 57% favored quarantine of non-compliant AIDS patients.
Conclusions. FPs compared favorably to IMs on the variables measured despite less contact with AIDS patients and less knowledge of HIV transmission. A better understanding of this phenomenon might allow educators to improve AIDS-related education programs targeting primary care MDs.

M.D.P.90 HEALTH AND HEALTH CARE CONCERNS OF AIDS AMONG MEDICAL AND NON-MEDICAL PERSONNELS

P.T.K.Subramanian * and S.[illegible] **
* Dept.of Medicine, Madurai Medical College, Madurai-625020, India.
** Dept.of Geography,Madurai Kamaraj University,Madurai-625002,India.

AIDS raised itshead after a decade and it casts its gloomy shadow around the world. The medical science is still trying to come up with either a preventive vaccine or a therapeutic cure for the insiduous disease. The World Health organisation has identified 1.29 lakh cases of AIDS around the globe. The present study is a piece of research investigation with a main view to understand the attitudes and awareness among the Medical andNon-medical personnels regarding the origin and prevention of the disease, therapeutic measures, public health care measures, people's attitude towards the disease and doctors and patients view on preventive measures in relation to social and economic implications of the disease on health and economic development. The analysis of findings revealed that the origin and prevention of AIDS is not fully understood because of the lack of medical knowledge. Although the doctors who are in major urban centreshave come across with some amount of medical knowledge, still the full ecological and environmental dimensions of the disease is not fully understood. The medical and non-medical personnels who are in rural areas are not clear on the concept of the disease. The doctors in the major metropolitan cities are better aware of the disease than the doctors in the suburban areas who have little knowledge on AIDS and it generally decreases in a hierarchical level. It is hence necessary to impart training programmes at all levels.

M.D.P.91 LES TRAVAILLEURS SOCIAUX ET LE SIDA : L'EXEMPLE DES APPARTEMENTS THERAPEUTIQUES.

Cordonnier, J.P.*; Javanni,J.**; Maurel,H.***; Michel,A.**** et Sobel,A.*****.
*Psychiatre, Délégué Médical (APARTS); **Président (APARTS); ***Secrétaire Général (APARTS), ****Délégué Social (APARTS); *****Professeur d'Immunologie Clinique, Vice-Président (APARTS), FRANCE

Le sida entraine une prise en charge spécialisée lorsque les malades atteints par la maladie (stade IV) se trouvent en situation de marginalisation sociale.
L'accueil post-hospitalier à caractère sociothérapeutique définit de nouvelles modalités d'exercice professionnel des travailleurs sociaux.
Les auteurs, à partir de l'expérience des appartements de relais thérapeutique et social (APARTS, implantés à Paris et en Ile de France : 38 malades hébergés en 1987-1988 et 130 suivis en ambulatoire), analysent les changements observés dans le pratique professionnelle de ces travailleurs. Confrontés à la prise en charge de malades démunis et en situation de difficultés sociale et psychologique, ils observent soit les modifications de l'approche professionnelle des assistantes sociales, soit la nécessité de créer une nouvelle catégorie d'intervenants : les coordonnateurs psycho-médicaux.

M.D.P.92 INFORMATION AND EDUCATION GROUPS FOR CARERS.

Church, John; Koomis, A.E; Veervals, S.F.; Green, J.
Peterson Wing, St. Mary's Hospital, London, UNITED KINGDOM

Objectives: To provide support for carers of those with HIV infection and AIDS. 2) To encourage contact with health professionals before crisis situations occur.

Method: An open group for partners, relatives and friends of those with HIV infection and AIDS at a Large London Teaching Hospital was set up. Topics to be discussed at the meetings were advertised beforehand and included the following: Understanding the Hospital System; Standard and Alternative Therapies; Dealing with Stress and Life Changes; Social Service Benefits and Legal Issues. They were advertised as "Information Sharing" rather than emotional support groups so as to be as unthreatening as possible. Evaluation of the effects of the groups was carried out by questionnaires handed out at each meeting. The questions related to: HIV status of the carer, contact to date with health professionals in the hospitals; whether the initial contact was crisis or routine; whether further contact was desired; the reasons for wanting further contact and perceived obstacle to contact. Additionally each meeting was evaluated on a variety of measures for information content and emotional supportiveness.

Results: Results pertaining to the above questions are presented for two groups of eight sessions each.

Conclusions: The effectiveness of such groups for providing support and increasing appropriate adn early contact with health professionals are addressed.

Adolescents (partie 2)
Adolescents (Part 2)

T.D.P.1 MODIFICATIONS OF SEXUAL ACTIVITIES IN THE ERA OF AIDS: A TREND ANALYSIS

Tyndale, Eleanor
Vanier College, St. Laurent, Quebec, Canada and University of Calgary, Calgary, Alberta, Canada.

Objective. To empirically assess whether sexual conduct of primarily heterosexual 17-21 year olds has changed from 1981 in a direction likely to reduce transmission of HIV.
Methods. Logit analysis is used to identify trends and reversals of trends evident in responses of 1334 Montreal College students to questionnaires administered in 1981, 1983, 1985 and 1988.
Results. Trends toward decreasing age of first vaginal intercourse, increased likelihood of males participating in same-sex sexual activities, likelihood of coitus with casual partners, increasing numbers of coital partners, at least some use of condoms were identified for 1981 to 1985. In 1988 there is a reversal in the first two trends, decreasing age of first coitus and likelihood of males participating in same-sex sexual activity and a continuation of all other trends.
Conclusions. Based on the students surveyed, initiation of risk-related sexual activity was more likely to be postponed and condoms more likely to be used in 1988 than from 1981-1985. There is no change in the incidence of casual sex or reduction in the number of sexual partners reported from 1981 to 1988.

T.D.P.3 SHORT-TERM IMPACT OF AN AIDS EDUCATION CURRICULUM FOR ADOLESCENTS

Blake, S.*, Tishman, E., and Makinodan R.
*American Red Cross, Washington, D.C., U.S.A.

Objectives: To assess the short-term impact of an AIDS curriculum for adolescents on knowledge, attitudes, and behaviors related to AIDS, and to explore factors associated with change.

Methods: Two junior high schools in an ethnic, suburban community within the Boston metropolitan area participated in a 4-week AIDS education program. A treatment-delayed treatment control group design was employed wherein 1/2 of the students received the educational program in health education classes, and the other 1/2 received no education. Measures of knowledge, attitudes, and behavior were obtained from all students before and after the program.

Results: Chi-square test statistics revealed relatively few baseline differences between students in the treatment and control groups (N=289) prior to the education program in HIV knowledge, attitudes, or behavior. Significant differences were observed following the curriculum with students receiving the program having improved scores on most measures of change. Results from further statistical analyses controlling for baseline differences between groups, and baseline scores will be presented.

Conclusions: The relative impact of an AIDS education curriculum on knowledge and attitudes can be demonstrated with junior high school students. Greater difficulty exists in documenting behavior change due to school system constraints, temporal factors, and the expected prevalence of risk behavior at lower ages.

T.D.P.5 CONDOM BEHAVIOR IN 17, 18 AND 19 YEAR-OLD NORWEGIANS.

Traeen, Bente; Rise, J. and Kraft, P.
National Institute of Public Health, Oslo, Norway.

Use of condoms is widely accepted as a "safe-sex" practice. The present study was undertaken to describe and provide a better understanding of condom behavior in Norwegian adolescents. The material comprised a representative sample of 3000 persons in the age group 17 to 19, and the response-rate was 61%. Data were collected by self-administered questionnaires. The results showed that 62% of the boys, and 68% of the girls had made their sexual debut, 50% of the 17 year-olds, 67% of the 18 year-olds, and 80% of the 19 year-olds. Median age at first intercourse for both sexes, and all age groups were 17. The proportions in the respective age groups who claimed they did not use condoms habitually were 33%, 36%, and 44%. However, 37% of the boys, and 26% of the girls used condoms at their last sexual intercourse. In order to provide a better understanding of condom behavior, the theory of reasoned action was applied, in which the intention to use condoms at the next intercourse was considered to be a function of attitudes towards use of condoms as well as proposal of use and subjective norms. Preliminary analysis of the model showed that behavioral beliefs related to the immediate consequences of condom use and the sexual context, and the normative expectations of significant others were the strongest predictors of intention (eta-correlations 0.20-0.60). There was no relationship between neither intention to use condoms nor actual use of condoms, and fear of hiv-infection. The theory of reasoned action seemed to provide a sufficient understanding of intention to use condoms, but further empirical analysis in terms of estimating the full model are forthcoming.

T.D.P.2 SEXUAL BEHAVIOR, CONTRACEPTIVE USE, AND STD HISTORY AMONG HETEROSEXUAL COLLEGE STUDENTS

June M. Reinisch, S. A. Sanders, M. Ziemba-Davis, and C. A. Hill
The Kinsey Institute for Research in Sex, Gender, and Reproduction, Indiana University, Bloomington, IN, U.S.A.

Objective. To describe the prevalence and frequency of sexual behaviors of college-age heterosexuals that place them at increased risk for Human Immunodeficiency Virus (HIV) infection.
Methods. A questionnaire developed by The Kinsey Institute asked respondents to indicate which of specific sexual behaviors they had engaged in and to report on a number of other phenomena relevant to HIV transmission.
Results. Data on the sexual histories of 810 self-selected college students, who based on their demographic characteristics appear to be representative of the targeted student population, were obtained. The typical respondent was 22 years old, white, Protestant, politically moderate, and from the Midwest. In reporting on sexual behavior, we consider only those respondents who labeled themselves as currently heterosexual (over 90%) and have experienced penile-vaginal or penile-anal intercourse. Over 80% of the respondents had engaged in one or both of these behaviors, while over 23% of the females and 27% of the males reported engaging in heterosexual anal intercourse at least once. Of these self-labeled heterosexual males, 3.39% had engaged in anal intercourse with another male. The average number of one-night stands was 3.75, while the average number of male partners for females was 6.17 and the average number of female partners for males was 10.72. Less than a third of the respondents had used a condom the last time they engaged in penile-vaginal or penile-anal intercourse, while close to a quarter had either used no contraception or used the rhythm or withdrawal methods. Approximately one in five respondents had experienced some form of sexually transmissible disease (STD).
Conclusions. Although the young adults in this sample have been sexually active a relatively short time, they have both engaged in unprotected sexual activity and had multiple sexual partners. Based on a Midwestern sample, these findings might be regarded as a conservative estimate of the proportion of young adults in the U.S.A. who engage in sexual activities which place them at risk for STD's, including HIV.

T.D.P.4 SEXUAL BEHAVIOR IN HIGH-RISK ADOLESCENTS

Meyer-Bahlburg, Heino F.L., Rotheram-Borus, M.J., Koopman, C., Exner, T.M., and Ehrhardt, A.A.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, N.Y., USA

Objective. To evaluate sexual behavior in runaway adolescents and gay youths who are believed to be at high risk of unprotected sexual activities and HIV infection.
Methods. A detailed semi-structured sexual history interview, the Sexual Risk Behavior Assessment Schedule for Youths (SERBAS-Y; Meyer-Bahlburg et al., 1988) was developed in 3 versions, extensively piloted, and then administered to 50 males and 50 females in 2 runaway shelters and to 50 homosexual males in a special agency, all ranging in age from 12-18 years, with an overrepresentation of minorities.
Results. Preliminary analyses showed that 56% of the adolescents engaged in sexual intercourse during the past 3 months prior to evaluation, with significant differences between the 3 groups. Males reported significantly more partners and sexual occasions than females did. Only a small minority of adolescents in either group used condoms at all, and those who did so used condoms inconsistently and infrequently. Gay males were more likely to use condoms, the more sexual partners (r = .31) and the more sexual occasions (r = .48) they experienced.
Conclusions. These results confirm that runaway adolescents are a high-risk sex group and in need of preventive intervention.

T.D.P.6 THE IMPACT OF TEENAGER'S KNOWLEDGE AND CONCERN OF AIDS ON SEXUAL BEHAVIOR AND PREVENTION STRATEGIES

Sankary, Timothy, AIDS Prevention Center,
San Francisco, California, USA.

Objective. To assess the impact of teenager's self-rated knowledge and concern about AIDS, STD's and birth control (BC) on sexual behavior, prevention strategies, antibody testing, condom use and choice of information sources.
Methods. We surveyed 451 youths ages 13-21 (mean 16.6 and representative of each age) (59% F, 41% M) at the Youth Fair (73% unattached singles, 27% attached; 98% heterosexual; 46% white, 19% black, 21% asian, 11% hispanic).
Results. Self-rated knowledge of STD's, AIDS, BC and condoms was rated as high by 48.3%, 51.9%, 58.3%, 65.6% overall with few claiming little knowledge of the above (9.3%, 8.0%, 12.2%, 9.3%). While 19.6% of males vs. 7.1% of females claimed little knowledge of BC (p<.001) or STD (M 13.8%, F 6.7%, p<.05) when it came to condoms, there was no significant difference. Discussion of AIDS had occurred most frequently with friends (75.2%) and parents/family (62.3%) and teachers (55.7%), followed by doctors/nurses (21.3%), religious leaders (9.5%) and lastly an AIDS hotline (2.9%). In contrast, for more information about AIDS, 38.2% said they would go first to a doctor/nurse, AIDS hotline (29.1%), parent/family (11.6%), friend only 9.3%, teacher only 6.7%, newspaper/magazine (3.3%), and religious leader 1.1%. With the exception of single males, knowledge of AIDS did not affect # sex partners/last 12 months or condom use. Surprisingly, single males who rated their knowledge of AIDS high were least likely to use condoms (never 57.1%,some 14.3%,always 28.6%) while those knowing "little" (never 7.5%,some 25%,always 67.5%) (p=.002). First sex before age 12 occured in 2/136 (1.5%) 18-21 year-olds, the older half (53%) of the sample, in marked contrast to 16/121 (13.2%) of the 13-17 year olds, the younger half (47%) (p<.001). Always using condoms decreased with age from 13yo (67%) and 15yo (76%) to 19yo (27%) and 20yo (23%)(p<.05) but did not vary by sex or race. Unattached singles used condoms (56%) more than those attached (32%)(p<.01) with 41% citing BC as the major reason then AIDS (32%),STD (24%), but least of all because their partner wanted to (3%). Concern for HIV was high (M 85%,F 76%,p<.05). HIV tested:(M 16%,F 9%,p<.05). Many (F 41%,M 28%,p<.05) always ask for a test before sex, 15% sometimes.
Conclusion. Complex social factors influence teenagers sexual decisions.

T.D.P.7

TITLE: DEMOGRAPHIC AND HIGH RISK BEHAVIOR STUDY OF INCARCERATED ADOLESCENTS

AUTHORS: *Morris, R., *Huscroft, S., *Roseman, J., *Re, O., *Baker, C.J., and **Iwakoshi, K.A.
*Juvenile Court Health Serivces, Los Angeles County, California, USA
**AIDS Epidemiology Program, Los Angeles County Department of Health, California, USA

OBJECTIVE: To obtain demographic and AIDS high risk data to target and implement educational and research programs among incarcerated adolescents

METHODS: Interviews to gather data were conducted following a randomized design. This information was computerized (data manager d BASE III Plus) and analyzed with the statistical software package PRODAS.

RESULTS: 262 minors, age 16 and 17 were interviewed. 83% were males and 17% were females. 39% were Black, 29% Hispanic and 27% White. Incidence of sexual activity was high. Alcohol consumption during sex was frequent (47%), drug use concomitant with sex activity was 11%. Heroin and cocaine were the most frequently used I.V. drugs. Incidence of VD was 17% with gonorrhea the most common disease entity. While awareness about contracting AIDS was high, condom use and other precautionary measures were low.

CONCLUSION: Despite the fact that this population reported a 67% attendance to sex education classes, their degree of knowledge and concern about high risk behavior for AIDS was low. Educational programs with peer participation, seroprevalence studies and emphasis on HIV testing and counseling of high risk individuals will be pursued.

T.D.P.9

HIV-RELATED KNOWLEDGE, BELIEFS, AND BEHAVIORS AMONG HIGH SCHOOL STUDENTS IN THE UNITED STATES

Kann, Laura; Nelson, G.; Jones, J.; and Kolbe, L. Division of Adolescent and School Health, Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control, Atlanta, Georgia, USA.

Objective. To describe HIV-related knowledge, beliefs, and behaviors among high school students in cities and States in the United States with the highest cumulative incidence of AIDS and to describe the system of surveys developed to enable departments of education to collect these data annually. Methods. As part of a unique system of surveys involving participation and collaboration by department of education representatives, 9 states and 6 cities administered anonymous questionnaires to samples of high school students in their respective jurisdictions. Sample sizes ranged from 778 to 7,013. The response rate of schools from each site ranged from 52% to 100%. Results. Many students incorrectly thought HIV infection may be acquired from giving blood (range, 27.8%-53.3%), using public toilets (range, 41.8%-64.4%), or having a blood test (range, 49.6%-75.4%) or from mosquito and other insect bites (range, 28.9%-46.8%). Most students knew IV-drug use (range 83.8%-98.4%) and sexual intercourse (range, 88.3%-98.1%) can result in HIV infection. High school students from four sites reported variable rates of IV-drug use and sexual intercourse: 2.8%-6.3% reported ever injecting illegal drugs; 28.6%-76.4% reported having had sexual intercourse at least once; and 15.1%-42.6% reported having had 3 or more sex partners. Conclusion. Departments of education should implement programs to correct misperceptions about HIV transmission, to reduce behaviors resulting in HIV infection, and to assess periodically whether these misperceptions and behaviors change over time among high school students.

T.D.P.11

ADOLESCENT RUNAWAYS' BEHAVIORAL RISK FACTORS, KNOWLEDGE ABOUT AIDS AND ATTITUDES ABOUT CONDOM USAGE

Hudson, R.A.; Petty, B.A.; Freeman, A.C.; Haley, Charles E.; and Krepcho, M.A. Dallas County Health Department, Dallas, Texas, USA

Objective: Objectives of study were to: 1) determine behavior risk factors and knowledge about AIDS, 2) provide information about AIDS, and prevention, and 3) determine attitudes about condom usage among runaway adolescents while at an alternative school center.
Methods. Upon intake to the school, adolescents (213) were administered a questionnaire about AIDS knowledge, behavior risk factors and prevention information. While at the alternative school adolescents received 3 to 4 instructional classes about AIDS and prevention information. After the classes the adolescents (102) were given the same questionnaire to determine if the group had improved it's knowledge base about AIDS information, and changed attitudes about condom usage. Results. Results indicate that of the 213 runaway adolescents (between the ages of 11 and 16), 76% are sexually active, 7% have used intravenous drugs and, only 13% stated they always use condoms. Post data results on some knowledge questions indicate significantly larger proportions of correct responses. There are area where misunderstandings persist i.e., transmission through blood donation and transfusions. Attitudes about condom usage did not improve and adolescents feel uncomfortable talking about condoms with a partner. Conclusions: Runaway adolescents' behavior puts them at risk for HIV infection and AIDS. Alternative schools provide a setting for exposure to information about AIDS. A change in attitudes toward condom use and a change in condom use require more than classroom exposure to AIDS information.

T.D.P.8

KNOWLEDGE, ATTITUDES AND BEHAVIOR OF STREET-INVOLVED PEOPLE IN VANCOUVER

Rekart, Michael L.; Manson, L.; Loftus, P., STD Control, Ministry of Health, Vancouver, British Columbia, Canada

Objective To assess and describe the knowledge, attitudes and behaviors of street-involved people in Vancouver in relation to AIDS.
Methods In January 1989, sixty-nine street-involved youth answered an anonymous, standardized questionnaire administered on the street by outreach nurses.
Results Of the 40 males and 29 females interviewed, 93% were 14-29 years old, 56% were Caucasian and 39% Native Indian, 44% lived with lovers or friends and 40% lived alone. The majority supported themselves by prostitution (70%) and/or welfare payments (48%). Seventy-seven percent felt that AIDS was not as serious as the media said, 46% would use condoms with a new but not a steady partner, 45% felt their chances of catching an STD were low. With regard to drug-taking behavior, 54% had used intravenous drugs within the past year, 73% of these had shared works and 76% cleaned their needles with bleach. The favorite drugs were cocaine and talwin and ritalin. Findings with regard to sexual behavior included the following: 45% had had sex with a homosexual man and 43% with an IVDU; 6 women and 10 men said they were bisexual in their private lives; 85% always used condoms with 'dates' (i.e. customers) but only 26% always used condoms with 'lovers' (i.e. steady partners). Their ability to be safe when having sex or using intravenous drugs was often adversely affected by being drunk or high.
Conclusion Street involved people in Vancouver remain at highest risk for acquisition and transmission of HIV because of risk behavior in their personal lives.

T.D.P.10

ETUDIANTS ET SIDA : INTERET D'UNE TYPOLOGIE POUR UNE PREVENTION SPECIFIQUE

Pérard, Dominique* ; Lazartigues A.** ; Lisandre H.*** et Pailleux T.****.
*Université Paris X et Rouen, Centre de Recherche de l'Enfant et de l'Adolescent (CREA), Paris, France, **Fondation santé des étudiants de France, Sceaux, France, ***CREA, Paris, France, ****Institut Français d'Etudes et d'Analyses (IFEA), Paris, France.

Objectifs. 1) Décrire étudiants (18-22 ans) de région parisienne, 2) Mesurer les corrélations entre facteurs de risque SIDA et facteurs de risque "supposés", 3) Construire une typologie pour actions préventives spécifiques. Méthode. 1) Echantillon : 963 étudiants représentatifs (méthode des quotas), 2) Intervention : strict anonymat, faite d'avril à juin 1988, 3) Auto-questionnaire : 175 items sur représentations, attitudes, comportements sur sexualité, maladie, SIDA, valeurs, informations SIDA, prévention, mesurant l'état des connaissances sur entre autres SIDA, facteurs de risque SIDA, 4) Tris à plat, croisés, analyses en composantes principales et typologique (logiciel EOLE). Résultats. 1) Parmi très nombreux résultats : 16 % lors premier rapport ont utilisé préservatif, 15 % ont pratiqué dépistage du VIH, 69 % pensent que le préservatif est le moyen le plus sûr pour éviter le VIH, 52 % s'estiment insuffisamment informés sur SIDA, 84 % pensent qu'un médecin est mieux à même de les informer, 52 % que l'information doit être faite en Faculté, 2) Cinq facteurs de risque supposés ont été retenus car tous bien corrélés aux facteurs de risque du SIDA, 3) Proposons une typologie de dix types associés différemment aux facteurs de risque conduisant à approches préventives particulières dont "petits groupes".

T.D.P.12

THE RELATIONSHIP OF KNOWLEDGE AND ATTITUDES TOWARDS AIDS TO SAFE SEX PRACTICES AMONG RUNAWAY AND GAY ADOLESCENTS

Rotheram-Borus, Mary Jane; Selfridge, C.; Koopman, C.; Haignere, C.; Meyer-Bahlburg, H.; Ehrhardt, A.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, NY, USA

Objective: To evaluate the relationship between knowledge of and attitudes towards AIDS and safer sex practices among runaway and gay adolescents.
Methods: Questionnaire assessments of knowledge of transmission, high risk groups, outcomes, prevention strategies, definitions, and HIV testing were collected and extensive interviews of sexual behavior during the last three months were conducted with 95 runaway and 30 gay youth in community agencies in New York City.
Results: There was moderately high general knowledge of AIDS (74%) and positive attitudes towards safer sex (74%) across all groups; as well as substantial unsafe sex. These high risk youth reported an average of 3 sexual partners and 12 sexual encounters over the last three months, most of which were unprotected by condom use (89%). General knowledge of AIDS was more highly correlated with condom use ($r = .31$, $p<.05$) and positive attitudes ($r=-.56$, $p<.01$) among gay male youth than for runaway youth. In addition, general knowledge of AIDS was positively related to the number of partners among gay youths ($r=.31$, $p <.01$), indicating those most at risk knew the most about AIDS.
Conclusions: Altering attitudes towards AIDS, not general knowledge, appears important and potentially effective among those at most risk: gay youth.

Comportement (partie 2)
Behaviour (Part 2)

T.D.P.13 YOUTH IN DETENTION AT HIGH RISK FOR HIV: KNOWLEDGE, ATTITUDES, AND BEHAVIORS REGARDING CONDOM USAGE

Temoshok, Lydia*; Moulton, J.M.*; Elliner, R.M.*; Sweet, D.M.*; Baxter, M.**; Shaiwitz, J.**; *Univ. of California School of Medicine, San Francisco, **San Francisco Dept. of Public Health, San Francisco, CA., U.S.A.

Objective. Because youth who come into contact with the juvenile justice system are typically sexually active, prone to drug experimentation, and have high levels of STDs, they are at particularly high risk for HIV infection and transmission. Our aim was to examine their knowledge of how HIV can be transmitted and prevented, and their attitudes and behaviors about condoms. Methods. 184 juvenile offenders (mean age = 16) at the San Francisco Youth Guidance Center completed anonymous self-report questionnaires. The sample was 86% male, and 63% Black, 16% Hispanic, 7% Asian, 6% White, 7% other. Results. Knowledge about HIV prevention was generally high; for example, 85% agreed that using condoms during sex reduces the chances of HIV infection. Further, ability to obtain condoms "on the outside" was not a problem: 90% said that it would not be difficult at all. There was also evidence of motivation: 71% said they were "very afraid of getting AIDS." On the other hand, only 14% of the sample said they used condoms all the time during sexual intercourse, and 35% never used them. A striking 46% agreed that "sex without condoms is worth the risk of getting AIDS," and 41% said they would not use condoms because they would "really like to have a baby." Conclusion. The findings of low intention to use condoms and low usage are disturbing, in view of the fact that 35% admitted to having had sex with someone in exchange for money, drugs, etc. during the past year. Results suggest that culturally sensitive HIV education programs aimed at changing attitudes about using condoms are urgently needed for this high risk group

T.D.P.14 THE NATIONAL STUDY OF HEALTH AND SEXUAL BEHAVIOR

Cain, Virginia S. and Baldwin, W.
National Institute of Child Health and Human Development, NIH, Bethesda, Maryland, USA

Objective. To describe the development of a national survey of health and sexual behavior. This is a major undertaking that will provide data to help understand sexual behavior patterns associated with varying degrees of risk with respect to HIV infection and the contexts in which the behaviors are occurring. It will also provide some of the data needed to model the spread of HIV infection, e.g. rates of partner change and sexual behaviors within relationships. Many of the estimates of HIV infection depend upon estimates of risk behavior derived from the Kinsey studies of the 1940's. While these were landmark studies, the lack of a representative sample and the changes in sexual behavior that are known to have occurred in the past 40 years make a new study necessary. The present study confronts the problems of obtaining high quality data on sensitive questions from the general U.S. population and simultaneously being able to accommodate the less frequently occurring high risk behaviors. The development of the survey has included a number of methodological tests designed to determine the most effective means of eliciting accurate information. These include effects of (1) matching interviewers and respondents on selected demographic characteristics, (2) the location of the interview (in sites or in the home), (3) telephone vs. face-to-face interviewing including a self-administered questionnaire and (4) a closed-ended questionnaire vs. an open-ended semi-structured interview.

T.D.P.15 HIV STATUS RELATED TO KNOWLEDGE AND BEHAVIORAL CHANGE

Miller, Kenneth and Patient Managers, University of California, San Francisco, U.S.A.

Objective. To assess whether knowledge about AIDS influenced behavior in anti-HIV(+) blood donors, blood recipients, hemophiliacs and their sexual partners as compared to anti-HIV(-) controls.
Methods. A 16 item multiple choice questionnaire and an 11 item behavioral survey were distributed to 228 study participants and their sexual partners 6 to 12 months following standard verbal counselling regarding transmission and prevention of AIDS.
Results. 35/51 (69%) of anti-HIV(+) respondents and their sexual partners, who correctly identified preventive measures, indicated that they used condoms more than half the time; while only 36/131 (27%) of the anti-HIV(-) controls did so. 32/69 (46%) of anti-HIV(+) respondents and their sexual partners identified and practiced health promoting behaviors as compared to 37/149 (25%) of anti-HIV(-) controls. 66/69 (96%) of the anti-HIV(+) respondents avoided sharing unsafe items such as needles, razors, etc. with their partners while an equivalent number of anti-HIV(-) controls 139/155 (90%) evinced similar behavior.
Conclusion. In this sample, generally, knowledge about AIDS prevention was more likely to be translated into behavioral changes by anti-HIV(+) subjects than by those who were anti-HIV(-).

T.D.P.16 SELF PERCEPTION OF THE RISK OF CONTRACTING AIDS AMONG UNIVERSITY STUDENTS.

Díaz, M.M.***, Aoki, Francisco H.*, Goodson, P.***, Díaz, J.** Vera, S.*** and Pinto e Silva, J.L.*
* State University of Campinas, Campinas, SP, Brazil; ** The Population Council, New York, USA; *** CEMICAMP, Campinas, SP, Brazil.

Objective: To assess how accurate is the self perception of the risk of contracting AIDS among University Students.
Methods: A structured questionnaire on sexual behavior and knowledge about AIDS was mailed to 2609 students of the first two grades of the State University of Campinas. Analysis was performed using SPSS PC.
Results: The percentage of students declaring not having risk of AIDS was 21.7%, but 56.3% of them did not use condons, 14.1% had anal intercourse and 12.2% of men had had homosexual relations.
Based on the whole questionnaire, each student was classified as having null, low or high risk. Seventy five per cent of those who classified themselves as having null risk, actually had low or high risk. On the other hand, 77.8% of those who classified themselves as high risk, were low, according to our classification.
Conclusion: Even though the level of knowledge about AIDS is relatively high among University Students, there is still a high incidence of misconceptions or classifying which behaviors do actually constitute risk. Further educational activities appear as a high priority.

T.D.P.17 PREVALENCE OF GENITAL LESIONS IN AN STD CLINIC: SEXUAL BEHAVIOR CHARACTERISTICS.

Jacobs, B.*; Edwards, T.**; Mosey, E.***, Whittington, N.#; Whittington, W.*; Nahmias, A.**. *Centers for Disease Control, **Emory University School of Medicine, ***DeKalb Health Department, and #West Paces Hospital, Atlanta, GA, USA.

Objective. To determine the prevalence of genital lesions in individuals attending an STD clinic and to evaluate their sexual behaviors.
Methods. During a 15 week period, individuals (n=3247) making their first visit for a variety of reasons were studied and those patients with genital lesions were referred to a single clinician for evaluation. The patterns of sexual behavior of these patients were compared to those without lesions.
Results. Patients with genital lesions accounted for 241 (7.5%) visits. Men were more likely than women to present with genital lesions ($p<.01$) and genital lesion patients were less likely to be referred as a sexual partner ($p<.01$). Women with genital lesions more often did not use chemical or mechanical barriers for contraception and also gave a history of anal intercourse ($p<.05$). Men with genital lesions were less likely to use condoms than men without lesions ($p<.01$). After lesions were recognized, 24% of the men and 21% of the women continued to have sexual intercourse.
Conclusion. In view of previous findings that genital lesions are associated with an increased risk of HIV transmission, it is important to understand the patterns of sexual behavior of persons with such lesions. The current evidence for poor use of preventive measures must be addressed.

T.D.P.18 BEHAVIORAL PATTERNS OF BISEXUAL MALES IN THE U.S., 1982

Lever, Janet*; Rogers, W.H.*; Carson, S.*; Hertz, R.**; Kanouse, D.E.*
*The RAND Corporation, Santa Monica, California, U.S.A.; **Wellesley College, Wellesley, Mass., U.S.A.

Objective: To analyze 1982 survey data on the sexual practices of 7,484 behaviorally bisexual males to better understand the lower-than-expected incidence of HIV infection in that population and their female partners.
Methods: Data from a national survey of 80,324 and female readers of Playboy magazine were examined using analysis of variance techniques. Demographic profiles and sexual behavior patterns were compared among men whose adult sexual behavior was exclusively heterosexual (N=54,088), exclusively homosexual (n=780), predominantly heterosexual (N=6,905), or predominantly homosexual (N=579).
Results: Of 7,484 behaviorally bisexual men, 2,111 described themselves as bisexual, 141 as homosexual, and 5,232 as heterosexual in orientation; 39% were currently married (vs. 44% of heterosexual men) and 39% were currently dating more than one partner. Bisexual men were less concentrated in cities than homosexual men (43% vs. 63%, 38% for heterosexual men). Behavioral bisexuality was associated with increased promiscuity (.63 SD on an index combining no. of partners and 3 other indicators) and increased risk of STDs (18% vs. 10% reporting one or more in past 5 yrs.) compared to exclusively heterosexual men, and with increased use of prostitutes in last five years (33%) vs. 19% for exclusively heterosexual or homosexual men.
Conclusions: The behavior reported by this large sample of bisexual men would place them at intermediate risk of HIV infection. Bisexual patterns of behavior are not well captured by self-reported sexual orientation.

T.D.P.19

PATTERNING IN THE SEQUENCES OF SEXUAL ACTIVITY BETWEEN MEN AND ITS IMPLICATIONS FOR HIV-1 TRANSMISSION

Davies, Peter* and Coxon, A.P.M.**, Project SIGMA.
*South Bank Polytechnic, London, U.K., **University of Wales, Cardiff, U.K.

Objective: Until now, analysis has concentrated on individual sexual acts and their role in the transmission of HIV-1. This paper looks at sequences of sexual acts which take place between men in order to discover any patterns which might be relevant to transmission.
Methods: Diaries of sexual activity were kept by 170 men who recorded, for each episode or session of sexual activity, where and when it took place; the other people involved (if any); the sequence of acts and other relevant details such as condom use. Diaries were encoded and analyzed using a specially written computer programme.
Results: Analysis suggests the existence of two patterns or modes of sexual interaction: role-playing and reciprocal. Role-playing keeps the insertor-insertee distinction, while reciprocal action does not, typically involving an alternation of such roles. Role-playing sessions involve fewer individual acts than reciprocal ones ($p \ll .01$) and are more likely to include anal intercourse ($p < .05$). When anal intercourse does occur in reciprocal sessions, it is less likely to produce orgasm ($p < .001$).
Conclusions: Reciprocal sex is likely to be safer sex. Further analysis of the patterns of sexual activity is urged as a means of understanding the context of transmission and as a resource for health education.

T.D.P.20

FACTORS ASSOCIATED WITH SEROPOSITIVITY TO HIV-1 AMONG A NON-CLINIC SAMPLE OF GAY AND BISEXUAL MEN IN LONDON

Hunt, A.J.*; Davies, Peter*; Coxon, A.P.M.**; McManus, T.J.*** and Sutherland, S.****, Project SIGMA. *South Bank Polyechnic, London; **University of Wales, Cardiff, U.K.; ***King's College Hospital, London, U.K.; ****Dulwich PHLS, London, U.K.

Objctive: To describe the relevant characteristics of those found to be HIV antibody positive in a study of homosexually active men.
Methods: As part of a national study, 310 gay and bisexual men in London were recruited using a variety of sampling methods and interviewed in a non-clinic setting. 122 (71.6%) volunteered a sample of blood, which were tested for HIV-1 antibody using the Wellcome competitive assay, with positives confirmed using the Abbott recombinant assay. Interviewees could choose to know the result of the test. Data from the intrview were analysed using ANOVA.
Results: Individuals were classified as positive (30, 9.7%), negative (192, 61.9%) and not tested (88, 28.4%). Positives were found to be significantly younger ($p < .05$) and to have had more penetrative sexual partners - 'psp's: partners with whom anal intercourse had taken place - ($p < .05$) in the course of their lives. There was no difference between the groups in having had a psp in the month prior to interview, but of those who had, positives had significantly more than the other groups ($p < .01$). Level of education, current relationship status and degree of disclosure were not significantly different.
Conclusions: The hypothesis that younger gay men are currently more at risk gains some support from these findings.

T.D.P.21

TRENDS IN AIDS KNOWLEDGE, ATTITUDES AND BEHAVIORS (KAB) IN HETEROGENEOUS, HIGH-RISK GROUPS, FLORIDA

Lieb, Spencer*; Zimmerman, R.S.**; Kuechler, M.***; Langer, L. M.**; Sims, J.* and Witte, J.J.*.
*Florida Department of Health and Rehabilitative Services, Tallahassee, Florida, USA, **University of Miami, Coral Gables, Florida, USA, ***Hunter College (CUNY), N.Y., N.Y., USA.

Objective. To compare levels of AIDS KABs in 1987 and 1988 in groups at high risk in a region having 4,000+ reported AIDS cases as of 1/12/89.
Methods. A KAB survey was administered anonymously in 1987 (N=1,937) and 1988 (N=1,873) to those sampled non-randomly in 4 south Florida counties. Weights were assigned to each 1988 respondent by race, age, sex, education and distributing agency for comparability with 1987 values.
Results. Knowledge levels of HIV transmission modes were high in both years. A decline in anal intercourse was reported by gay/bisexual men [t(1198)=2.78, p=.005]. The percent tested for HIV antibody increased significantly ($p < .005$) for 6 of 7 hierarchical risk groups, 3 of which are shown below. Condom usage increased markedly among 2 of the 3 groups:

	N		%Tested for HIV		% Always Using Condoms	
Group	1987	1988	1987	1988	1987	1988
Gay/bisexual male	651	586	35%	51%*	15%	25%*
IV drug abuser	222	118	30%	69%*	3%	12%**
STD client	276	421	11%	31%*	4%	6%

*$p < .00001$ **$p < .003$

Conclusion. To the extent that such groups may be 'sentinels' for larger, at-risk populations, these results favor a reduction in HIV transmission.

T.D.P.22

BEHAVIORAL AND PSYCHOSOCIAL PREDICTORS OF COMPLIANCE IN HIV ASYMPTOMATIC AND SYMPTOMATIC PATIENTS IN CLINICAL TRIALS

Patrone-Reese, Janie; McCann,M; Chidekel, J; Fayne, T; Haliburton,B; Pringle, L; et al. University of Miami, Miami, Florida, USA.

Objective. To evaluate and determine factors associated with study compliance among HIV infected patients in clinical drug trials.
Methods. A voluntary, anonymous, self-administered questionnaire consisting of demographic and risk factor information, recreational and non-FDA approved drug use, and sexual practices was completed by patients with asymptomatic or symptomatic HIV infection participating in clinical drug trials.
Results. Of 150 distributed questionnaires, 120 were completed. The majority of patients not filling out questionnaires were hispanic. Of the 120 participating patients, 86 had asymptomatic and 32 had symptomatic HIV disease. A greater study compliance rate was noted among symptomatic patients vs asymptomatic patients. Further, asymptomatic patients were less likely to take study medication as prescribed (p=.023). No differences between men and women, marital status, or risk group were noted between the two groups. Patients with asymptomatic HIV infection were more likely to be younger (p= active (p=.003), and presently employed (p=.004) compared to patients with symptomatic HIV infection.
Conclusions.Asymptomatic patients with HIV infection are generally more likely to be non-compliant with clinical drug trials. Factors associated with recreational drug use, alcohol use and sexual activity must be considered in developing strategies to improve compliance rates of asymptomatic patients in clinical drug trials.

T.D.P.23

MALE HOMOSEXUAL SEXUAL BEHAVIOUR IN THE UK 1985-1988

Thomas J McManus[1], Peter Davies[2], APM Coxon[3]
[1] Department of Genito-Urinary Medicine, King's College Hospital, London SE5
[2] South Bank Polytechnic, London SE1
[3] University of Wales, Cardiff, UNITED KINGDOM

Objective. To monitor changes in male homosexual sexual behaviour in the United Kingdom using a non-clinic sample.

Method. A questionnaire was circulated via the gay press. It was self administered and asked about numbers of sexual partners, changes in sexual behaviour, drug use, condom use, HIV antibody status and sexual assault.

Results. 1292 replies from 1985 and 1200 from 1988 were analysed. The demographic details of both samples were comparable. 60% of men in 1988 had less than 5 sexual partners in the previous 12 months compared with 35% in 1985. The 1988 respondents reported a 50% decrease in both oral and anal sex with casual sexual partners but only 36% used condoms >50% of the time during anal sex. Very little illicit drug use was reported. 18% of the 1988 cohort had been sexually assaulted by another man.

Conclusion. This national survey of sexual behaviour in gay men in the UK is attempting to monitor changes in behaviour as the HIV epidemic increases. There is evidence of a change towards safer sex but a significant proportion of respondents still have unprotected anal sex. The number of men sexually assaulted is higher than previously reported in smaller samples.

This investigation is part of Project SIGMA and is funded by the Medical Research Council.

T.D.P.24

A REVIEW OF STUDIES OF BEHAVIORAL RESPONSE TO HIV-ANTIBODY TESTING AMONG GAY MEN

AR Stempel; AR Moss. School of Medicine, University of California, San Francisco; San Francisco, CA, USA.

Objective. To review changes in sexual behavior made by gay men receiving HIV-antibody test results.
Methods. We examined 22 studies of sexual behavior change by groups of gay men from the United States and Western Europe.
Results. A median of 61% of study subjects (range=23-84%) choose to know their HIV-antibody status when made available to them in the context of their research study. Most studies (n=15) have indicated that awareness of infection decreases risk behaviors (anal intercourse and multiple partners) with seropositives showing greater declines than seronegatives. A considerable number of studies (n=07), however, have shown no difference in the post-notification behavior of subjects.
Conclusion. The behavioral consequences of HIV-antibody test result notification remains unresolved, but a reduction in behaviors which transmit HIV usually ensues. No clear pattern explaining these ambiguous findings is yet apparent. Inappropriate ('binge') behaviors following notification have not been reported in these groups.

T.D.P.25 ATTITUDES OF DENTISTS AND GRADUATION STUDENTS TOWARDS AIDS IN BELO HORIZONTE , BRAZIL

Greco,Dircey B.;Oliveira,E.I;Oliveira,M.R.; Paulino,U.H.M;Vitoria,M.A.A. and Adams,I. Immunodeficiency Clinic,Faculty of Medicine, Belo Horizonte, Brazil

Objective: To study the attitudes and reactions of these professionals towards HIV infection.
Methods: In September 1988 we have evaluated, through a questionnaire the attitudes and reactions of 40 dentists and 36 graduation students of dentistry towards HIV infection:12 questions before and after a six hour intensive course on AIDS.

Results:Questions	Yes(%) Before	After
1.HIV+ should be treated as a special group	93.9	63.6
2.Prepared to treat HIV+	15.1	72.7
3.Afraid of infection by treating HIV +	97.0	75.7
4.Afraid of losing patients if they know you treat HIV+	84.8	63.6
5.Are you sure about safety measures at work	18.2	84.8
6.HIV+ persons should inform their dentists	100	100
7.Infected dentists should inform patients	72.7	66.7
8.Better infection control since HIV era	69.7	72.7
9.Would treat with an infected dentist	24.2	42.4
10.Would be treated by a homosexual dentist	51.5	51.5
11.Risk groups should be screened	87.9	84.8
12.Have you been applying the recommended preventive measures at the work place	66.7	63.6

Conclusion: There are many misconceptions related to HIV infection despite the literature available and the various mass media campaign. Some of them seem to be easily changed through direct information, while others, especially those reflecting day to day contact are clearly misconceptions and remain unchanged.

T.D.P.26 A STUDY TO INVESTIGATE THE EFFECTIVENESS OF ROLE PLAY IN HIV HEALTH EDUCATION GROUPS FOR DRUG ABUSERS

Mary Burgess, King's College Hospital, London, U.K.

Objective: To assess whether role play is an effective modulator of behavioural and attitudinal change in drug abusers.
Methods: Residents of a drug dependency unit completed a questionaire before and after an education group to assess their knowledge of and attitudes towards HIV and behaviour in potential risk situations. Subjects were randomly assigned to 3 groups as follows:- Group 1 received information about HIV, safer sex and risks associated with injecting behaviour. Strategies for reducing risk were explored via discussion. Group 2, as for Group 1, but included role play to explore risk reduction strategies. Group 3 (control) received no HIV education.
Results: Initial results indicate that it was only those subjects who received active learning via role play that underwent significant attitudinal change.
Conclusion: Attitudes are indicators for behavioral change; role-play does facilitate attitudinal change in this population and is therefore a useful educational tool in the prevention of the spread of HIV.

T.D.P.27 PERCEIVED COMMUNITY NORMS AND RISK REDUCTION: BEHAVIOR CHANGE IN A COHORT OF GAY MEN

O'Reilly, Kevin R.*, Higgins, DL*, Galavotti C*, Sheridan, J**, Wood, R.***, Cohn, D.****
*Centers for Disease Control, Atlanta, Georgia, U.S.A., **Professional Management Associates, Rockville, Maryland, U.S.A., ***Seattle-King County Health Department, Seattle, Washington U.S.A., ****Denver County Health Department, Denver, Colorado, U.S.A.

Objective: To examine the effect on behavior of an individual's perception that others in his community were changing their unsafe sexual practices.
Methods: 500 gay men from two sites completed initial and six month follow-up questionnaires on their sexual behavior and a number of other behaviors and beliefs. Changes in two behaviors—frequency of unprotected receptive anal intercourse for seronegatives and number of anonymous sexual partners for seropositives—were evaluated.
Results: Positive perceptions of community norms may influence reduction in risk behavior. For example, subjects who believed that gay men in their community were changing their lives for the better showed significant reductions in numbers of anonymous sex partners ($z=2.57$, $p<.01$) (seropositives) and number of partners with whom they have unprotected anal intercourse ($z=2.87$, $p<.01$) (seronegatives).
Conclusions: Changing perceptions of community norms for risk behavior may be an effective way of reducing risk behavior.

T.D.P.28 HYPERMASCULINITY AS A PREDICTOR OF SEXUAL RISK BEHAVIORS IN A COHORT OF GAY MEN

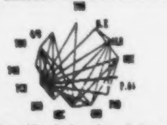
Exner, Theresa M., Meyer-Bahlburg, H.F.L., Gruen, R.S., Ehrhardt, A.A., and Gorman, J.M.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute; Columbia University, New York, NY, USA.

Objective. Previous research with straight males indicates that hypermasculinity (macho) is associated with a greater number of lifetime intercourse experiences and with less frequent and consistent condom use. This study explored the relationship between sexual risk behaviors and hypermasculinity in a New York City cohort of 110 HIV positive and 40 seronegative gay men (primarily white and middle class, aged 19-60 years).
Method. Subjects underwent a detailed sexual history interview and completed the Hypermasculinity Inventory (HMI; Mosher & Sirkin, 1984), a forced-choice self-report inventory designed to assess a macho personality constellation. The HMI was modified for use with this population.
Results. According to initial analyses (N=70), approximately 74% of the cohort reported sex with multiple partners and engaged in at least one act of unprotected receptive anal, insertive anal, and/or active oral sex. Correlational analyses indicate that hypermasculinity is associated with a greater number of sex occasions ($p<.05$), but not with number of partners nor with unprotected anal and oral sex.
Conclusion. Hypermasculinity in middle-class, AIDS-informed gay men predicts frequency of sexual activity but not sexual risk practices, in contrast to findings with heterosexual samples.

T.D.P.29 BEHAVIORAL TARGETS FOR POSSIBLE IMMUNOMODULATION THERAPY IN AIDS PATIENTS

Kvitash, V I * and Schmidt, Robert M ** Center for Preventive Medicine and Health Research. *San Francisco State University and *Pacific Presbyterian Medical Center. San Francisco, California. USA

Objective To demonstrate the value of Psycho-Immune-Balascopy (PIBa) for the cognition of patterns of interaction between and within behavioral and immunological parameters, with application to immunomodulation therapy
Methods. PIBa was applied for detecting, mapping and measuring the complexity and patterns of regulatory interactions among 7 behavioral and 6 immune (WBC: B, T, T4, T8 lymphocyte counts; T4/T8 ratio) variables in 11 AIDS patients. Thirty-eight healthy controls were obtained from the Health Watch program, a longitudinal prospective study of healthy aging. All participants completed the Health Watch Questionnaire which provides quantitative scores of health status and lifestyle habits in 7 areas: nutrition, medical events, general wellbeing, psychological wellbeing, physical activity, alcohol use and smoking
Results. The diagram represents the characteristic structure of INTER (Behavior-Immunity) and INTRA (Behavior-Immunity) abnormal interactions in AIDS patients, where inter-systems interactions are more prevalent (13 single interactions) than intra-system interactions (6 in behavior and 11 in immunity).



Conclusion. Psycho-Immune-Balascopy (PIBa) can identify behavioral targets for possible immunomodulation therapy in patients with AIDS.

T.D.P.30 WILLPOWER ASSESSMENT: A DECISION MAKING MODEL FOR DESIGNING TAILORED TARGETTED AND POSITIVE PROMOTION.

Carol Lynn Pass*, BJ Lapointe**. *McGill University, ~~Montreal, Quebec~~, Canada, **Clinique L'Actuelle, Montreal, Quebec, Canada.

Objective: To develop a simple and reliable measure of willpower (WP) and its components for use in descriptive and experimental studies, using a self-administered post-dictive weighted multiattribute utility assessment instrument with elicited attributes within model sub-dimensions. The model was defined to allow generalisation to other health behaviours, and applied to the study of behaviour related to AIDS transmission.
Methods: Instrument design was based on focus group meetings and interviews with members of the target population, consultations with counselling professionals, and prefeasibility and feasibility testing with clinic attenders and members of a francophone homophile organization. The instrument is for use in an anonymous setting to assess respondent WP for his most recent salient "risky" sexual behaviour decision.
Results: Adaptation of the instrument using desktop publishing resulted in a doubling of the response rate to 66% in the feasibility study. Respondents completed the WP questionnaire in 20-30 minutes. They reported an increase in awareness of their WP in decision-taking. Emotional well-being was found to be most important, with weight approximately equally divided between abundancy and deficiency motivations. The WP instrument is now being made available to francophone and anglophone homosexual community members in Montreal via clinics and community organizations.
Conclusion: Investigators can use a self-administered questionnaire to assess WP for compliance with health behaviour prescriptions, without compromising respondent anonymity or target population coverage.

T.D.P.31 FACTORS ASSOCIATED WITH RECURRENCE OF UNSAFE SEXUAL PRACTICES IN A COHORT OF GAY MEN PREVIOUSLY ENGAGING IN 'SAFER' SEXUAL PRACTICES

Seltzman, Scott'; Stoddard, A''; McCusker, J''; Mayer, K'. 'Fenway Community Health Center, Boston, MA; ''U of Mass, Amherst, MA.

Objective. To analyze the behavior of gay men who had engaged in 'safer' sexual behaviors (SS) for one or more years and assess the predictors of subsequent maintenance of SS.
Methods. Collection of the longitudinal behavioral, attitudinal, clinical and immunologic data was gathered as part of a natural history of HIV infection of a cohort of initially asymptomatic gay men (n=336) seen in a Boston health center. 25% were HIV antibody positive at outset. SS was defined as 100% condom usage if anal intercourse was practiced.
Results. Those maintaining SS were similar in age, smoking and drinking activities, duration of homosexual activity and Ab status to those who did not. Subsequent non-maintainers tended to have higher levels of 'unsafe' sexual behavior on entry to the project as well feeling that behavior change was not beneficial. Non-maintainers increasingly perceived greater barriers to maintaining SS. Other Health Belief Model components such as perceived susceptibility and severity were not able to differentiate maintainers and non-maintainers.
Conclusions. Health education strategies designed around the Health Belief Model may need to be reassessed in relation to long term maintenance of sexual behavior change.

T.D.P.32 THE ROLE OF PENITENTIARY REFORM AND SOLIDARITY ENHANCEMENT AMONG JAIL INMATES IN THE PREVENTION OF AIDS IN THE DOMINICAN REPUBLIC.

De Moya, E. Antonio; Carías, S; Rosario, S; Guerrero, E; Abreu-Larancuent, L; García-Alvarez, R.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To evaluate the approach to AIDS prevention in highly crowded Dominican jails through the inducement of penitentiary reform measures and the enhancement of solidarity networks among inmates.

Methods. AIDS CAP studies were carried out in Dominican jails in November 1987 and February 1989. Ongoing intervention includes attempts to create staff committees, training of health personnel, inmates' group discussion and lecture sessions, group formation and voluntary HIV testing and counselling.

Results. A lag of 24 months in AIDS awareness among inmates as contrasted to the general population has been overcome by the joint peer-professional intervention. Gang sex rapes ("maniguas") of youngest prisoners have been reduced to a minimum by inmates' defense committees.

Conclusion. Empowering inmates for self-generated preventive action in prisons both enhances their self-esteem and decreases the transmission potential of HIV among inmates.

T.D.P.33 IMPLICATIONS OF HEALTH BELIEFS FOR AIDS PREVENTION PROGRAMS: THE SAN FRANCISCO MEN'S HEALTH STUDY

Ekstrand, Maria L. *,**; Coates, T.J.*; Stone, G. ***.
* Center for AIDS Prevention Studies, and *** Health Psychology, U.C. San Francisco, CA U.S.A., ** Fellow, American Foundation for AIDS Research

Objective. To examine the relationship between health beliefs and sexual behavior among gay and bisexual men in San Francisco.
Method. This analysis is based on 455 single sexually active gay and bisexual men participating in the San Francisco Men's Health Study (a population-based longitudinal study of single males in San Francisco). Health beliefs specific to HIV infection and AIDS prevention were assessed in 1987. Number of sexual partners and condom use were measured at six and twelve month follow up. Low Risk was defined as mutual monogamy or 100% condom use. High Risk was defined as having multiple partners and less than 100% condom use. The longitudinal relationship between the respondents' beliefs and subsequent sexual behaviors was examined using univariate statistical tests.
Results. The longitudinal analyses showed that subjects who perceive safe sex as important in preventing the spread of AIDS and who do not perceive safe sex as pleasure reducing are significantly more likely to report low risk sex during the next twelve months than are those who hold the opposite beliefs. In addition, high risk subjects were significantly more likely to believe that safe sex is unnecessary when two partners have the same serostatus than were low risk subjects. Finally, high risk subjects perceived significantly fewer behaviors as transmitting HIV than did low risk subjects.
Conclusion. These results support the hypothesis that health beliefs influence preventive behaviors among gay and bisexual men. AIDS prevention programs may thus benefit from including work on beliefs regarding HIV transmission and safe sex.

T.D.P.34 SEXUAL BEHAVIOUR OF EXPATRIATES IN AFRICA

Houweling, Hans*; de Grave, A.; Smits, S.P.; Ligthelm, R.J.; Leentvaar, A.; Kok, P.W.; et al.
*National Institute of Public Health (RIVM), Bilthoven, The Netherlands.

Objective. To describe sexual behaviour of Dutch expatriates in Africa with respect to risk of HIV infection.
Methods. In the course of a routine medical check Dutch expatriates working in sub-Saharan African countries are asked to complete a self-administered questionaire on sexual and other risk factors (since 1978) for HIV infection.
Results. Between Sept.1987-Dec.1988 699 men and 531 women entered the study; 558 men and 429 women were married or cohabited; resp. 408 and 404 were accompanied by their partner during their stay in Africa. Participants were posted in cities and rural areas of all sub-Saharan countries, including those in which prevalence of HIV infection is high. Of participants 28% had heterosexual contact with African partners (HCA): 37% of men and 15% of women. The mean number of sex partners was 5, the median 2, range 1-150. Ten % of men and 4% of women had been treated for S.T.D. HCA was associated with a history of S.T.D., being single, and not being accompanied by the partner ($p < 0.001$). Males more often had HCA, independently of the previously mentioned factors ($p < 0.001$). Condom use was infrequent and inconsistent.
Conclusion. Sexual contact with African partners is a frequent occurrence especially among single men; Dutch expatriates run a substantial risk of sexual exposure to HIV.

T.D.P.35 CHANGES IN SEXUAL PRACTICES IN THE SYDNEY AIDS PROJECT: 1984 - 1989.

Tindall, Brett*; Nicholas T* and Cooper DA*.
NHMRC Special Unit in AIDS Epidemiology and Clinical Research, University of New South Wales, Australia.

Objective: To describe the changes in sexual behaviour in a cohort of homosexual and bisexual men in Sydney, Australia.
Methods: The Sydney AIDS Project is a prospective cohort study of 1037 homosexual and bisexual men enrolled between February 1984 and January 1985. At each six-monthly review visit subjects complete a self-administered questionnaire that examines their sexual practices during the preceeding six months.
Results: A decrease in the mean number of sexual partners during the preceeding 6 months was reported by both seropositives (22 to 4) and seronegatives (16 to 2) over the first 3 years of observation. Seropositives reported a reduction in receptive anal intercourse from a mean of 8 to 2 times per month and seronegatives from 4 to 1 per month. There was a similar reduction in all sexual practices. These changes were reflected in a decrease in the seroconversion rate within the cohort which peaked at 4% during early 1985 but remained below 1% in 1988.
Conclusion: These data indicate significant changes in the sexual practices of a large group of homosexual men in Sydney since 1984. These changes are reflected in a decrease in the seroconversion rate for this cohort. An updated analysis of the data, incorporating data to early 1989, will be presented.

T.D.P.36 CHANGE IN SEXUAL BEHAVIOR IN HOMOSEXUALS AT RISK FOR AIDS

S.Maurice Adib; Joseph, J.; Tal, M.
University of Michigan, Ann Arbor, Michigan, United States

Objective. To describe longitudinal prevalence and predictors of safer sex among homosexual men at risk for AIDS.
Methods. Detailed behavioral data describing condom usage during receptive and insertive anal sex were collected in the Coping and Change/Chicago MACS cohort, beginning in February 1986. Change in behavior between W4 and W5, separated by a six month interval, was used as the dependent variable. Attitudes, peer norms, prior experience with condom usage, and sociodemographic variables were used as predictors.
Results. W4-W5 data are shown in Table 1. Predictors of behavioral change during receptive vs. insertive anal sex were dissimilar. While HIV serologic status was related to subsequent changes in receptive anal practices, socioeconomic and attitudinal variables predicted change in insertive anal practices.

Table 1 - Safer Sexual Practices at Two Time Points

	Safe (W4) N(%)	Not Safe (W4) N(%)	Total N(%)
INSERTIVE ANAL SEX:			
Safe (W5)	192(58)	148(55)	340(57)
Not Safe (W5)	137(42)	123(45)	260(43)
Total	329(100)	271(100)	600(100)
RECEPTIVE ANAL SEX:			
Safe (W5)	243(66)	141(60)	384(64)
Not Safe (W5)	124(34)	93(40)	217(36)
Total	367(100)	234(100)	601(100)

Conclusion. Individual condom usage is not consistent over time. Previous reports of aggregate measures showing improved condom usage among gay men should be viewed with caution because of such individual fluctuations which are not yet fully understood. Our findings also suggest that serostatus is influencing decision-making regarding condom usage and/or choice of partner(s). Decreasing seroconversion rates might be ascribed partly to these processes, rather than the elimination of anal sex or consistent use of condoms.

T.D.P.37 TITRE : COMPORTEMENT SEXUEL ET RISQUE D'INFECTION A V. I. H. AU SENEGAL

DIOUF Ousmane*
CARBALLO M** ; NDOYE I* ; PETITGIRARD Anne**
*Ministère de la Santé Publique - SENEGAL -
** GPA/OMS - GENEVE

OBJECTIF : Identifier les comportements Sexuels et ses déterminants dans une population de 15 - 49 ans.
METHODOLOGIE Enquête par interview sur un échantillon national représentatif (Sondage par grappes : 2.500 personnes) complétée par observation, interview ethnographiques, focus-group. Conception finale et Exécution faites par équipe pluridisciplinaire. Coordination par Centre National d'Education Pour la Santé.
RESULTATS La recherche essaie d'établir les rapports entre comportements sexuels et données sur l'infection à VIH et les autres M.S.T. Les résultats permettent d'établir entre autre un lien entre comportements et données démographiques (migration et idéologie sexuelle) et persistance de valeurs socio-culturelles (fidélité, croyances religieuses) d'une part,entre perception du risque et prédisposition à adopter un comportement sexuel à risque.
CONCLUSION
Ces résultats spécifient les incidences pratiques pour l'orientation, le renforcement et l'évaluation des programmes d'intervention éducatives facilitant leur intégration et efficacité.

T.D.P.38 "Pretesting AIDS Health Promotion Materials".

Mclellan, Iain*; Richardson A.**
*World Health Organization, Health Promotion Specialist, GPA/HPR, Geneva; **World Health Organization, Health Educator, HPS/HPR, Geneva, SWITZERLAND

This presentation will be supported by slides illustrating types of changes made to materials and pretesting sessions with target audiences. A poster presentation will be available.

Objective. 1) To introduce methods for pretesting prototype AIDS health promotion messages and materials designed for culturally diverse target audiences in Africa, Asia, the Pacific and the Caribbean. 2) To promote the concept of developing specific AIDS messages for primary, secondary and tertiary target audiences with the long range goal of behavioural change.
Method. 141 persons working in AIDS health promotion from 54 countries participated in a series of 5 WHO-sponsored workshops during 1988-89. The health educators, communication specialists and medical doctors conducted focus group interviews with various target audiences such as prostitutes, STD patients, high school students, teachers, hotel workers, lab technicians, military personnel, hospital workers, truck drivers and others. Messages and materials were produced with the assistance of graphic artists and were pretested on these same target audiences.
Results. 1) More than 200 different prototype messages in the form of posters, story boards, comics, radio scripts and other materials were produced, pretested and revised. 2) The participants became convinced of the value of pretesting.

T.D.P.39 BEHAVIORAL INTENTIONS AND OTHER FACTORS INFLUENCING BEHAVIOR CHANGE IN A COHORT OF GAY MEN: A PROSPECTIVE STUDY

Galavotti, Christine*; O'Reilly, K.R.*; Higgins, D.L.*; Sheridan, J.**; Cohn, D.L.***. *Centers for Disease Control, Atlanta, Georgia, U.S.A., **Professional Management Associates, Rockville, MD., U.S.A. ***Denver Disease Control Service, Denver, Colorado U.S.A..

Objective: To examine the influence of intentions to change unsafe sexual behavior on reported behavior change in a cohort of gay and bisexual men.
Methods: 217 gay and bisexual men completed baseline and six month follow-up questionnaires on their HIV risk behavior, beliefs, attitudes and intentions. A model to predict behavior change from Time 1 (T1) to Time 2 (T2) was developed using variables drawn from social cognitive theories of behavior change.
Results: Behavioral intentions at T1 predict behavior change at T2. Men who reported intentions to decrease the number of occasional partners with whom they had receptive anal intercourse at T1 reported significant decreases at T2 ($z=3.99$, $p<.05$). Beliefs about normative behavior mediated this relationship. Among men who intended to decrease the number of one-time partners with whom they had anal intercourse, only those who perceived positive norms for this behavior had made significant reductions ($z=2.34$, $p<.05$).
Conclusions: Cognitive models of behavior change may help identify predictors of change, and thus be useful in developing risk reduction interventions.

T.D.P.40 AIDS-RELATED BEHAVIOR CHANGE OF GAY MEN IN RICHMOND VA, 1985-1988

Bradford, Judith B.; and Johnson, D. Virginia Commonwealth University, Richmond, Virginia, USA.
Objective. To present baseline and follow-up data on AIDS-related behavior change and related variables among a non-clinical sample of gay men in the Richmond metropolitan area. Key variables to be discussed are sources of information, perception of threat to self, and change in risk-associated sexual and drug use behaviors.
Methods. Initial data were collected in the spring of 1985; follow-up data were collected two years later. A questionnaire was prepared specifically for the study, with the help of focus groups of gay men in the city. The same process was used to modify the original questionnaire before follow-up. A two-stage method was used to distribute questionnaires to potential respondents. A list of distributors, both individuals and organizations, was recruited and trained in contacting gay men and explaining the study. The same distribution network was used for the follow-up, in order to make comparison feasible. Anonymity of respondents was carefully protected, in order to gain participation in this city, where homosexual behavior is a felony offense. The response rate was 45% in 1985 and 68% in 1988.
Results. Very few had been tested for HIV infection in 1985, but 43% had been tested by 1987. Thirty-seven percent of the 1987 cohort were infected; 8% had ARC or AIDS. In 1985, 23% experienced "great fear" about their own vulnerability to infection; in 1987, this percentage was about the same (21%). However, more than half of gay men sampled in 1987 had experienced an increase in level of fear from when they first heard about AIDS. Changes were noted in sources of information about HIV: physicians, AIDS service organizations, and the public health department gained in prominence. Only a minority reported self-protective behavior change in 1985; in 1987, almost everyone reported that he had made changes.
Conclusion. Gay men in this middle-sized southern city were 3 times as likely to have made some changes in risk behaviors in 1987 as they were to have done so in 1985. Reported changes were probably insufficient to prevent transmission of the virus to increasing numbers of individuals in the population sampled.

T.D.P.41 SEXUAL BEHAVIOUR CHANGES AMONG MALE SEXUAL CONTACTS OF MEN WITH HIV DISEASE: A 3 YEAR OVERVIEW.

Calzavara, Liviana;Coates, R.;Read, S.;Johnson, K.;Farewell, V.;Fanning, M.;Shepherd, F.;MacFadden, D. University of Toronto, Toronto, Ontario, Canada.
Objectives: To describe the behaviour changes which have taken place (over a 3-year period) in a cohort of male sexual contacts of men with HIV disease.
Methods: 249 sexual partners of men with HIV disease were recruited into a prospective study between July 1984 and July 1985. The cohort has been monitored every three months. Data on sexual activities have been collected through an interviewer-administered questionnaire and comparisons between the first and twelfth follow-up visit have been made.
Results: The cohort has experienced a reduction in the number of sexual contacts from a median of 3.7 (mean=7.5) to a median of 1.1 (mean=4.1). The percentage of men who did not have sex increased from 24% to 51%. The mean number of anonymous partners has dropped from 3.7 to 2.0. High risk sexual activities such as anal insertive and anal receptive have decreased (anal insertive from 68% to 43% and anal receptive 58% to 42%). Only a small number are being exposed to semen in the rectum (14/106) or orally (19/106). The frequency of lower risk activities such as oral insertive and receptive has also decreased; frequency of masturbation with a partner has remained unchanged. 70% of the men who engage in anal intercourse use condoms more than 50% of the time.
Conclusion: Overall, the men have reduced both the numbers of sexual partners and the volume of sexual activity. The reduction in volume of sexual activity has been gradual and consistent in trend.

T.D.P.42 PSYCHOSOCIAL AND BEHAVIORAL COMPONENTS OF BELIEF OF ANTI-HIV-1 STATUS IN HEALTHY GAY MALES

August, Sharon*, Antoni, M.*, Ironson, G.**; Laperriere, A.*; Schneiderman, N.*, Fletcher, M.A.*; et al.
*University of Miami, Miami, FL, USA; **Stanford University, Palo Alto, CA, USA

Objective. This study investigated the relationship of perceived belief of HIV-1 exposure to sexual and health behaviors, psychological and social variables in healthy gay men at risk for AIDS, prior to notification of their anti-HIV-1 status.
Method. Healthy gay males at risk for AIDS (n=45) wishing to know their anti-HIV-1 status participated as part of a longitudinal investigation. At baseline, prior to being informed of their diagnosis, subjects provided behavioral and psychological data including measures of psychological distress, coping, gay hassles, internalized homophobia, and sexual behaviors. Immune functioning and HIV-1 antibody status were also determined. Prior to diagnosis, subjects were classified as belief negative (BN) or belief positive (BP), based on their self-predicted anti-HIV-1 status.
Results. Of 17 anti-HIV (+) subjects, 10 (59%) were BP; of 28 anti-HIV (-) subjects, 22 (79%) were BN. Thus, 71% of all subjects predicted their anti-HIV-1 status correctly. Controlling for status, CD8+ (cytotoxic/suppressor) cell counts, were significantly higher for BP than for BN subjects. Among all subjects, CD8+ numbers were positively correlated with distress measures of intrusive and avoidant thoughts about AIDS. Significantly more intrusive thoughts about AIDS were reported by BP subjects. BP subjects also engaged in more analingus and fellatio and reported more receptive anal intercourse partners in the last month, as well as, more fellatio, active intercourse, and analingus and greater number of partners for analingus and fellatio one year ago. BP subjects reported more gay hassles, more positive feelings about being gay and engaged in more self-disclosure about their sexual orientation with family and friends. In BP subjects, internalized homophobia was negatively correlated with total AIDS-related intrusive and avoidant thoughts. Also a more positive feeling about being gay in BP subjects was significantly correlated with decreased anxiety about receiving anti-HIV-1 results.
Conclusion. Self-reported behavioral and psychological as well as actual immunological differences were related to belief in HIV-1 seropositivity. Supported by NIMH, P50MH42455-03.

T.D.P.43

SAFE AND UNSAFE SEXUAL PRACTICES BY HETEROSEXUALS AND HOMOSEXUAL MEN: PREDICTING INTENTIONS AND BEHAVIOUR

McCamish, Malcolm, Gallois, C., Kashima, Y., Edis, A., and Chauvin, A.
University of Queensland, Brisbane, Queensland, Australia

Objective. To examine, in these three groups, the influence of attitudes, personal and peer norms, and past behaviour on the *intention to practice safe or unsafe sexual behaviour* and on actual behaviour at the next sexual encounter.

Methods. Homosexual men and heterosexual men and women (N = 240) were recruited from the Brisbane community to participate in the study. They rated (1) their intention to engage in several sexual behaviours and behaviours occurring during sexual encounters, (2) the pleasantness of these practices, and other costs and benefits, (3) their personal norms about the behaviour, (4) peer norms, (5) norms for significant others, and (6) their past practice on each behaviour. The behaviours had previously been classified as safe or risky with respect to HIV transmission. At their next sexual encounter, subjects completed a brief questionnaire indicating the behaviours they had engaged in, using the same list as on the initial questionnaire.

Results. On the basis of their behaviour, subjects were classified as practicing safe, possibly risky, or risky sexual behaviour. Homosexual men were significantly more likely to practice safe behaviour than heterosexual men or women. Multiple regression analyses indicated that past behaviour was the strongest influence on both intentions and actual behaviour for all three groups of subjects, but that attitudes towards the behaviours also played a significant role. Multivariate analyses of variance explored further differences among the three subject groups, and between subjects practicing safe and unsafe sex, on the influence of attitudes and norms, especially peer norms. These results indicated that peer norms are more influential for homosexual men, while the sexual partner is the most important normative influence for heterosexual men and women.

Conclusion. These results highlight the importance of individual psychological variables in the decision to practice safe or unsafe sex, and thus have strong implications for safe-sex education programmes. Much more account must be taken of the influence of past sexual behaviour on present practice.

T.D.P.44

PSYCHONEUROIMMUNOLOGIC RELATIONSHIPS IN MEN WITH ARC

Temoshok, Lydia*; Solomon, GF**; Jenkins, S***; Stites, D.P.*; Sweet, DM*. *Univ. of California San Francisco, **Univ. of California Los Angeles, ***Univ. of California Berkeley, CA., U.S.A.

Objective. To describe and understand the nature of relationships among psychosocial, neuropsychologic, and immunologic variables in HIV disease. To our knowledge, the interactions of variables in these 3 domains have not been reported for men with HIV spectrum disorders.

Methods. Laboratory immunologic measures were obtained for 103 seropositive homosexual men with at least one HIV-related symptom who were recruited from the UCSF AIDS Clinic, and administered neuropsychological tests and psychosocial self-report measures. All the measures were obtained at 3 time points, approximately 6 months apart.

Results. Significant correlations were found between measures of anxiety, depression, confusion, fatigue and absolute numbers of Leu 3+ cells, and Natural Killer (NK) cell activity. At Time 1, higher scores on emotional suppression were also significantly correlated with more Leu 3+ and Leu 3+ Leu 8+ cell numbers, as well as with more NK cell activity. At Time 2 (N = 56), higher scores on suppression of anxiety and unhappiness were significantly correlated with higher numbers of Leu 2+, Leu 2+ Leu 7+, Leu T7+, and Leu 2+ Leu 15-, and with more NK cell activity. Higher numbers of Leu 2+ and Leu 2+ HLA-DR cells were significantly correlated with numbers of neuropsychological impairments from mild to marked.

Conclusion. While it is premature to draw conclusions about the implications of psychoneuroimmunologic relationships in HIV disease, our findings suggest that these relationships change with disease progression, and are perhaps best interpreted in the context of immunologic and psychologic adaptation to ongoing disease and psychosocial events.

T.D.P.45

CHANGES IN CONDOM USE AMONG GAY MEN: PREDICTORS AND METHODOLOGICAL ISSUES

Catania, Joseph*; Coates, T.*; Stall, R.*; Bye, L.**; Capell, F.**; Turner, H.*, et al. *University of California, San Francisco, Center for AIDS Prevention Studies, **California State Office of AIDS.,U.S.A.

Objective. Psychosocial predictors of changes in condom use over time were examined. Sample attrition and repeated measurement effects on changes in condom use in two studies were also examined.

Methods. Respondents were gay men in San Francisco. Study One: a longitudinal sample (n=300;1984-1987) and cross-sectional samples (n's=200 per wave; 1985-1987) were randomly selected by random digit dial techniques; Study Two: a longitudinal sample (n=600; 1984-1987) was recruited from bars and bath houses and mailed-in questionnaires. Identical behavioral measures were used across studies (Psychosocial measures will be described).

Results: Condom use increased significantly over time in all samples. This increase was unrelated to subject attrition or repeated measurement effects (Study 1 & 2). Higher levels of social support and enjoyment of condoms were associated with increased condom use over time (analysis of covariance: Study 2). Health beliefs, alcohol use, and antibody status did not predict changes in condom use.

Conclusion: Prevention programs with gay men should focus on building social support groups and eroticizing safe sex practices. Changes in condom use observed in longitudinal studies of gay men are probably unrelated to design features.

T.D.P.46

COPING OF HIV-INFECTED MEN AND AIDS-PATIENTS

Leiberich,P.[1]; Engeter,M.[3]; Hermann,Claudia[4]; Harrer,T.[2]; Olbrich,E.[3]; Kalden,J.R.[2].
University of Erlangen, [1]Medical Clinic I, [2]Medical Clinic III, [3]Dept. of Psychology I, FRG; [4]AIDS-Center of Federal Health Administration, Berlin.

Objective. To assess relationships between psychosocial stress caused by an HIV-infection and different reaction patterns as directly influenced or modified by coping processes.

Methods. Life Quality-, Coping-, and Social Support Questionnaires and semi-structured interviews, administered to 30 homosexual men and Ex-IVDU's, Walter Reed Stage I-V, at least 3 months after diagnosis.

Results. Feelings of psychic (60% "strongly affected") and job distress (45%) decreased from high levels after the HIV test to moderate degrees (20% resp. 10%). In order to minimize stress, individuals used differential patterns of coping. Passive cooperation, rumification, problem-analysis, tackling, activity as diversion were used most frequently. Gay men further preferred perceptual defence and tried to preserve composure, while Ex-IVDU's were seeking social support. Gay men felt more threatened by HIV than Ex-IVDU's.- Clustering over subjects, we found one group, aged 19 to 28, who at the start of their autonomous life were hit by the diagnosis, and developed a depression, showing high scores in perceptual defence, social withdrawal, self-accusation and psychosomatic reactions. A second group of professionally successful gay men focussed on distraction by emphasizing job activity.

Conclusions. Coping patterns of HIV-positives are similar to those of cancer patients (cf.Heim 1988). Effectiveness of coping will be discussed.

Psychology and Sexology

T.D.P.47

DE NOUVEAUX COMPORTEMENTS PARMI LES HOMOSEXUELS EN EUROPE : LES CAS DE PARIS ET D'AMSTERDAM.

Algra,Y.*;Bergès(Dr),O.**;Dröge,W.A.M.*;Hannema(Dr),H.I.*;
Pelé,G.**;Pollak,M.***.
*Amsterdam Jacks,Amsterdam,Pays-Bas;**Santé et Plaisir Gai,Paris,France;
***Centre National de la Recherche Scientifique (CNRS),Paris,France.

Objectif. Etudier si des rencontres régulières avec pratiques sexuelles à moindre risque, ainsi que la diffusion d'informations spécifiques ont une influence sur le changement en profondeur du comportement des homosexuels. Ces rencontres(Jack Off Parties-JOP-) seront évaluées simultanément à Paris et Amsterdam et l'étude permettra de mieux connaitre les pratiques sexuelles des participants en dehors des Jack Off Parties.

Méthodes. Réalisation et diffusion du même questionnaire(60 questions) portant sur: prise de contact avec les JOP, évaluation des JOP, test de détection des anticorps du VIH et résultats, pratiques sexuelles habituelles en dehors des JOP, caractéristiques sociodémographiques des participants,...Questionnaires diffusés lors des JOP de janvier, février et mars 1989 (600 à 800 retours attendus pour les deux villes).

Résultats. La première enquête de ce type avait été réalisée à Paris début 88. Les conclusions, présentées à la Conférence de Stockholm (abstract n° 6543), indiquaient le rôle important des JOP pour diffuser et maintenir de nouveaux comportements sexuels à moindre risque .De même, cette enquête avait fait apparaître trois grands groupes de participants selon l'âge et la sérologie. L'étude actuellement en cours devrait valider ces résultats, noter les évolutions, mettre en évidence les différences éventuelles entre deux pays ayant des traditions et des politiques de prévention différentes.

T.D.P.48

T.D.P.49 PSYCHOSOCIAL REACTIONS OF MEN WHO ARE CARERS FOR HIV-INFECTED PEERS AND MEN WHO ARE HIV-ANTIBODY POSITIVE.

Viney, Linda, L., Crooks, Lavinia, Walker, B.M.
Psychology Department, University of Wollongong, NewSouth Wales, Australia.

Objectives: (1) To describe and compare the psychosocial reactions of HIV-antibody positive gay men and gay men involved in providing care to their HIV-infected peers in three Australian cities. (2) To contrast these responses to those of two groups of men, one with non HIV-related illness and one with no major illness. (3) To examine the implications these findings have for the development and implementation of counselling and support services for carers and HIV-infected men.
Methods: Content analysis scales are applied to transcriptsof the men's interviews to secure measures of distress, anxiety, depression, uncertainty, anger and helplessness, together with their better experiences of competence and sociability as well as general positive emotion.
Results: (1) The psychosocial reactions of gay men showed considerable consistency acrossthe three Australian cities. (2) The HIV-antibody positive men and the carers react differently from both the ill and well men, but their reactions are very similar to each other. Depression is most common for the HIV-antibody positive men, followed by the experience of anger. Depression is also common for carers. However, perceived competence is also high for both the antibody positive and carer groups.
Conclusions: Caring for people with HIV infection can be distressing and demanding The psychosocial reactions of individual carers needs to be examined in order to develop adequate support structures for them. Methods of counselling and support used with HIV-antibody positive men should be examined when developing interventions for carers. The perceived competences retained by carers and HIV-infected mensuggest these strengths should be fostered in developing counselling.

T.D.P.51 DEFENSE MECHANISMS AND HIV RISK RELATED BEHAVIORS IN SUBSTANCE ABUSERS

Bihari, Bernard and Ottomanelli, Gennaro*
*SUNY Health Science Center, Brooklyn, N.Y., U.S.

Despite the clinical importance of understanding a patient's defensive structure, little attention has been devoted to the role of defense mechanisms in the intrapsychic structure of substance abusers and the relationship of defenses to HIV-related risk behaviors. In this study, substance abusers were administered the Defense Mechanism Inventory (DMI) and the Risk Behavior Inventory (RBI). The DMI measures five defense categories - Turning Against Object (TAO), Turning Against Self (TAS), Reversal (REV) Principalization (PRN) and Projection (PRO). The RBI elicits demographic and HIV-related risk information such as sexual activities, needle sharing and drug-related risk activities. The sample studied consisted of 29 substance abusers hospitalized for detoxification from heroin and cocaine addiction. Results showed that despite an adequate knowledge fund of AIDS prevention and risk reduction information, the patients reported substantial risk related behaviors on the RBI. Evaluation of the DMI data indicated that the patients scored highest on the REV defense, followed by PRN, PRO, TAO and TAS respectively. PRN and REV, which represent intellectualization and denial defenses, may play a significant role in the interpersonal dynamics of continued involvement in substance abuse and contingent HIV-related risk behaviors. Clinical and health education implications of providing treatment services and AIDS prevention information to substance abusers is discussed.

T.D.P.53 RETENTISSEMENT PSYCHOLOGIQUE DE L'INFECTION A VIH SUR LA RELATION DE COUPLE.

Marie-Ange GUDEFIN**, S. TISSERON**, Y. EDEL*.
* Département des Maladies Parasitaires et Infectieuses, Unité INSERM 313 (Pr M. Gentilini), G.H. Pitié-Salpêtrière, Paris, France.
** Service de Médecine Interne, Maladies Infectieuses et Tropicales (Pr C. Lafaix), Centre Hospitalier de Villeneuve-St-Georges, France.

L'étude des facteurs psychologiques qui perturbent la relation d'un couple stable a été effectuée auprès de 40 patients séropositifs et SIDA, hospitalisés. A partir d'entretiens semi-directifs et de questionnaires auprès du patient et de son partenaire habituel, les auteurs ont trouvé que les facteurs de risque psychologique sont corrélés avec la situation affective et sociale du couple antérieure à l'annonce de la séropositivité au VIH.

Dans la majorité des couples, homosexuels et hétérosexuels, la séropositivité est annoncée par le patient au partenaire, alors qu'elle est gardée secrète vis-à-vis des parents (tout au moins au début de l'infection) et plus encore vis-à-vis des enfants. Le mode de contamination sexuelle est en règle non évoqué ou tenu secret dans la relation de couple hétérosexuel (mécanisme de protection du couple, systèmes de loyauté). On observe une plus grande stabilité du lien dans le couple homosexuel. En cas de rupture à cause de la séropositivité, peu de couples se sont reconstitués ultérieurement. Le lien affectif supplée à la réduction notable des pratiques sexuelles, à l'exception du sous-groupe des couples dont l'un des partenaires ou les deux sont toxicomanes. Les particularités de ce sous-groupe sont analysées par rapport aux comportements du couple vis-à-vis de la prévention de l'infection par le VIH.

T.D.P.50 PSYCHOLOGICAL INTERVENTIONS IN THE TREATMENT OF PERSONS WITH AIDS, ARC & ASYMPTOMATIC HIV INFECTION.

Entus, Anne K. Metaformation Inc., Montreal, Quebec, Canada

Objective. To report on the use of Neuro-Linguistic Programming (NLP) in the treatment of HIV infected persons and the consequent beneficial effects on quality of life and clinical status.
Methods. The approach is based on psychoneuroimmunology (PNI), the study of the complex bidirectional interactions of consciousness (psycho), brain and central nervous system (neuro), and the body's defense against desease (immunology). The NLP model of human behavior provides a behavioral technology for changing beliefs and attitudes correlated with immunosuppression, as well as for learning the coping strategies that characterize long term survivors of AIDS and other life threatening illness. The asymptomatic group participated in a 2 1/2 day workshop, persons with AIDS or ARC were seen individually (from 4 to 16 hours each).
Results. The preliminary results (follow-up period of 6 to 24 months) indicate substantial increase in self-reported quality of life, changes in life style and livivng/working situations, weight gain, decrease in number and intensity of symptoms and infections, elimination and/or substantial decrease in number and intensity of side effects from drug treatments.
Conclusion. Because of lack of control with respect to other treatments it is not possible to isolate the effects of NLP. Nevertheless, the timing and extent of many changes was impressive and not merely coincidental. Given that it has no harmful side effects, NLP offers an effective strategy in the treatment of AIDS and ARC and in the maintainance of health in asymptomatic HIV infected persons

T.D.P.52 PROCESSUS D'ADAPTATION A LA MALADIE DE PERSONNES ATTEINTES DU SIDA

Côté, José; Fortin, M.-F. Université de Montréal, Montréal Québec, Canada.

En raison de l'absence de traitement efficace à ce jour, il paraît essentiel de promouvoir le bien-être des personnes atteintes du SIDA.
Objectif. Décrire le processus d'adaptation à la maladie des personnes atteintes du SIDA.
Méthodes. Une étude descriptive de type transversal s'est déroulée dans un centre hospitalier universitaire de Montréal auprès de 50 sujets, la moitié au stade primitif et les autres, au stade progressif avancé. Les variables étudiées ont été: les perceptions des sujets vis-à-vis la sévérité des pertes (questionnaire élaboré), leurs stratégies adaptatives (échelle de coping, Billings & Moos, 1984) et l'état psychologique (échelle de bien-être, Kovess et al. 1985).
Résultats. I. Les pertes d'ordre physique sont celles perçues le plus sévèrement. II. Les stratégies adaptatives orientées vers la recherche d'information sont celles les plus utilisées. III. La sévérité des pertes éprouvées influence de façon statistiquement significative l'utilisation des stratégies d'évitement. IV. Les sujets qui ont les meilleurs scores de bien-être utilisent davantage des stratégies orientées vers la recherche d'information et ils ont moins recours à des stratégies d'évitement. V. Les sujets qui sont au stade progressif-avancé de la maladie perçoivent plus sévèrement les pertes d'ordre social que ceux au stade primitif.
Conclusion. Les efforts déployés par les sujets pour composer avec les pertes subies ont des répercussions profondes sur leur intégrité psychologique.

T.D.P.54 DIFICULTIES IN THE MANAGEMENT OF AIDS PACIENTS AND INFECTED PEOPLE IN BRAZIL

Rodrigues, Lair*; Ervolino, Luiz**; Silva, Amélia***
*,**,*** Divisão Nacional de Doenças Sexualmente Transmissíveis/AIDS – Ministério da Saúde – Brasília, Brazil

Objectives: To identify the problems health professionals have in dealing with AIDS patients and infected individuals.

The managment of AIDS patients and infected individuals in a hospital, out-patient clinics, home care facilities or work place have brought convulsive responses from health professionals in Brazil. The main responses were the following: irrational fear, arrogance, refusal to provide medical care, impotence, lack of solidarity and discrimination. These responses brought a crisis on the management of patients on both in-patient and out-patient basis and led us to develop and implement a training course and counseling services. The methodology used in the training was role-play. From 480 health professionals evaluated, 90% (432/480) showed improvement on the level of knowledge, change in perceptions and attitudes towards infected individuals, AIDS patients, and themselves.

T.D.P.55

PSYCHOLOGICAL CORRELATES OF THE TRANSMISSION AND ACCEPTANCE OF RUMORS ABOUT AIDS

Kimmel, Allan J.
Fitchburg State College, Fitchburg, Massachusetts, U.S.A.

Objective. To identify the emotional and cognitive factors that underlie the transmission and acceptance of widely disseminated rumors about AIDS, and to determine the prevalence and degree of belief in the rumors. Rumors were expected to thrive in an atmosphere of anxiety and uncertainty.
Method. A questionnaire, which listed current rumors about AIDS, was completed by 229 college students. Items were designed to explore the relationship between apprehension, doubt, AIDS-related changes in behavior, and rumor-specific anxiety, importance, and uncertainty as correlates of self-reported frequency of rumor transmission and degree of rumor belief.
Results. Stepwise regression analyses revealed that the best predictive equation of frequency of rumor transmission included rumor-specific anxiety and behavior change ($R=.50$, $p<.001$); rumor-specific anxiety, importance, and expectation of AIDS-related personal consequences best predicted belief in rumors ($R=.75$, $p<.001$). Rumor-specific credulity was related to AIDS uncertainty ($r=.30$, $p<.001$) and rumor transmission ($r=.37$, $p<.001$). Overall uncertainty about AIDS and rumor transmission were related ($r=.15$, $p<.05$).
Conclusion. Rumor-specific anxiety appears to be the strongest predictor of rumor transmission and credulity. Tendencies to transmit anxiety-provoking rumors are likely to accompany AIDS-related behavior change, perhaps to justify the change or reduce post-decisional dissonance. Anxiety-provoking rumors perceived as important and personally consequential are most likely to be believed. Reduction of anxiety in AIDS education campaigns is advised.

T.D.P.57

HELP-SEEKING FOR AIDS-RELATED CONCERNS: A COMPARISON OF GAY MEN WITH VARIOUS HIV DIAGNOSES

Hays, Robert; Catania, J.; McKusick, L. and Coates, T.
Center for AIDS Prevention Studies, University of California, San Francisco, California, USA

Objective. To examine psychological distress levels and help-seeking patterns among four groups of gay men (AIDS diagnosed, HIV seropositives, HIV seronegatives, men unaware of their HIV status) and assess the helpfulness of different sources used (peers, family, professional helpers).
Methods. 574 gay men who participated in the 1987 wave of the AIDS Behavioral Research Project completed questionnaires regarding help-seeking, HIV status, AIDS-related worry, anxiety and depression.
Results. Respondents reported high anxiety, depression and a high degree of help-seeking. Men diagnosed with AIDS and seropositives reported the most AIDS-related worry and were the most likely to seek help. Peers were the most widely sought help-source and perceived to be the most helpful. Helpfulness of peers was correlated with less anxiety and depression. Family members were least likely sought and perceived as least helpful.
Conclusions. Peers serve as the primary and most effective help-source for gay men confronting the AIDS crisis. Community programs are needed to promote the helping abilities of peers, prevent burn-out among peer helpers and provide alternative help sources for men who lack supportive peer networks .

T.D.P.59

EVIDENCE OF FRANK COGNITIVE IMPAIRMENT AND DEPRESSION APPEARING INDEPENDENTLY OF WALTER REED STAGE

Grace, William C.*, Tramont E.C.**, Oster, C.N.**
*Psychology Service, Walter Reed Army Medical Center and the Walter Reed Retrovirus Research Group, Washington, D.C. United States of America
**Infectious Disease Service, Walter Reed Army Medical Center, United States of America.

Objective. To provide descriptive information on levels of depression and global cognitive functioning in HIV positive males at a military medical center.
Methods. A retrospective review of psychological test data was conducted. Scores on a standard depression scale (Zung) and cognitive test (Shipley-Hartford) are presented, and these were examined in relation to the patient's stage of infection in the Walter Reed Classification system.
Results. Descriptive data are presented in tables. Of 254 patients, 27% scored in the clinically depressed range, and a frequency analysis of these showed no relation between walter reed stage and number pf patients with a depressed score. Using a Shipley-Hartford CQ of less than 80 to indicate cognitive decline, 15% of 256 patients evidenced such a change. Frequency analysis revealed no relation between Walter Reed stage and CQ.
Conclusion. Patients in both early and late stages of HIV infection are subject to depression and cognitive impairment, and substantial numbers of patients in all stages had normal scores. Professionals should not assume either normality or dysfunction of a patient's psychological status on the basis of information on stage of infection alone.

T.D.P.56

THE STRESS OF CARING: DIMENSIONS OF STRAIN AMONG INFORMAL AIDS CAREGIVERS

Turner, Heather University of California, San Francisco, USA

Objective. To identify the dimensions of stress experienced by gay men caring for friends or lovers with AIDS. Methods. Qualitative interviews were conducted with 20 informal caregivers. Interviews were taped, transcribed and analyzed for stress-related content. Structured questionnaires were administered to an additional 30 respondents. Results. Three broad dimensions of stress were identified: 1) Primary Caregiver Strains that arise directly out of the demands and responsibilities of the caregiver role; 2) Secondary Strains that develop in other areas of the caregiver's life because of the intrusion of caregiving demands; and 3) Intrapsychic Strains resulting from the caregiver's own fear of contracting AIDS, the attenuation of his social network because of AIDS-related deaths, and the anticipated loss of an intimate relationship. Several sub-components within each of these general dimensions of stress have been identified. The types of coping strategies used to deal with these stressors will also be presented. Conclusion. While caring for the AIDS patient in the community has humanitarian benefits for the patient and economic advantages for society, it is not without costs. The informal caregiver is often left to contend with a great number of intense stressors. The importance of incorporating the needs of informal caregivers into public health policy is evident.

T.D.P.58

SHORT-TERM MEMORY (STM) CAPACITY DECLINES AS A FUNCTION OF AIDS DEMENTIA COMPLEX (ADC) SEVERITY

Dorfman, D; Keilp, JG; Sadler, AE; Wolf, L; Price, RW &
Sidtis, John J. Memorial Sloan-Kettering Cancer Center, NY, NY, USA

Objective. To assess STM capacity as a function of clinical severity of ADC. Although memory failure is a frequent complaint in ADC patients the bases for such complaints have yet to be determined.
Methods. STM on a free recall task was examined in a group of 89 patients at various stages of HIV-1 infection. Patients were rated according to cognitive impairment based on a standard neurological history and examination: 50 (unimpaired), 21 (mild) and 18 (moderate to severe). STM capacity was measured by determining the mean number of items recalled from STM in the Auditory Verbal Learning Test (Waugh, NC and Norman, DA. Psych. Rev., 89-104, 1965).
Results. STM declined as a function of cognitive impairment [$F(2,86) = 8.30$, $p<.001$]. Whereas the decline was modest in patients with mild impairment (7%), it was more pronounced in patients with moderate or severe impairment (42%). The decrease in STM correlated with other neuropsychological measures of ADC: timed gait ($r=-.34$), grooved pegboard ($r=-.43$), and trail making A and B (-.46), but not with measures of psychiatric distress.
Conclusions. STM decreases as a function of increased severity of ADC. This decline reflects diminished cognitive capacity but because of the role of attention in STM, it is unclear whether the reported results represent a true memory deficit. The extent to which this decline affects cognitive functioning warrants further investigation.

T.D.P.60

ATTRIBUTIONAL STYLE AND DEPRESSION IN HIV-RELATED ILLNESS

Van Gorp, Wilfred,***;Freeman, D.***;Evan, G.***;
Rosenbaum, J.***;George, L.***;Hamilton, J.****, et al.
*West Los Angeles VA Medical Center,L.A.,Calif.,USA,**UCLA School of Medicine,L.A.,Calif.,USA,***VA Medical Center,Durham,N.C.,USA.

Objective. To examine the incidence of self-reported depressed mood in a group of ARC and AIDS patients and the relationship of attributional style to mood state.
Method. Thirty subjects (AIDS, n=10; ARC, n=20) were administered the following tests: MMPI-168, Beck Depression Inventory (BDI) and Attributional Style Questionnaire (ASQ). The subjects' ages ranged from 22-62 with a mean and median of 42 years and a mean education of 14 years.
Results. Elevated depressed mood was found for the total sample on both the depression scale of the MMPI-168 ($M=64.33$, $SD=16.44$) and the BDI ($M=14.83$, $SD=10.20$). Although both groups reported significant depressed mood on the MMPI-168 depression scale (AIDS, $M=70.80$, $SD=14.76$; ARC, $M=61.10$, $SD=16.62$) and mild to moderate depressed mood on the BDI (AIDS, $M=15.10$, $SD=9.47$; ARC, $M=14.70$, $SD=10.79$), no significant differences were found between the groups on these measures. A significant positive correlation was found between the ASQ and MMPI-168 depression scale ($r=.49$, $p<.006$) and the BDI ($r=.49$, $p<.006$).
Conclusion. Elevated depressed mood was observed in a sample of ARC and AIDS patients and a significant positive relationship was found between internal, stable and global explanations for negative events and self-reported depression. Attributional style may be an important factor in the manifestation of depression among patients presenting with HIV-related symptoms, and the implications of this will be discussed.

T.D.P.61 HIV-1 PATIENTS' SELF-REPORTED COMPLAINTS OF MEMORY FAILURE AND THEIR RELATIONSHIP TO ACTUAL MEMORY PERFORMANCE

Kelly, John G; Sadler, AE; Wolf, A; Brew, BJ; Dorfman, D; Price, RW; Sidtis, JJ. Memorial Sloan-Kettering Cancer Center, NY, NY, USA

Objective: To evaluate the relationship between HIV-1 patients self-reported memory complaints and their actual performance on formal tests of memory.
Methods: 123 untreated HIV-1 patients at varying AIDS Dementia Complex stages were evaluated with the Neuro-AIDS Study Group neurological history, examination, and neuropsychological battery. Patients also completed a self-report scale of memory complaints [Memory Assessment Clinics, Inc.], which provides scores on two general factors: (1) ability (ABIL) to perform a variety of everyday memory tasks and (2) frequency (FREQ) with which lapses in performing such tasks occur.
Results: ABIL and FREQ factors were strongly correlated with each other (r=-.64, p<.001), and with the number of memory complaints elicited from neurological history (ABIL: r=.-45, p<.001; FREQ: r=.50, p<.001). ABIL score was lower (t=3.17, p=.002) and FREQ score higher (t=3.12, p=.002) in patients with mild to moderate symptoms of ADC. Only the ABIL score was mildly correlated with performance on formal tests of memory (with Verbal Learning, r=.20, p=.009; with Visual Retention, r=.16, p=.08) or tests with a memory component (with Verbal Fluency, r=.22, p=.01). The FREQ factor was most strongly correlated with mood (r=.51, p<.001) and general psychiatric symptom (r=.56, p<.001) ratings.
Conclusions: Complaints of impaired memory ability are mildly related to actual decrements in performance. The frequency of reported lapses, however, is strongly related to the intensity of mood/psychiatric disturbance.

T.D.P.63 EMOTIONAL STATES IN RELATION TO IMMUNE FUNCTION IN A COHORT OF MALE SEXUAL CONTACTS OF MEN WITH HIV DISEASE.

Barnes, Rosemary*;Calzavara, L.**;Coates, R.**;Read, S.***;MacFadden, D.****;Johnson, K.**;Fanning, M.****;Shepherd, F.****.
*Women's College Hospital, Toronto;** Department of Preventive Medicine and Biostatistics, University of Toronto;***Hospital for Sick Children, Toronto; The Toronto Hospital, Toronto, Ontario, Canada.

Objective: To explore the relationship of emotional states and laboratory measures of immune function.
Methods: Men with prior homosexual contact with an individual with HIV-related illness were recruited without respect to emotional state for a study of HIV status, risk behaviour, clinical status, and immune function. 155/161 (96.2%) men without AIDS completed the Profile of Mood States (POMS) for at least one quarterly visit in one year. 6 POMS scales X 12 immune function measures = 72 possible significant ($p<0.05$) correlations.
Results: POMS scale scores did not differ between HIV+ and HIV- men. For HIV- men, 1 POMS/immune function pair was correlated at visit 1 (N=47) and 2 different pairs were correlated at visit 2 (N=42). For HIV+ men, 5 POMS/immune function pairs were correleated at visit 1 (N=99) and 19 pairs were correlated at visit 2 (N=78); unexpectedly, greater emontional distress was associated with better immune function on all correlations.
Conclusion: In this long-term study of homosexual men, greater emotional distress was not associated with deterioration in immune function measures commonly used to monitor progress of HIV infection.

T.D.P.65 HIV INFECTION AND NEUROPSYCHOLOGICAL STATUS IN ASYMPTOMATIC HEROIN ADDICTS

Jacas Carlos, Tor J, Muga R, Llistar R, Pascual J, Planas P
Service of Internal Medicine. Hospital "Germans Trias i Pujol". Universitat Autònoma de Barcelona. Barcelona, Spain.

Objective: To analyse the area of visuo-spatial reasoning and verbal memory in HIV+ compared to HIV- and to observe if there is any relation between these two neuropsychological functions and HIV seropositivity.
Methods: 201 IDAs admitted to a detoxification unit were tested from January 87 to December 88.
The psychometric tests used were: The Raven's Standar Progressive Matrices for the area of visuo-spatial reasoning (IQ equivalent) and the WAIS Digit Span subtest for the auditive memory area ("T" score).On days 1 and 11 after admittance at the detoxification unit, patiens were tested with the Digit Span; on the 7th day by the Raven.
Results: 143/201 (71.14%) of patiens had HIV antibodies (EIA test) and 58/201 (28.86%) had not. The age was 25.66 ± 4.16 years and the time of addiction was 69.33 ± 35.77 months: 74.81 ± 32.52 m in HIV+ and 55.81 ± 39.91 m in HIV- ($p<0.001$). 78.5% had only primary schooling level and in 74.6% of cases social status was middle-low or low. Abuse of other drugs was high, but not significative, in both groups. 31.3% of the HIV + obtained an IQ<25 percentile in the area of visuo-spatial reasoning. The Digit Span showed no differences, between the two days of testing, and finding the same evolution in both serostatus.
Conclusions: There were not significative differences in the visuo-spatial reasoning and auditive memory areas of both seropositives and seronegatives . Nevertheless, it exists a decreased visuo-spatial reasoning in a third of the cases that does not seem related to HIV serostatus, in asymptomatic IDAs. Therefore, factors as low school level , abuse of other drugs and long-term heroin adicttion could explain these findings.

T.D.P.62 QUALITY OF LIFE OF PERSONS WITH AIDS/ARC.

Donald Ellerman, Health Planning Consultant and Mark Smith, University of Pennsylvania, Philadelphia, PA, USA.

Objective: To document and quantify the effects a diagnosis of AIDS has on ones life.
Methods: All persons diagnosed with either AIDS or ARC (PWAs) were surveyed in the metropolitan Philadelphia area. A mail-return survey method resulted in 90 completed surveys of a total documented population of 523 PWAs. The survey was distributed through health care and social service networks.
Results: The survey produced evidence for a cycle of impacts on PWAs of diagnosis leading to illness, to loss of employment, to loss of health insurance, to loss of financial security, and all these to mental stress. Average monthly income declined from $1885 before diagnosis to $885 afterward. Health care dominates PWAs' lives; they spent a mean of 5.9 hours per day on their personal medical care, paperwork and extra hours sleeping and made an average of 6 visits per month to health care facilities. Overall quality of life is standardized on a scale from 0 to 10 using Spitzer's Quality of Life Index. The mean for PWAs is 6.8. Spitzer reported means of 7.1 for cancer patients and 7.3 for chronically ill persons.
Conclusion: A diagnosis of AIDS leads to significant impacts on employment, finances, mental health, daily living and overall quality of life which can be documented and quantified.

T.D.P.64 PERSONALITY DISORDERS AND HIV INFECTION IN HEROIN ADDICTS

Jacas Carlos, Muga R,Tor J ,Llistar R , Pascual J, Planas P
Service of Internal Medicine.Hospital de Badalona "Germans Trias i Pujol".Universitat Autònoma de Barcelona.Barcelona,Spain.

Objective: To test the hypothesis that personality disorders can favour some risk practices for HIV infection in intravenous drug abusers (IDAs), through the analysis of psychometric scales and factors, in a hospital detoxification unit (HDU).
Methods: 201 asymptomatic IDAs (156 males and 45 females) underwent personality tests (Eysenck's EPQ, Catell's 16PF and MMPI) without knowledge of their serological HIV status in a HDU from January 87 to December 88. Factors such as schooling level, prison, social status, daily heroin doses, use of other drugs and time of parenteral addiction were also studied.
Results: 143/201 (71.1%) had HIV antibodies (EIA test) and 58/201 (28.9%) had not. Average of parenteral addiction was 69.33 ± 35.77 months: 74.81 ± 32.52 m in HIV+ and 55.81 ± 39.91 m in HIV- ($p<0.001$). There were not any differences in sex, age, daily heroin doses, use of other drugs and prison (49.3%). The seropositive group tended to psychoticism (EPQ-P scale) but we did not find differences in the other four scales (Neuroticism, Psychoticism, Extraversion and Lie scale).
Two factors of the 16PF questionnaire: Suspicious ($p<0.01$) and Shrewd ($p<0.01$), were related to seropositivity for HIV infection.
In spite of a tendency to a psychopathological deviance (Pd) in the HIV+ group, MMPI test showed no significative differences in none of the 10 scales.
Conclusions: Personality disorders with the exception of Suspicious and Shrewd factors, do not seem to be related to the HIV infection in IDAs. Co-factors as long-term addiction and low socioeconomical status contribute to the main risk factor -sharing needles- for HIV infection in IDAs.

T.D.P.66 PSYCHOLOGICAL FACTORS PREDICTING DISTRESS AFTER HIV TESTING

Fishman, Baruch; Perry, S.; Jacobsberg L.; Frances, A. Cornell University Medical College, New York, NY, USA.

Objective. To identify individuals at risk for distress after HIV testing.
Methods. When 264 physically asymptomatic subjects voluntarily sought HIV antibody testing, three hypothesized predictors of distress were assessed: 1) perceived social support,(Interpersonal Support Evaluation List, ISEL); 2) hardiness,(Hardiness Questionnaire, HQ); 3) attributional style,(Health Attributional Style Questionnaire, HASQ). Distress was concurrently assessed by the Beck Depression Inventory (BDI), State/Trait Anxiety Inventory (SAI, TAI), and Brief Symptom Inventory (BSI). The distress measures were readministered 9 weeks later, after notification and one of three psychoeducational interventions.
Results. Zero-order correlations (initial) and partial correlations (follow-up; controlling for effects of serological status and intervention):

	Initial (N=264; 28% HIV+)				Follow-up (N=167; 28% HIV+)				
	BDI	SAI	TAI	BSI	BDI	SAI	TAI	BSI	For all
ISEL	-.55	-.44	-.54	-.42	-.43	-.46	-.57	-.53	coefficients
HQ	-.59	-.51	-.66	-.57	-.35	-.34	-.50	-.41	p<.001
HASQ	-.52	-.54	-.56	-.42	-.30	-.28	-.43	-.37	

Conclusion. Perception of social support, hardiness and attributional style were strongly associated with distress before HIV testing and predict distress 9 weeks later. They may be useful assessments to identify patients for preventive psychosocial interventions.

T.D.P.67 PSYCHOLOGICAL AND SOCIAL FUNCTIONING IN A COHORT OF HOMOSEXUAL MEN AT RISK FOR AIDS

Caumartin, Susan; Tal, M.; Joseph, J.; Kessler, R.
University of Michigan, Ann Arbor, Michigan, United States

Objective. To describe mental health and social functioning in a cohort of gay men at risk for AIDS.
Methods. 414 members of the Chicago Multi-Center AIDS Cohort Study (MACS)/Coping and Change Study (CCS) completed each of six biannual, self-administered questionnaires between 1984 and 1988. General mental health is determined by the Hopkins Symptom Check List-58 (HSCL), including 5 subscales (somatization, obsessive-compulsive behavior, interpersonal sensitivity, depression and anxiety) and a total score. Depression is also measured by the single adapted Diagnostic Interview Scale (DIS) question and 5 questions from the Center for Epidemiologic Study Depression Scale (CES-D). (High correlations were found between measures.) AIDS-specific mental health is determined by 3 sub-scales: AIDS worries, negative emotions about AIDS, and impairment of social functioning due to AIDS. Suicidal ideation is measured by a single question.
Results. While mean HSCL and CES-D scores were stable across the 6 assessments, AIDS-specific distress increased at each time point. The HSCL scores for the cohort were somewhat elevated above general population norms but considerably below psychiatric outpatient norms. HSCL depression and anxiety greater than one standard deviation above the general population mean in at least 3 of the 6 waves were experienced by 42.2% and 35.8% of the sample, respectively. According to the DIS, 13.4% of the sample experienced a week-long depressive episode within the 6 months preceding each of the 3 waves in which the question was asked. While 54.9% of the sample never had thoughts of ending their life, 18.8% had experienced suicidal ideation during 3 or more of the 6 waves. General and AIDS-specific distress decreased with age. Income has a positive effect only on general feelings of well-being, having no effect on AIDS-specific concerns. Seronegatives had a lower AIDS-specific distress scores.
Conclusion. Although the mean level of psychological distress in this group is somewhat elevated over the general population, it is remarkably stable over time. These results are consistent with a coping strategy which successfully compartmentalizes AIDS-specific distress for most men, but also suggest an important minority experience significant depression.

T.D.P.69 Beyond information provision as a Technique for HIV Education

A study of the psychological determinants of young offenders beliefs about HIV.

THORNTON David* Curran L***

- * Principal Psychologist, young offender Psychology Unit, Home Office, London.
- ** Principal Psychologist, Medical Directorate, Home Office, London, UNITED KINGDOM

Objective

To identify targets for education which go beyond the simple provision of information.

Method

Questionnaire measures covering beliefs about HIV together with aspects of Psychopathy, Neuroticion, and ethnocentrism were administered to a representative sample of male youth custody trainees. The data were exploded with corelation and regression analyses.

Results

Results implied a strong non-rational component in young offender beliefs about HIV indicating limits on the likely effectiveness of HIV education.

T.D.P.71 RISK OF ADULT HIV INFECTION AND CHILDHOOD SEXUAL ABUSE

Zierler, S.; Feingold, L.; Laufer, D.; Mayer, Kenneth.
Brown University, Providence, Rhode Island, and Memorial Hospital, Pawtucket, Rhode Island, U.S.A.

Objective. To estimate the frequency of heterosexual transmission of HIV infection and to identify risk factors for transmission.
Methods. A population-based prospective cohort study of heterosexually active adults in southeast New England began enrollment in 1988. Information is collected at the first visit and at periodic followup visits on sexual and drug use history and current behaviors by an interviewer-administered questionnaire. Blood is drawn from all cohort members and analyzed for antibody to HIV using ELISA and confirmatory Western blot.
Results. During the first year, 109 women and 106 men have enrolled. To date, 53 women and 38 men have provided information on childhood sexual abuse. A total of 32% of the cohort reported that they had been raped; of those ever raped, the time of first rape was during childhood for 62% of the cohort. Survivors of childhood sexual abuse were more likely to be women (40% of women vs. 21% of men reported rape) and nonwhite (47% nonwhite vs. 29% white). Cohort members were twice as likely to work as prostitutes if raped in childhood than people without this history. IV drug use was also more commonly reported among survivors of sexual abuse (50% IVDU among survivors vs. 37% among those never raped). At entry into the study, 33% of the survivors vs. 21% of those never raped had evidence of HIV infection.
Conclusion. Survivors of childhood sexual abuse may be at increased risk for sexual and drug using behaviors that lead to transmission of HIV infection.

T.D.P.68

Title The Psychological Management of a Care Support Unit for male prisoners with HIV in England and Wales.

Nooney Kay * Curran L **

- * Head of Psychological Services, HM Prison, Wandsworth, London
- ** Principal Psychologist, Medical Directorate, Home Office, London, UNITED KINGDOM

Objective To provide a descriptive analysis of the history and development of a Special Care and Support Unit for male prisoners with HIV in Britain.

This paper focuses on the management of the particular problems faced by inmates with HIV in penal establishments and the role of Psychological counselling in this process.

Method

A Psychologist who functioned as a participant observer was attached to assist in the management of the Unit and to provide counselling and support to both staff and inmates.

Results Lessons for Regime design, anxiety management strategies, are among the results from a participant observation over the 3 years history of the Unit.

T.D.P.70 PSYCHOSOCIAL ADAPTATION AMONG HIV POSITIVE PATIENTS

Korniewicz, Denise*;
*Johns Hopkins University, Baltimore, Maryland, USA

Objective. To identify, describe and compare selected aspects of psychosocial adaptation: self-concept, self-esteem, social isolation, and social functioning among individuals infected with human immunodeficiency virus (HIV).
Methods. A comparative descriptive cross-sectional research design was used to assess psychosocial adaptation among individuals infected with HIV. Sixty-three consenting subjects from inpatient and outpatient units within a major medical center located in a large metropolitan area were categorised into one of four groups: (1) asymptomatic (n=10); (2) early stage (n=10); (3) late stage (n=19) and (4) at risk (n=24). Four quantitative instruments were used for data collection: Rosenberg's Global Self-Esteem Scale; Sherwood's Self-Concept Scale; Inventory of Social Functioning and the Dean Alienation Scale.
Results. There were no significant differences among the four groups for the dependant measures of self-concept, F=.309, p=.819; self-esteem, F=.126, p=1.26, and social functioning, F=.260, p=.854. However, asymptomatic individuals (Group I) scored significantly higher on the Dean Alienation Scale, F=3.205, p=.030 than the other three groups.
Conclusion. These results indicate that newly diagnosed patients experience greater alienation during the initial onset of HIV infection.

T.D.P.72 NEUROPSYCHOLOGICAL DEFICITS ASSOCIATED WITH ASYMPTOMATIC HIV INFECTION

Van Dis, Huib*, van Beuzekom, M.*, de Wolf, F.** and Coutinho, R.A.**
*Department of Psychology, University of Amsterdam, The Netherlands,
**Department of Infectious Diseases of the Municipal Health Service, Amsterdam, The Netherlands

Objective. The hypothesis was tested that central nervous system involvement by HIV infection may begin early in the course of AIDS and may manifest itself with mild neuropsychological deficits already in HIV seropositive otherwise asymptomic subjects.
Methods. 46 seronegative and a representative sample of 54 seropositive subjects were compared on a broad range of cognitive, psychomotor and emotional tests.
Results. Slight decrements in memory verbal fluency and digit span were found in the seropositive group. These differences could not be attributed differences in age, educational level, level of general intelligence or differences in emotional state. Discriminant-analysis predicted 86% of the cases correctly on the bases of neuropsychological tests.
Conclusion. for analysis of the nature of the neuropsychological differences between seronegative and seropositive subjects longitudinal studies are required to further evaluate the possible involvement of the CNS.

T.D.P.73

PSYCHOSEXUAL ASSESSMENT IN AIDS RESEARCH: INTERVIEWER SELECTION, TRAINING, AND MONITORING

Gruen, Rhoda S.*; Calderwood, M.*; Meyer-Bahlburg, H.F.L.*; Ehrhardt, A.A.*
*HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, NY, USA.

Objective. To describe a program designed to optimize rapport between interviewer and subject and to minimize specific biases in this value-laden and emotionally charged area of assessment.
Method. (1) Interviewer selection; criteria include both general educational requirements and level of comfort in dealing with diverse sexual histories. (2) Desensitization workshops, to familiarize the interviewer with sexual vernacular. (3) Item-by-item review of the sexual instrument. (4) Co-rating of audiotaped interviews. (5) Supervised interview practice with staff members. (6) Supervised interview practice with subjects from the target population. (7) In the field: Coding-review of every interview. (8) Monitoring of interviewer style by audiotape-review of every 7th to 10th interview. (9) Weekly group supervision of interviewers.
Results. Careful selection of interviewers reduces overall training time. The training program facilitates rapport, self-disclosure, etc. Group sessions enhance interviewer motivation.
Conclusion. Overall quality of psychosexual data is enhanced by interviewer selection and training procedures,

T.D.P.74

T.D.P.75

SELF-LABELED SEXUAL ORIENTATION AND SEXUAL BEHAVIOR AMONG WOMEN

Stephanie A. Sanders, J.M. Reinisch and M. Ziembe-Davis
The Kinsey Institute for Research in Sex, Gender, and Reproduction, Indiana University, Bloomington, IN, U.S.A.

Objective. To describe the relationship between women's self-labeled sexual orientation and actual sexual behavior both since age 18 and since 1980.
Methods. A self-selected sample of women from 34 states completed a questionnaire specifically designed for this study. The instrument included questions examining demographics, sexual behavior with both men and women, and both knowledge and opinions regarding AIDS.
Results. The data suggest that self-labeling of sexual orientation among women does not necessarily correlate with sexual behavior since age 18 or since 1980. In our sample of 262 women who label themselves lesbian, self-labeling of sexual orientation and actual sexual behavior patterns appear to be relatively independent -- 75% of these women had had sex with men since age 18 and 46% had done so since 1980. Thirty percent of the lesbian women reporting sex with men since 1980 had engaged in penile-anal intercourse. Our data also indicate that the likelihood of engaging in anal intercourse is significantly related to the sexual orientation of a woman's male partner. Among lesbian women in our sample, only 23% of those with heterosexual partners engaged in anal intercourse as compared to 45% of those with known behaviorally bisexual male partners.
Conclusion. The labels "heterosexual" and "homosexual" are often presumed to predict the sex of partners, the types of behavior engaged in and in some cases, the overall frequency of sexual activity. Moreover, once a label has been identified, it is accepted as characterizing an individual's lifetime sexual behavior. Like other non-risk-identified groups in our society, lesbian women are assumed to be at minimal risk for infection with Human Immunodeficiency Virus (HIV). Although sexual behavior between women may be an unlikely route of transmission, the danger of assuming that lesbian women or, for that matter men and women of any particular orientation group, are at minimal risk, lies in the erroneous notion that such group designations impose impermeable barriers to sexual interactions.

T.D.P.76

SAFER SEX AMONGST HOMOSEXUAL MEN; MEANING & MOTIVATION.

Chetwynd, Jane*; Horn, J*; Kelleher, J.
*Christchurch School of Medicine, Christchurch, New Zealand.

OBJECTIVE. To study the motivations and meanings of changing sexual practices amongst men who have sex with men, in response to AIDS.
METHOD. Fifty men were contacted at a gay sauna or through snowball sampling and were interviewed with an unstructured, in-depth approach.
RESULTS. Sexual practices were variable over time and context dependent. Those generally practising safer sex were characterised by one or more of the following: most strongly identifying themselves as gay; concerned to maintain a healthy life-style; close relationship with someone with HIV infection; concerned for health of others particularly their partners.

Those men who tended to participate in "unsafe" sexual practices included those who: were still in the process of "coming out"; saw themselves as sexually inexperienced; lacked social skills or self - confidence to assert their preference for safe sex; younger men who used sex as a means of gaining entry into gay society; older men who were willing to compromise health concerns for sexual availability; men who had broken off a stable relationship and were particularly vulnerable.

Changes to sexual behaviour had usually been made at great cost. Often, safer sex represented a major disruption in social life. Semen exchange was seen by most as "real sex" and therefore giving it up was a significant loss. It appeared that sex was the most important form of communication between these men. Other forms of intimacy were poorly developed.
CONCLUSIONS. Consistency in the practice of safer sex depends upon circumstances, characteristics and context. The extent of the sacrifice required should not be underestimated.

T.D.P.77

VARIABLES INFLUENCING CONDOM USE AMONG INTRAVENOUS DRUG USERS

Magura, Stephen*; Shapiro, JL*; Siddiqi,Q*; Lipton DS*
*Narcotic and Drug Research Inc., New York, New York, USA

Objective: To determine the knowledge, beliefs, attitudes, and behaviors related to the use of condoms among IVDUs. IVDUs are at risk of contracting and/or transmitting HIV through unprotected sexual contact.
Methods: 289 IVDUs attending 3 methadone maintenance clinics in New York City completed confidential standardized questionnaires during 1987-1988.
Results: AIDS risk factors were: sexual activity in previous month (yes=73%); condom use among sexually active (no use=68%); sexual partner(s) injected drugs in past year (yes=33%); intravenous drug use in previous month (yes=41%); needle-sharing in previous month (yes=20%). Multiple logistic regression was conducted for the sexually active subjects to predict their condom use in the previous month (none vs. some). Condom users scored higher on Acceptability of Condoms, e.g., to believe that condoms did not "cut down on my enjoyment" and to be willing to use condoms "if my partner asked me" (Odds Ratio=1.7, 95% CI=1.2, 1.4). Users also scored higher on Receptivity of Partners to Protection, e.g., to believe that their sexual partners would "not be insulted" by requests for condom use or other sexual protections (OR=1.6, 95% CI=1.1, 2.2). Condom users were also more likely to personally know a person with AIDS (OR=1.5, 95% CI=1.2, 2.3) and to be recent entrants to methadone treatment (OR=.84, 95% CI= .73, .96).
Conclusion: IVDUs' willingness to use condoms is significantly determined by specific beliefs and attitudes that could be modified by appropriate health education and cognitive-behavioral interventions.

T.D.P.78

SEXUAL BEHAVIOR SURVEY OF BRAZILIAN MEN THAT ARE CLIENTS OF TRANSVESTITE PROSTITUTES

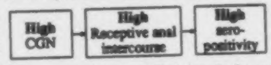
Pinel, Arletty*
*Centro de Referência e Treinamento-AIDS, São Paulo, Brazil

Objective. To elucidate the sexual behavior of men that engage in sexual contact with transvestite prostitutes.
Methods. A 20-item questionnaire was applied to 162 men that regularly engaged in sex with transvestites. 150 men were included in the study.
Results. The mean age was 34.01 years. 68% were married or had stable female partners. 3.3% reported homosexual activity in adulthood. None had stable male partners. 97.33% of the subjects identified themselves as heterosexuals and 2.6% as bisexuals. 18% were engaged exclusively in active anal intercourse with the transvestite, 20.67% in passive anal intercourse, and 57.33% in both. 4% did not engage in anal intercourse. 81.33% reported some degree of alcohol or drug use before or during the encounter. 4.6% reported IVDU with the transvestite. 94.67% acknowledged the risk for acquiring some form of STD. None thought that they were at risk for AIDS.
Conclusion. This study demonstrates that transvestite prostitution is an important risk factor for heterosexual transmission in Brazil, as well as, the need for developing specific educational programs for heterosexuals including these aspects.

T.D.P.79

CHILDHOOD GENDER NONCONFORMITY PREDICTS HIV-1 SEROPOSITIVITY IN HOMOSEXUAL MEN

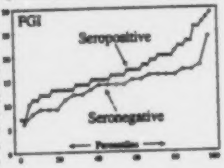
Weinrich, James; Grant, I.; Atkinson, J.; Richman, D.; Spector, S.; and McCutchan, J. University of California, San Diego, U.S.A.



Objective: To determine whether childhood gender nonconformity (CGN, an important variable in gender identity research) is of value in AIDS research. The central hypothesis is that homosexual men with high CGN become disproportionately seropositive for HIV-1, largely due to high levels of receptive anal intercourse (figure above).

Methods: N = 72 homosexual men have been recruited (23 seronegative and 49 seropositive), and completed the Clarke Feminine Gender Identity Scale (FGI). A one-way ANOVA correlated seropositivity with FGI scores. Additional analyses used scoring variations.

Results: FGI scores differ significantly by seropositivity status (figure below). (F = 6.65, df = 71, $p < 0.012$; Fisher PLSD = 2.41, Scheffe F-test = 6.65, $p < 0.05$). *All except one of the men with the highest FGI scores were seropositive.*



Conclusions: The association between FGI and seropositivity is so strong at the high end of the FGI distribution that it might not arise merely by way of the hypothesized intermediate variable. Personality variables as well as behavioral ones may be required. Additional analyses will be reported at the meeting that suggest that FGI may be a good surrogate for receptive anal intercourse experience, and might to some extent mitigate the underreporting of such experience in direct questions. Implications for medicine and sexology will be discussed.

T.D.P.80

SEX AND DRUG PRACTICES IN THE ILLICIT SEX INDUSTRY AS RELATED TO THE SPREAD OF AIDS

Wallace, Joyce I.* and Beatrice, S.**; *Foundation for Research on Sexually Transmitted Diseases, NY, NY and **New York City Department of Health, NY, NY, U.S.A.

Objective. To assess the sexual practices of prostitutes and their clients with respect to AIDS transmission.

Methods. Information was collected from a total of 169 streetwalking prostitutes contacted on the streets of New York City from 1985 to 1988. (22 in 1985, 43 in 1986, 65 in 1987, and 37 in 1988.)

Results. Of 169 streetwalking prostitutes, 14 (8.7%) were found by ELISA with confirmation by Western Blot to be positive for HIV-1. Of the 22 (13%) of these women who admitted to former or present intravenous drug use, 32% were positive, while among the 147 (87%) women not admitting to intravenous drug use, only 5% were positive. Many of these women reported having lovers who used intravenous drugs.

From questioning about the types of sexual practices, it was concluded that over 70% of the sexual acts performed by streetwalkers are oral. Vaginal sex is performed by streetwalkers only about 20-30% of the time. This is in contrast to brothels where vaginal sex is the most common practice.

Condom use was reported in 1985 by only 50% of streetwalkers; by 1987 almost all reported condom use. In contrast to this, in a parallel study, male clients reported having used condoms only 38% of the time. The men admitted to being inebriated half of the time.

Conclusion. The predominant sexual practices of streetwalkers (manipulation or fellatio), plus a high reported rate of condom use in this group, suggest that streetwalkers are less at risk of contracting AIDS than are prostitutes in brothels, since oral sex carries a lower risk to the recipient than the vaginal or anal intercourses often practiced in brothels. The increased use of "safer" sex practices among participants in the illicit sex industry may be responsible for relatively low transmission of AIDS. Absence of "safer" sex practices by prostitutes with their lovers (as opposed to clients) continues to present a hazard. Also, it is possible that efforts to move prostitutes off the streets could backfire by resulting in an increase in the less "safe" sex practices. Outreach to prostitutes and clients must be a priority in AIDS prevention.

T.D.P.81

CONDOM USE AMONG HETEROSEXUAL MALE IV DRUG USERS IS AFFECTED BY THE NATURE OF SOCIAL RELATIONSHIPS.

Sotheran, Jo L.*, Friedman, S.R.*; Des Jarlais, D.C.**; Engel, S.D.***; Weber, J.****; Rockwell, R.*, et al.
*Narcotic and Drug Research, Inc., N.Y., N.Y.; **NYS Division of Substance Abuse Services, N.Y., N.Y.; ***New York University Medical Center, N.Y., N.Y.; ****Beth Israel Medical Center, N.Y., N.Y.

Objectives. To describe the extent to which male IV drug users in treatment know that condoms reduce HIV transmission risk, contrast knowledge to actual use, and determine whether characteristics of sexual relationships affect men's condom use with women.

Methods. One hundred fifty-nine men recruited from 3 New York City methadone treatment programs in 1984 and 1986 were re-interviewed with a structured questionnaire in 1987-88.

Results. Of the 159, 137 (84%) had sex with women in the period (mean 23 months) covered by the interview. Of these 137 sexually active men (of whom 2 also had sex with men), 57% (78/137) reported only one sexual partner. While 93% (125/134) knew that condom use can prevent sexual transmission of HIV, only 56% (76/135) of the sexually active men ever used condoms during the interval. Black/Hispanic/White status, education, and number of women partners were not significantly associated with condom use, but the nature of sexual partnerships was. Among the 64 men who lived with a sexual partner, 44% used a condom at some time during the period, compared to 68% of the 71 who did not live with a sexual partner ($p < .005$). The relationship remained significant after controlling for number of partners.

Conclusion. Education about condoms is not necessarily sufficient to promote actual use; the nature of social relationships also affects sexual risk reduction. Condom use among men is less frequent in relationships with more complex interdependence.

T.D.P.82

HIV SEROPREVALENCE AND ITS IMPLICATIONS FOR A TRANSSEXUAL POPULATION

Alan D.L., Guinan, J.J. McCallum, L.
Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia.

Objective. To determine HIV seroprevalence and risk factors in pre-operative transsexuals.

Method. Data collected as a routine part of the Albion Street (AIDS) Centre and Outreach programmes screening and follow-up services were collated and reviewed using the clinic's computer database, individual files and personal interviews with transsexual clients.

Results. Preliminary analysis of the data from 58 transsexuals tested indicated that 12 (21%) were HIV infected. Major risk factors were prostitution (75%) and intravenous drug use (46%).

Conclusion. The high HIV seroprevalence and the frequency of HIV risk behaviour in the transsexuals tested indicate the urgent need to direct the attention of ongoing educational and behavioural change programmes to this minority group. The psychosocial implications of denial of the right to sex change surgery on the basis of HIV seropositivity also needs to be addressed.

T.D.P.83

EVALUATION OF SEXUALITY IN HIV INFECTED PATIENTS BY THE WARTEGG TEST.

Longo, Paulo Henrique Pinheiro; Carvalho Neto, L.D. and Morais de Sá, C.A.
Gaffrée & Guinle University Hospital - University of Rio de Janeiro (UNI-RIO) - BRAZIL.

Objective: To observe possible changes in the sexuality of HIV infected patients by sexual transmission, compared to those infected by blood transfusion.

Methods: 30 HIV positive patients were assessed by a non directive archetypal method, this group including 18 (60%) infected by sexual transmission (14 homosexuals and 4 female partners of bisexual men) and 12 (40%) by blood transfusion. The Wartegg test was performed in all infected patients on account of its accurateness and easiness. Through archetypal stimule the patients develop pictures and comments about the subject, eliciting adequate and non adequate responses in 8 different fields. The sexuality field was specifically evaluated and statistically assessed by Chi-Square Test.

Results: Data are apresented in the following table:

SEXUALITY FIELD ALTERATIONS	SEXUAL TRANSMISSION N	SEXUAL TRANSMISSION %	BLOOD TRANSFUSION N	BLOOD TRANSFUSION %	T O T A L
OBSERVED	18	100	5	41,6	23
NOT OBSERVED	0	0	7	58,3	7

$p < 0.001$

Alterations in the sexuality field observed ranged from difficulty in reacting to archetypal stimuli to non adequate responses.

Conclusion: HIV positive individuals (who were) infected by sexual transmission may develop deep changes in their conception of sexuality.

T.D.P.84

AIDS PHOBIA : A CLINICO-PSYCHOANALYTICAL STUDY.

Dr. Gilada I.S., Bhimani G.V., Shah B., Thakur V., Indian Health Organisation, J.J. Hospital, Bombay, India.

AIDS PHOBIA; A state of intense anxiety, crystalized around an obsessional idea of suffering from AIDS, which is precipitated by an actual sexually transmitted disease or an illicit sexual contact and which may lead to a gradual deterioration of the personality. It may or may not be relieved through reassurance, insight and information.

This study presents analysis of about 88 cases of AIDS phobia managed by the authors comprising a venereologist and 3 psychiatrists.

During the initial stage of it's spread, AIDS has created generalised anxiety in the population, mainly due to its' difficult clinical management and final outcome. From an initial linking to sexual intercourse, the authors have observed that over a period of time, the cases started associating it with history of any possible mode of spread, stretching it further to any possible mode of spread with minimum risk and also to any illness state that somehow resembles the earlier symptoms of AIDS.

The present study also highlights the issues of Public Education of AIDS. Preliminary contact with the physician, ordering of diagnostic tests for AIDS, and myths and misconceptions shrouding the dreaded disease and patient education.

ATTITUDES AND BEHAVIORAL RESEARCH FOR AIDS.

Dra. León, Guerra, Casco et. al.
Minister of Health, Central University, School of Profesional Psychology of Pichincha, Quito - Ecuador.

OBJECTIVE: To know the attitudes and sexual behaviors of the population towards AIDS, to plan and form health programs and education of this disease.
JUSTIFICATION: While the HIV Virus expandes uncontrollably up the scale of the worldy population, because of the lack of medication, vaccines, information and education, the process of change of attitudes and sexual behavior is very slow in relation with sexual promiscuity and AIDS.
Ecuador is a country in the absence of the elementary support of basic resources for the scientific investigation unable us to carry out the plans, programs of sexual education and AIDS.
HYPOTHESIS
- The stereotype, attitudes and sexual behaviors are very negative in the examplairy stratus.
- No sificant differences in the study of thefacts, stereotypes, attitudes and sexual behaviors determined by the following variabies: sex, age, educational level and geographical region.
METHOD: Scientific investigation by means of the observation of field research or by means of inquiry.
The investigation is underway.

Auspice: International Development Research Centre - Canadá.

LE RISQUE DE CONTAMINATION PAR LE VIH DANS UNE POPULATION DE JEUNES EN PSYCHIATRIE

Lazartigues, Alain* ; Pérard D.** ; Lisandre H.*** et Pailleux T.****.
*Fondation santé des étudiants de France, Sceaux, France, **Université Paris X et Rouen, France, ***Centre de Recherche de l'Enfant et l'Adolescent, Paris, France, ****Institut Français d'Etudes et d'Analyses, Paris, France.

Objectifs. 1)Décrire des jeunes (16-25 ans) hospitalisés en psychiatrie, 2) Mesurer les corrélations entre les facteurs de risque et les facteurs de risque supposés du groupe en les comparant à ceux d'une population de référence (963 étudiants représentatifs, étudiés dans un autre travail), 3) Etudier les relations entre ces facteurs de risque et les effets de la pathologie psychiatrique,sur la transmission du VIH.
Méthodes. 1) Echantillon : 180 patients hospitalisés en institution psychiatrique pour étudiants. La passation garantit un strict anonymat, 2) Auto-questionnaire : 175 items, déjà utilisés dans une étude précédente sur la population évoquée ci-dessus, permet de repérer les représentations, attitudes, comportements en relation avec la sexualité, la maladie, le SIDA,l'information sur le SIDA, la prévention, le niveau de connaissances sur les préservatifs, MST, SIDA et évaluer la fréquence des facteurs de risque, 3) Tris à plat, croisés, tests de significativité des résultats.
Résultats. Par rapport à la population de référence, ces patients ont des rapports sexuels complets moins nombreux, des facteurs de risque plus élevés, certains de ces facteurs reliés à la pathologie psychiatrique, permettant de proposer des éléments préventifs à introduire dans la prise en charge.

T.D.P.87

TARGETING AIDS INFORMATION AT SEXUALLY ACTIVE 15-17 YEAR OLDS

Barbara Jones*, Heidi Liepold*, Shane Lunney**,CANADA

The Canada Youth and AIDS Study provides a national information base on what youth think, know and do about sexual behaviour, AIDS and STDs.

Building on this Study, this project provides a comprehensive approach to reaching sexually active teens through vehicles of their choice - national television, rock video, and music. Reinforcement of the information and messages disseminated in the half hour television program are reinforced directly to youth through available rock video and accompanying hit-tune recordings, posters and print material and as well through a well designed school marketing and delivery program.

National focus testing of scripts and messages allows for consideration and identification of regional differences.

T.D.P.88

PEER EDUCATION IN ADOLESCENT AIDS PREVENTION EXPERIMENTAL PHASE

A Bunde-Birouste*, D Guillemot*, D Jayle*
*APS Association pour la Prevention du SIDA, Paris, FRANCE

Objective To offer AIDS related peer education training in a limited number of schools in order to evaluate its feasibility and the types of activities possible prior to designing and implementing an extensive pilot project
Methods APS (l'Association pour la Prévention du SIDA) has been active in training adults as AIDS-educators since early 1987 The majority of the AIDS educators trained are involved in youth-related work (teachers, youth workers, school doctors/nurses etc.) To date more than 800 AIDS educators have been trained thoughout the country Noting a high level of motivation on the part of certain young people, APS decided to to implement a formal study of peer educator training The approach of using peer educators is completely innovative in France - it had never before been attempted, in any subject area Thus, rather than immediately establishing a protocol, APS organised pilot peer education activities in 10 different establishments in order to gain an understanding of the realities and problems prior to designing the in depth study Following an extensive training period, each group of young people, working in collaboration with their respective adult AIDS educator and APS, designed original prevention projects for their peers Projects developed by the peer educators include radio broadcasts, theatrical productions, video tapes, poster and comic strip contests, information stands and classroom interventions.
Results Although a formal quantitative evaluation was not performed as this was the pilot phase of project development, qualitative analysis is currently underway, the results of which will be available in May 1989
Conclusion Although the evaluation is in process, preliminary reactions to this approach of AIDS education for adolescents are quite positive APS receives more requests for this type of program than it can handle The association will implement a state-wide peer education pilot program durning 1989

T.D.P.89

IMPACT OF ADOLESCENT HEALTH MESSENGERS' AIDS PREVENTION PROGRAM ON PEERS AND ADULT RELATIVES IN THE DOMINICAN REPUBLIC

De Moya, E. Antonio; Brea de Cabral, M; Guerrero, E; Domínguez, L; Buttler, M.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To describe the joint Ministries of Public Health/Education, Instituta of Sex Education and PROFAMILIA approach to adolescent AIDS prevention - through peer sex education messengers at schools and communites.

Methods. Discussion of the conceptual framework of adolescent AIDS prevention program, pre/and post intervention CAP studies, and appropriate educational technology evaluation studies at public and private schools.

Results. Relatively widespread unacknowledgement of STD/AIDS in 1985 has shifted to adolescents' eagerness to participate in school/community preventive action. AIDS related CAPs among teenagers show a much more positive stance and a high morale to face the epidemic. Spontaneous reverse transmission of AIDS preventive culture from adolescents to their parents and other adult relatives is consistently reported.

Conclusion. Adolescents' increasing active participation in the AIDS struggle has shown to be most effective not only for conveying educational contents to their peers at schools and local communities, but to their parents and other adult relatives as well.

T.D.P.90

GENERAL AND PERSONALIZED KNOWLEDGE OF AIDS AMONG ADOLESCENTS

Koopman, Cheryl*; Hunter, J.**; Henderson, R.*; Rotheram-Borus, M.*.
* HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, NY, USA
** Hetrick Martin Institute, New York, NY, USA

Objective: To develop reliable and valid measures of general knowledge of AIDS and positive attitudes towards safer sex and drug use behaviors. Methods: Focus groups, interviews, reviews of the literature, consultations with advisory boards regarding content and reading level, and preliminary item-analysis of questionnaires were conducted to construct a 61-item test of general knowledge of AIDS and a 41-item assessment of attitudes towards safe sex. These scales were administered to 95 runaways, 60 high school students, and 30 gay male youths. The samples were similar in ethnicity (30% Black; 40% Hispanic), SES (poor), and age (X=16). Results: The internal consistency of the scales was high (Cronbach's alphas over .84) and test-retest reliability using 46 runaway and gay youths was over .7 across a week. Overall, general knowledge of AIDS was high (74% correct), with gay youths (79% correct) being better informed than nongay youths (72%), particularly on means of transmission and HIV testing. Adolescents reported high personal efficacy and very positive attitudes towards safe acts (74%). Knowledge was not significantly associated with positive attitudes. Conclusions: Adolescents have basic knowledge regarding AIDS and report very positive attitudes towards safe behaviors on questionnaire measures. These positive attitudes and intentions stand in contrast to youths' abilities to implement safe acts and reports in focus groups.

T.D.P.91 INFLUENCE OF PERCEIVED REFERENT-GROUP NORMATIVE BEHAVIOR ON ADOLESCENTS USE OF CONDOMS

DiClemente, Ralph; DuNah, R.
University of California, San Francisco, California, USA.

Objective. To identify the correlates of adolescents' condom use during sexual intercourse.
Methods. A school-based sample of sexually active adolescents (N=229) completed self-report questionnaires assessing their knowledge, attitudes and frequency of condom use.
Results. Analyses assessed the relationship between demographic factors, AIDS-specific knowledge, perceived susceptibility, age at onset of sexual intercourse, number of sex partners, and perception of referent-group normative behavior on frequency of condom use. Perception of referent group normative behavior was identified as the only factor which significantly differentiated adolescents who use condoms from those who do not. Approximately 81% of adolescents who perceive referent-group norms as supporting condom use during sexual intercourse were frequent condom users; while, in contrast, only 47% of the adolescents who perceived referent-group norms as supporting unprotected sexual intercourse were condom users (PR=1.7, 95% CL=1.3-2.3, P=0.000).
Conclusion. Adolescents who perceive referent-group norms as supporting condom use are almost twice as likely to use condoms during sexual intercourse. Modifying adolescents' perceived referent norms may result in increased condom use.

T.D.P.92 DIFFERENTIAL EFFECTS OF AIDS KNOWLEDGE AND PERCEIVED SUSCEPTIBILITY ON THE REDUCTION OF HIGH-RISK SEXUAL BEHAVIORS AMONG COLLEGE ADOLESCENTS

DiClemente, Ralph*; Forrest, K.**, Mickler, S.***
* University of California, San Francisco, California, USA
** Planned Parenthood of California, USA.
*** Vassar College, Poughkeepsie, New York, USA.

Objective. To evaluate the relative effect of AIDS knowledge and perceived susceptibility to HIV infection in promoting AIDS-preventive behavior change among sexually active adolescents.
Methods. A national sample of 1,129 undergraduates, ages 18-23, completed a self-administered questionnaire assessing knowledge about AIDS-prevention behaviors, attitudes about AIDS (perceived susceptibility to HIV infection) and prevalence, type and frequency of sexual behaviors and condom use.
Results. Behavior change was not associated with level of AIDS knowledge while perception of susceptibility to HIV acquisition was strongly associated with reduction in high-risk behaviors.

Behavior Change	Knowledge (%)				Perceived Risk (%)			
	High	Low	PR	95% CL	High	Low	PR	95%CL
increase condom use	37.3	38.6	1.0	0.8-1.2	44.1	32.5	1.4	1.1-1.6
decrease partners	30.8	35.0	0.9	0.7-1.1	38.3	28.3	1.4	1.1-1.7
decrease anal sex	9.7	10.7	0.9	0.4-1.9	10.1	10.3	1.0	0.5-2.1
decrease oral sex	8.3	13.2	0.6	0.4-1.0	15.3	6.9	2.2	1.4-3.6

Conclusion. Perceived susceptibility to HIV is a more powerful mediator of risk-reduction behavior change in this population.

W.D.P.1

HIV PARTNER NOTIFICATION WITHIN AN ANONYMOUS TESTING SYSTEM

Blankenship, Evelyn R.; Owen-O'Dowd, J.R.; Jolly, D.H.; Petz, W.J.; Meriwether, R.A. North Carolina Division of Health Services, AIDS Control Program, Raleigh, North Carolina, USA.

Objectives. To describe HIV partner notification in an anonymous testing system.
Methods. This paper discusses North Carolina's HIV partner notification program; outlines protocols and procedures; highlights advantages and disadvantages; and examines problems and strategies to resolve them. North Carolina requires reporting of AIDS cases meeting the C.D.C. surveillance definition, but not other cases of HIV infection. All 100 local health departments offer anonymous as well as confidential testing for HIV infection. In early 1988, a unique statewide HIV partner notification system was developed to assist infected persons in meeting newly established legal obligations to notify sex and needle-sharing partners and to increase their opportunities for additional counseling and referrals. The program offers clients three options for notifying partners: 1) meet with an HIV counselor who will notify and counsel partners confidentially; 2) complete and mail to the AIDS Control Program a form identifying partners so an HIV counselor can notify partners; 3) notify partners themselves. The infected person may remain anonymous under all three options.
Results. Preliminary data on the partner notification program suggests cooperation by HIV-infected persons. In the first seven months 70 forms were received, counselors interviewed 89 HIV antibody positive persons, and notified and counseled 143 partners. This program encourages participation of HIV-infected persons by allowing them to maintain anonymity. Other studies have indicated that offering HIV services anonymously fosters cooperation of those who fear discrimination. Specific problems encountered include: quality of information obtained via mailed forms, inability to notify partners of anonymously tested HIV-infected persons who do not return for test results, and provider skepticism about patient participation leading to ineffective referral for partner notification.
Conclusions. Despite certain problems, HIV partner notification can be effective in a system where HIV is not reportable and anonymity is maintained.

W.D.P.2

INTENSIVE HIV COUNSELLING FOLLOWING SEROSTATUS NOTIFICATION IS ASSOCIATED WITH A LOW DIVORCE RATE IN 122 SERODISCORDANT ZAIRIAN MARRIED COUPLES

Mbuyi, Kashama*; Jingu, M.*; Mbu, M.*; Nzila, N.*; Ryder, R.*/**. *Projet SIDA, Kinshasa, Zaire; **CDC, Atlanta, GA, U.S.A.

Objective. To prospectively observe the impact of an HIV counselling program on the psychosocial and marital status of 122 discordant Zairian married couples (one member HIV(+), the other HIV(-)=DC).
Methods. During a serosurvey of 12,000 employees and their wives at 2 Kinshasa businesses, 122 DC (67 M+F-, 55 M-F+) have been identified and followed monthly since being jointly informed of their serostatus (total follow up time=83 couple-years of observation). When a DC's marriage was threatened or when one or both DC members experienced severe depression, suicidal intentions, violence, or severe anxiety (psychological distress=PD), a female nurse, trained in HIV counselling, made multiple (average 5/DC) home visits.
Results. Seventeen DC(14%) (7 M+F-, 10 M-F+) developed PD requiring intervention. The remaining 105 DC accepted their serostatus following clinic-based counselling. Of the 17 DC with PD, 5 separated temporarily and 2 divorced. There were 3 threatened suicides (2 HIV(+)women, 1 HIV(+) man). Inability to ever again conceive children because of the necessity of practicing protected sex (F+ DC) and fear of the women's family that her husband would infect her (M+ DC) were common sources of PD.
Conclusions. There was wide initial concern that serostatus notification of DC in a patriarchal society would lead to high divorce rates particularly when the female was the seropositive individual. However, intensive home counselling has resulted in divorce in only 2 (1.6%) of 122 DC followed for at least 6 months. The counselling has also alleviated considerable PD.

W.D.P.3

RECENTLY ACQUIRED SEXUALLY TRANSMITTED DISEASES (STD) IN HOMOSEXUALS WITH HIV-INFECTION

B.Heinrich, U.Kronawitter, J.R.Bogner, A.Manaschke, H.S.Füeßl, F.D.Goebel
Medizinische Poliklinik d. Universität München, Federal Rep. of Germany

Objective: Several studies have shown, that risky behaviour of homosexuals can be reduced by counseling. However, no data on recently acquired STD in homosexuals with HIV-infection exist.

Methods: We have assessed the number of recently acquired STD in our outpatient clinic (internal medicine). The influence of STD on immunological parameters was studied.

Results: In 1988 we have seen 228 HIV-patients in our clinic (64% homosexuals, 23% i.v. drug users, 1% hemophiliacs, other or unknown riskgroup: 10%). All patients were repeatedly counseled about risky sexual behaviour and the possibility of transmitting the virus. Six of 147 homosexuals (4%) have been diagnosed with recently acquired STD, among them 2 with gonorrhea, 3 with syphilis and 1 with hepatitis B. All patients admitted that at least at one occasion safer sex was not practised because of HIV-infection of the partner (5 patients) or the conviction everybody practising homosexual sex nowadays must be aware of contracting HIV-infection (1 patient). In 1987 no STD was seen among 134 homosexual patients attending the clinic. In 3 patients with recently acquired STD evaluation of lymphocyte subsets revealed activation of T-cells (up to 56%).

Conclusion : Recently acquired STD demonstrate that counseling efforts were not effective in 4% of our patients with HIV-infection. The necessity of safer sex has to be emphasized not only to prevent spread of HIV but also to reduce probability of disease progression to AIDS if both partners are HIV-infected.

W.D.P.4

"DISCUSSING THE DO NOT RESUSCITATE ISSUE WITH THE AIDS PATIENTS"

Madera, Inez, R.N., B.S.*, Laviena, Luis, PhDC**, de Caprariis, P.J., M.D.*, Stehney, M., M.D.*, Stiles, J., M.P.H.*
*Sunset Park Family Center of the Lutheran Medical Center, Brooklyn, N.Y., USA

Objective: This paper was prepared to help establish when is the most appropriate moment to discuss death and dying issues with AIDS patients.

Methods: A physical and psychological status assessment is implemented on all patients. This evaluation establishes critical periods to discuss the death and dying issues as well as the do not resuscitate procedures. Standardized instruments are used to objectively assess their physical and emotional state.

Results: The hospitalization period is not the ideal setting to discuss DNR. In an ambulatory setting, utilizing a case management team helps the patients deal in a more effective way with the bereavement process associated with this disease. AIDS affects not only the person but the person networks therefore the family systems and other significant figures need to be included in this process.

Conclusion: Once they are involved in this multidisciplinary approach they become more knowledgeable of their disease. While having the cognitive, physical and emotional strengths they are in a more comfortable and clear state of mind to make responsible decisions on DNR. A global view of the patients' state provides the clinical staff with an adequate knowledge as to when to address such a sensitive issue.

W.D.P.5

AIDS RISK ASSESSMENT (ARA) AND COUNSELING BEHAVIORS OF PRIMARY PHYSICIANS IN COMMUNITY MEDICAL CENTERS.

Laux, Lila; Coverdale, J. and Aruffo, J., Thornby J., and Vallbona, C. Baylor College of Medicine, Houston, Texas, U.S.A.

Objective. To describe ARA and counseling behaviors of primary care physicians.
Method. This study surveyed 37 out of 40 primary care physicians treating adult patients in the Harris County Hospital District System of Community Health Centers. They are responsible for the health care of over 90,000 low income largely minority patients. Ninety-seven percent had previously replied that no one in the centers had discussed AIDS with them.
Results: Physicians believe (1) that they should provide AIDS information to patients, (2) that AIDS education is effective in reducing the spread of AIDS, and (3) that their own patients are at significant risk of AIDS. However, they report that they are counseling only 1 in 10 of their patients about AIDS transmission. We also asked physicians how comfortable they felt when asking patients about their sexual practices and drug use. Ninety-five percent reported feeling comfortable giving information about AIDS but a substantial proportion of them (27%) said they were uncomfortable asking the personal questions that need to be asked to assess AIDS risk.
Conclusion: Interventions aimed at increasing the ARA and counseling behavior of physicians must be developed and must include desensitization with regard to sexual history taking.

W.D.P.6

AIDS RISK BEHAVIORS AND AIDS BELIEFS IN HIV SEROCONVERTORS

Dunphy, C., Wood, R., & Krueger, L. AIDS Prevention Project, Seattle-King County Department of Public Health, Seattle, WA, USA 98101.

Objective: To describe behaviors and beliefs among HIV seroconvertors compared to non-seroconvertors.

Methods: We compared alcohol and drug use, intended and actual HIV risk behaviors, reasons for having sex, beliefs about impact of AIDS on the community, and beliefs of self-efficacy in implementing safe sex behaviors in 10 members of a Longitudinal Cohort Study for men who have sex with men who HIV seroconverted while in the study with 900 men who didn't seroconvert.

Results: HIV seroconvertors were significantly more likely to: stop having safe sex with a partner after having sex with him a few times; feel partners would object to using a condom; have partners who use condoms less frequently; feel it is not getting easier to find partners who enjoy safe sex; and have less accurate HIV knowledge.

Conclusion: Clients who reveal these beliefs, behaviors and partner choices and who have low HIV knowledge may be important to counsel more intensively.

W.D.P.7

MANAGEMENT OF PSYCHOLOGICAL DISTRESS: A HOSPITAL BASED "MUTUAL AID" SUPPORT GROUP FOR HIV SEROPOSITIVE MEN

Jacobs, Jonathan; Ilaria,G.
Center for Special Studies, New York Hospital-Cornell Medical Center, New York, N.Y., USA

Objective. To decrease psychological distress and increase social support and the exchange of medical and treatment information, an innovative "mutual aid" support group for HIV seropositive men was created.
Methods. A support group consisting of nine seropositive men led by a trained facilitator met for one and one-half hour weekly sessions for ten weeks. In the "mutual aid" support group format two types of support occur: (1)a non-threatening, non-judgemental milieu structured by a facilitator fluent in group therapeutic technique and (2) a peer support model for group-generated topic preference, permitting the group to identify and process self-selected issues at their own pace.
Results. Two forms of self-report ratings were utilized in evaluating the intervention's efficacy. Informal, anecdotal reporting by group members on a weekly basis indicated a general decrease in emotional distress and an increase in social contacts. A written evaluation after ten weeks of group indicated improved affect, increased adjustment to serostatus, increased social support, increase in current knowledge of medical and treatment information and a desire for continued group interaction.
Conclusion. This unique hybrid of psycho-education, peer support, group therapy and crisis management increases adjustment to a traumatic psychological event: HIV seropositivity. This group has proven so effective that group members have determined the need for continued meetings beyond the proposed ten week period. This model is efficient in the hospital outpatient care setting using minimal staff resources while maximizing patient well-being.

W.D.P.8

THE NEED FOR COUNSELLING OF HIV TESTED INDIVIDUALS IN A RURAL POPULATION OF UGANDA.

Lwegaba, Anthony*; Wawer, M.**;Konde-Lule, J.***;Naamara, W.*; Serwadda, D.***;Musgrave, S.** *AIDS Control Program, Entebbe, Uganda; **Columbia University, NY, USA,***Makerere University, Kampala, Uganda.

Objective: To determine the demand for HIV serological results among serosurvey subjects in a rural Ugandan population.
Method: The Uganda AIDS Control Programme has implemented a longitudinal study of HIV related knowledge and behaviors, and of HIV serological trends in rural Rakai district. A baseline knowledge, attitudes and practices (KAP) and serological survey was conducted on consenting adults in 21 randomly selected rural and 9 trading center clusters. Plans call for repeated KAP and serological survey rounds.
RESULTS: Preliminary results indicate 72% of adult study subjects stated they wished to know their serostatus. 81% knew there is no cure for AIDS, 60% knew of a period of latency between infection and illness, 83% knew of sexual transmission. Survey team members were approached by individuals asking to know their serostatus.
CONCLUSIONS:Demand for serological results in this population was high. Baseline knowledge of characteristics of the illness was also high. The information is being used to design a counselling program for survey clusters, which will permit persons to learn their results in a confidential and culturally appropriate manner. The special circumstances of serosurvey subjects will be considered in developing counselling in this non-clinical setting. The researchers consider a counselling program essential for program creditability and for the success of repeat visits for data and blood collection.

W.D.P.9

PSYCHOSOCIAL ISSUES PRESENTED BY SELF IDENTIFIED BISEXUAL MEN WITH HIV CONDITIONS

L. Gallo-Silver, A. McCabe, R. Moynihan, V. Raveis, C. Kletecka, J. Segal
Memorial Sloan-Kettering Cancer Center, New York City, U.S.A.

Objective: To examine the lifestyle consequences and related psychosocial issues confronting bisexual and gay men with HIV conditions.

Methods: A study of 35 HIV positive (30 with AIDS) bisexual men, aged 26-64, who were seen in individual counseling by a social worker as part of standard patient services and 38 gay men with AIDS, aged 24-61, who completed a structured interview with a social work researcher. Data collected from 8/86 to 12/88.

Results: Both groups were similar on educational, racial and religious background and occupational groupings. Groups differed on marital status (63% of bisexuals were currently or previously married compared to 13% of gay men) and parental status (41% of bisexuals had children vs. 3% of gay men). Prior to their learning their HIV status, only 11% of currently married bisexuals told their wives of their bisexuality and only 8% of bisexual fathers had told their children. However, 39% of bisexuals have told family members about their HIV status and 73% of those who have AIDS have told their family. Of the gay men 76% of their immediate family know about their status.

Conclusions: A major task confronting bisexual men is that of the disclosure of their condition and lifestyle. Mental health professionals need to develop specific strategies for assisting them in communication about these issues.

W.D.P.10

PSYCHOSOCIAL ISSUES PRESENTED BY TRANSFUSION ASSOCIATED HIV INFECTED ADULTS AND THEIR FAMILIES

L. Gallo-Silver, S. Wise Campbell, R. Moynihan, JMW. Gold, V. Raveis
Memorial Sloan-Kettering Cancer Center, New York City, U.S.A.

Objective: To identify psychosocial issues of transfusion associated HIV condition in infected adults and their families.

Methods: 15 patients (5=HIV/10=AIDS), ages 30-92, transfused for: cancer-related treatments (3), cardiovascular surgery (5), trauma (3), other medical conditions (3), sexual contact with a transfused spouse (1). Information drawn from individual, family, and group counseling sessions and team meetings with physicians.

Results: Common themes reported by patients and their families: intense anger with medical community and blood banks, mistrust of health care providers, feelings of victimization, lack of identification with other HIV patient groups and need for control of their medical care. Male patients reported concerns of being labeled homosexual. Fourteen patients and families expressed anger at the gay community and reluctance to utilize community AIDS organizations. Of 8 married couples, 7 have since abstained from sexual relations.

Conclusions: Special circumstances of transfusion associated HIV infection require psychosocial interventions that are specifically designed to diminish feelings of isolation, enhance communication with family, health care professionals and physicians; and provide a way to manage anger and mistrust.

W.D.P.11

A REVIEW OF HIV COUNSELING IN AN INNER CITY UNIVERSITY HOSPITAL.

Barbacci Marguerite; Wilson, W.; Chaisson, R.: Johns Hopkins University, Baltimore, MD, USA.

Objective: To review HIV counseling procedures in an inner city university hospital.
Methods: Review of HIV counseling policy in effect 9/87 - 1/89 at Johns Hopkins University Hospital. Pre-test counseling and informed consent was the responsibility of the medical ordering the HIV test. Patients with positive or indeterminant Western blot results were to be referred to the hospital HIV counselor for post-test counseling. No policy is in effect for counseling patients with negative HIV results.
Results: Between September 1987 and January 1989, 4350 HIV tests were performed. Of these, 510(12%) were ELISA and Western blot positive: 47(1%) were ELISA positive and Western blot indeterminant. HIV infection risk factors: 36% intravenous drug use (IVDU), 7% gay/bisexual man, 4% sexual partner of a person at risk, 2% transfusion. No risk factor was identified in 48% of patients testing positive/indeterminant. Of 557 patients with positive/indeterminant tests, 329 (59%) were referred for post-test counseling. Counseling sessions include basic education in HIV infection, safer sex practices, cleaning IV drug needles, ending with the counselor making a determination what psychologic and/or medical follow-up is necessary. The remaining patients testing HIV+, being followed by either an inpatient service or an out-patient clinic, will likely receive some form of informal counseling from their care provider. Although most patients testing HIV positve/indeterminant received some post-test counseling, this represents only 8% (329/4350) of patients undergoing HIV testing.
Conclusion: This HIV test counseling program was effective at reaching most HIV positive/indeterminant patients. Since there is no policy for counseling HIV- patients, those at continued risk of infection may not get adequate counseling. HIV counseling should not only be based on test results, but on the patients risk factor as well.

W.D.P.12

COUNSELLING TRAINING - CURRENT NEEDS: AN EVALUATION OF AIDS COUNSELLING TRAINING COURSES LOOKING AT CHANGE AND CONTENT.

L Sherr, A MacCreaner, J Green / St Mary's Hospital, National AIDS Counselling Training Unit, London, UNITED KINGDOM

OBJECTIVE:- To examine the changing needs for training over time and to assess current course content, demand and efficacy.
METHOD :- Training of health care staff has been carried out since 1985. All participants are questioned before and after courses. A Random sample is followed up for long term data. This study examines change over time and current course needs.

RESULTS :- AIDS and HIV Counselling training has changed in focus, content and style over time. This is in response to new information, needs, demands and essentially different audiences who require training. A shift has been noted over three years. Initially front line workers were involved. Their needs were informational and they required a validation of counselling need, approach and technique. Counselling has now become accepted and attenders tend to be more entrenched role staff. Training has moved towards skills based needs. Early anxieties about contact with AIDS and HIV individuals has now been replaced with worries about basic counselling skills. Skills training is more lengthy and requires active participation. Role play, contracts, group work and the use of video techniques are discussed.
CONCLUSION :- Training demand is high and needs constantly change.

W.D.P.13

HIV PRECIPITATED LIFE CRISES: LIFE ENHANCING AND CONSTRICTING RESOLUTIONS

Zaner, Karl; Walter Reed Retrovirus Research Group, Washington, D.C., U.S.A.

Objective: To trace the sequence of major life issues precipitated by acquiring HIV infection; to describe the different meanings patients give those issues in resolving them; to study the impact of those resolutions.
Methods: Regular psychiatric follow-up of HIV infected individuals is part of the USA Army's HIV program. Psychotherapy by the author, emphasizing reframing of troubling issues, occurred at all stages of infection.
Results: The meaning each person gives to issues effects his life. Acute HIV issues are: 1. the meaning of the HIV test, e.g., "AIDS, dying, no future, kill myself," which usually shifts to "infected, not-diseased, a future, live. " 2. Will others be "fearful, condemning, rejecting" or "fearful, but caring, interested?" 3. The meaning of HIV for their sexual and social life, for their expectancy, for their career goals in life. Longer term issues arise from confronting the issue of death. Given limited time, what really do I want to do and be?" Frequent changes are: (1. From being one's body to just having a body. 2.) From life being about "making it," to being about loving, caring, living in the present, insisting less on one's way and accepting more how things are,) leading to "peace," greater self expression, contributing to others.
Conclusion: These patients are not "dying" but actively living, dealing with issues often avoided or denied. Some give to those issues meanings which constrict participation, relationship, aliveness. More give meaninfs which enhance the quality, e.g. loving, peacful, enjoying the moment.

W.D.P.14

EVALUATION OF A PSYCHOTERAPEUTIC PROGRAM IN HIV SEROPOSITIVE SUBJECTS

Salama Elias*, Rossi L*, Ornelas G*, Sepulveda J.*
*General Directorate of Epidemiology. Ministry of Health Mexico.

Objective. To evaluate the response of seropositive subjects to a preestablished psychoterapeutic individual program planned with the patient's participation.
Method. 60 HIV seropositive asymptomatic men (average age= 30 yrs) were assigned to 3 groups (20 homosexuals, 20 bisexuals and 20 heterosexuals). 15 % had had a stable sexual partner (sp) for at least a year before treatment. After their knowledge of the positive result, an individual psychotherapeutic plan was established with them (40 sessions, 45', 2 x wk). Free association psychoanalytic technique was employed to favor the appearance of conscious and unconscious fantasies associated to HIV infection and to influence the acceptance of seropositivity and its personal, family, work and couple implications through the interpretation of unconscious contents.
Results. 95% of patients inhibited active sexuality for fear of damaging and/or destroying their sp, specially those with a stable relationship, regardless of sexual orientation. All cases verbally expressed hostile feelings to whom they considered source of their infection to the therapist but did it indirectly with the sp because of fear of being abandoned. Fights with friends and sp increased. 75% presented alteration of sleep cycle and/or nightmares, loss of appetite, sadness and careless general appearance as signs of depression. 60% of patients reinitiated active sexual life, making use of safe sex techniques. 50% of cases continued expressing hostile feelings which were generalized to other areas of their life. No difference was found between the groups.
Discussion. The knowledge of infected status in this group originated reactivation of previous psychopathology. An increase in paranoid and depressive features was detected. Sexual activity was reinitiated and promotion of preventive measures was successful.

W.D.P.15

HIV COUNSELING AND TESTING IN NEW YORK STATE (NYS) SEXUALLY TRANSMITTED DISEASE (STD) CLINICS

DiFerdinando, George Jr.; Chang, H; Morse, D; Murphy, D; Tobey, E. New York State Department of Health, Albany, NY, USA.

Objective. To provide HIV counseling and education for a high risk population, and to determine the HIV-ab seroprevalence (ELISA, WB) of those requesting testing.
Methods. Persons in 18 NYS counties who received HIV counseling at STD clinics from 1/88 through 10/88 were interviewed for demographics, risk factors, and STD history.
Results. Of 3451 persons receiving counseling and eduction, 3045 (88%) chose to receive an HIV-ab test; the proportion choosing confidential testing was essentially the same as those who chose anonymous (51 v. 49%). Of the 97% (2953/3045) with available data, 133(4.5%) were WB+. Those tested were predominately male (62%), never married (66%), white/non-Hispanic (70%), self-identified as heterosexual (85%), and 25 to 34 years old (42%); 14% admitted IV drug use. Those who had been previously tested (500, 17%) were more likely to be HIV+ (10 v. 3.4%). Those HIV+ but not previously tested were more likely to be older (33 v. 31 yrs.), male (80 v. 60%), non-white (41 v. 28%), Hispanic (13 v. 4%), or to have ever had an STD (61 v. 43%), especially syphilis (16 v. 3%), then those HIV-. Over 69% of those HIV- and not previously tested had at least one HIV risk factor; 63% said they had an intimate partner at risk. Those previously tested and HIV+ were more likely to use IV drugs (25 v.11%), have multiple (7 v. 2) or unknown (10 v 4%) sex partners, or ever have had syphilis (29 v. 16%), than those HIV+ but not previously tested.
Conclusion. A large percentage of STD clients choose confidential HIV testing if available. Persons previously tested differ markedly from those tested for the first time.

W.D.P.16

HELPING HIV MOTHERS AFTER THE BIRTH OF THEIR BABIES. "A COUNSELLING OUT PATIENT CLINIC".

F. WEIL-HALPERN, BLANCHE, S. VEBER, F. DEBRE,M.DULIEGE,A.M. GRISCELLI,C. U.I.H., INSERM U 132 Hôpital des Enfants-Malades Paris,FRANCE

There is an increasing number of newborn from HIV mothers. Actually, the transmission of the virus can be diagnosed when the baby is between 6 to 12 months old or even older. It is for the mother a period of anxiety which may have consequences on mother/infants' interactions. We propose a "Counselling out patient clinic"open to all HIV mothers being informed before, during pregnancy or after birth that her baby may have been or not infected. It is not a medical or psychiatric counselling. The aim is to authorize these often very young mothers, isolated without any maternal or grang-maternal pattern to ask "simple" or "natural" questions about their babies' pre-occupations: the way it is developping, eating, sleeping. Are they doing well? The setting the counselling situation will give us the possibility of observing the mothers in interaction with their babies in different situations as: playing, eating, nursing, etc. We will analyze the part of the child in the interaction, the attention capacities of the mother to her baby's need, the fantsmatic interactions. We will, also, analyze if the characterisitc of the child at birth, the announcement of the possible infection induce specific interactions or an interactif dysfunctionnement. This programm has 2 aims. 1° Prevention and therapeutic. For the child: prevention of developpmental for the mother: prevention of depression, relapse of drug-addition;

W.D.P.17

EVALUATION OF A MEDITATION AND HYPNOSIS-BASED STRESS MANAGEMENT PROGRAM FOR MEN WITH HIV

Kelly, Paul J.
Toronto General Hospital, Toronto, Ontario, Canada

Objective. To investigate the efficacy of an 8 session stress management program based on mindfulness meditation and self-hypnosis training for homosexual men with HIV infection and related illness. Methods. A group-based program, taught in 8 weekly 2 hour sessions, was offered to men with HIV-related psychological distress. The following techniques were taught (in the order listed): abdominal breathing; mindfulness meditation -- basic technique and variants; stretching exercises; and self-hypnosis for relaxation, improved mood, and enhanced health. The following dependent measures were given: POMS, Basic Personality Inventory, checklists of medical and psychological symptoms; and 2 measures of hypnotic responsiveness (SHCS:A, CHEQ).
Results. The program has been offered to 3 groups of patients with N = 4, 11, and 8, respectively. Outcome data from group 1 indicate a reduction in measures of psychological distress and enhanced sense of control and enjoyment of daily activities. Results from the 2 groups in progress (N = 19) will be presented at the poster session. Conclusions. Preliminary results suggest that the program can significantly reduce HIV-related psychological distress. Data from the larger sample will permit stronger conclusions.

W.D.P.18

THE EFFECTS ON PARENTS OF HOSPITALISATION OF AIDS PATIENTS.

John Quirk, Frances Pearce. Academic Department of G U Medicine, University College and Middlesex School of Medicine, London, UNITED KINGDOM

Objectives. To identify and highlight the problems experienced and reactions of parents whose son is hospitalised with an AIDS related illness. To provide a link between parents and care givers as well as offering ongoing counselling and support services.
Method. Parents were interviewed by a Research Nurse on two occasions; on average approximately 1 month after hospital admission and 6-10 months later. Parents were questioned regarding reactions to sexuality, perception of illness, mental state, networks of care. This identifies any changes in attitude or reactions to the death of their son.
Results. 23 patients consented to their parents participation. 31 parents were interviewed with an average age of 62.3. A majority were resident in London and were prepared to care for their son at home. 21/31 felt that they had benefited from discussion of their sons illness especially on first hearing of an AIDS diagnosis. Just under half stated that they were regular church or synagogue attenders; few had told their priest or rabbi of their sons diagnosis. 19/31 knew of their sons sexuality prior to learning of an AIDS diagnosis. These parents were better able to accept or cope with an AIDS diagnosis than those who were unaware of their sons lifestyle.
Conclusion. Discussion of their sons diagnosis and early intervention of support personnel is beneficial to the majority of parents. Proximity to centres of care is influential in parents decision to care for their son in a home setting.

W.D.P.19

COUNSELLING HIV ASYMPTOMATIC PATIENTS FOR AZT MRC/INSERM DRUG TRIAL

Miller, Riva; Bor, R.; Lee, C.A.; Lim, S.C. and Johnson, M.
Royal Free Hospital and School of Medicine, London, England, UNITED KINGDOM

Objective. To describe an approach and method for counselling asymptomatic HIV infected patients being considered for the MRC/INSERM Zidovudine (AZT) drug trial.
Method. Structured interviews of patients were carried out at intervals of pre-enrolment, enrolment, at 3 months and thereafter 6 monthly. Hypothetical, future-orientated questions were used. Some issues addressed were the extent of knowledge about AIDS and how entering the trial influenced the perception of having HIV. Content analysis of patients' responses were made.
Results. Patients who entered the trial after counselling had improved their understanding of HIV and AIDS and had more realistic expectations. Problems were anticipated and identified at an early stage. Those who had to stop were better prepared. There was less denial about having HIV, opening up discussion of many issues with relatives and others. There was more preparation for an emphasis on HIV infection rather than AIDS. Younger patients wanted AZT.
Conclusion. Counselling about drug trials is an essential part of patient management. It has an important effect on the number of patients entering and complying with the protocol. Clinical staff report a greater ease in counselling in relation to other fears which patients may have.

W.D.P.20

LACK OF IMPACT OF HIV COUNSELLING ON WOMEN WITH STD CHECKUPS TO ALTER THE LIKELIHOOD OF SUBSEQUENT STD VISITS.

Hammond, Gregory W.*; Malazdrewicz, R.**; Tate, R.**; Bhayana, V.***; and Elmslie, K.****.
*Cadham Provincial Laboratory, Winnipeg, Manitoba Canada, **University of Manitoba, Winnipeg, Canada, ***Mt. Carmel Clinic, Winnipeg, Canada, ****Federal Centre for AIDS, Ottawa, Ontario, Canada.

Objective. To assess the impact of HIV counselling on risk for subsequent STD.
Methods. Ninety-one volunteer women were enrolled in a prospective seroprevalence survey of HIV infection. These women, visiting a clinic because of suspected STD were matched to all non volunteer women (184 controls) seen for STD checkups on the same initial enrollment date.
Results. A survey of all women requesting STD checkups at the clinic showed no difference in risk behaviour and age, for study subjects and controls. The rate of first return visits for STD checkups revealed no difference between the group who received standard counselling for STD vs. the group who received specialized counselling for HIV over an 11 month period (p=0.47). However, there was a more rapid rate of first return visits for STD checkups in the initial two months for the control subjects, but by 6 months, both groups had a 50% probability of return. A subset of women in both the study and control group had multiple visits for subsequent STD checkups and confirmed STD's
Conclusion. The effectiveness of specialized HIV counselling to alter behaviour among these women in a core area family clinic was not documented. Further studies are required to evaluate specialized HIV counselling.

RACIAL/ETHNIC DIFFERENCES IN COHORTS OF GAY/BISEXUAL MEN AND RECOVERING ADDICTS: IMPLICATIONS FOR AIDS PREVENTION STRATEGIES

Mantell, Joanne E.*, DiVitis, A*., Spivack, H. B.*
*Gay Men's Health Crisis, New York, New York, USA

Objective. To examine educational and sociocultural variations in perceptions of risk, behavioral history and social support systems related to the spectrum of HIV-related disorders among Blacks, Latinos and Whites.
Methods. Two cohorts of participants in AIDS educational programs in New York City during 1988 were surveyed. The first cohort was comprised of 157 gay/bisexual men (13% Black, 24% Latino and 63% White) surveyed in three Manhattan gay bars. Data were collected during a two-hour period on a designated night in each bar. The second cohort was comprised of 107 participants of Project HEART, a 6-session AIDS-prevention educational program in three sites of two drug-free therapeutic communities (TCs). The TC residents were of mixed gender (65.4% male), primarily heterosexual (79.6%) and ethnically diverse (51% Black, 22% Latino, 27% White). TC residents were surveyed at the beginning of the program and at its termination (six weeks later). Data regarding perceptions of HIV-related risk, sexual and drug-related history, and measures of social support were collected from both cohorts. Additional information regarding social support, self-esteem and life satisfaction was gathered from the TC residents.
Results. Analysis of variance results are indicated below.

	Bar Cohort		TC Cohort	
Variable	F	p	F	p
HIV-related knowledge	12.57	<.0005	4.96	.01
Salience of health	*	*	3.96	.02
Informational support for AIDS	*	*	6.02	.004

* Not asked of bar participants

For both cohorts, Whites performed significantly better than their Black and Latino counterparts. When education was controlled, these differences were upheld. In the bar sample, Chi-square analysis revealed that significantly more Whites sought AIDS-related information from friends than did either Blacks and Latinos. Further, gay Whites were more likely to rank insertive oral and anal sexual behavior as less risky than receptive oral and anal sexual behavior and were more likely to engage in insertive behaviors than their Black and Latino counterparts.
Conclusions. The data indicate that Whites who participated in AIDS educational programs were better informed about HIV-disease than either Blacks or Latinos. Further, Blacks and Latinos report less support for their concerns than Whites. Finally, gay White men were more likely to engage in unsafe sexual behavior if they perceived their personal risk to be relatively low. Educational strategies that promote sexual responsibility and strengthen social support systems will be presented.

W.D.P.22

SOURCES OF AIDS INFORMATION AMONG HETEROSEXUAL ASIAN, BLACK, LATINO AND WHITE COLLEGE STUDENTS

Cochran, Susan D.*; Mays, V.M.** and Rothspan, S.**
*California State University, Northridge, California, United States,
**University of California, Los Angeles, California, United States

Objective. The research literature on health communications in areas other than AIDS supports a tentative hypothesis that ethnic minority status influences the receipt of health-related communications (Allen, 1981; Allen & Bielby, 1979a, 1979b). The current study sought to evaluate whether or not such effects are also observed in delivery of AIDS-related information.
Methods. Questionnaires were completed by 665 unmarried young adults attending Southern California universities. Subjects ranged in age from 18 to 24 years old (median = 19.0 years). Fifty four percent were women; 46% were men. Forty percent were White, 20% Black, 18% Hispanic, and 17% Asian.
Results. Most subjects indicated television was their primary source of AIDS information, followed by magazines and newspapers. Few subjects had made use of AIDS hotlines or AIDS service centers (< 9%) for AIDS information. Less than 1/4 reported that their families provided information about AIDS. Both Asian (14%) and Latino (14%) subjects were less likely than Whites (25%) to indicate that their family was a source of AIDS-related information. Less than 1/3 of Asians had spoken with a health professional about AIDS in contrast to approximately 45% of other subjects. Overall, Asian subjects reported significantly fewer sources of AIDS information than other subjects.
Conclusion. Results support the hypothesis that ethnic minority status does influence the ways in which young adults receive information about AIDS.

W.D.P.23

Prevention of HIV infection in the mentally impaired, featuring West- Berlin

R. BACHMANN, C. HATTERY, B. DIECK, E. HESSING
Arbeitsgruppe AIDS beim Landesinstitut für Tropenmedizin Berlin, FRG

Currently, about 12 000 mentally handicapped persons live in West- Berlin.
For one year approximately 400 mentally disabled persons were attended in the context of the community based AIDS preventive activities of the West- Berlin senate. This practice as well as intensive inquiries resulted in the following conclusions:'
At least 50% of the mentally impaired have experienced sexual contact at latest in the middle stage of life. Within this group the range of sexual activities and inclinations resembles that of the general population. Furthermore, frequent sexual assaults are seldom acknowledged by the mentally disabled as what they are and so tolerated.
Concerning mental impairment, sexuality is under taboo. Because of this, group specific AIDS preventive training programs were not developed in the past. The general social and medical informations for the public, however, did not efficiently reach this group.

This situation urgently demands efforts to prevent HIV infection in the mentally impaired.
In case of HIV infections the specific way of life (e.g. accomodation in large institutions) causes particular problems. Our experience shows that in this field measures requiring time and intensive personal contact are usually effective.

Considering the specific limitations, even the severely mentally handicapped may gain a solid knowledge and make use of it.

W.D.P.24

RACIAL AND ETHNIC DIFFERENCES IN HIV SEROPREVALENCE IN SELECTED UNITED STATES POPULATIONS

Gwinn, Marta, Selik R, Allen D, Petersen L, St. Louis M, and Dondero T. AIDS Program, CID, CDC, Atlanta, Georgia, USA

Objective. To assess racial and ethnic differences in risk of HIV infection in the United States by reviewing data on seroprevalence and AIDS incidence.
Methods. We reviewed published reports and unpublished results of HIV seroprevalence studies in selected populations. Racial and ethnic differences in HIV antibody prevalence within studied groups were expressed as a ratio of prevalence rates (PRR), using non-Hispanic whites as the reference group. Corresponding ratios of AIDS incidence rates (RR) were based on cases diagnosed in 1988.
Results. Prevalence of HIV infection was higher among blacks and Hispanics than among whites in nearly every group studied, including military applicants (blacks: PRR=6, Hispanics: PRR=3); blood donors in selected regions (black: PRR=12, Hispanics: PRR=3), and patients at sentinel hospitals (blacks: PRR=2, Hispanic: PRR=1). Similar disparities were observed among studied groups of IV drug users (blacks: median PRR=5, Hispanics: median PRR=3), as well as in surveys of childbearing women and patients in several clinical settings. AIDS incidence in 1988 was also higher in blacks (RR=4) and Hispanics (RR=3).
Conclusions. The consistently observed racial and ethnic differences in prevalence of HIV infection have been attributed to differences in the prevalence of high risk behaviors, including IV drug use. However, marked differences in seroprevalence even within groups of IV drug users emphasize the need to describe high-risk behaviors more precisely for prevention.

W.D.P.25

RECRUITMENT, RETENTION AND COMPLIANCE OF MINORITY PATIENTS AND DRUG ABUSERS IN A VA COOPERATIVE STUDY

Simberkoff,M.;Hamilton,J.;Hartigan,P.;Drusano,G.; and the VA Cooperative Studies Group on Treatment of AIDS-Related Complex, New York, N.Y.,USA

Objective: Minorities and drug abusers (IVDA) have been under-represented in some HIV treatment trials. We analyzed their recruitment, retention and compliance in a multi-center VA Cooperative Studies trial of AZT vs. placebo for patients with AIDS-Related Complex.
Methods: Demographic characteristics, risk behavior activities and follow-up (F/U) for scheduled visits of the patients were reviewed. Blood samples were analysed for study drug by HPLC and classified as complaint, non-complaint or indeterminant.
Results: Results are tabulated below: (*=p<.01)

			% STUDY DRUG COMPLIANCE		
RACE OR RISK	#PATIENTS	%SCHEDULED F/U	COMP	NON-COMP	INDETERMINANT
White	131	80.2	92	2	6
Non-White	58	75*	93	3	4
HS (Homosexual)	115	83	92	2	6
IVDA	32	64*	92	4	5
HS & IVDA	16	79*	91	2	7
Blood	5	75	97	3	0
Heterosexual	6	85	94	3	3
Unknown	10	78	92	0	8

Conclusion: Minority patients and IVDA were significantly less likely to return for scheduled F/U. However, they were compliant with taking study medication. These data should be taken into account in considering them for HIV clinical trials.

W.D.P.26

W.D.P.27

CLOSE ENCOUNTERS OF AN UNSAFE KIND: RISKY SEXUAL BEHAVIORS AND PREDICTORS AMONG BLACK GAY AND BISEXUAL MEN

John L. Peterson, Robert Fullilove, **Joseph Catania,** Thomas Coates,
* Center for AIDS Prevention Studies, University of California, San Francisco and Multicultural Inquiry & Research on AIDS, Bayview-Hunter's Point Foundation
**Center for AIDS Prevention Studies, University of California, San Francisco, U.S.A.

Objectives: To determine the current high risk sexual behaviors and predictors of those behaviors in a cross-sectional study of Black gay and bisexual men.
Method: The sample consisted of 50 gay and 50 bisexual Black men recruited in 1988 through gay organizations, gay bath houses, parks, personal referrals and unsolicited volunteers in San Francisco, Oakland and Berkeley, California. All respondents were questioned about their unsafe sexual behaviors (e.g. all anal and oral unprotected sexual activity within the last month), AIDS knowledge, attitudes and beliefs.
Results: Compared to gay men, Black bisexual men had a higher total number of sexual partners ($\bar{x}$= 3.9 vs. 5.7, p <.01), a higher percentage of unsafe sex (50 % vs. 78 %, p < .001), including a higher percentage of unsafe sex with primary partners (50 % vs. 78 %, p<.02), and unsafe sex with other partners (60 % vs. 88 %, p < .05). In testing for correlates of unsafe sex for the combined sample, discriminant analyses revealed the following predictor variables significantly discriminated(p < .01) between the respondents who practiced unsafe compared to those who practiced safe sex: self efficacy, enjoyment of sexual activity with partners, close association with persons with AIDS, and media awareness of AIDS.
Conclusion: This study, one of the first to examine non-white gay and bisexual men, reveals high levels of risk behaviors in bisexual men. Prevalence studies and culturally-appropriate interventions are drastically needed among these minority men at high risk for HIV infection.

W.D.P.28

DEMOGRAPHIC PROFILES OF SAN FRANCISCO BAY AREA BLACK AND LATIN AIDS DEATHS, 1985 - 1986

Haynes, K.*; Chu, G.**; Riordan, N.**; Tokugawa, D.***; Fullilove, R.*
*Multicultural Inquiry and Research on AIDS component of the UCSF Center for AIDS Prevention Studies and Bayview-Hunter's Point Foundation; ** UCSF Center For AIDS Prevention Studies;***Kaiser Foundation Hospital, San Francisco, U.S.A.

Objective: To obtain demographic data not currently available from AIDS surveillance statistics for planning intervention strategies for Blacks and Latins in five San Francisco Bay Area counties.
Methods: Vital statistics data were used to identify all Black and Latin deaths in 1985 and 1986 with ICD codes consistent with AIDS-related illnesses. Death certificates were then reviewed to confirm AIDS as the cause of death and abstract demographic data. Addresses of decedents were converted to census tracts.
Results: 223 Black and Latin AIDS deaths were identified. 97.7% were male, living primarily in middle-class neighborhoods. 27.8% died in private residences, 33.2% in public hospitals, and 38.6% in private hospitals. Overall, 71.3% were employed as skilled workers. Blacks in professional and clerical/sales positions were more likely to die in private residences (62.5%) while Latins in those occupations were more likely to die in private hospitals (61.5%). Occupations of most Latins suggest proficiency in English.
Conclusion: In contrast to the underclass profile of minorities with AIDS nationally, data show that, prior to 1985, AIDS was not a disease of disadvantaged Blacks and Latins in the San Francisco Bay Area.These findings are consistent with the nature of the epidemic in San Francisco where white, gay men are disproportionately represented among people with AIDS. Active surveillance, incorporating socioeconomic data, such as that available from death certificates, is necessary for planning targeted regional interventions and tracking the epidemic in minority communities.

W.D.P.29

COMPARISON OF THE KNOWLEDGE, ATTITUDES, AND AIDS-RISK BEHAVIOR OF BLACK AND WHITE COLLEGE STUDENTS IN THE SOUTHEASTERN UNITED STATES

St. Lawrence, Janet S.*; Betts, R.*
*Jackson State University, Jackson, MS, USA

Objective: To compare the knowledge, attitudes, and risk behaviors of black and white college students in a currently low-AIDS prevalence area.
Method: 395 undergraduate students attending 3 state-supported universities in Mississippi completed measures evaluating AIDS-risk knowledge, prejudice toward persons with AIDS, willingness to interact with PWAs, and self-reported sexual behavior and substance use for the preceeding month. The sample included 212 black and 183 white college students.
Results: 61% of students were sexually active and engaging in practices which pose potential HIV-exposure risk. There were no significant racial differences in the frequency and range of sexual activities. Black and white college students were significantly different in substance use patterns with white students reporting use of both legal and illegal substances significantly more often (p < .001), although white students were better informed about practical aspects of AIDS risk (p < .002). Black students reported less prejudicial attitudes toward persons with AIDS (p < .05). There were no significant differences between black and white students' willingness to interact with a person with AIDS in casual social situations. Multiple regression analyses found no relationship between students cognitive knowledge of AIDS-risk and the frequency with which they personally engaged in potentially risky practices.
Conclusion: The results confirm the need for prevention efforts targeting college students to reduce their present and future vulnerability to HIV infection.

W.D.P.30

AIDS: KNOWLEDGE, ATTITUDES AND SEXUAL PRACTICES AMONG HISPANICS IN CHICAGO-RESULTS OF A 1988 CITYWIDE SURVEY.

Aida L. Giachello*, Aguillon, O., and Probst, J.
*University of Illinois at Chicago, Chicago, Illinois US.

In 1980 Hispanics represented 6 percent of the U.S. population and currently they account for 15 percent of all US. AIDS reported cases.
Objective: To obtain baseline information on Chicago Hispanics on knowledge, attitudes about AIDS transmission, sexual practice and prevention of HIV infection useful for program planning and implementation and for policy formulation.
Method: During the Spring of 1988 400 Hispanic persons 16 years of age and over were interviewed using Random Digit Dialing (RDD) telephone survey.
Results: Most Hispanics have general awareness and basic knowledge about AIDS. However, they have high levels of misinformation about mode of transmission. Many believe that they can contract AIDS through kissing, shaking hands or through toilet seats. Younger people and those with high education know more about AIDS. Youth and single people were found to be more at risk for AIDS due to their sexual practices.
Conclusion: There is a gap between what Hispanics know and what they do. They know that AIDS can be prevented with the use of condom, but most Hispanics do not use them as a mean of protection.

W.D.P.31

PSYCHO-SOCIAL ASPECTS OF MALE PROSTITUTION IN WASHINGTON, DC

Cudore L. Snell[*]; *Jones, A.B.S.*[**]; [*]*Howard University, Washington, DC, U.S.A.*, [**]*Whitman-Walker Clinic, Washington,* DC, U.S.A.

OBJECTIVE: The major objective of this presentation is to describe and analyze the help-seeking characteristics of 70 male prostitutes in Washington, DC. In addition, it will discuss the levels of knowledge, attitudes and safer sexual practices of male prostitutes regarding AIDS.

METHODS: The sample was collected through the use of the "snowball" method on the street of Washington, DC through the researchers' involvement with two community sex education programs. Structured face-to-face interviews and direct observation of informal and formal settings where young street males congregated, were utilized to gather data.

RESULTS: Demographic data will be reported on such variables as age, race, education, employment, family background, living arrangements, onset and duration of prostitution experiences. Significant differences were found between Black and White male prostitutes and between younger and older prostitutes in terms of help-seeking behaviors, mental health status, utilization of services, risk behavior and AIDS awareness.

CONCLUSION: Overall, the majority of the prostitutes sought help; reported poor mental health and worried about AIDS. Suggestions will be made for practice and future research.

W.D.P.32

PULLING COYOTE'S TAIL: AMERICAN INDIAN SEXUALITY AND AIDS-EDUCATION AND PREVENTION IN A CROSS-CULTURAL SETTING

Tafoya, Terry; Rowell, R; Beaulieu, L; Green Rush, A.
National Native American AIDS Prevention Center, Oakland
California, USA

Objective: To illustrate the effectiveness of using traditional legends as a way of understanding Native concepts of behavior and expectations and as a vehicle for doing HIV prevention education among Native people.

Method: The National Native American AIDS Prevention Center has incorporated the use of traditional legends, such as those in which "Coyote" plays a central role in its training on AIDS with both urban and reservation-based communities in the U.S. and Canada. These legends have been combined with slides of "third gender" individuals (whose tribal social roles usually overlap, but do not encompass Western concepts of homosexuality) to discuss how currently available curricula from non-Native sources may not be appropriate in describing same-sex sexual relationships in some tribal communities. Specific examples of successfully adapted Native American AIDS curricula will be provided.

Results: Pre-/Post-test results showed increased understanding of AIDS by participants.
Conclusion: Traditional legends are an effective tool in AIDS education for Natives.

W.D.P.33

AIDS AMONG HISPANICS IN THE UNITED STATES

Kroliczak, Alice, Ph.D. KOBA Institute,
Washington, D.C., U.S.A.

Objective. To demonstrate the effectiveness of an outreach intervention model in causing behavioral change within the Hispanic IV drug user community, identified as at risk of AIDS.
Methods. Indigenous outreach workers (ex IV drug users) gave AIDS education, condoms, and bleach to Hispanic IV drug users in San Diego, CA, Laredo, TX, and San Juan, PR. The impact of project intervention was measured by a series of comparative measures on a "before" and "after" set of questionnaires used to interview Hispanic IV drug users in the 3 cities. IV drug users were interviewed about their demographic background, high risk drug and sex behaviors, and their health.
Results. This project demonstrated that it is feasible to implement the indigenous outreach intervention approach to stem the spread of the HIV virus at different sites within varous geographical areas. We gathered a better profile of the IV drug users and their associates in the 3 cities. In addition we saw reported changes in needle use and sexual behavior from the time of the respondent's initial interview until the time of his/her followup interview.
Conclusion. Once implemented, this outreach intervention model is successful in meeting the goal of behavioral change among Hispanic IV drug users in a variety of sites. It is also feasible to employ such an approach with different populations.

W.D.P.34

HIV SEROPREVALENCE AND ITS IMPLICATIONS FOR A TRANSSEXUAL POPULATION.

ALAN, Diana L; GUINAN, J; McCALLUM, L.
Albion Street (AIDS) Centre, Sydney Hospital, Sydney NSW, Australia.

Objective: To identify the incidence of HIV seroprevalence and its implications upon Pre-Operative Transsexuals.
Methods: Data collected as a routine part of the Albion Street (AIDS) Centre and Outreach Programme's screening and follow-up services were collated and reviewed with the use of the Centre's master database, individual files and personal interviews with transsexual clients.
Results: Preliminary analysis of the data from the 58 transsexuals tested by the Centre had indicated an HIV seroprevalence of 21%, a prostitution incidence of 75%, and an IV drug usage of 46% within the study group.
Conclusions: This study has identified a minority group which to the present date appears to have been overlooked by AIDS Researchers. The transsexual clients within our study population had a significantly higher HIV seroprevalence than other groups tested by the Albion Street (AIDS) Centre. This infection rate has some rather serious implications in terms of long-term management of transsexuals and especially those Pre-Operative transsexuals where surgery is indicated but refused on the grounds of their HIV status.

W.D.P.35

MINORITY PATIENT POPULATIONS' KNOWLEDGE ABOUT AIDS.

Aruffo, John: Coverdale, J.: Vallbona, C.

Baylor College of Medicine, Houston, Texas, USA

Objective: To describe Black and Hispanic populations' understanding about AIDS transmission and prevention.
Method: In the Harris County System of Community Health Centers in Houston, 587 patients including 143 White, 151 Blacks and 293 Hispanic completed a structured interview on AIDS issues. The Hispanic patients were interviewed by a native Spanish speaking interviewer fluent in both English and Spanish. Patients were given a cumulative correct score for 10 questions on AIDS transmission.
Results: An ANOVA showed significant differences in knowledge between each ethnic group. Cumulative scores were: White (78%), Blacks (68%) and Hispanics (61%). Only 58% of Hispanics reported that using a condom during sexual intercourse lowered the risk of contacting AIDS, compared to 84% of whites and 83% of blacks. A regression analysis showed signficant effects for both education and ethnic group but not for age and sex.
Conclusion: Dissemination of AIDS information is essential to prevent the spread of AIDS. These data demonstrate an ethnic difference in assimilated knowledge about AIDS. Additional attention should be focused on educating low-income Blacks and Hispanics about AIDS.

W.D.P.36

HIV-RISK RELATED SEXUAL PRACTICES AMONG ASIAN YOUNG ADULTS

Mays, Vickie M.[*]; Cochran, S.D.[**] and Leung L.[*]
[*]University of California, Los Angeles, California, United States [**]California State University, Northridge, California, United States

Objective. In the U.S., cases of AIDS in ethnic minority Asians, unlike Blacks and Hispanics, are not currently disproportionate to their representation in the population (CDC, 1988). Little is known about the sexual practices of unmarried, young Asian adults. The current study examined HIV-risk related sexual behavior in a sample of Asian young adults attending college in the Southern California area to identify the parameters for HIV prevention in this population.
Methods. Sixty five men and 88 women, self-identified as heterosexual Asians, completed questionnaires assessing sexual behavior histories. Approximately half were U.S. born. Subjects ranged in age from 18 to 24 years (X = 19 years).
Results. 28 men (44%) and 44 women (50%) had engaged in heterosexual sexual intercourse at least once. Of those who had, less than 1/3 always used birth control and only 11% always used condoms. Yet, 3/4 had used condoms at least once. Nearly 30% of men and 57% of women reported that a sexual partner had objected to using condoms at some time in the past. Fifteen percent had engaged in anal intercourse. None of the men, but 6% of the women, had been treated for a sexually transmitted disease.
Conclusion. Results illuminate factors that contribute to delay of initiation of sexual activities among ethnic minority Asians. Once sexually active, sexual behaviors are consistent with behavioral patterns observed in research on primarily White young adults (Hagales et al, 1988).

Les femmes (partie 1)
Women (Part 1)

W.D.P.37 EFFECTS OF A SPANISH-LANGUAGE COMMUNITY INTERVENTION IN SOUTHWEST TEXAS ON REPORTED HIV INFECTION KNOWLEDGE, ATTITUDES AND BEHAVIOR

Amezcua, C.*; Ramirez, A*; McAlister, A.*; McCuan, R.*; Galavotti, Christine**; and Reed, C.***.
*The University of Texas Health Science Center, Houston, Texas, USA, **Centers for Disease Control, Atlanta, Georgia, USA, ***Texas Department of Health, Austin, Texas, USA.

Objectives: To test the effect of a Spanish-language community intervention on reported HIV infection knowledge, attitudes and behavior in a treated vs. a matched community in Southwest Texas.
Methods: A telephone survey of randomly sampled Spanish speaking adults on knowledge about AIDS/HIV, attitudes, behavior change, and information source prompting them to change, was completed in 1988. There were 91 respondents from the intervention community and 56 from a demographically matched community. The intervention community, in its fourth year of a National Cancer Institute (NCI) funded health promotion campaign, received an HIV infection emphasis in 1987. Activities included hand delivered calendars, featured informative communications in the local media, saturated delivery of a Spanish language version of the Surgeon General's handout on AIDS, and distribution of a telephone hotline number.
Results: Respondents from the intervention community were more knowledgeable about HIV transmission (F=3.9, df=1,146, p<.05), and felt a greater need for testing among various AIDS risk groups (F=5.8, df=1,146, p<.01). A greater proportion of intervention community residents reported changing sexual behavior (33% intervention vs. 26% comparison, p<.05), with the local media the primary source of information prompting change in both communities.
Conclusions: Relatively inexpensive community information campaigns, when given within existing health risk prevention programs, can positively influence reported knowledge, attitudes and behavior in Spanish speaking ethnic minorities.

W.D.P.38 PSYCHOSOCIAL ASPECTS OF THE HIV INFECTED WOMEN IN RIO DE JANEIRO, BRAZIL.

Longo, Paulo Henrique Pinheiro, Manen, J.L.L.; Carvalho Neto, L.D.;Morais, de Sá, C.A.
Gaffrée & Guinle University Hospital, University of Rio de Janeiro (UNI-RIO) - Brazil.

Objective: To identify the emotional and social adaptations that more frequently occur to HIV infected women.
Methods: The study comprised 32 HIV infected women including 29 female sexual partners of infected men, 2 female intravenous drug users and one blood transfused women, aged 23 to 45 years, who were interviewed and observed from Feb 88 to Dec 88.
Results: Psychosocial patients' adaptation are shown in the following table:

PSYCHOLOGICAL FINDINGS	N	%
Anxiety	32	100,0
Depression	25	78,1
Guilt and Ambivalence	19	59,4
Poor Self-Esteem	15	46,9
SOCIAL IMPACT	N	%
Decrease on economic status	32	100,0
Increased concern about their children's future	21	65,7
Unemployment	17	53,1
Lack of professional training	15	46,9

Conclusions: The female group deserves a special psychosocial support because of its specific characteristics and demands. This female psychosocial profile could be an important determinant on the clinical progression of infected women. We believe fundamental to continue developing the present study.

W.D.P.39 EVALUATION OF THE WPC-333 FEMALE CONDOM BARRIER

Leeper, Mary Ann*; Conrardy, M.*; Henderson, J.**
*Wisconsin Pharmacal, Jackson, Wisconsin, United States,
**Medical College of Wisconsin, Milwaukee, Wisconsin, United States.

Objective. To present clinical results evaluating whether the design and materials used in the new female condom, WPC-333, are safe and create an effective barrier as compared to the male condom.
Methods. Two separate studies were completed. In one study, 108 couples used 521 WPC-333 polyurethane female condom devices and 516 latex male condom devices. Each device was returned within 24 hours of use to determine integrity of the barrier as measured by the standard water leak test. In a separate study, 49 couples used 147 WPC-333 devices and 147 male condoms. Questionnaires were completed after each use related to functionality of the devices. Risk of barrier failure defined as spillage of seminal fluid inside the vagina was quantified. Adverse reactions were also recorded.
Results. WPC-333 had significantly fewer water leaks than the male condom at a p-value of .001. The combined probability of risks of leaks, tears and spillage inside the vagina using WPC-333 was 3.3%; the combined probability of risks using the male condom was 11.5%. No adverse reactions were reported.
Conclusion. WPC-333 provides an important alternative to the latex male condom for reducing the risk of contracting STDs and preventing pregnancy. Polyurethane is a safe material for use in barrier contraceptives. WPC-333 does not introduce any new risks and may reduce total risk versus the male condom.

W.D.P.40 DIFFERENCES IN STAGE OF PRESENTATION AND PRESENTING SYMPTOMS BETWEEN WOMEN AND MEN IN A PRIMARY CARE AIDS CLINIC.

Bibble, Denise; Marte, C.; Tiersten, A.; Kelly, J.; Keyes, C.; Wolbert, J.; Bellevue Hospital/Community Health Project, NY, NY, USA.

Objective: To examine gender differences in stage of presentation and presenting symptoms and to ascertain possible reasons for such differences. Methods: A questionnaire was administered to 20 female and 20 male clients within one month of intake at a community based, primary care clinic for HIV infection. Information was elicited about reason for visit and factors that prompted urgency or, alternatively, delayed time of entry. Charts were reviewed for diagnosis, presenting symptoms, demographic information and risk category. Intake laboratory data was reviewed. Results: Women presented with more advanced disease and more symptoms than men. As an incidental finding a large number of women had gynecologic complaints prior to other HIV-related symptoms. There was a large difference in mean self-reported duration of symptoms prior to entry (39.75 wks-women, 24.30 wks-men). Differences in psychosocial factors included less awareness of risk, less knowledge about health care resources and less access to treatment protocols in women. Women cited as hindrances caretaker roles, lack of transportation and of child care. Women more often stated concerns about partners refusing safer sex and anticipated illness and death. Both men and women stated concerns about employment, financial resources and stress. Conclusion: This study suggests that HIV-infected women present with more symptoms and at a more advanced stage of illness than men. It further suggests that psychosocial factors such as lesser awareness of risk status, greater family caretaker responsibilities and more limited financial resources play a significant role in explaining the differences in stage of presentation.

W.D.P.41 MALE CLIENTS OF FEMALE PROSTITUTES IN BIRMINGHAM ENGLAND: A BRIDGE FOR TRANSMISSION OF HIV?

Kinnell, Hilary; Griffiths, R K
Community Medicine Department, Central Birmingham Health Authority, UNITED KINGDOM

Background: Prostitution in Birmingham is a £13 million p.a. industry. We estimate that 10% of adult males regularly pays for sex.
Project: An outreach team has interviewed 258 female prostitutes about risk factors for HIV. Prostitutes have also helped us study their clients by direct interview with 125 men. Others completed survey sheets on 50 consecutive clients each, providing data on a further 350 men.
Results: 95% are local to the West Midlands. Ages range from 20 to 80, the mean being 41.5 years. 77% had non-prostitute female sexual partners. 14% had 3 or more such partners in the previous 12 months. 11% had had male sex partners in their lifetime. 82% rarely or never carried condoms. 5% had injected since 1985. 3% had been HIV tested. 33% did not know that anal sex with a woman was high risk for HIV. 34% name prostitutes as a main source of information about HIV, while only 8% name a medical source. Reasons given for seeking commercial sex and frequency of visits indicate that this activity cannot be limited by law. Only 8.5% had ever been warned by police for kerb-crawling, despite intensive policing over the period of data collection.
Conclusions: i) Clients of prostitutes are sufficiently numerous to affect a heterosexual HIV epidemic, ii) Outreach programmes to prostitutes must continue as they have a role in educating clients; iii) the demand for commercial sex is too high to be reduced by legislation, therefore risk reduction must be effected in other ways.

W.D.P.42 EDUCATIONAL NEEDS ASSESSMENT FOR WOMEN AT RISK FOR HIV THROUGH INTRAVENOUS DRUG ABUSE

Williams, Ann B. Columbia University, NewYork,U.S.A.

Objective: To acquire information needed by educators to develop education and support programs for women at risk for HIV through intravenous drug abuse.
Method: A qualitative needs assessment based on in depth interviews with 21 women at risk for HIV through intravenous drug use. Results were analyzed using variables of the Health Belief Model and the concept of self-efficacy.
Results: The women showed high levels of knowledge about HIV transmission and little misinformation. They perceived the severity of the AIDS threat, their personal vulnerability and the efficacy of protective behaviors. Barriers to effective behavior change included fear of withdrawal symptoms, peer pressure, unavailability of sterile injection equipment, ambiguity about the risk of needle sharing with close friends or sexual partners, a perception that condoms are not 100% effective,lack of trust in relationships with significant others, a perception that perinatal transmission occurs 100% of the time, and fear of HIV testing. Contextual variables included community fear of AIDS, lack of hope, social isolation, importance of the childbearing role and rejection by health care providers.
Conclusions: Didactic educational programs targeted to women at risk should be continued but should be supplemented with support programs which are dialogic and interactive to encourage change.

AIDS OUTREACH/PREGNANT WOMEN AND CHILDREN

Objective: To discuss an aggressive outreach effort to pregnant high risk women to prevent heterosexual and perinatal AIDS transmission, and to study the attitudes, knowledge and behaviors of those women.
Methods: A quasi-experimental demonstration project in two sites will be presented which will implement and evaluate AIDS prevention and outreach services for high risk pregnant women and their sexual partners. Study sites already provide medical and drug treatment; this project will enhance existing services through education and prevention activities, HIV testing, related counseling, and efforts to engage and counsel the sexual partners of these women. Periodic assessments of the women's physical health, psychosocial functioning, parenting abilities and AIDS risk reduction knowledge will be conducted as well as assessment of the children's development. Coordination of counseling and concrete services will be provided in response to identified needs.
Results: The effectiveness of intervention with the women as individuals will be considered as compared to intervention with the women and their sexual partners. The impact of service provision on changing AIDS risk behaviors will be reviewed.
Conclusion: The panel will discuss the role of comprehensive service delivery to pregnant women and their families as an effort to impact on changing AIDS risk behaviors.

W.D.P.44

HIV/AIDS PUBLIC INFORMATION CAMPAIGN TARGETING WOMEN AT RISK AND SEXUALLY ACTIVE ADULTS

Williams, Kenneth R.*; Kroger, F.*; and Shepherd, M.B.*. Centers for Disease Control, National AIDS Information and Education Program, Atlanta, Georgia, U.S.A.

Objective. To describe the U.S. Government's national AIDS public information campaign phase targeted to women at risk (e.g., sexual partners of IV drug abusers) and multiple partner, sexually active adults whose sexual behaviors place them at increased risk of exposure to and infection by the human immunodeficiency virus (HIV).
Method. In October 1988, The National AIDS Information and Education Program initiated a public information campaign to inform and educate persons whose sexual behaviors place them at increased risk of exposure. Strategies (i.e., public service announcements (PSA's), active marketing of materials, development of local programs around the materials) for implementing the campaign and preliminary results from the campaign will be presented.
Results. Preliminary data on the campaign's success in reaching intended audiences are presented as well as problems in implementing the campaign. Special attention will be given to the lessons learned in attempting to disseminate timely, relevant informational materials to the public, and building public support for airing of PSA's and effective networking to maximize the impact of the campaign.
Conclusion. Evidence to date suggests that the campaign has been successful in reaching target audiences, that messages are well received, and that a public health system to support media based public information campaigns is developing.

W.D.P.45

BARRIERS TO COMPREHENDING RISK REDUCTION MESSSAGES AMONG HIGH RISK BLACK AND LATINA WOMEN

Eversley, Rani B*
*The Center For AIDS Prevention Studies, UCSF, San Francisco, USA

OBJECTIVE. To identify difficulties among sexually active Black and Latina women in adopting HIV risk reduction behaviors.
METHODS. Psychotherapy interviews of Black and Latina women were collected and qualitatively assessed for common difficulties identified by the clients in reducing HIV risk.
RESULTS. The following common problems were identified: difficulty with selecting credible sources of information, difficulty with comprehending conflicting information regarding heterosexual HIV risk, difficulty with identifying prospective sexual partners risk status, difficulty with self assertion regarding condom use, habitual use of substances during sexual activity, and lack of knowledge about where to obtain additional information regarding HIV risk.
CONCLUSION. There is a high level of concern among high risk minority women about HIV risk, although, implementing personal risk reduction remains a problem. There is a need for psychotherapists who work with sexually active females to equipt themselves with knowledge regarding risk to this population as well as skills to increase risk reduction self efficacy among their clients.

W.D.P.46

AIDS RISK AMONG WOMEN WITH MULTIPLE SEXUAL PARTNERS: HIV RISK SCREENING DATA FROM A FAMILY PLANNING POPULATION

Eversley, Rani B.* Newstetter, Amanda**
*The Center For AIDS Prevention Studies, UCSF, San Francisco, USA
** Planned Parenthood of San Francisco- Alameda, San Francisco, USA

OBJECTIVE. To identify HIV high risk behaviors in a family planning population, enabling family planning providers to plan prevention strategies targeted toward this group
METHODS. Behavioral risk screening data collected from 2112 female family planning patients attending a San Francisco Bay Area Planned Parenthood Clinic was analysed to determine the proportions of HIV high risk behaviors in this population. Data was collected between January and May of 1988. Analysis included tests of proportion and chi square.
RESULTS. Eighteen percent reported some HIV risk.The highest risk categories were 12.16% who were at risk due to multiple sexual partners, 3.2% who were at risk due to having a bisexual male partner, and 2.46% who were at risk due to either a history of IV drug use or an IV drug using sexual partner. Twenty eight percent of the at risk population was assessed to have two or more risk factors. Women with multiple partners were significantly more likely to report bisexual partners ($p < .001$), IV drug involvement, or IV drug using partners ($p < .001$).
CONCLUSION. These data indicate that females who are exposed to multiple partners do have a significantly higher chance of encountering a male in a high risk category. As IV drug use and bisexual activity are generally not perceived as attractive behaviors, they are probably not readily reported to female partners, especially within the context of a casual sexual encounter. This suggests that these risks are actually somewhat higher in this population. In order to assess true risk more information is needed about condom use and other safe sex practices in this population. A survey to assess the prevalence of preventative practices is now in the planning stages.

W.D.P.47

ATTITUDES TO AND AWARENESS OF AIDS AMONG SOUTH AFRICAN WOMAN.

Sifris,Dennis,and Millar,Steven. HIV Clinic, Johannesburg Hospital, South Africa.

Objective. To explore the current awareness of the awareness of the attitudes to AIDS, and the role of woman in the prevention of AIDS.
Method. Group discussions were held with 200 Black & White woman aged between 18 & 34. A self-completion questionnaire was also used. Use was made of a projective questioning and stereotypes for the more sensitive questions
Results. The majority felt that they knew very little and needed more information. Casual sex was coidered the predominant mode of transmission, but donating blood was thought to be a risk factor by 48%, toilet seats by 44% and spitting coughing and sneezing by 22%. Almost all felt that the womens role in prevention was important & 87% of Black woman were personally concerned about catching AIDS, as compared to only 42% of White woman. Within the Black culture, one partner relationships appear to be the exception rather than the rule. White woman felt it would be embarrassing to ask their partners to use condoms. Most Black woman were concerned about catching AIDS through their partners activities whereas half the White woman were not concerned.
Conclusion. Knowledge about AIDS is poor among South African Woman and more information is needed. Woman feel they have a vital role to play in prevention.

W.D.P.48

NATIONAL SURVEILLANCE OF AIDS IN WOMEN, 1981-1988: A REPORT FROM THE CENTERS FOR DISEASE CONTROL

Ellerbrock, Tedd; Chamberland, M.E.; Bush, T.J.; Rogers, M.F.; Centers for Disease Control (CDC), Atlanta, Georgia, USA.

Objective. Describe the epidemiology of AIDS in women in the United States.
Methods. All AIDS cases in females 13 years of age and older reported to CDC through December 31, 1988, were analyzed.
Results. Since 1981, a total of 6,983 (9%) of 81,418 adults with AIDS have been women. AIDS cases in women have increased from 196 (7% of adult cases) reported before 1984 to 3,296 (10%) in 1988. During these same two periods, the male-to-female ratio for AIDS cases among heterosexuals has decreased from 3.1:1 to 2.5:1. The nine States (72% of cases in women) with the highest cumulative incidence rates of AIDS cases in women were all on the Atlantic coast. The racial/ethnic distribution of women with AIDS (52% black, 28% white, and 19% Hispanic) was similar to that for heterosexual men. Hispanic and black women had cumulative incidence rates 8 and 12 times, respectively, that for whites. Most women (85%) were of reproductive age (15-44 years) and perinatal HIV exposure was a risk factor for 1,044 (78%) pediatric AIDS cases. IV drug abuse was associated with 70% of AIDS cases in women (52% were IV drug abusers and 18% were sex partners of IV drug abusers) and 73% of perinatal AIDS cases. The median survival time from AIDS diagnosis to death for women was 10 months; the same as that for heterosexual men. By the end of 1988, a total of 3,853 (55%) women with AIDS were reported to have died.
Conclusion. Prevention efforts in women and their children must be directed towards IV drug abusers and their sex partners, with particular focus on blacks and Hispanics in geographically discrete areas.

W.D.P.49

COMPARISON OF BLACK AND WHITE WOMEN TESTED FOR HUMAN IMMUNODEFICIENCY VIRUS

Coats, Bonnie*; Simpson, Sharleen H.*
*University of Florida, Gainesville, Florida, U.S.A.

Objective. The primary goal was to develop a profile of women in a low incidence area by examining characteristics of 340 white and 55 black women, self-selected as at risk for HIV infection.
Methods. The women were anonymously counseled and tested at a public health facility in a university town in north central Florida. Differences in risk behaviors, STD history, educational level, safer sexual practices, sources of information regarding AIDS, and level of fear were examined.
Results. The mean educational level for white women was 14 years, for black women 13 years. Using Spearman correlation coefficients, history of hepatitis, IV drug use, sexual partner with HIV infection, and presence of tatoos were significantly associated with seropositivity in the group as a whole. Seropositive black women were more likely to have had a transfusion, tatoos, and an HIV seropositive partner. Seropositivity in white women was negatively correlated with education. They were also more likely to have had a history of hepatitis, IV drug use or a partner who was a hemophiliac.
Conclusions. Women who come for voluntary testing represent an educated group, which may imply that this type testing only reaches a select population, and that women at risk may not be respresented. Identified risk factors for women who are seropositive match those found in high risk areas.

W.D.P.50

COMPARING ESTIMATES OF HIV SEROPREVALENCE IN U.S. WOMEN: CHILDBEARING WOMEN AND MILITARY RECRUIT APPLICANTS.

Wasser, Shari*; Gwinn M*; Pappaioanou M*; Novello A**; Willoughby A**; AIDS Program, CID, CDC, Atlanta, GA, **NICHD, Bethesda,MD., U.S.A.

Objectives. To assess bias in estimated HIV seroprevalence rates for U.S. women by comparing rates in female military recruit applicants with those from the Survey in Childbearing Women.
Methods. Since October 1985, female civilian applicants for U.S. military service have been tested for HIV-1 infection. Beginning in October 1987, ongoing, blinded statewide HIV seroprevalence surveys have been conducted in U.S. women delivering live infants.
Results. Statewide prevalence rates among childbearing women were higher than corresponding rates among female military applicants in each of four regions of the U.S. Among childbearing women, state-specific rates ranged from 0.03% to 0.66%, with corresponding rates from 0.00% to 0.29% in female military applicants. State-specific rates from both surveys were highest in the Northeast, followed by the South, North Central, and West regions.
Conclusions. Women who participate in high-risk behaviors such as IV drug use may be less likely to apply for military service. This introduces bias in the population tested and likely produces underestimates of the prevalence of HIV infection among U.S. women. In contrast, the population of women delivering live infants includes women from all risk groups. Seroprevalence among childbearing women, however, may be different from that in women who choose not to or are unable to become pregnant or who experience adverse pregnancy outcomes. Data from both surveys, however, though subject to these biases, provide useful information on the prevalence and trends of HIV infection in U.S. women of reproductive age.

W.D.P.51

UNSAFE SEXUAL BEHAVIOR AND HIGHER RISK PARTNERS: CHANGE OVER TIME IN A PROSPECTIVE STUDY OF WOMEN AT RISK FOR AIDS

Cohen, Judith B.*, Dorfman, L.E.*, Kelly, T.J.*, Rita, M.*, Garcia, D.R.*, Wofsy, C.B.*
University of California San Francisco, San Francisco, California, USA

Objective: To assess sex and drug use behavior changes in a prospective study of women at risk for HIV infection.
Methods: 279 sexually active women with infected, high risk, or multiple partners were interviewed and tested between 1985 and 1987, and followed up 6 to 12 months later.
Findings: At entry, 84% reported unsafe or possibly unsafe behavior with IVDU, bisexual, or HIV-infected partners. At follow-up, 70% fit this same definition; one had seroconverted. Significantly more women reported changing to lower-risk partners than reported changing to lower-risk behaviors.

	Entry	Follow-up
Partner at Risk and High Risk Behavior	84%	70%
Partner at Risk and Low Risk Behavior	1%	4%
Low Risk Partner and High Risk Behavior	14%	26%

Conclusion: Women followed over time have significantly reduced unsafe partnerships but only moderately reduced unsafe behaviors. To the extent that they continue to engage in risky behavior and do not always know their partners' risk, they remain at some risk for HIV infection. Prevention programs for women need to emphasize reduction of risky behavior as the only certain prevention strategy.

W.D.P.52

EMERGING PATTERNS OF DRUG USE, SEXUAL BEHAVIOR, HIV INFECTION AND STDS IN HIGH RISK SAN FRANCISCO AREAS FROM 1986-1989

Cohen, Judith B.[1], Lyons, C.A.[1], Lockett, G.J.[1,2], McConnell, P.A.[1,2], Sanchez, L.R.[1,2], Wofsy, C.B.[1]

[1]University of California San Francisco, [2]California Prostitutes Education Project, San Francisco, California, USA

Objective: To evaluate changes in drug use, sexual behavior and STDs among high risk women and their partners participating in a street-based peer provided prevention research and education program.
Methods: In a two phase ongoing program, 192 women in 1986-87 (T1) and 153 women and 34 male partners (MP) thus far in 1988-89 (T2) received interviews, counseling, and testing for HIV Ab, HepB, and syphilis infection in San Francisco Bay Area districts known for drug use and prostitution.
Findings: From T1 to T2, HIV infection was unchanged at 5% in women but was 12% among MPs. HepB rates were unchanged among women (48%, 49%) but were 85% for MPs. HIV infection was associated with IV drug use among women and MPs. Probable active syphilis (RPR and MHA-TP+) was significantly associated with crack cocaine use, younger age, and less condom use, but not with IV drug use or HIV infection.
Conclusion: Ongoing assessment of AIDS risk in these areas indicates two patterns: that of HIV infection associated with IV drug use, and an ominous new pattern of crack cocaine use associated with syphilis that may predict increased HIV infection to come. Existing prevention programs do not address the problems or needs of people in the latter group.

W.D.P.53

BEHAVIOR CHANGES TO REDUCE HIV TRANSMISSION RISK IN A PROSPECTIVE STUDY OF SEROPOSITIVE WOMEN

Poole, Lauren E.*; Cohen, J.B.*; Lyons, C.A.*; Kelly, T.J.*; and Wofsy, C.B.*
University of California San Francisco, California, USA

Project AWARE has evaluated 1,047 women at risk for HIV infection 56 (5%) of whom are seropositive. Of the 40 seropositive women who have been followed for at least 12 months, (16) 40% are IVDU, (16) 40% had an HIV infected sexual partner, (4) 12% had a partner at increased risk for HIV infection (3) 5% had no identified risk and 1 was probably infected through a blood transfusion. Selected sexual and drug using behavior changes include:

Behavior	Entry	6 Mo.	12 Mo.
Number of Women	40	40	24
Avg. No. Sex Partners	5.2	2.1	4.0
% With Fewer Partners	n/a	40	50
% Abstinent	0	35	8
% Tongue Kissing	93	60	67
% Cunnilingus, No Barrier	85	45	54
% Any Vaginal Sex, No Condom	75	37	37
% Sex During Menses	42	11	8
% IV Drug Use	40	23	10
% Sharing Needles	40	15	5

Of the 11 women who are still exposing uninfected partners to vaginal secretions, 5 engage only in cunnilingus, 3 have partners who refuse to use condoms, and 3 have been unable to disclose their antibody status.

Although many HIV+ women experienced a period of abstinence, most resumed sexual activity but dramatically reduced sexual and needle-sharing behavior known to transmit HIV to others.

W.D.P.54

EPIDEMIOLOGICAL INFECTIOLOGICAL AND IMMUNOLOGICAL RESULTS FROM THE HIV-AMBULANCE OF THE DEPARTMENT OF OBSTETRICS AND GYNECOLOGY

Friese K, Rossol S, Voth R, Hess G, Meyer zum Büschenfelde, KH, Knapstein PG. University of Mainz,FEDERAL REPUBLIQUE OF GERMANY

OBJECTIVE: To examine gynecological problems in HIV-infected women in relation to immunological parameters.
METHODS: From 40 HIV-infected female patients, who were treated, 25 women were seen every three to six months. Most of them are living outside the cities of the state Rheinland-Pfalz. 52% of them are or have been i. v. drug abusers, 44 % have been infected by sexual transmission. Only one third use condoms for cohabitation, another third denies this form of protection. The rest has no sexual intercourse in the moment. 23 pregnancies are known in this group and in 20% of the cases HIV-infection has been discovered during prenatal care.
Results: 80 % of the patients had have a recurrent candida infection of the vagina which was detected in culture. Immunologically 75% of the women belong to the stage III (in order to the CDC-classification). Out of this group more than 50% show less than 400 CD 4 + cells/μl. A positive result for HIV-Ag, anti-p 41 and negative anti-p 24 could be detected in five cases. One of the four women with AIDS died of a rapid growing cervix cancer although treated with radiotherapy.
CONCLUSIONS: Our data provide evidence for the increasing incidence of gynecologic problems in HIV-infected women. From our experience gynecological examination has to be routinely integrated into medical cave of HIV-infected women.

W.D.P.55 HIV-INFECTION IN HETEROSEXUAL WOMEN IN COPENHAGEN

Smith, Else*; Kroon, S.**; Gerstoft, J.***; Kvinesdal, B.****; Mathiesen, L.*.
* Hvidovre Hosp., Univ. of Copenhagen, DK. ** Bispebjerg Hosp., Copenhagen, DK.
*** Rigshosp., Univ. of Copenhagen, DK. **** Seruminstitutet, Copenhagen, DK.

Objective: To describe the spread of the HIV-infection in women in Copenhagen, especially the heterosexual transmitted cases.
Methods: From 1.I.1985 to 1.IX.1988 the charts of all HIV-seropositive women in the main hospitals in Copenhagen were studied. Data were collected on sexual activities and practices, intravenous drug abuse, transfusions, history of sexual transmitted diseases (STD) and CDC classifications. The women were categorised in four groups according to the mode of transmission of the HIV-infection.
Results:

	I.v. drug abuse	Heterosexual cases	Transfusion	Undetermined
Number	58 (50%)	3[illegible] (31%)	12 (10%)	10 (9%)
Unsafe sex+risk man	41/45 (91%)	17/25 (68%)	—	6/10 (60%)
Former STD	36/50 (72%)	11/32 (34%)	1/12 (8%)	4/10 (40%)
Former HBV	22/58 (38%)	4/35 (11%)	0/12 (0%)	3/10 (30%)
Classification at latest follow-up				
CDC II	30/43 (70%)	17/30 (57%)	4/12 (33%)	5/8 (62%)
CDC III	8/43 (18%)	9/30 (30%)	1/12 (8%)	3/8 (38%)
AIDS	5/43 (12%)	4/30 (13%)	7/12 (59%)	0/8 (0%)
Median:HIV-pos. test	X 1985	VII 1986	I 1986	XII 1985

Conclusion: Heterosexual transmission of the HIV-infection occur among women in Copenhagen also among women without risk behaviour. The prevalence of HIV-infection in the heterosexual population is unknown and the importance of co-factors such as STD and genital lesions and anal intercourse remains to be determined but will be analysed in a coming study.

W.D.P.56 IMPORTANCE OF IVDA AS A RISK FACTOR FOR HIV INFECTION IN WOMEN OF BUENOS AIRES CITY.

Benetucci, Jorge*; Multare, S*; Martinez Peralta, L**; Macias, J*; de Bouza J*; Compagnucci, A*; Calello, M**; Weissenbacher, M**.
*Muñiz Hospital; **Department of Microbiology, School of Medicine, Buenos Aires. Argentina.

Objective. To determine the main risk factors responsible for HIV infection in women living in Buenos Aires City and surroundings.
Methods. A group of 213 out of 246 women who spontaneously consulted because of HIV in the Infectious Diseases Hospital of Buenos Aires City from 1/1/87 to 6/30/88 (age between 14 and 58 years) were studied clinically and serologically. The main items considered in the questionnaire were sexual habits, drug addiction and other sexually transmited illnesses. Anti-HIV antibodies were screened by EIA methods and confirmed by Western blot.
Results.

HIV Serology	Number	IVDA %	Non-addicts or non-IV DA	Sexual Contact	Promiscuity	Hepatitis	Syphilis	Gonorrhea
HIV posit.	63	88.8	11.2	11.2	31.7	19.0	34	14
HIV negat.	150	19.3	80.7	10.6	11.3	3.0	8	4.6

Among all the women studied, 29.5% presented anti-HIV antibodies. In this group, 88.8% was IVDA and the remaining 11.2% had sexual contact with HIV-positive men. A higher percentage of a previous history of syphilis, gonorrhea and clinical hepatitis as well as promiscuity was also observed in the HIV-infected women.
Conclusion. One third of the studied women which represent almost 90% of the female population consulting for HIV at the Infectious Diseases Hospital, were infected with HIV. Among these 88.8% were IVDA and 11.2% were the sexual partners of infected men. IVDA is remarkably important as a risk factor for HIV infection of women in Buenos Aires City.

W.D.P.57 WORKING WITH HIGH RISK WOMEN IN A NATIONAL AIDS PREVENTION PROGRAM--THE U.S., PUERTO RICO AND MEXICO

Barbara Sowder,* Weissman, G.,** Hunt, D.,*** Brown, V.,**** Arguelles, L.*****. *NOVA Research Company, Bethesda, Maryland, **National Institute on Drug Abuse, Rockville, Maryland, ***Abt Associates, Cambridge, Massachusetts, ****W.A.R.N. Project, Los Angeles, California, *****California State University-Long Beach, California, U.S.A.

Objective. To describe programs and strategies for identifying and working with women who are sexual partners of intravenous drug abusers (IVDAs) and/or are themselves IVDAs, and to present interim findings and results from ongoing AIDS demonstration research programs funded by the National Institute on Drug Abuse, United States of America.
Methods. Presenters will describe methods used in the national effort to: identify/contact high risk women; increase their knowledge/understanding of risk behaviors, their skills in removing barriers to change and in sustaining safe behavior practices; link them with needed community resources; and collect and analyze pre-post intervention data.
Results. Findings will cover the demographic characteristics of over 1,000 women, their risk behaviors prior to intervention, and changes in these behaviors six months later. Results will include women served in programs that also target male IVDAs as well as individual programs that target only women.
Conclusion. Presenters will focus on the most conclusive findings from the ongoing national project and invite questions and discussion from the audience.

W.D.P.58 INFLUENCE OF HIV INFECTION ON PREGNANCY DECISIONS

Sunderland, Ann; Moroso, G., Holman, S., Berthaud, M., Mendez, H., Landesman, S., SUNY-HSC Brooklyn, NY, USA

OBJECTIVE: To describe the impact of HIV serostatus on pregnancy decisions in 2 groups of seropositive (SP) and seronegative (SN) women.
METHOD: At-risk women are offered testing and are enrolled in a 4 year prospective perinatal HIV transmission study. Group I: SP and SN women initially learning their results while abortion (AB) was an option.
Group II: Women who became pregnant again after learning their HIV status.
RESULTS: Group I: from 1/1/86 to 1/27/89, 39/82 SP (46%) and 31/95 SN (33%) had the option of AB. 4/38 SP (11%) and 1/31 SN (3%) chose AB (p>.2). SP and SN groups did not differ significantly in sociodemographic parameters. Group II: As of 1/27/89, 24/90 SN (27%) and 15/80 SP (19%) (p>.2) have gotten pregnant one or more times since their initial pregnancy. 5/15 SP and 3/24 SN have been pregnant twice and 2/5 SP have been pregnant 3 times. PREGNANCY OUTCOMES: 1st Repeat: 1/15 SP chose AB, 12/15 continued and 2/15 miscarried. 15/24 SN continued, 7/24 chose AB, and 2/24 miscarried. Ignoring miscarriages, 8% SP vs 32% SN chose AB (p=.05). 2nd Repeat: All SP chose AB, all SN continued. 3rd Repeat: Both SP continued. SP and SN groups did not differ in sociodemographic parameters. Individuals' rationales for decisions will be described and general issues discussed.
CONCLUSION: HIV infection does not have a clear impact, if any, on reproductive decisions in this population; psychosocial and economic variables may have greater influence.

W.D.P.59 AIDS IN WOMEN: CANADIAN SURVEILLANCE PROGRAM

Elmslie, Kimberly; Nault, P. Federal Centre for AIDS, Health Protection Branch, Ottawa, Ontario, Canada.

Objective: To assess trends in AIDS cases reported among women in Canada.
Methods: National surveillance of AIDS in Canada was initiated in February 1982. Demographic, risk factor, clinical and laboratory data are collected on a standard case report form. The National AIDS Surveillance database was reviewed with specific reference to adult females.
Results: As of January 23, 1989, 118 women (5% of adult cases) were reported to the National AIDS Surveillance Program. Of these, 3% were injection drug users; 28% recipients of blood/blood products; 64% heterosexual contacts and 6% had no identified risk factors. The heterosexual contact classification includes two categories: (1) persons originating in an area with a high prevalence of HIV infection and where heterosexual transmission is the major route of spread; (2) heterosexual partners of person(s) with HIV or at risk for this infection. There has been a significant decrease over time in the proportion of women in category (1) - 58% (11 of 19) of AIDS cases diagnosed before 1985 compared to 26% (26 of 99) diagnosed since 1985 ($p< .01$). The proportion of women in category (2) has remained stable at 32%. Overall women account for a constant proportion of total AIDS cases over time, ranging from 4% - 6% between 1984 and 1988. 1988 data are preliminary since cases diagnosed during this year will be reported through mid-1989. Based on overall projections for AIDS cases in Canada, it is expected that 40 - 60 female AIDS cases will be diagnosed in 1988.
Conclusions: These surveillance data indicate that the incidence of AIDS in women is remaining quite stable over time and, therefore, is keeping pace with the overall growth in the number of AIDS cases.

W.D.P.60 A SURVEY OF AIDS-RELATED KNOWLEDGE, ATTITUDES, BELIEFS AND BEHAVIORS AMONG WOMEN IN NEW YORK CITY

Balanon, Angelita; Fordyce, EJ; Stoneburner, RL; Rautenberg, E; New York City Department of Health, New York, N.Y., U.S.A.

Objectives. To examine levels of AIDS knowledge, risk perceptions and sexual practices among women aged 15–44 in New York City.
Methods. A cross-sectional survey of 1800 female NYC residents was conducted from November, 1988 to January, 1989. Data were collected by door-to-door, in-person interviews throughout the New York City area.
Results. Preliminary data from the first 912 respondents show that 79% considered themselves knowledgeable about AIDS, 38% reported a change in behavior to reduce risk, 41% knew someone with AIDS, and 20% had a family member or other relative with AIDS. Odds ratios between respondents' characteristics and behavior change are shown below.

Characteristic*	Odds Ratio	95% C.I	p
Had HIV antibody test	3.15	2.10–4.71	.001
Not married	2.33	1.75–3.11	.001
Knows person with AIDS	2.26	1.70–3.01	.001
U.S. born	2.15	1.60–2.90	.001
Income $11,000 +	2.01	1.46–2.73	.001

*Age, education and perception of risk were not significantly associated with behavior change in this population.
Conclusion. Our data suggest that future AIDS education and prevention programs should be directed toward low SES women. Special programs for immigrant women may be required.

Consommateurs de drogues par voie intraveineuse (partie 1)
I.V. Drug Users (Part 1)

W.D.P.61

CRACK USE AND RISK FOR AIDS AMONG BLACK ADOLESCENTS

Fullilove Robert E*; Fullilove MT*; Bowser BP**; Gross SA*
* Multicultural Inquiry and Research on AIDS of the University of California San Francisco and the Bayview-Hunter's Point Foundation, San Francisco, CA, U.S.A.
** California State University at Hayward

Objective. To describe the characteristics of black adolescent crack cocaine users and assess their risk for sexually-contracted HIV.
Methods. 204 black adolescent crack users in Oakland and San Francisco, California, were surveyed about their use of crack and other drugs, their sexual partners, their sexually transmitted disease (STD) history, their attitudes toward condoms, their use of condoms, and their use of crack during sexual activity.
Results. 100 respondents (49%) reported using crack in combination with sexual activity. Of those mixing crack with sex, 50% reported a history of one or more STD's, as compared with 29% (significant at p<.01) of those who did not combine sexual activity with crack use. A history of gonorrhea was more prevalent among those combining sex with crack (42%) than among those who did not (13%, significant at p<.001). The prevalence of STD history among those who reported both having sold crack and having combined sexual activity with crack use (92% for females, 48% for males) was much higher than for those who did not (22% for females, 13% for males).
Conclusion. Given the prevalence of a history of STD reported by respondents, particularly among those who have sold crack and among those who combine crack use with sexual activity, the risks for contracting and transmitting HIV in this population appear to be great. Further studies to assess HIV prevalence among crack users and dealers and expanded efforts to develop and test interventions to prevent HIV spread within this population are urgently needed.

W.D.P.63

THE EFFECT OF A NEEDLE AND SYRINGE EXCHANGE ON A METHADONE MAINTENANCE UNIT

Wolk, J.S.*, Wodak, A.**, Guinan, J.J.***
*University of New South Wales, Sydney, Australia, ** St. Vincent's Hospital, Sydney, Australia, ***Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia.

Objective. To determine if the location of a needle and syringe exchange adjacent to the methadone maintenance (MM) unit was associated with an increase in the use of heroin. Methods. A needle and syringe exchange scheme was opened in November 1986 adjacent to an inner city MM unit. Urinalysis results of 128 MM clients who were on the programme continuously 3 months before and 3 months after the introduction of a needle and syringe programme were analysed for morphine. Results. There was no significant increase in the overall proportion of clients who had contaminated urines before (45%) and during exchange operation (z=1.6, p=0.11). A proportion of clients (28%) who had clean urines prior to the establishment of the exchange were found to have contaminated urines after it began. However, a comparable proportion of clients (19%) with dirty urines prior to the exchange opening were found to have contaminated urines prior to the exchange opening were hound to have clean urines after it opened. Conclusion. The increase in availability of sterile needles and syringes adjacent to a drug treatment unit did not appear to adversely affect the proportion of drug free clients in this study. While some clients started using heroin during exchange, others who were using before exchange ceased, indicating that factors other than the exchange were influencing heroin use.

W.D.P.65

A HIV-PREVENTION SYRINGE EXCHANGE PROGRAM IN LUND, SWEDEN. TWO YEARS OF OBSERVATIONS OF THE ATTENDERS

Tunving, Kerstin*; Andersson, B*; Ljungberg, B**; Christensson, B**.
*Dept of Psychiatry and Neurochemistry, **Dept of Infectious Diseases. University of Lund, Sweden.

In november 1986, a syringe exchange program at the Clinic for Infectious Diseases at the General Hospital in Lund, was started. The program gets active support from the local drug treatment facilities. So far no HIV-epidemic has broken out in our region. No negative side-effects have been observed. 800 persons have visited the program. 75 % use centralstimulants, the rest use heroin. Drug abusers involved in heavy usage of drugs, as well as drug abusers with a small limited abuse, attend the program. 76 % of the visitors are males. The program attracts even those with a hidden abuse, since only half of the attenders have been in contact with local drug treatment facilities. There where no significant differences between these two groups except the fact that a greather proportion of those who used amphetamines where without treatment experiences. Since the attenders can decide for themselves if and when to visit drug treatment centers, we do not know the exact relationship between attenders of the program and other kinds of care. In spite of this, we have observed that more drug abusers come to the out-patient clinic and detoxification unit. Few of the clients are below 20. The program does not reach the very young and probably not the most chaotic.

W.D.P.62

RELATIONSHIP BETWEEN HIV RISK BEHAVIOURS, KNOWLEDGE AND SEROSTATUS OF SYDNEY INTRAVENOUS DRUG USERS, 1987.

Wolk, J.*, Wodak, A.**, Morlet, A.*, Gold, J.*.
*Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia, **St. Vincent's Hospital, Darlinghurst, Sydney Australia

Objective. To investigate the HIV risk taking behaviours, knowledge, attitudes and HIV serostatus of Sydney intravenous drug users (IVDU's). Methods. On hundred and eighty-one Sydney intravenous drug users both in and out of drug treatment were recruited. An interviewer administered questionnaire was used to collect information on demographic characteristics, drug-using and sexual behaviour, AIDS knowledge and prison experience. HIV test results were obtained from subjects. Results. The mean age was 27 +/-, the M:F ratio 2:1, and 77% of the males were heterosexual. The majority injected daily (91%) and preferred heroin (87%). Eighty percent admitted to sharing needles; 50% weekly or daily and 91% cleaned their equipment. Condoms were used only by 12% with regular partners but by 18% with casual partners and by 77% of prostitutes with their clients. Thirty percent (54/181) had been in prison since 1981 of whom 50% (27/54) had engaged in risk taking behaviours while in custody. Knowledge was satisfactory and perception of risk of HIV infection for IVDU's was high. However perception of personal risk was low. Twelve out of 131 (9%) subjects had HIV antibodies of whom 7 were homosexual. Conclusion. The 9% HIV seroprevalence found in this study can be expected to increase due to the frequency of HIV risk-taking behaviours. The high proportion of HIv positive homosexual IVDU's suggests the need for targeted campaigns for this subgroup.

W.D.P.64

HIV RISK BEHAVIOURS OF INTRAVENOUS DRUG USERS PRESENTING TO THE ALBION STREET (AIDS) CENTRE, SYDNEY, AUSTRALIA.

Morlet, A.; Guinan, J.J.; Gold Julian, Darke, S.
Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia.

Objective: To investigate needle sharing behaviour and sexual practices of intravenous drug users (IVDU) presenting to the Albion Street (AIDS) Centre.
Methods: Detailed medical history, physical examination, intravenous drug use history and sexual behaviour information were collected and computer coded for all clients presenting for HIV diagnosis. Those reporting IV drug use, between March 1985 and March 1988, were included in this analysis.
Results: 1047 clients presenting during this period reported IV drug use as a risk factor. The mean age was 27 (sd 5.6) years, 747 (71.3%) were male, 292 (27.9%) female and 8 (0.8%) transsexual. 55% of males and 77% of females claimed exclusive heterosexuality. 39% reported current intravenous drug use and 87% of the total reported having shared needles and syringes. 16% had worked as prostitutes and the mean monthly number of sexual partners (prostitutes excluded) was 1.7 (sd1.9). The overall HIV seroprevalence in this sample was 12.4%, with 15.4% of males and 4.3% of females being infected. 42.8% of homosexual men were infected compared to 3.8% of male and female heterosexuals. There was a small but significant quarterly increase in the proportion of HIV seropositive heterosexual IVDUs during this period.
Conclusions: The HIV seropositive prevalence of IVDUs tested was substantially lower than reported amongst European and Nth American samples and is consistent with the low incidence of IVDU AIDS cases reported in Australia (1%, NOV 1988). However, evidence of continued risk behaviour indicate the possibility of rapid spread of HIV within this subgroup.

W.D.P.66

Risk Taking and Risk Reduction Among IV Drug users in 4 US Cities

Wiebel, Wayne; Altman N. Chene, D.; Fritz R.
University of Illinois at Chicago, Chicago, Illinois, USA

Objective: To examine the AIDS risk behaviors and risk-reduction activities of active IV drug users in Baltimore, Chicago, Denver, and El Paso.
Methods: This is a multi-method study using quantitative and qualitative methods. Face to face interviews were conducted with active intravenous drug users not in treatment. Study participants were recruited using street-based indigenous outreach workers who are also involved in prevention and education activities. In addition, ethnographic interviews were conducted to aid the interpretation of results.
Results: A total of 115 active IV drug users were interviewed in Baltimore, 619 in Chicago, 139 in Denver, and 92 in El Paso. Different patterns of needle sharing and needle cleaning emerged in each city. Inter-city comparisons reveal a complex but identifiable set of associations between various social, demographic, and drug-related variables on the one hand and needle sharing and cleaning behaviors on the other.
Conclusion: It is concluded that AIDS/IVDU education programs must understand and take into account (1) racial/ethnic and regional subcultural differences and (2) the local IV drug use practices (in terms of types drugs used and frequency of injection).

W.D.P.67 CESSATION OF ALCOHOL AND DRUG USE DISORDERS IN AN HIV SAMPLE

Remien, Robert H.; Rabkin, J.; Williams, J.; Gorman, J.; Ehrhardt, A.
HIV Center for Clinical and Behavioral Studies, NY State Psychiatric Institute and Columbia University, New York, N.Y., U.S.A.

Objective. To assess longitudinal patterns of cessation of abuse of alcohol and other drugs in an HIV community sample.
Methods. 160 gay and bisexual men were assessed as part of a longitudinal study examining predictors of HIV illness progression. Structured clinical interviews were conducted to evaluate past and current psychiatric disorders, as well as current levels of depression and anxiety. Self-report measures of personality attributes and life outlook were also collected.
Results. A significant number of men in our sample reported successful termination of past alcohol and drug abuse and dependence with maintenance of that change (see table below). Many of the men attribute this behavioral change, at least in part, to their concern about AIDS. They appear no different on current measures of psychological distress when compared to those men who never had an alcohol or drug use disorder.

	Past Dependence/Abuse*		Current Dependence/Abuse*	
Group	Alcohol	Drug	Alcohol	Drug
HIV+ (N=118)	40%	64%	3%	9%
HIV- (N= 42)	24%	48%	7%	5%
Total (N=160)	36%	59%	4%	8%

* percentages reflect co-existence of alcohol and drug diagnoses in some subjects.

Conclusion. In a group of men at risk for AIDS we find successful cessation of maladaptive substance use that is rarely reported in the alcohol and drug literature.

W.D.P.68 DEMOGRAPHIC, BEHAVIORAL, AND CLINICAL FEATURES OF HIV INFECTION IN NEW YORK CITY INTRAVENOUS DRUG USERS (IVDUs)

Brown, Lawrence S.; Chu, A.; Nemoto, T. and Primm, B.J.
Addiction Research and Treatment Corporation, New York, USA

Objective: To determine the demographic, behavioral, and clinical features of HIV infection in 454 IVDUs.
Methods: Subjects were recruited from patients scheduled for physical examination in drug treatment clinics in NYC. A questionnaire was administered and serum was collected for HIV serology, using ELISA and Western blot techniques. Subjects were categorized using the CDC HIV classification system. Data was examined using univariate and multivariate analyses.
Results: The HIV infection rate was 61% with antibody and antigen detected in 58% and 4%, respectively, of the population. Nineteen percent of 307 subjects were in Group III or Group IV of the CDC classification system for HIV-associated infections. Only behavioral factors ($p=.001$) and clinical indicators ($p=.003$) were found to distinguish the HIV infected from the non-infected. Frequent use of IV drugs ($p=.016$), duration of drug use ($p.=050$), daily methadone dose ($p=.018$), and duration of drug treatment enrollment ($p=.038$) were significantly associated with HIV seroinfection status and CDC HIV stage.
Conclusions: These findings strongly support aggressive efforts to reduce parenteral drug use and enroll IVDUs into effective drug treatment.

W.D.P.69 NEEDLE SHARING AMONG IVDU'S WHERE NEEDLES ARE AVAILABLE WITHOUT PRESCRIPTION.

Sibthorpe, Beverly M.*; Fleming, D.*; McAlister R.*, Klockner, R.*; Gould J.**.
*Oregon Health Division, Portland, Oregon, U.S.A.; **Multnomah County Health Division, Portland, Oregon, U.S.A.

Objective. To assess needle sharing among intravenous drug users (IVDU's) in a region where sterile needles are readily available without prescription.
Methods. Current IVDU's in Portland, Oregon, were questioned about AIDS, drug-use history, and needle-sharing practices using a standardized questionnaire that included both structured and open-ended questions. Sources of recruitment included a corrections facility, county health clinics, private welfare organizations and street outreach. Participation was voluntary and confidentiality was assured. Preliminary results are presented below.
Results. Between 12/88 and 2/89, 150 IVDU's were interviewed. Mean age was 28 years; 56% were male. Mean years of IV drug use was 7.5. Heroin was the principal drug injected for 25%, cocaine for 31%, amphetamines for 27% and heroin plus cocaine or amphetamines for 17%. Most (58%) had never been in drug treatment. Needles were purchased from pharmacies or other stores by 79% of users. Over half (54%) stated they currently shared needles while shooting drugs. Of those sharing needles, 15% shared only with their sex partners, 39% also shared with other friends, and 46% shared with total strangers. The main reason given for sharing needles was convenience (50%); less than 5% said they shared because of difficulty obtaining needles. Needles were never cleaned by 27%. Needles were cleaned by 23% using bleach and 50% using water. Over 95% of all these IVDU's, including those who shared needles, knew that sharing could transmit AIDS. Sixty five percent of IVDU's who shared needles assessed their risk of AIDS as moderate or high compared with 18% of those who did not share ($p<.001$ by chi square).
Conclusion. The ready availability of sterile needles, knowledge of AIDS transmission, and perception of personal risk are not sufficient to prevent needle-sharing among many IVDU's. Education regarding safer needle cleaning may be the most effective intervention among IVDU's who continue to shoot up.

W.D.P.70 SEXUAL RISK FOR HIV TRANSMISSION IN A GAY MALE SUBSTANCE-ABUSING POPULATION

Paul, J.;* Stall, Ron;* and Davis, F.** (*University of California San Francisco Center for AIDS Prevention Studies; **18th St. Services) U.S.A.

Objective. Combining alcohol and/or drugs with sex is associated with sexual behavior that is high-risk for HIV transmission. Gay substance abusers were compared to the general gay population to further test the relationship between high-risk sex and alcohol/drug use.
Methods. Substance abusers entering treatment at 18th St. Services in San Francisco were asked to fill out a self-administered questionnaire on sexual activity, substance use, and AIDS knowledge ($n = 108$). The comparison sample of gay/bisexual men were recruited in a random digit dial telephone study in San Francisco (Communications Technologies, 1987, $n = 201$). Sexual risk was calculated with a version of the Chicago Multi-Center AIDS Cohort Study (MACS) group's scale.
Results. 26.8% of the substance abusers were rated "high-risk" (i.e. anal sex without condoms outside of monogamous relationships), compared to 6.9% in the Communications Technologies sample. This was true although the clinical sample was well-informed regarding AIDS prevention, had high levels of educational achievement, and was as likely to be sober as high during sex.
Conclusion. The association between drug/alcohol use and unsafe sex is not a simple one. The proportion of high-risk sex not associated with drug or alcohol abuse in this clinical population suggests that we may be dealing with more than a "disinhibition effect." Programs are needed to intervene with substance abusers, and further research on the psychosocial factors contributing to these levels of unsafe sex is needed.

W.D.P.71 ABSENCE OF ANTIBODY TO HIV IN LONG-TERM, SOCIALLY REHABILITATED METHADONE MAINTENANCE PATIENTS

Novick, David M.*; Joseph, H.**; Croxson, T.S.*; Salsitz, E.A.*; Wang, G.***; Richman, B.L.*, et al.
*Beth Israel Medical Center, New York, NY, USA,** New York State Division of Substance Abuse Services, New York, NY, USA;*** St. Luke's - Roosevelt Hospital Center, New York, NY, USA.

Objective. To determine the prevalence of antibody to HIV in long-term, socially rehabilitated methadone-maintained former heroin addicts in New York City, where 55-60% of active IV heroin addicts are HIV-infected.
Methods. Of the 68 former parenteral heroin addicts in "medical maintenance", 58 (85%) agreed to participate in this study. In medical maintenance, socially rehabilitated methadone maintenance patients are treated in the offices of primary care physicians, who provide methadone treatment and general medical care (JAMA 1988;259:3299). Antibody to HIV (anti-HIV) was determined in all patients by both ELISA (Dupont) and indirect immunofluorescence (Fluorognost). Hepatitis B surface antigen, antibody and core antibody were determined by ELISA (Abbott).
Results. None of the 58 socially rehabilitated methadone maintenance patients had anti-HIV. One or more markers of HBV infection were seen in 53 (91%). The duration of methadone maintenance was 16.9 ± 0.5 yr, and the median daily dose was 60mg. Before methadone treatment, the patients had abused heroin parenterally for 10.3 ± 1.7 yr, and they had engaged in additional high-risk practices for HIV infection.
Conclusion. Effective methadone maintenance treatment can protect parenteral drug abusers from HIV infection.

W.D.P.72 HIV STATUS & RISK BEHAVIOR IN PARTICIPATING AND NON-PARTICIPATING I.V. DRUG PATIENTS IN A HIV TESTING/EDUCATION PROGRAM

Schaefer, Melodie R.*,** Dorus,W.*,**, Pachucki,C.*,**,Lentino J.*,**,Schaeff,D.*.*Hines Hospital, Hines, IL. USA;**Loyola University, Maywood IL. USA.

Objective. To describe differences in rates of HIV infection and risk behaviors between I.V. drug patients who volunteer ($n=224$) and those who decline ($n=95$) to participate in a HIV testing/AIDS education program.
Methods. I.V. drug users seeking drug treatment were screened for willingness to participate.
Results. T-test results revealed significant differences in age (higher in non-participants, $p=.025$), and number of needle-sharing partners (higher in participants, $p=.014$). There were no significant differences related to drug choice, length of drug treatment, number sexually active, number of sexual partners, frequency of sexual activity, or demographic variables. Reasons given for not participating included: not interested in the program (13%); didn't think they were at risk (12%); didn't want to spend the time (12%); wanted testing, not education (10%); previously educated (9%); previously tested (7%). HIV antibody was anonymously tested on non-participants from remaining serum obtained from standard SMA-12 samples. Although differences in the prevalence of HIV seropositive status between groups was not significant (chi-square $p=.2675$), the percentage of HIV positive non-participants (13.5) was almost twice as high as HIV positive participants (7.2).
Conclusions. Although participants reported more needle-sharing partners,non-participants appear to have a higher frequency of HIV infection. Patients who refused to participate may under report high-risk behaviors or engage in other high risk behaviors. Voluntary serotesting and education programs may miss some I.V. drug users at high risk for HIV infection.

W.D.P.73

DO MALE INTRAVENOUS DRUG ABUSERS (IVDA) GIVE CONSISTENT RESPONSES TO BEHAVIORAL QUESTIONS?

P.Akarasevi*,N.Wright*,W.Pokapanichvong**,S.Vanichseni***,K.Choopanya***,*Div.Epid.,Min.Pub.Hlth.,**Prog.Approp.Tech. Hlth.,***Bangkok Metropolitan Administration.Thailand.

Objective. To measure the consistency of the responses of IVDA to selected demographic,health and behavioral questions.
Methods. A subsample of male IVDA paticipating in a case control study were asked to return a month after an interview with a female social worker.Those returning completed a shorter,self-administered questionnaire including 20 identical questions from the first interview.
Results. Seventy-eight(65%) of the subsample returned spontaneously. Consistency ranged from 68%(number of female sex partners in last year) to 99%(homosexual behavior).Consistency for current age(5 year groups) was 90%"works"sharing behavior 88%,and ever-injecting at the seller's house 76%.In most questions judged to be sensitive, respondents answered more positively in the self-administered questionnaire,e.g.,sharing same "load",19 to 27%;injecting at seller's house,53 to 59%;and sex with a prostitute in the last year, 31 to 39%.In contrast,admitting treatment for STD decreased,37 to. 31%.
Conclusion. The effect of current drug addiction on responses to behavioral questions that may predict the risk of HIV infection is unknown.Our results show that consistency of response may vary over time,by question,and by mode of interview.

W.D.P.74

PREDICTING NEEDLE-SHARING BEHAVIOR OF IVDU'S IN TREATMENT

Woods, William J.*; Abramowitz, A.**; Guydish, J.*; Clark, W.**; Hearst, N.*; and Kieler, R.*
*UCSF Center for AIDS Prevention Studies, San Francisco, CA, USA**Community Substance Abuse Services (CSAS), Department of Public Health, San Francisco, CA, USA.

Objective. To identify characteristics of intravenous drug users (IVDUs) in treatment who were at greatest risk for transmitting and acquiring HIV infection, enabling substance abuse efforts to more accurately target interventions to populations at risk.
Methods. The Department of Public Health collects information on all individuals admitted to drug treatment programs contracting with the city of San Francisco. The data is collected on a standard form at intake to treatment. This study asked: which of the 36 variables on the intake form predict needle-sharing behavior among 3028 IVDUs admitted from April 1 - Sept. 30, 1988? Analysis included chi square and log-linear regression.
Results. Significant differences between needle-sharing and non-sharing were found for certain demographic variables, i.e. age, education ($p<.05$), race, sex and employment ($p<.01$). The primary drug used was also significant ($p<.01$), i.e. heroin (then amphetamine) users were more likely to share needles. Preliminary results of the log-linear analysis suggest that cocaine use was significant ($p<.0001$) in predicting needle sharing behavior. Also, though seroconversion continues to rise among blacks in treatment in San Francisco, blacks were less likely than non-blacks to share needles ($p<.0001$).
Conclusion. These data require further analysis but may indicate that special attention to cocaine use among IVDUs will be necessary in prevention efforts in San Francisco. The role of race in particular, as well as other demographic variables, require further investigation. AIDS interventions at some agencies may explian some of the demographic differences found.

W.D.P.75

HUMAN IMMUNODEFICIENCY VIRUS IN DRUG USERS AND INCREASED CONSULTATION IN GENERAL PRACTICE

Skidmore CA, Roberts JJK, Robertson JR
Edinburgh Drug Addiction Study
Muirhouse Medical Group, Edinburgh,UNITED KINGDOM

OBJECTIVE: In areas of intensive drug abuse, in the absence of an operative drug dependency unit, the burden of care falls heavily on the Primary Health Care providers - General Practitioners. Anecdotal evidence suggests HIV infected IVDA were taking up an increasing amount of the GP's time. Attempts to relate increased consultation rates to HIV infection and knowledge are shown.
METHOD: 25 HIV+ and 25 HIV- IVDA were selected randomly from a larger group of 350. Case notes were examined for GP attendances, defaults and out-of-hours calls. Hospital referrals were noted, as were defaults to those same services. Full case notes were analysed for a four year period 01-01-84 to 31-12-85 and 01-01-86 to 31-12-87. The first two years represent an era of pre-AIDS awareness, both for the IVDA and physicians.
RESULTS: The most extensively used facility for both groups in both time blocks was their GP. The infected users attended more often throughout, but not significantly so. Both groups significantly increased the number of visits to their GP from the first two year block to the second (P<.0005). Casualty was the most frequently utilised hospital based service. With the exception of the Infectious Diseases Unit (the regional AIDS Screening Clinic) none of the hospital based services were attended more than once in two years by either group. The seropositive IVDA attended the ID Unit on average 1.4 times in the second two year period, compared to only 0.28 visits by the seronegative IVDAs. All services represented had a significant problem with defaulters, in particular the psychiatrists.
CONCLUSIONS: The large number of consultations increased after awareness of AIDS in a group of IVDA, particularly in those IVDA who became infected with HIV. By far the most utilised service was the GP, the hospital services were poorly attended by all IVDA whether infected or not. The implications for future management of all IVDA and funding of services are discussed.

W.D.P.76

HIV STATUS AND CHANGES IN RISK BEHAVIOUR AMONG ARRESTED AND DETAINED INTRAVENOUS DRUG ABUSERS IN STOCKHOLM 1987-88

Olin, Robert; Käll Kerstin
Department of Social Medicine, Karolinska Institute/Kronan District Health Centre, 172 83 Sundbyberg, Sweden

Objective. To follow the spread of HIV among intravenous drug abusers (IVDA) in Stockholm and their risk behaviour. HIV entered this population in 1983.
Methods. From January 1987 until October 1988 1068 IVDA arrested or detained at the remand prison in Stockholm have been interviewed about HIV risk behaviour and tested for HIV antibodies. The participation is volontary; the drop out rate is 40% in the arrested population and 10% in the detained population.
Results. The overall seropositive rate is 13%, approximately the same for men and women. Among IV amphetamine users (who constitute about 85% of the IVDA in Stockholm) the HIV seropositive rate is 6%, whereas it is 47% among the heroin addicts. More than 40% of the addicts have participated more than once. Three have seroconverted during the investigation period. In the project we have discovered fifteen HIV-positive addicts. Of these nine were not previously tested, whereas six had a previous negative test. The annual incidence rate is about 1%. More than 90% of the addicts entering January-June 1988 were tested before (average 3.8 times) compared to 1987 when 80% were tested (average 2.5 tests.)

There is no measurable change in sexual risk behaviour in terms of number of partners or condom use between 1987 and -88, but there seems to be a tendency among the HIV negative IVDA to have become more careful with their injection equipment in terms of frequency of needle sharing.
Conclusion. The HIV seroprevalence among IVDA in Stockholm 1987-88 has been stable. There seems to be risk reduction in terms of needle sharing but not in sex behaviour.

W.D.P.77

OBSERVANCE ET COMPLIANCE DU TRAITEMENT PAR ZIDOVUDINE (A.Z.T.) CHEZ LES TOXICOMANES I.V. INFECTES PAR LE VIH

Michaël Finaud*, Rambaud P.**,et Casanova P.*
* Service des Maladies infectieuses,Marseille,France.
** Service de Psychiatrie,Marseille,France.

Objectifs : Observer la compliance et les effets du traitement par A.Z.T. chez les toxicomanes intra-veineux infectés par le VIH.
Méthodes : A travers le suivi clinique et biologique d'une cohorte de toxicomanes séropositifs pour le VIH1, appartenant aux groupes III et IV de la classification du CDC; les critères d'inclusion retenus sont cliniques : apparition d'une ou plusieurs infections opportunistes du groupe IV et/ou biologiques: lymphocytes CD4 $\leqslant$400/ml en permanence et/ou antigénémie P24 $\geqslant$ 200pg/ml.Le sevrage des drogues I.V. est exigé avant le début du traitement.
Résultats :42 patients toxicomanes intraveineux ont reçu un traitement par A.Z.T. Sur 56 elligibles pour ce traitement avec un recul variant entre 3 mois et 18 mois; la durée moyenne du suivi est de 10 mois.
L'observance a été complète pour 33 patients,partielle pour 5 patients et mauvaise pour 4 patients. Les causes de non-observance ont été 3/9 une rechute de la toxicomanie, 4/9 malades perdus de vue,2/9 refus par le malade.
Conclusion : L'observance du traitement est possible lorsque la toxicomanie est sevrée et prise en charge parallélement.

W.D.P.78

REDUCING HIV TRANSMISSION BY PROVIDING METHADONE TREATMENT TO INTRAVENOUS DRUG USERS IN JAIL

Magura, S.*; Joseph, Herman**; Rosenblum, A.*; Jeffers J.***; Perez, J.**; Wishart, M.**** ; et al.
*Narcotic and Drug Research, Inc., **N.Y. State Division of Substance Abuse Services, ***N.Y.City Department of Correction; ****Montefiore-Rikers Island Health Services., U.S.A.

Objective: The KEEP program at the central N.Y.C jail facility on Rikers Island provides methadone treatment to incarcerated IVDUs and routes them into community methadone programs after release, to prevent relapse to intravenous drug use and associated AIDS risk behaviors. Intensive Transition Services (ITS) are provided to randomly assigned KEEP participants at their release to increase their rate of entry to community treatment.
Methods: The program is being evaluated with a controlled pre/post-test experimental design. Subjects are assigned to interventions as follows: KEEP methadone only (N=120); KEEP plus ITS (N=120); heroin detoxification-controls (N=150).
Results: 2,000 male and female IVDUs are served annually by KEEP. Preliminary pre-test interviews were conducted with 36 IVDUs not in drug treatment at incarceration. Subjects averaged 11 years of drug injection and used $120 of intravenous heroin daily; 85% reported sharing of unclean injection equipment (needles, syringes, "cookers"); 80% were literally "street addicts" with no stable living quarters or social supports; and the women averaged about 20 lifetime prostitution arrests.
Conclusion: The in-jail KEEP methadone program serves a large, relatively neglected population of criminally-involved street addicts and addicted prostitutes who are at high risk of contracting and transmitting HIV. Successfully routing these groups into community drug abuse treatment will help stem the spread of AIDS.

W.D.P.79 IVDU AND AIDS: MORE RESISTANCE TO CHANGING THEIR SEXUAL THAN THEIR NEEDLE-SHARING PRACTICES.

Sunita Jain, Flynn N, Bailey V, Swaha A, Ding D*, Sloan W*. Univ. of California Davis, * AIDS-IVDU Task Force Sacramento, U.S.A.

OBJECTIVES To study the effect of intensive education /prevention program (EPP) on 1) high-risk behavior of IV drug users and their sexual partners and 2) the spread of HIV-1 in this population.
METHODS: We started an EPP in Sacramento in 7/87 consisting of education regarding spread of HIV, ways to reduce drug- and sex-related risks, and HIV ab test for IVDU and their sexual partners. The program operates at drug treatment programs (DTP), hospital and jail. Test results are given 1 wk later and "safer shooting" and "safer sex" methods are discussed again. IVDU are retested and assessed for behavior modification every 4-6 months.
RESULTS: Of the 671 IVDU tested initially, 7% never share and 93% share paraphernalia(P). Of the 93%, only 40% disinfect P often, usually or always. 68% of IVDU never use condoms for vaginal sex and only 22% often, usually or always use them. The average # of sexual partners 1 and 6 mos prior to testing was 3 and 11. 150 IVDU have returned for retesting and, of these, 10% no longer use drugs, 34% do not share and 52% share P. Of the people who share P 52% disinfect P often, usually or always. 64% still do not use condoms for vaginal sex and only 26% often, usually or always use them. The average # of sexual partners in the last 1 and 6 mos was 2 & 5.6. The rate of sero-conversion among returnees was zero. The prevalence rate for HIV-ab among DTP clients has not increased since the EPP was begun.
CONCLUSIONS We believe IVDU can change drug-related high-risk activities, but in our program they are resistant to changing their sexual habits. This type of EPP should be integrated into all DTPs to slow the spread of HIV among IVDU. Better methods to change sexual habits need to be developed.

W.D.P.81 Experience With An Anonymous Drop-in HIV Testing Program For Intravenous Drug Users (IVDU) and Their Contacts

Comella Brianne*, Feltch F*, Kunches L**, Harris J*, Steger, K, Craven DE*.
*Boston City Hospital, Boston Univ. School of Med.
**MA Center for Disease Control, Boston, MA, U.S.A.

Objectives: To initiate a drop-in HIV education, counseling, and testing program for IVDU-Project TRUST (PT) staffed primarily by recovering IVDU.
Methods: Demographic and risk behavior data was collected by a standardized questionnaire and correlated with HIV serology.
Results: During 1988, PT saw 875 clients: 758 (87%) were tested; 67% were male, 70% were white. Overall, 20% were seropositive. Seropositivity was significantly higher in active vs recovering IVDU (34% vs 20%, p<0.01), and in blacks and Hispanics vs whites (p<0.01). Of note is that 78% of clients returned for their test results. Seropositive clients were offered immediate medical and drug treatment options, and participation in support groups.
Conclusions: PT is a "user friendly", unique, and successful model for education and counseling IVDU about HIV. Although the initial population tested was primarily white, the addition of minority counselors has dramatically increased use by Hispanics. Former IVDU are effective counselors and role models for this risk group.

W.D.P.83 PREVENTION OF AIDS IN IV DRUG USERS AND ITS CONSEQUENCES ON THE EPIDEMIC IN AN INTERACTING HETEROSEXUAL POPULATION

Halloran, Mary E.*; and Struchiner, Claudio J.**
*Harvard School of Public Health, Boston, MA, USA
** Instituto do Medicina, Universidade Estado do Rio de Janeiro, Brazil

Objective: To study the potential effect of IV drug users on the epidemic in the heterosexual population as well as the effects of interventions in IV durg users on the epidemic in IV drug users, heterosexuals and newborns.
Methods: Mathematical Models and Computer Simulations
Results: For a population of 5000 IV druq users interacting with 300,000 heterosexuals corresponding to a medium sized urban center with 20% of the IVDU already infected, the cumulative number of non-IV drug user heterosexual AIDS cases could be increased up to 1200-fold after 10 years by interaction between the two populations. The number of heterosexual cases increases linearly with the degree of interaction. Interventions redusing elements of the transmission coefficient, such as the probability of shooting with a reused needle or infectivity, affected by the supply of needles and use of bleach have less than linear effects on reducing cases in both IV drug users and non-IVDU unless very effective comprehensive programs are undertaken. Withdrawal type programs, such as methadone/detox and needle distribution programs have linear effects even with small progams. The total number of cases can be increased enormously because the heterosexual population is so much larger than the IV drug user population.
Conclusions: The degree of interaction between IV drug users and heterosexual non-IVDU needs to be studied and reduced. Withdrawal programs are more effective than other programs. The cost of waiting to intervene can be high.

W.D.P.80 USE OF A FINGERSTICK PAPER-ABSORBED (PA) BLOOD SAMPLE FOR HIV SEROSURVEYS IN INTRAVENOUS DRUG USERS (IVDU).

Steger Kathy*, Comella B*, Forbes J*, McLoughlin R*, Hoff RA**, Craven DE*.
*Boston City Hospital, Boston Univ. School of Med.
**Ma. Center for Disease Control, Boston, Ma., USA

Objective: To evaluate the utility of PA fingerstick blood samples for serosurveys of IVDU.
Methods: Populations of IVDU: methadone maintence (MM) clients and IVDU using an HIV drop-in testing program (TP). A PA fingerstick sample of blood, demographic and risk factor data were obtained with consent. Samples were tested by ELISA & confirmed by WB (Hoff, NEJM:1988:318:525), & results were correlated to risk behavior data.
Results: Of MM patients, 145/209 (69%) consented: 46% were women, 39% were minorities. Seropositivity was 39% overall and significantly higher in minorities vs whites (49% vs 30%, p=.01). For the 393 TP clients, seropositivity was 17% overall, higher in active vs recovering IVDU (34% vs 14%, p<0.001), and higher in minorities vs whites (36% vs 13%, p=.002).
Conclusions: Seroprevalence rates may vary widely among innercity IVDU. A fingerstick PA blood sample is a convenient method for serosurveys of IVDU, because it is rapid, obviates venipuncture, poses less risk to the provider, and specimens are easy to store and transport.

W.D.P.82 DRUG USE AND SEXUAL BEHAVIOR IN MALE PATIENTS AT AN STD CLINIC: IMPLICATIONS FOR AIDS PREVENTION

Gibson, Paul M.; Kohn, R. and Bolan, G.
Department of Public Health, San Francisco, California, USA.

Objective. To describe drug use and sexual behavior relevant to AIDS prevention among male patients attending an STD clinic.
Methods. In March 1988 a consecutive sample of male patients at the SF STD clinic completed a self administered questionnaire. Demographic characteristics, types of drugs used, frequency of use, use with sex, knowledge of risk and sexual behavior change were compared.
Results. Patient response included 292 heterosexual (115 white/177 minority) and 163 gay/bisexual (109 white/54 minority) males. Drug use prevalence included: alcohol 87%, marijuana 55%, cocaine 26%, crack 12% and methamphetamine 12%. 75% reported using drugs with sex. Heterosexual males reported more regular use than gay/bisexual males of alcohol (73% vs 63%, p=.04), cocaine (15% vs 3%, p=.0004) and crack (10% vs 1%, p=.007). Among heterosexuals, whites more than minorities used alcohol regularly (79% vs 65%, p=.04) and used drugs with sex (81% vs 65%, p=.02). Minority heterosexuals regularly used crack more (15% vs 3%, p=.007). Gay/bisexual males were significantly more likely to know that drug use increased unsafe sex than heterosexuals and report reduced drug use with sex in response to AIDS (36% vs 16%, p=.00001). Minority heterosexuals reported reduced drug use with sex more than whites (22% vs 8%, p=.01).
Conclusions. There is substantial drug use among male patients at an STD clinic. STD clinics need to develop information and services for patients regarding drug use and sexual behavior relevant to preventing AIDS.

W.D.P.84 ROLE OF HIV INFECTION IN ALTERATION OF PULMONARY FUNCTION IN INTRAVENOUS HEROIN ADDICTS (IHA).

Foresti Valeriano, Villa A, Guarnaschi G, Parisio E, Scolari N, Pediconi AM.
Fatebenefratelli Hospital, Milan, Italy.

Objective. IHA and patients (pts) with AIDS frequently develop interstitial lung disease. In IHA HIV infection could represent a cause of further pulmonary damage. We studied a group of IHA, to evaluate the role of HIV infection in alteration of respiratory function (RF). Methods. RF tests, blood gas analysis and CD4 lymphocytes counts were performed in 33 IHA, with no pulmonary symptoms and normal chest x-rays, 23 male and 10 female, 12 HIV- and 21 HIV+, 6 belonging to group II of CDC classification system, 11 to group III and 4 to group IV. Results. Only DLCO expressed as percent of the predicted (74.6±14.1 % vs 86.9±6.6 %, p<0.01) and CD4 lymphocytes (785±428/mm³ vs 1236±464/mm³, p<0.01) were significantly lower in HIV+ pts than HIV- pts. DLCO was <80% in 15/19 (79%) HIV+ pts and in 1/11 (9%) HIV- pts. The 4 HIV+ pts with normal DLCO (>80%) were in group III and IV of the CDC classification.
Conclusions. These data show that HIV+ IHA had significant reduction in DLCO in comparison to HIV- IHA. The absence of clinical symptoms and/or radiological abnormalities of pulmonary disease suggests a subclinical pulmonary infection or alveolitis caused by HIV. Since DLCO abnormalities, that we mostly find in HIV+ IHA, are present in the asymptomatic stages of the infection and are not related to CD4 lymphocytes reduction, we suggest that interstitial lung involvement can be due to a direct action of the virus rather than to a subclinical opportunistic infection.

W.D.P.85 SEXUAL BEHAVIORS OF INTRAVENOUS DRUG USERS

Whittaker, S; Calsyn, D; Saxon, Andrew; Freeman Jr, G. Veterans Administration Medical Center and University of Washington, Seattle, Washington, USA

Objective: Ascertain the sexual behavior patterns of intravenous drug users and correlate these with drug use and needle sharing patterns. Methods: In 1988, 273 intravenous drug users in treatment provided extensive interviews regarding drug use, needle sharing practices and sexual behavior. The demographics of the sample were: male 186(68.1%), female 87(31.9%); (age X=38.4); White 188(69.9%), Black 65(23.8%), other 13 (4.8%).
Results: Numbers of heterosexual partners in past 12 months

	None	1	2-4	5-10	>10	Median
males	27(14.5%)	72(38.7)	55(29.6)	26(14)	6(3.1)	1.0
female	23(26.4%)	34(39.1)	24(27.6)	4(4.6)	2(2.2)	1.0

Condom use for vaginal intercourse was low for both males (8.7%) and females (13.6%). Males reporting sharing needles in the past year had more sexual partners (mdn=2.0) than those not sharing (mdn=1.0,U=2928.5,p<.02) Males (mdn=2.0) and females (mdn=2.0) reporting recent IV cocaine use had more sexual partnrs in past year than those reporting other recent IV drug use (males, mdn=1.0,U=363p<.05; females mdn=1.0,U=192 p<.02). Conclusion: The high risk behaviors of needle sharing and sexual promiscuity are related for males in this sample. IV cocaine use appears to be further related to sexual promiscuity for both males and females.

Additional

W.D.P.87 THE USE OF CONDOMS BY PROSTITUTES IN YAOUNDE-CAMEROON

Marcel Monny-Lobe*,D.Nichols**,L.Zekeng***,R.Salla*,L.Kaptue*
*Central Hospital Yaounde,Cameroon,**Family Health International,NC,USA,***University Teaching Hospital Yaounde.

Objectives.To determine barriers and to explore ways of overcoming cultural, moral,social and economical resistances to the use of condoms in Africa.
Methods.An AIDS education campain was conducted among 125 prostitutes in Yaounde and free condoms were supplied since January 1988.The prostitutes had to require all the clients to use condoms as effective protection against STDs and AIDS.An evaluation was done in July(79/125 of the girls)and in December.
Results.Use of condoms:

	January 1988	July 1988	December 1988
No answer	48% (60/125)	1,3%(1/79)	2,2%(2/87)
Never or rarely	24% (30/125)	3,8%(3/79)	25,3%(22/87)
Half the time	21,6%(27/125)	29,1%(23/79)	19,5%(17/87)
More than ½the time	6,4%(8/125)	62% (49/79)	47,1%(41/87)
Always		3,8%(3/79)	5,7%(5/87)

Reasons given by prostitutes for not using condoms were:pelvic irritation; they did not like it;no pleasure;the client did not accept;non availability of condoms;the cost ofcondoms.

Clients who refused the use of condoms had these arguments:they said AIDS does not exist;they were not afraid of STDs or AIDS;they said they were healthy;they thought the prostitutes had STD or AIDS;no pleasure;because of the size and frequent condoms breaks;they wanted to pay less.
Conclusion.The use of condoms has increased but Cameroon still needs an educational campain which has to dissuade men from engaging in unprotected sex with prostitutes.Condoms should be more available.

W.D.P.89 Barriers to continued condom use.

Mary-Louise McLaws, B Oldenburg, DA Cooper.
NHMRC Special Unit in AIDS Epidemiology and Clinical Research, Sydney, Australia.

Reasons for use of condoms by homosexually active men were examined. Homosexual and bisexual men were recruited around Sydney from social venues and from advertisements of a telephone interview service. Open ended discussions about all aspects of condom use were recorded on tape. 195 interviews were conducted and subjected to content analysis using five categories: normative behaviour, behavioural beliefs, decision making, effort and self efficacy. Results for the five categories were stratified into faulty or sound responses and age did not markedly influence the overall results. However, the qualitative aspects of the faulty responses varied by age. Half the men in all age groups were judged to have weak normative behaviour while the majority expressed strong behavioural beliefs. Even though over a quarter of men had faulty decision making processes about when not to use a condom, the majority of men had high expectations about their continued condom use in the future. It was found that categories can not be examined independently of one another. The effort involved in using condoms was an important factor for almost half the participants, and dislike for condoms was two times more frequent for men 35 to 40 years of age, compared to both younger and older men. Contextual factors, such as drugs and alcohol use and romantic ideals, are important mediating factors in determining the impact of beliefs and attitudes on the decision making processes of condom use. Individual groups at-risk of HIV infection need to have their specific attitudinal and lifestyle barriers to condoms addressed in targetted educational and behaviour change programmes.

W.D.P.86 PREVENTION AND COUNSELING ACTIVITIES OF DRUG ABUSE CENTERS FOR HIV-INFECTED AND NON-INFECTED DRUG ADDICTS

Fahrner, Eva-Maria; Schumann, J.; Niemeck, U. Institut für Therapieforschung, München, West Germany

Purpose. The Federal Republic of Germany currently has 500 substance abuse centers. Due to the high incidence of AIDS among i.v. drug users their programing now includes prevention and psychosocial counseling in the field of AIDS for this population. To evaluate and improve AIDS services, a demonstration project was implemented at 18 facilities.
Method. Data was collected on an ongoing basis by structured interviews and questionnaires. Preventive activities, treatment plans, client characteristics and daily management issues were the areas of evaluation.
Results. The range of provided activities is broad and includes education, streetwork, group therapy and services to the terminally ill. The average number of HIV positive clients utilizing services was 40 (range 3-200). Less than projected numbers of HIV positive clients have resulted in an increased focus on the areas of AIDS prevention and psychosocial supportive counseling.
Conclusions. An analysis of the data reveals that overall the counseling centers coped well with the AIDS treatment tasks, but, however, more improvement in special areas is indicated.

W.D.P.88 FREE CONDOMS FOR 15-25 YEAR OLDS - A Pilot Project in Stockholm County, Sweden

Urwitz, V. and Mobrant L.
Yourth Project, Stockholm Aids Prevention Programme, Stockholm, Sweden

Objectives:
- to make condoms easily accessible to young people in a way they can accept.
- introduce the condom to young people.
- offer support, advice and possibilities to discuss sex and relationships with trusted adults.

Method: Every week 40 places varying from highschools to discos and footballclubs were asked to participate. They distributed the condoms each in their own way - suitable to their activities and target groups.

Evalution: Every week all participants filled in a preconstructed survey. After the project extensive interviews were made with participants and teenagers in 10 places.

Results: The evalution showed young people understood the purpose of the project and liked it. They felt more comfortable getting condoms from people they knew than in drugstores and shops. Boys and girls turned to different places for condoms and advice. Participants with special training gave more opportunities for talks. The project was succesfull and a fullscale program is now starting.

W.D.P.90 LES FEMMES AFRICAINES DEVANT LE SIDA AU ZAIRE

Walu Engundu, Payanzo Ntsomo, Rukarangira wa Nkera et Brooke G. Schoepf, Projet CONNAISSIDA, Kinshasa, Zaire

La transmission du SIDA en Afrique étant surtout à prédominance hétérosexuelle, les femmes en âge de procréer et leurs enfants sont particulièrement à risque. Quoiqu'urgente, l'action préventive est entravée par des contraintes d'ordre économique, social, culturel et psychologique.

Cette communication présente les contraintes existentielles parmi des femmes de divers milieux sociaux telles qu'elles ressortent des recherches-actions menées à Kinshasa en 1987-88. On verra comment les comportements individuels sont médiatisés par des institutions sociales. Ainsi, pour être efficaces les programmes de prévention nécessitent une approche totalisante qui permet d'augmenter les ressources dont disposent les femmes dans leurs familles et sociétés.

W.D.P.91 SURVEILLANCE-EDUCATION SANITAIRE DES PROSTITUEES AU SENEGAL

Siby, Tidiane*, Thior, I.*, Sankalé, J.*, Gueye, A.*, Ndoye, I.**, M'boup, S.*, et Coll.
*Bactério-Virologie/Université de Dakar, Sénégal; **Clinique MST/IHS Dakar, Sénégal.

Objectif. Sensibiliser une population à risque pour rompre la chaine de transmission du HIV et des autres MST.
Methodes. Au Sénégal, 15% des prostituées sont porteuses d'Ac anti-HIV contre 0,6% dans la population de contrôle. Au cours des visites sanitaires périodiques instituées grâce à la réglementation de la prostitution. 1700 prostituées ont bénéficié de séances d'éducation et d' information où les modes de contamination, les manifestations cliniques, et les moyens de prévention des MST et du SIDA sont débattus.
Resultats. Nous notons qu'un climat de prise de conscience commence à se répandre parmi ces prostituées (souvent en possession de préservatifs, prélèvements vaginaux pathologiques en régression). Mais, le refus des clients d'user de préservatifs, les raisons d'ordre économique qui les poussent à enfreindre les mesures de prévention, le nombre élevé de prostituées clandestines sont autant de facteurs qui rendent cet apprentissage difficile.
Conclusion. Une information permanente et soutenue, une stratégie permettant de cibler les clandestines, des préservatifs de qualité, peu onéreux et facilement accéssibles contribueront à diminuer considérablement la dissémination du HIV et des autres MST au SENEGAL..

W.D.P.92 SELF-REPORTED SEXUAL BEHAVIOR IN A COHORT OF HOMOSEXUAL MEN: CROSS-SECTIONAL ANALYSIS AT 6 YEARS

Willoughby, Brian*; Schechter MT*; Douglas B*; Craib KJP*; Constance P*; McLeod WA*; Maynard M*; Broughton S*; Fay S*; O'Shaughnessy M**; et al.
*The Vancouver Lymphadenopathy-AIDS Study, St. Paul's Hospital and the University of British Columbia, Vancouver, BC, Canada. ** Federal Centre for AIDS, Ottawa, Ontario, Canada

Objective. To describe sexual behavior in the Vancouver Lympedenopathy-AIDS cohort in 1988.
Methods. Eligible subjects completed their most recent visit during the period 10/87-09/88. Questionnaire responses about numbers of partners, frequency of anal receptive intercourse (ARI) and frequency of condom use by the partner during ARI in the prior 12 months were compared. Distinctions were made concerning regular (≥1 contact/month) and casual partners. Seronegatives (SN) were compared to seropositives (SP).
Results. A total of 383 subjects were eligible (197 SN/186 SP). SN and SP had similar annual numbers of all sex partners (median 3.0 vs 4.0; p=.382), regular partners (median 1.0 vs 1.0; p=.960) and casual partners (median 2.0 vs 3.0; p=.391). More SN than SP subjects reported never engaging in ARI with regular partners (55.3% vs 31.9% respectively), and never engaging in ARI with casual partners (80.2% vs 41.0%). More SN than SP subjects reported never using condoms during ARI with regular partners (45.4% vs 18.2%) but frequency of condom use by casual partners during ARI was similar. Among those reporting ARI with casual partners, only 72.0% of SN and 70.8% of SP reported always using condoms during this very high risk activity. Those who did not always use condoms during ARI with casual partners cited the following reasons: no perceived risk; casual attitude; drug/alcohol impairment; personal preference; and/or both partners seroconcordant.
Conclusion. Despite marked overall behaviour changes, some subjects in our cohort in 1988 continue high risk activities. Numbers of partners have fallen and are now similar in HIV+ and HIV- men but behaviour patterns differ. Analysis of behaviours should take into account the type of partner as behaviours vary with regular and casual partners.

Les femmes (partie 2)
Women (Part 2)

Th.D.P.1 HIV ANTIBODY AND HIGH RISK BEHAVIORS AMONG NON-INTRAVENOUS DRUG USING WOMEN OBTAINING ABORTIONS IN THE SOUTH BRONX, NEW YORK CITY.

Schoenbaum EE*, Steen LS*, Webber Mayris*, Drucker E*, Gayle H.**,
*Montefiore Medical Center, Bronx, New York and **CDC, Atlanta, GA, USA.

Objective: To determine the prevalence of HIV antibody (Ab) and high risk behaviors in low income pregnant adolescents and young women obtaining first trimester abortions in an out-patient facility in the South Bronx, New York City.
Methods: During 4-7/88, 516 patients having a 1st trimester elective abortion were interviewed about demography, drug use and sexual, medical and venereal disease history. Discard blood and urine were coded and linked to interview data and anonymously tested for serum HIV Ab, syphilis serology and urine toxicology.
Results: HIV Ab was detected in 9/504(1.8%) sera; none in 127 subjects aged 15-19, 4/163(2.5%) aged 20-24, 3/116(2.6%) aged 25-29, 2/57(3.5%) aged 30-34, and 0/41 aged 35-44 (p=.06). Two of 222(0.9%) blacks, 6/260 (2.3%) Hispanics and 0/6 whites had HIV Ab. Of 431 interviewed, none reported IV drug use. Urines were negative in 133/142 (93.7%) and positive in 9/142 (6.3%); 7/9 corroborated by self-report of drug use (non-IV). Non-IV cocaine &/or heroin use was reported in 37.5% of subjects &/or their male sex partners of prior 2 years (20.8% in <20yrs to 50.6% in 30-34yrs). In age stratified analyses, drug use (non-IV) by subject and/or sex partner was associated with ≥3 sex partners (OR=6.0 p<.01), sex daily (OR=2.5 p<.05), a gonorrhea history (OR=3.2 p<.01), ≥3 pregnancies (OR=2.6 p<.01) and ≥2 abortions (OR=1.7 p<.05). Barrier contraceptives were never used by 32.2%(125/388), unrelated to drug use.
Conclusion: Women obtaining abortions in the South Bronx are at risk for HIV infection from unsafe sex. Drug use (non-IV) is common and associated with sexual behaviors predisposing to HIV infection. AIDS prevention programs must address the inter-relation of drug use via non-IV routes and high risk heterosexual activity.

Th.D.P.2 HIV INFECTION IN WOMEN: EFFECT OF COUNSELLING ON RISK-ASSOCIATED BEHAVIOR.

Danforth, S., Charles C.J. Carpenter. Brown University Medical Center, Providence, RI USA.

Objectives. To determine effects of counselling on certain risk behaviors in North American women infected with HIV. Methods. 31 HIV-seropositive women were carefully evaluated and followed closely in a multidisciplinary ambulatory care program for a mean of 22 months. Intensive counselling in regard to preventing transmission was provided to all. The impact of counselling on intravenous drug use and sexual activity was monitored. Results. Of 31 HIV seropositive women (mean age 31 years), 26 had been infected by intravenous drug use (IVDU). Of the 26 IVDU, 17 achieved drug abstinence after documentation of HIV infection. Abstinence was achieved by 7 of 12 women who had served prison terms for drug-related offenses. Each of the 17 drug abstinent women always (11) or almost always (6) practiced safe sex. Of the 14 IVDU who had supported drug use by prostitution, only 6 achieved drug abstinence; the remaining 8 continued both IVDU and 'unsafe' activity in the sex industry. Conclusions. With concerted peer and professional counselling, abstinence from IVDU can be achieved in a large proportion of women with HIV infection. Drug abstinence was more difficult to achieve in women who had been financially dependent upon prostitution. Support systems directed specifically toward and developed with the collaboration of participants in the sex industry may be critical in limiting transmission of HIV.

Th.D.P.3 GLASGOW STREET PROSTITUTES: A STUDY OF SEXUAL BEHAVIOUR AND INJECTED DRUG USAGE.

Stephen T. Green, DJ Goldberg, A Thomson, DH Kennedy & JA Emslie; Infectious Diseases Unit & CD(S)U, Ruchill Hospital, Glasgow, U.K

Objective: To study aspects of sexual behaviour and drug injecting among female street prostitutes in Glasgow.
Methods: Over a 4 month period in late 1988, a group of unselected female prostitutes attending a drop-in centre and/or a HIV Counselling Clinic were interviewed about aspects of sexual behaviour and drug abuse.
Results: Of 63 women interviewed, 40 (64%) were aged 25 years or under. 53/63 (84%) had recently injected drugs; 17 (32%) of these 53 were known HIV-positives. Almost all were well-informed about HIV and AIDS. Only 9/58 (16%) performed vaginal intercourse (VI) with more than 50% of their clients; 58/59 (98%) claimed they always used condoms for VI with clients, although 59/62 (95%) reported that clients had asked them for VI without a condom. Of 47 who had a regular sexual partner, only 8 (17%) used condoms for VI with these regular partners. 35/63 (56%) used contraception other than condoms; 18/63 (31%) were on long-acting IM medroxyprogesterone acetate ("Depo Provera").
Conclusion: These findings indicate that much client-prostitute interaction does not involve high-risk activity. Furthermore, most prostitutes have adopted risk reduction measures with their clients; this does not extend however to their regular partners. Despite public education initiatives, many clients are still requesting unprotected sexual intercourse.

Th.D.P.4 SEXUAL PARTNER NOTIFICATION: ATTITUDES AND ACTIONS OF HIV-INFECTED WOMEN.

Chervenak, Judi L.; Weiss, Stanley H.; UMDNJ, Newark,NJ USA

Objectives: To survey HIV+ women concerning attitudes toward sexual partner (SP) notification (N) and feelings concerning future pregnancy.
Methods: 25 HIV+ women were interviewed at Infectious Disease & Pediatric AIDS clinics during July and August 1988 in northern New Jersey (NJ).
Results:

Questions (summarized)	Affirmative Responses (%)
1. Should the Health Dept (HD) be involved in confidentially assisting in the N of SP of HIV+ women?	16/25 (64%)
2. Would you be willing to confidentially provide the names of your SPs to the NJ HD?	17/25 (68%)
3. Would you agree to HD disclosure of your name to SPs?	5/25 (20%)
4. Have you informed all male SP you had previous to your HIV+ diagnosis (dx) that you are now infected with HIV?	6/25 (24%)
5. Have you informed all male SP you had since your HIV+ dx?	12/23 (52%)
6. Do you wish to become pregnant?	1/25 (4%)

Women interested in HD involvement in N tended to be willing to disclose SP names to the HD, and those uninterested tended to be unwilling. 38% of the 16 women who had not notified all SP did not desire HD involvement.
Conclusions: SP of HIV+ women are frequently uninformed of possible risks from prior sexual encounters. SP information required for centralized N programs may not be volunteered or readily available. Compliance must be evaluated in constructing SP N programs. Many HIV+ women in NJ are becoming pregnant despite the reported lack of desire. Innovative approaches to assist women in disclosure and family planning are needed.

Th.D.P.5 PERCEPTION OF AIDS RISK AMONG WOMEN SEXUAL PARTNERS OF IV DRUG USERS IN SAN FRANCISCO

Wermuth, Laurie, and Ham, J.
University of California, Center for AIDS Prevention Studies, San Francisco, USA

Objective. To explore the factors that shape women's perception of HIV risk and to examine the role that perceived risk plays in introducing preventive behavior change in a sample of women sexual partners of male IV drug users in San Francisco, California. Data presented are from interviews conducted at entry to an AIDS prevention counseling trial.
Methods. Sixty-two women sexual partners of IVDUs recruited from a variety of outreach efforts were interviewed concerning their sexual practices, beliefs about their HIV risk, and their partners' HIV serostatus and needle practices. Average age of subjects was 33 years. Fifty-five percent were white, 33% black, and 10% Hispanic. Sixty-nine percent had at least a high school education. One subject was known to be infected with HIV, 28 (45%) had received negative antibody test results, and 33 (53%) had unknown serostatus.
Results. Although the majority of subjects considered themselves to be at risk or possibly at risk (61%), only 20% (13) reported always using condoms. Women whose partners shared or possibly shared needles in the year prior to interview were more likely to perceive themselves at risk (69%) than women whose partners did not report sharing. A second factor that appeared to influence women's beliefs about risk was their partners' antibody status. Women with partners who had a negative antibody test result were less likely to consider themselves at risk than women whose partners had not been tested or had received seropositive results. While the perception of risk did not differentiate between women who had adopted preventive measures and those who had not, concrete knowledge of an infected sexual partner resulted in consistent condom use or abstinence. Six of the 13 women who reported always using condoms had known seropositive partners.
Conclusion. Assurances from their male IVDU partners concerning safe needle practices and negative antibody results served to allay fear of infection in this sample of women. Given the high rates of recidivism among IVDUs and the uncertainty of partners' reports, this group may be downplaying their risk for HIV infection. Effective health education of this high risk population must address the resistance to adopting safer sex practices among women with partners of unknown serostatus .

Th.D.P.6 AN ETHNOGRAPHIC STUDY OF HIGH RISK SEXUAL BEHAVIOR IN 96 WOMEN USING IV HEROIN, COCAINE AND CRACK IN THE SOUTH BRONX

Worth D, Drucker Ernest, Eric K, Chabon B, Pivnick A, Cochrane,K.
Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, N.Y. USA.

Objective. To identify determinants of high risk sexual behavior and the obstacles to risk reduction in IV drug and crack using women in the South Bronx.
Methods. In late 1987 we initiated an ethnographic study in the Women's Center - a drop-in education and support group meeting weekly in a Methadone clinic. Women served as "community informants" to describe prevalent sexual and drug use practices in the local drug sub-culture. Information was gathered through individual ethnographic interviews, process ethnography of group interactions, focus groups, and structured attitudinal questionnaires. Participants (n=96) were 55% Hisp, 40% Blk, 5% Wht; Mean Age 33 with 2.2 children.
Findings. All women were 2nd or 3rd generation substance abusers - 75% using crack/cocaine 30-40% still injecting. Drug related violence and illegal activities often characterize relationships with sex partners. Sexual relationships were determined by current drug use patterns (especially cocaine use) which amplifies risk of HIV exposure due to frequency of sexual contact with multiple partners, usually without the use of condoms.
Conclusions. The high rates of continued polydrug use by inner city minority women, driven by crack/cocaine addiction, is the major obstacle to successful AIDS risk reduction efforts in this most vulnerable group of women. Access to effective drug treatment services is essential to restrict the further spread of AIDS by unsafe and unprotected heterosexual behavior.

Th.D.P.7 THE WOMEN'S CENTER: A MODEL PEER SUPPORT PROGRAM FOR HIGH RISK IV DRUG AND CRACK USING WOMEN IN THE BRONX.

Eric, K.; Drucker, Ernest; Worth, D.; Chabon, B.; Pivnick, A.; Cochrane, K. Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, New York, USA.

Objective. To provide women with a safe and confidential group setting in which to share feelings, thoughts, and information about sexual behavior, drugs and AIDS, and to support behavior change and risk reduction activities.
Method. Groups meet weekly in a Methadone clinic or in a Community Health Center. Focus groups, educational lectures, video and support groups are used to facilitate discussion. Peer leadership is encouraged and participants do outreach work in the community to enroll other women.
Results. The groups have been functioning for one year in which there have been 625 visits from over 100 women. Each weekly group session is attended by an average of 20 women. A close relationship of drug use (especially crack) to high risk sexual behavior is apparent and has led to a "drug free" ethos in the groups. The group process has contributed to the development of peer counsellors, group leaders, and outreach workers from among participating women. In one group with 25 regular participants, 13 (>50%) women have entered hospital to detoxify from crack use, four have enrolled in a local community college.
Conclusion. Group intervention resulting in risk reduction is possible among high risk drug using women through peer support models focusing on reducing drug use.

Th.D.P.8 THE EXTENT AND IMPACT OF HIV-RELATED DISCRIMINATION IN NEW YORK CITY-A SURVEY OF PWAS AND SERVICE PROVIDERS.

Karp, Mitchell, New York City Commission on Human Rights, AIDS Discrimination Division, New York, N.Y. USA.

Objective. To document the full extent of HIV-related discrimination in New York City.
Methods. A diverse sample of 60 PWA's and 60 AIDS service providers interviewed in standardized format concerning discrimination.
Results. Survey revealed that the scope of actual discrimination experienced by people affected by AIDS extends far beyond the areas anti-discrimination laws are designed to remedy.
Conclusion. Local, state and federal anti-discrimination laws must be amended if they are to provide meaningful protections to those who suffer HIV-related discrimination. Further, the social impact of HIV-related discrimination--cost of and access to public health, social services, education and prevention--is far greater than is generally recognized and must be incorporated into all programs and policy planning.

Th.D.P.9 DIFFERENCES BETWEEN SYMPTOMATIC HIV+ FEMALE & MALE PATIENTS

Kelly, Patricia, Graham,V.;Hall,L.;Kitchens,A.;Bastien,A; and DeHovitz,J.; Kings County Hospital Center, Brooklyn,NY,USA

Objective: To compare clinic presentation of female & male patients.
Methods: All 86 female patients seen in the year 1988 (N=86) at the HIV Clinic of a NYC municipal hospital were compared to male controls selected for similiar initial visit dates.
Results: Ethnic origins of female patients (Black-48, Haitian-16, Hispanic-15, Other-4) were similiar to those of males (45,14,21,3). IVDU was the largest risk factor for both females & males (43,54), but heterosexual transmission was a larger second risk factor for women (33) than men (4) in this clinic. Both sexes were similiar in age ($\bar{x}$=34.0 for women, range 19.5-45.9; $\bar{x}$=36.7 for men, range 19.6-55.8), in the average amount of time spent in the clinic system (8 and 8.8 months), in receiving AZT (42/45) and in numbers known dead (13 each). Significantly fewer women had a CDC-defined diagnosis of AIDS than men (39 v.64)(p=.01). In those patients with AIDS, similiar percentages had PCP as their initial opportunistic infection (56%/64%).
Conclusion: Significantly fewer women than men in this clinic have a CDC-defined AIDS diagnosis, suggesting that women may seek medical care earlier in the HIV disease process. However, this early intervention on their part results in an inability to receive CDC-AIDS defining economic and social benefits. Alternatively, the natural history of HIV infection may be different in women, with fewer severely immunosuppressed HIV infected women fulfilling CDC-AIDS criteria than men.

Th.D.P.10 SELECTED GYNECOLOGIC ISSUES IN WOMEN WITH HIV INFECTION

Anderson, Jean; Horn, J.; King, R.; Keller, J.; Herbert, B.; Barbacci, M. et al. The Johns Hopkins University School of Medicine, Baltimore, Maryland, USA. Supported by the Freeman Foundation.

Objective. Describe gynecologic (GYN) variables in women attending an inner-city HIV clinic.
Methods. Retrospective review of available GYN information obtained from 83 HIV seropositive women seen between 1984 and 1989.
Results. The mean age was 31.9 years (range 20-58). The racial distribution was: Black-80%;Caucasian-15%;Other-5%. HIV infection risk factors included: IV drug use (IVDU) alone-29%;heterosexual contact with a high-risk partner only-24%;blood transfusion-7%;unknown or denied-7%;IVDU and heterosexual contact with a high-risk partner-23%. Of 67 patients, 81% had ever been pregnant and 57% of these had >2 living children. Furthermore, 71%(39/55) continued to be sexually active;of these 9.7%(3/31) used no form of contraception and only 39%(12/31) used condoms. After knowing of their serostatus, 18%(10/55) became pregnant and 8/10 delivered term infants. History of GYN problems was elicited in 34%(25/74). Of 50 women reporting a history of sexually transmitted disease 56% had had gonorrhea;18% syphilis;20% genital herpes;and 14% genital warts. Active GYN problems at first visit were uncovered in 34%. During the time of review, 37%(31/83) women had abnormal GYN exams including 6 pelvic masses and 10 cases of genital herpes;19%(4/21) Pap smears were abnormal.
Conclusion. Heterosexual activity is a frequent mode of HIV transmission in this population. Unsafe sexual practices and inadequate contraception are prevalent and likely to perpetuate spread of infection. The GYN history and exam were often overlooked, but GYN problems accounted for substantial past and current morbidity in this predominantly inner-city population.

Th.D.P.11 COLLEGE WOMEN'S SEXUAL BEHAVIORAL INTENT AND PERCEPTION OF RISK OF HIV INFECTION FOR SELF AND PEERS

Richter, Donna L.; Sy, F.; Theocharis, T.; Summers, D.; and Hussey, J. University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective: To determine women college students' perceived risk of various sexual behaviors and their intent to engage in such behaviors with males in long-term and recently-initiated relationships.
Method: 334 randomly-selected female undergraduate students responded to a questionnaire in October 1988 at a major southeastern U.S. university. The questionnaire presented two hypothetical situations, one involving a long-term relationship with a male student and the other involving a recently-initiated relationship. Respondents identified for each situation the sexual behavior in which they and their peers would engage, and rated the level of risk of each behavior. Data were analyzed using paired T-tests.
Results: Preliminary analyses indicate the following significant differences: self and peer perception of risk in the newly-initiated relationships; self perception of risk in both hypothetical situations; self and peer behavioral intent in both hypothetical situations.
Conclusion: It appears that women college students perceived greater risk to themselves than to their peers in both hypothetical situations, even though they predicted lower sexual behavioral intent scores for themselves than for their peers.

Th.D.P.12 FEMALE SEX PARTNERS OF IV DRUG USERS: A STUDY OF SOCIO-PSYCHOLOGICAL CHARACTERISTICS AND NEEDS

Arguelles, L.[**], Rivero, A.M.[*], Reback, C.J.[*], and Corby, N.H.[***]
[*] AIDS Research and Education Project, California State University, Long Beach, CA, USA
[**] School of Social Welfare, University of California, Los Angeles, CA, USA
[***] Department of Public Health, Long Beach, CA, USA

Objective. To identify and examine the socio-psychological characteristics, needs, and service requirements of non-using female sex partners of IV drug users in Los Angeles County. The data will provide an information base for effective HIV infection prevention education programs and strategies.
Method. Eighty key informants including service providers, law enforcement officers, IV drug users, and sex partners from various ethnic groups were interviewed in-depth. Purposive sampling guided the approach to selecting the key informants. The interview protocols were semi-structured, with both open-ended and objective questions.
Results. The sex partner population is made up of different subpopulations with different characteristics correlated to ethnicity, non-IV substance use, and income and education levels. Commonalities across subpopulations are: low self-esteem, powerlessness, history of abuse, isolation, and low perception of HIV infection risk.
Conclusion. HIV prevention education leading to protective behavior change must be based upon an empowerment model which addresses the psychologies of powerlessness, and is sensitive to cultural and class differences.

Th.D.P.13 GENDER DIFFERENCE IN "MATURING OUT" OF INTRAVENOUS DRUG USE

Biernacki, Patrick; Mandel, J.; Aldrich, M.
Youth Environment Study, Inc., San Francisco, CA, USA

Objective. To specify the proportion of women among *different categories of* IVDUs, in order to better describe and predict the spread of AIDS.
Methods. Secondary analysis of 3 data sets of IVDUs (reported AIDS cases, drug treatment agency roster, and hospital emergency room admissions) in 3 cities (San Francisco, the Bronx and Chicago), comparing the gender ratios at different ages.
Results. In each urban area the proportion of women among IVDUs declines with age. About 1/3rd of IVDUs in their 20's, and 1/8th of those 40 and older are women. On treatment data, at least half the clients in their early 20's are female, though for older clients the proportion of women IVDUs in treatment increasingly resembles the proportion on other indicators. The declining proportion of women holds for all racial and ethnic groups, though at all ages there are few Hispanic, and especially Mexican American, women.
Conclusion. "Maturing out"-cessation of IV drug use for people as they age"-occurs for men and women at different rates. IV drug use is neither permanent nor demands a total commitment overriding all other aspects of life such as raising a family or a desire not to be a criminal. These countervailing forces weigh differently for men than women, so their IV drug careers are markedly different. In the early years, women especially seek out drug treatment to get away from "the life," and by their early 30's, and especially 40's, all indicators show far more women than menhave abandoned IV drug use. Substantial ethnic differences in gender roles are evident, though in all groups the risk of AIDS among IVDUs diminishes with age at a faster rate for women than men.

Th.D.P.14

Th.D.P.15 FEMALE FAMILY MEMBERS AS MEDIATORS OF UTILIZATION OF HEALTH AND SOCIAL SERVICES

Crystal, Stephen; Schiller, N; Dejowski, E.; Hansell, S.; Merzel, C.; Beck, P.
Rutgers University, New Jersey, United States

Objective. To analyze the degree to which the availability of family members, particularly women, as sources of informal support is related to the utilization of health and social services by People with AIDS.
Methods. Data from a survey of a population based random sample of living PWAS in New Jersey is analyzed. The sample includes a high number of intravenous drug users, male homosexuals, racial and ethnic minorities and women. An analysis is made of the differential access of these population groupings to informal family support, and the relationship between the degree of utilization of informal family support and the range and extent of utilization of formal services.
Results. Family members, especially women, are found to be to be the major source of informal support of PWAS among both IV drug users, homosexuals and women who acquired AIDS through heterosexual transmission. This finding hold true , for Black Americans, Hispanics, and whites. Support from women family members is demonstrated to be both instrumental and emotional. A significant relationship is demonstrated between high level of support from female family members and a high degree of utilization of health and social services.
Conclusion. There is a relationship between access to informal and formal supports among PWAS.

Th.D.P.16 HIV INFECTION AMONG FEMALES ENTERING NEW YORK STATE PRISONS

Smith, Perry*; Mikl, J.*; Truman, B.*; Lord, E.**; Broaddus, R.**; Morse, D.*.
*New York State Department of Health, Albany, New York, USA.
**New York State Department of Correctional Services, Albany, New York, USA.

Objective. To determine the prevalence of and risk factors for HIV infection among females entering New York State prisons.
Methods. From September 1988 to January 1989, information was extracted from the medical records of 514 consecutive females entering New York State prisons, and their sera were tested in a blinded fashion by ELISA and Western Blot for antibodies against HIV.
Results. Of 450 females tested to date, 85 (18.9%) were HIV seropositive. Seropositivity was highest among 30-39 year olds (24.5%) and varied by ethnicity (blacks--14.3%, Hispanics--28.9%, whites--8.2%) and residence (New York City--23.9%, Upstate--4.1%). Nearly half (46.9%) of the 126 intravenous drug users and one-third (34.8%) of the 69 women with serologic evidence of syphilis were HIV seropositive. Two of 19 pregnant women were seropositive. By logistic regression, seropositivity was associated with intravenous drug use (adj OR=10.0, $p<.05$), Hispanic ethnicity (adj OR=3.8, $p<.05$), black race (adj OR=2.9, $p<.10$), and residence in New York City (adj OR=7.3, $p<.05$).
Conclusion. In New York, nearly one of every five female prison entrants is infected with HIV, primarily due to IV drug use. The association between seropositivity and ethnicity may have resulted from unreported confounding risk factors, such as sex with an unrecognized high-risk person. Female prisoners are an important group for educational efforts to reduce the risk of transmission to their sexual partners and offspring.

Th.D.P.17 DETERMINANTS OF SEXUAL RISK REDUCTION IN FEMALE IV DRUG USERS RECRUITED FROM THE STREET.

Tross, Susan*; Abdul-Quader, A*; Des Jarlais, DC**; Kouzi, A*; Friedman, SR*.
*Narcotic and Drug Research, Inc., N.Y., N.Y., U.S.A.; **New York State Div. of Substance Abuse Services, N.Y., N.Y., U.S.A.

Objective. Female IVDU's are the primary link to perinatal HIV transmission. Their motivation for HIV sexual risk reduction is poorly understood. Therefore, our aim was to identify determinants of such efforts in a street sample of active female IVDU's in the lower east side of Manhattan.
Methods. 116 female IVDU's were recruited through street outreach contacts by neighborhood ex-IVDU workers. Paid face-to-face structured interviews were conducted to assess HIV-related risk behaviors, beliefs, personal or network experience, and network norms.
Results. 61% of the sample reported initiating any sexual risk reduction behavior (i.e., condom use, abstinence, reduction in number of partners, avoidance of "high risk" partners) since they heard of AIDS. In multiple logistic regression, significant positive predictors included having more than 1 partner during the average month of the past year ($p<.016$); having friends who practiced sexual risk reduction ($p<.019$); and perceived current ($p<.034$) and future ($p<.048$) risk of HIV infection. Ethnicity, relationship status, knowing someone with HIV disease, and perceived self-efficacy about being able to carry out risk reduction were not significantly associated with risk reduction behavior.
Conclusion. Elements of both Health Belief and Social Influence theory predict sexual risk reduction behavior in female IVDU's. These results are consistent with the findings of prior studies of drug risk reduction in IVDU's in treatment - which demonstrate that both fear of AIDS and positive social norms (Friedman, et al, 1987) are associated with drug risk reduction behavior. Since both health beliefs and perceived norms are malleable, these findings have immediate relevance for designing sexual risk reduction interventions.

Th.D.P.18 DIFFERENCES IN HIV/AIDS COUNSELLING FOR WOMEN AND FOR MEN

Hutterer, Judith; Blaas, P.; Oberauer, C.; Ogris, M.; Pec, B., Stögerer, M.; Zupan. B.
Osterreichische AIDS-Hilfe (Austrian AIDS Foundation) - ÖAH, Vienna, Austria.

Objective: 1) To find out the differences in the motives of why women and men visit an HIV/AIDS counselling centre and take an HIV test and 2) to present the varied role of female counsellors when counselling men and women.
Methods: Evaluation of reports of experiences given by the female counsellors of the seven HIV/AIDS counselling centres of the Austrian AIDS Foundation (ÖAH).
Results: Many women visit the counselling centres to get advice for others. They want to take an HIV test to make sure that they are not dangerous for others. Protection against AIDS is considered - like contraception - as in the first place a matter of women. The wish for an HIV test often has the following functions: to confirm the closeness to the male partner (especially when he is infected), to "liberate" ("permission" to engage in new relations), to draw a line underneath the past (test result as a proof of purity), to repress the topic AIDS (after a negative result, the topic AIDS is definitely terminated), to lay down a criteria for continuing a relationship (infection through the sexual evasion of the partner or not). Male clients often try to force a female counsellor intothe role of the "exculpating woman" and of a "Wailing Wall". Discussion of the effects of these circumstances in the course of the counselling.
Conclusion: The differences between men and women require different concepts for women which take into account their special concerns and desires.

Th.D.P.19 PRATIQUES DE RISQUE ET SIDA PARMI LES PROSTITUEES ESPAGNOLES

USIETO, RICARDO*; SASTRE, JULIA**; TORRES, JOSE***; ANABITARTE, HECTOR****; DE ANDRES, RAFAEL*****; MENOR, JUAN******
* UNIVERSITE INTERNATIONALE MENENDEZ PELAYO, MADRID, ESPAÑA; ** MAIRIE DE MADRID, ESPAÑA;*** DISTREX IBERICA, S.A., BARCELONA, ESPAÑA; ***** MINISTERE DE SANTE ET DE CONSOMMATION, MADRID, ESPAÑA; ****** COMMITTEE OF RESEARCH ON KNOWLEDGE AND CULTURE, STRASBOURG, FRANCIA.

Objectifs. Connaître d'une façon scientifique la situation des prostituées espagnoles face au SIDA quant aux pratiques de risque. Connaître leur opinion en toutes les matières relatives au risque d'être porteur du VIH ou de développer la maladie. Etude détaillé des changements des habitudes, etc. des prostituées espagnoles. Etude de l'émargement et du refus social dans l'Espagne
Méthode. Enquête d'opinion pour toute l'Espagne. Personnes âgés de plus de 14 ans. Proportionnel parmi des villes de moins de 10.000 habitants et plus de 500.000 habitants. Par régions, habitat, sexe et âge. Questionnaire: 333 questions et réponses possibles, résultant 1.117 entrevues valides, avec une erreur ± 3,5% niveau de confiance = 2 (95,5%) et la variance populationale P/Q 50/50.
Résultats. 40% a eu des relations sexuelles avec plus de 2.000 personnes différentes. 80% a ingéré de la semence. 71% reçoivent le coït anal. Seulement 31% a un couple permanent. 90% n'a que des études primaires. 15% ne passe aucune revision médicale. 69% utilise le préservatif et 25% la pilule anticonceptive. On connait le SIDA le 61%. 17% s'injecte heroïne et 11% cocaïne. 60% des prostituées héroïnomanes ingère de la semence habituellement 71% se ferait la preuve du SIDA.
Conclusion: L'usage du préservatif a augmenté dans un 29% et 28% a une plus grande hygiène dans les relations sexuelles.

Th.D.P.20 STD PATIENTS' AND PROSTITUTES' KNOWLEDGE ON AIDS: MODIFICATION OF SEXUAL PRACTICES, AND EDUCATION NEEDS.

F. Soyinka, M.Z. Hossain, O. Onayemi
Obafemi Awolowo University, Ile-Ife, Nigeria

Objectives: To assess STD patients' and prostitutes knowledge of AIDS with a view to identifying education needs and to assess if knowledge of HIV-status could influence sexual practices.

Methodology: 50 randomly selected STD patients and 25 prostitutes volunteers were interviewed concerning knowledge on AIDS, and sexual practices. HIV-antibody screening was carried out on all and the results were made known to them. Participants were reinterviewed 6 months later concerning their sexual practices after knowledge of HIV-status.

Result: There were serious gaps in knowledge about transmission and prevention in both groups. Majority of STD patients had prostitutes as clients while prostitutes were not discriminatory. None used condoms regularly. Majority of participants who know that condom could be used to prevent STD were not aware of its effectiveness in the prevention of AIDS. Over 95% of the prostitutes who screened negative for HIV-antibody responded 6 months later that they now insist on usage of condom while 30% of STD patients said they now keep to one sexual partner or regularly use condoms.

Conclusion: Identifying various gaps and other areas of education needs would be used to provide effective information needed to design health education strategies. Knowledge of the negative status of HIV-antibody could possibly be used to modify sexual behaviour in high risk groups. Integration of AIDS campaign into STD services is recommended.

Th.D.P.21 "TWILIGHT PHENOMENA" - A PROJECT CONCERNING MEN AS BUYERS OF THE SERVICES OF PROSTITUTES AS A RISK FACTOR.

Pettersson, Elisabeth*; Larsson, J**; Mellberg, G***; Pettersson, B****; Svennecke, B*****; Ungerfeldt, S******. Gothenburg Social Services, Gothenburg, Sweden.

Objective: To focus on, reach and influence men to refrain from buying the services of prostitutes. There are far more purchasers than prostitutes; they have greater social, sexual and geographical mobility and their risk-taking behaviour links several large peripheral groups together.
Methods: "Twilight phenomena" is a collective name for a number of sub-projects aiming at exposing the role of the man in prostitution and his risk-taking behaviour. This has been achived by:
-Initiating female politicians and civil servants to "on site" seeking out of men and spreading of information.
-A seminar for men about men who seek sexual contacts, men with risk-taking beahviour and men as buyers of sexual services.
-A Nordic conference on prostitution in Gothenburg to focus interest in Scandinavia on the buyers of the services of prostitutes.
-A cultural project with selected films,authors/debaters and specially commissioned work, such as plays,cabarets,music and pictures dealing with the conditions and risks involved in prostitution. We have also applied for funding of a research project from th Goverment's HIV/AIDS delegation, to find further methods and models to influence men to refrain from buying the services of prostitutes.
Results: We have emphasized the role of the man in prostitution and his risk-taking behaviours by involving and activating individuals,groups,administrations and authorities in the municipality of Gothenburg.
Conclusion: The project "Twiligt phenomena" is an example of how, on the basis and within the framework of the Social Services Act, a specific social problem and matter of public health of major municipal interest can be brought to public awareness and tackled by alternative methods.

Th.D.P.22 HIV INFECTION AND PROSTITUTION IN YAOUNDE-CAMEROON

Marcel Monny-Lobe*,D.Nichols**,L.Zekeng***,R.Salla*,L.Kaptue*
*Central Hospital Yaounde,Cameroon,**Family Health International,NC,USA,***University Teaching Hospital Yaounde.

Objective.To describe a preventive inteavention for prostitutes for HIV infection.
Methods.Early 1988, 11 prostitutes were selected from hotels,bars and nightclubs throughout Yaounde.They were trained (a)to ameliorate their knowledge on STDs and AIDS, (b)to educate their peers on STDs and AIDS, (c)to spread informations on safer sex practices including how to use condoms and spermicides. These actions were carried out: (a)determination of epidemiological,biological and clinical status of 168 prostitutes, (b)survey on knowledge,attitudes and practices towards AIDS among 125 girls, (c)information and education on safer sex practices, (d)free supply of condoms, (e)evaluation of the work.

Results.Respondents'age:the majority are in their twenties,were born around Yaounde,have never been married and became prostitutes to make money.

Prostitutes represent the highest infected group in Cameroon: 12 from 168 (7,14% versus 0,5% in the general population) had antibodies against HIV1. Four of those 12 girls had clinical symptoms of HIV infection.

In January 1988,most of the respondents said they have heard of AIDS since more than one year,but the degree of knowledge was low about the modes of transmission and methods of effective protection.As for January 1988 behavior change since hearing about AIDS, 22% said they had made no change because they lacked significant information to know what to do. Later,AIDS education demonstrated changes in risk perception,knowledge and attitudes.
Conclusion.This model intervention program planned by FHI and Ministry of Health can be effective for reducing HIV infection among prostitutes.

Th.D.P.23 HIV-INFECTION IN PROSTITUTES:THE POTENTIAL OF HIV-TRANSMISSION.

Friese K, Rossol S, Klein C, Hess G, Meyer zum Büschenfelde, KH, Knapstein PG. University Mainz, FEDERAL REPUBLIQUE OF GERMANY .

OBJECTIVE: To measure risk behavior for HIV-1 of prostitutes of a city with 200 000 inhabitants in West-Germany were tested for HIV-1 transmission. Other factors significantly related to high frequency of sexual activity as for example infection with gonorrhoea or syphilis were examinated. Additionally loose structured interviews were performed to collect information on sexual behavior.
RESULTS: Interestingly none of the women was infected with HIV-1. None of the women was a i. v. drug abusers. Episodes of infection with N. gonorrhoeae, Treponema pallidum and T. vaginalis were diagnosed in 50 % of the women. The most frequent source of customers was via brothel prostitution (80%). It turned out that all women did not use condoms with customers.
CONCLUSIONS: The prevalence of HIV-1 infection in prostitutes is highly dependent on local transmission. The use of the term "prostitute" does not automatically carry the possibility of a high risk group. On the other hand considering unprotectiveness of these women concerning the spread of the virus into these cohorts does serve as a severe marker for rapidly ongoing dissemination. For prevention efforts education campaigns, especially on risk practices have to be intensified.

Th.D.P.24 A DESCRIPTIVE ANALYSIS OF PATIENTS ATTENDING THE WOMEN'S HIV CLINIC AT THE JOHNS HOPKINS HOSPITAL

Hern.Janet, Anderson J. Atkinson J. Alwood E. Cohn S. Chaisson R. et. al.
The Johns Hopkins University School of Medicine. Baltimore. Maryland.USA. Supported by the Stetler and Freeman Foundations.

Objective: To describe a population of women attending an inner city clinic devoted to the care of HIV-positive patients
Methods: A retrospective review of 83 of 300 charts of HIV positive women seen at an outpatient clinic between 1984 and 1989.
Results: The mean age was 31.9 years with a range of 20-50. The racial distribution was: Black - 80%; Caucasian - 15%; Other 5%. Thirty percent of the women were married or had spouse-like partners. no partner or support - 50%. unknown - 20%. Of the women. 81% (54/67) had one or more living child. and 57% (38/67) had at least 2 children. Sixty-four percent were on some form of medical assistance. disability. or both. At their first visit. 57% were asymptomatic. 29% - symptomatic . 7% - AIDS. Risk factors for HIV infection were: IV drug use (IVDU) alone - 29%; heterosexual contact with a high risk partner (HC) only -30%. IVDU and HC -23%.blood transfusion - 7%; unknown or denied risk factors - 7%.Of 60 women who stated reasons for being tested. seropositivity was initially discovered as an incidental finding in 23% (14/60). A complicated past medical history was common. including: psychiatric- 33% (24/74). gynecologic (GYN) - 36% (28/74). and cardiovascular - 11% (8/73). Remarkably. 30% had a history of 3 or more serious medical problems. Half of the women had 2 or more active medical problems at the first visit including. psychiatric - 37% (29/78). GYN - 34% (26/77). and dermatologic - 18% (14/77). Twenty-seven percent admitted to active IVDU. and 20% (13/66) admitted to recent incarceration or legal problem.
Conclusion: The data shows that women attending an inner city HIV clinic are likely to present complex medical and psychosocial problems in addition to their HIV status. This. combined with reproductive and family issues. and limited financial resources. support systems. and medical information will likely create a need for an expansion of services for this population.

Th.D.P.25

AIDS AND WOMEN: CHANGE IN SEXUAL BEHAVIOR

Sy,Francisco;Richter,D;Theocharis,T;Hussey,J; and Summers,D.
University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective. To determine the change in sexual behavior of college women with emphasis on their use of effective AIDS risk reduction behavior.
Methods 334 randomly selected, female undergraduate students in a major university in southeast U.S. responded to an AIDS questionnaire survey for women.Data collected included demographic information, level of sexual activity, change in sexual behavior, knowledge and frequency of use of effective AIDS risk reduction behavior.
Results. The majority of the respondents had high level of knowledge regarding effective AIDS risk reduction behavior. 49.4% reported change in sexual behavior. Those who claimed to have changed their sexual behavior tend to have been more sexually active. They are more likely to discuss their partners' past sexual experience, and insist their use of condoms. They are also more likely to report using condoms frequently.
Conclusion.Despite the high level of knowledge regarding effective AIDS risk reduction behavior, only half of the respondents reported to have changed their sexual behavior and of whom only 15% claimed to always use condoms.

Th.D.P.26

SEROSURVEY OF WOMEN OF CHILDBEARING AGE IN TEXAS, USA

Thompson, E. G.[a], Suarez, L.[a], Reed, Christie M.[a], Buchanan, B. R.[a] and Therrell, B. L., Jr.[a]
[a]Texas Dept. of Health, Austin, Texas, USA

Objective: To survey women of childbearing age in Texas for the presence of HIV antibodies.
Methods: 87,016 whole blood specimens of newborn infants received at the Texas Department of Health (TDH) Laboratory for heritable disease screening were tested in a blinded fashion for HIV antibodies.
Results: Eighty-three (83) HIV positives were found among all women tested for an overall prevalence rate of 0.095% (95% confidence interval, .076%-.119%). When only Texas residents (86,180 women and 81 HIV positives) were considered, the prevalence rate remained essentially the same at 0.094% (95% confidence interval, .075%-.117%). The HIV positives were widely dispersed across the state's 254 counties generally consistent with the distribution of the state population. The 3 exceptions were: (1) Harris County, which has approximately 17.3% of the 1987 estimated Texas population and submitted 20.173% of the samples tested in this survey, but accounted for 42.975% of the HIV positives for a prevalence rate of 0.196% (95% confidence interval, .014%-.277%); (2) East Texas which has 7.5% of the state population and accounted for 4.6% of the specimens tested, but only had 1.235% of the HIV positives for a prevalence rate of 0.025% (95% confidence interval, .001%-.140%); and (3) Far West Texas, which has 6,875% of the state population and accounted for 7.8% of the specimens tested, but had no HIV positives. Blacks account for 11.4% of the state population and 12.784% of the specimens tested, but has 48.1% of the positive HIV results. Whites account for 66.0% of the state population and accounted for 50.9% of the specimens tested, yet only accounted for 32.0% of the positives. Hispanics account for 22.5% of the state populations and 20.3% of the specimens tested, but only had 14.8% of the HIV positives.
Conclusion: Prevalence of HIV specimens is generally distributed among Texas women of childbearing age in a manner similar to the overall population of the state, with the noted exceptions. However, black women were more likely to be HIV positive in 1988 than either whites or persons of Hispanic origin. Women of Hispanic origin were the least likely to be HIV positive.

Th.D.P.27

UPDATE TO THE COMMUNITY RESPONSE ON WOMEN AND AIDS

Saint Cyr-Delpe, Women and AIDS resource Network, Brooklyn, N.Y., U.S.A.

AIDS is the leading cause of death among women aged 25 - 34 years in New York City. Black and Hispanic women account for 85% of all cases. Nationwide AIDS surveillance data indicate that the proportion of women who acquired AIDS through heterosexual contact is increasing (from 12% in 1982 to 30% in 1987). Despite this increase and the projected need for services geared towards women with HIV infection and their families, there has been minimal planning and little systemic response by the public and private sectors or by service providers.

The Women and AIDS Resource Network (WARN) is a not-for-profit agency that has been working to enhance and facilitate access to resources for women and children affected by HIV infection and AIDS. WARN provides information and referral, counseling including crisis intervention. Technical assistance to agencies developing services for women, group training and educational presentations is also provided in hopes of empowering women so we can help curve the rising of mortality and morbidity statistics among women.

Th.D.P.28

MEDICAL-PSYCHOSOCIAL COUNSELLING FOR WOMEN

Fröschl,Monika; Dorn,B.; Hutner,G.; Braun-Falco,O.
Dermatological department of Ludwig-Maximilians-University, Munich, FRG

Objective: To determine problems of medical-psychosocial counselling for women. Methods: In our outpatient clinic for sexually transmissible diseases (STD), we have attemped to realize a medical-psychological care system. Results: 12.4 % (53/429) of medical patients were female. They are younger than men (26.4 vs 35.1 years) and come with special problems in particular with questions concerning contraception and childbirth. Since January 1987 psychosocial counselling was carried out in 3320 cases, 662 of whom were female. 68.6 % required information about HIV-infection or antibody tests. 557 women made use of the phone counselling service and 105 wanted to have personal counselling. 33 % of women coming to personal counselling were partners or relatives of HIV-infected men. 14 % of female clients were HIV-infected. Conclusion: To the present most of the women require information about HIV-infection. The close cooperation between physician, psychologist and social worker as an integrated team has proved a great benefit for patients and seems to be especially useful for counselling women.

Th.D.P.29

Consommateurs de drogues par voie intraveineuse (partie 2)
I.V. Drug Users (Part 2)

Th.D.P.30

RISK-TAKING BEHAVIORS OF INTRAVENOUS DRUG ABUSERS

Snyder, Frederick, and Myers, M.
NOVA Research Company, Bethesda, Maryland, USA 20814

Objective. To describe the needle use and sexual risk behaviors of intravenous drug abusers (IVDAs) interviewed in nine large U.S. cities.
Methods. Persons included in this study are 1,669 IVDAs who responded to an interviewer-administered questionnaire developed by participants in the National AIDS Demonstration Research (NADR) project sponsored by the U.S. National Institute on Drug Abuse.
Results. Injecting practices identified as risk-behaviors included: number of persons sharing needles/syringes; renting/borrowing used needles; and, cleaning needles (with other than bleach). Seventy percent of males and 56% of females reported sharing needles with two or more persons in the past six months. Furthermore, fully 47% of these male IVDAs and 34% of female IVDAs had engaged in all three of the identified risk behaviors. Forty-one percent of the total sample reported having visited a "shooting gallery".

Sexual practices identified as risk-behaviors included type of sex practice (e.g., anal receptive), number of IVDA sex partners, and condom use. As a group, 16% reported not having had sex in the past six months and an additional 43% reported having had sex but not with an IVDA. This latter figure represents a potential vector for the transmission of HIV infection outside the IVDA population. Additionally, 14% of the males and 36% of the females reported having engaged in the exchange of sex for money and/or drugs. Twenty-nine percent of both male and female IVDAs engaged in sexual activity with one or more IVDAs and did not always use a condom, thus increasing their own risk for HIV infection.
Conclusion. Despite efforts to inform the IVDA population of the dangers of certain risk taking/risk giving behaviors, a large proportion of IVDAs continue to put themselves and others at high risk of HIV infection. The NADR project should identify interventions that are effective in bringing about risk reducing behavioral change.

Th.D.P.31 RISK FACTORS FOR HIV SEROPOSITIVITY AMONG IV DRUG ABUSERS (IVDA) IN FRANCE: EVIDENCE OF A CHANGE IN BEHAVIOUR.

CHOSSEGROS PHILIPPE, BARLET P, RITTER J, FAYOL V, TREPO C, SEPETJAN M et al. INSERM U271, INSTITUT PASTEUR, DPAS, LABORATOIRE de SANTE PUBLIQUE, PRISONS DE LYON, LYON, FRANCE.

Objective: To evaluate risk factors for HIV contamination in an homogeneous population of IVDA not recruited on the ground of health problems.
Methods: We have studied 152 consecutive IVDA entering LYON's prisons after november 1987 and 2 control groups of 100 subjects each(non IVDA and inmates denying drug abuse).
Results: The overall HIV seroprevalence among IVDA was 15% whereas none of the controls were positive. In a multivariate analysis the only variables related to HIV seropositivity were the form of needle sharing (NS), the location of drug addiction (Areas of low versus high prevalence of AIDS), and sexual promiscuity evaluated on syphilis seropositivity. We observed a significant decrease in NS between IVDA whose addiction had begun before and after 1986. That change was associated with a decrease of HBV (77 to 39%), HIV (18 to 8%) and syphilis (14 to 2%) seropositivity as well as the incidence of clinical hepatitis(44 to 19%). In a multivariate analysis a change in initial NS and rates of HBV and syphilis seropositivity significantly differanciated IVDA whose addiction had begun before and after 1986. Furthermore a reduction in NS was observed in 61% of IVDA of the first group.
conclusion: sexual promiscuity as well as NS may be responsible of the spread of HIV among IVDA. The change in sexual behaviour observed since 1986 was not an increase of the use of condoms but rather a reduction of the number of sexual partners.

Th.D.P.32 THE IMPACT OF LAW AND POLICY ON NEEDLE AND SYRINGE EXCHANGE PROGRAMMES IN CANADA

Orkin, A. and Duffie, Anne;
McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada

Objective. To evaluate policy and law as factors impeding public health initiatives aimed at preventing the spread of HIV amongst intravenous drug users in Canada.
Method. Analysis of Canadian policy and legislative approaches to illicit drug use and their impact on the distribution of needles and syringes to those who cannot or will not stop such use.
Results. The response to illicit drug use in Canada, mirrored and influenced by that of the U.S., has generally been crimino-legal. Opiate use was criminalized in 1908 as an indirect result of anti-Asiatic riots. Subsequent legislation was also fuelled by demands for stronger control of illicit drug markets which criminalization had helped to create. Canadian narcotic legislation since 1961 imposes harsh penalties for possession, trafficking, importation and exportation, but notably none for use. Treatment modalities have received little emphasis. The general climate is one of harsh societal disapproval of illicit drug use and drug users.

In contrast to the U.S., there are no specific laws in Canada prohibiting the possession of needles and syringes or their supply to intravenous drug users (a recent Act criminalizing possession, sale and distribution of drug paraphernalia appears to exempt needles and syringes from its purview). Government advisories and other factors have acted to dissuade pharmacists from selling "works" to intravenous drug users. At least one licensing authority has told physicians that the provision of needles and syringes to intravenous drug users is unethical and/or illegal. Those proposing programmes for the distribution of needles and syringes have expressed fear of criminal liability. Legislators have expressed fear of being perceived as encouraging illicit drug use, and funding programmes that apparently contradict historical responses to drug use.
Conclusion. The climate surrounding illicit drugs in Canada is a substantial obstacle to urgently-needed public health programmes to prevent the spread of HIV. Socio-politico-legal factors have frustrated distribution of syringes and needles to intravenous drug users in Canada; only one pilot programme has been established (Feb. 1989). A conflict is perceived between the urgent need for measures to prevent the spread of HIV and demands to suppress drug use. Increased efforts are required to persuade legislators and the public that these two goals are not incompatible, and that needle and syringe distribution appear not to encourage drug use.

Th.D.P.33 INCREASING CRACK USE AMONG DRUG USERS IN AN AIDS EPICENTER: SAN FRANCISCO

Abramowitz, A.*; Guydish, Joseph**; Woods, W.**; and Clark, W.*
*Community Substance Abuse Services (CSAS), DPH, San Francisco, CA, USA
**UCSF Center for AIDS Prevention Studies, San Francisco, CA, USA

Objective. Recent studies have linked risk of HIV infection and other STDs to use of crack cocaine through 1) exchanging sex for drugs and 2) disinhibition enabling unprotected sex. This study compared changes in characteristics of crack users over time.
Method. CSAS collected standard admission data on all clients entering drug treatment from 1986 to 1988. Chi square analyses were used to compare admissions from April to Sept., 1986 (n=3673) with admissions for the same period in 1988 (n=4459).
Results. Cocaine use was reported by 31% of clients in 1986, compared to 41% for the same period in 1988 ($p < .001$). As the primary drug of choice, cocaine was reported by 11% in 1986 and 16% in 1988 ($p < .001$). Among those reporting cocaine as the primary drug, smokable cocaine use increased over time from 53% to 80% ($p < .001$), while injecting and inhaling cocaine decreased (17% to 5% and 29% to 14%, respectively). Among crack users, the proportion under 26 years old increased from 19% in 1986 to 35% in 1988 ($p < .001$). Blacks represented 85% of crack clients in 1986 and 77% in 1988; Latinos represented 1% in 1986 and 8% in 1988 ($p < .001$).
Conclusion. Overall, smokable cocaine use more than doubled (156%) from 1986 to 1988. Latinos and youths under 26 account for increasing proportions of crack users, and Blacks constitute the majority of users in this sample. Injectable cocaine use has apparently decreased while smokable cocaine use has increased. The greatest HIV infection risk related to cocaine use may be through sexual transmission, associated with increased sexual risk behaviors among smokable cocaine users.

Th.D.P.34 SHARING NEEDLES: RISK REDUCTION AMONG INTRAVENOUS DRUG USERS IN SAN FRANCISCO

Guydish, Joseph*; Abramowitz, A.**; Woods, W.*; Newmeyer, J.***; Clark, W.*; and Sorensen, J*.
*University of California **Community Substance Abuse Services
***Haight Ashbury Free Medical Clinic. San Francisco, CA, USA

Objective. To describe changes in needle sharing behavior over time (April 1986 to September 1988), and identify predictors of needle sharing.
Methods. Participants were all intravenous drug users entering two city drug detoxification clinics (N=7660). At admission, participants reported number of needle sharing occasions in the past 30 days. Clinic samples differed in terms of drug of choice (X2=403, p .001), ethnicity (X2=249, p .001), and age (t=-14.9, p .0001). Proportion of cases sharing needles was evaluated cross-sectionally in consecutive 6 month time blocks.
Results. Needle sharing decreased for both samples combined from 50% in 1986 to 28% in 1988 (X2=239, p .001), and for each sample separately (see table).

	% sharing in each consecutive 6 month time period					
	T1	T2	T3	T4	T5	p value
Clinic A	55%	46%	38%	31%	28%	.001
Clinic B	48%	41%	35%	28%	27%	.001

In a logistic regression model controlling for other demographics, cocaine use (OR=1.2, 95% CI=1.1-1.3), age (OR=1.07, 95% CI=1.04-1.11), and being white rather than black (OR=1.16, 95% CI=1.09-1.13) were positively associated with needle sharing.
Conclusion. 30% of participants continued to share, and this proportion did not decrease substantially in the past year. Cocaine use predicts sharing.

Th.D.P.35 MODIFICATION DU COMPORTEMENT DES TOXICOMANES IV

ESPINOZA P. *, LEBOUC V**, ROUSTANG I.***, POLO DEVOTO J.**, BOUCHARD I.*, BALIAN P.**, GOLOVINE P.**, BONINSEGNA T.*, DGS°
* Hopital de Fresnes (EHPNF) Allée des Thuyas 94261 FRESNES CEDEX FRANCE
** APSP, *** Prison de Bois d'Arcy, ° Direction Générale de la Santé, bureau de la toxicomanie.

Alors qu'en France le partage des seringues était quasi systématique, l'apparition du SIDA et l'autorisation de la vente des seringues en pharmacie sans ordonnance depuis mai 87 ont manifestement changé les habitudes des toxicomanes.
Nous comparons plusieurs études qui ont été menées à la Prison de Fresnes sur le comportement des toxicomanes masculins (par voie IV). Les deux premières ont eu lieu en 86 et concernent 141 toxicomanes, la 3ème en 88 et concerne 312. Les groupes sont comparables en ce qui concerne l'âge, l'origine ethnique la situation pénale et la toxicomanie (durée, nombre moyen de 4 injections/J). Le comportement des toxicomanes en 88 est significativement différent de ce qu'il était en 86 en ce qui concerne : le nombre de jour d'utilisation d'une seringue (1,4 en 88/8 en 86), le nombre d'injection pour une même seringue (5,6/32), l'utilisation d'une seringue strictement personnelle (54,5%/16%).
Sur le plan du comportement sexuel : l'usage du préservatif est plus répandu qu'auparavent (37,5%/27%), le nombre de personnes qui se protègent sur les deux plans : préservatifs et seringues est encore faible mais en augmentation (24%/12%). Le comportement des toxicomanes vus en 88 est analysé en fonction de la pratique du test sérologique et de ses résultats (non testés : 103, ⊖ : 97, ⊕ : 96, sans résultat 16).
Nous remercions les Oeuvres Hospitalières Françaises de l'Ordre de malte (OHFOM) pour leur contribution aux deux études de 1986.

Th.D.P.36 A HIV-PREVENTION SYRINGE EXCHANGE PROGRAM IN LUND, SWEDEN. OBSERVATION OF THE ATTITUDES OF: 1. ATTENDING IVDU:S 2. COUNSELLORS IN A NEARBY DRUG TREATMENT CENTER. 3. SOCIETY.

Tunving, Kerstin*; Ljungberg, B**, Andersson, B*; Christensson, B**, [illegible],E*
* Dept of Psychiatry and Neurochemistry; ** Dept of Infectious Diseases, University of Lund, SWEDEN

1. In November 1986 a HIV-prevention program designed for IVDU:s started at a Clinic for Infectious Diseases in Lund. The program offers clean utensils and condoms, information, personal advice and regular HIV-testing. 800 IVDU:s have so far visited the program, 20% more than 10 times. Every month 30 more individuals appear. 90% are HIV-tested. Out of a sample of 78 attenders, 81% said that they nowadays never share equipment. Most syringes are returned. Out of a sample of 40 patients at a nearby drug treatment center, 62% had attended the exchange program. 90% had abstained from drugs or used utensils of their own.
2. Counsellors at the nearby center for IVDU, find no difficulty in working parallelly in the same city. On the contrary, addicts seem to bee more interested in treatment than before.
3. When we started the program, we estimated the 3 000 IVDU:s in the region to be on the treshold of an epidemic. There is still no epidemic. IVDU:s are extensively HIV-tested. Out of deceased drug abusers 1987-1988, none were HIV-infected when autopsies were made at the Forensic Institute in Lund. The program is increasingly accepted by society in southern Sweden. There are no side-effects, and what's more important, there is no increase in drug abuse in the society as a whole because of the program.

Th.D.P.37 AN AIDS INTERVENTION PROGRAM FOR THE BLACK OUT-OF-TREATMENT INTRAVENOUS DRUG USER

Valentine, J.*; Thomas, A.**; Krepcho, M.*, Johnson, D.*; Freeman, A.*; Haley, Charles E.* *Dallas County Health Department, **Dallas Urban League, Dallas, TX, USA.

Objectives. To reach the black out-of-treatment intravenous drug users, develop relationships to promote risk reduction behaviors, promote drug treatment, and improve their access to health care. Methods. The intervention in the targeted community is conducted in stages, and includes: 1) involving former and current black IVDU's in the outreach effort, 2) establishing a local counseling/testing site, 3) enlisting assistance from local merchants to distribute intervention materials, and 4) making contact with the black IVDU's, offering information regarding AIDS, antibody testing, drug treatment, and providing condoms and bleach kits. Outreach educators visit the target areas regularly, becoming recognizable to the target population. Results. The program has been ongoing for 7 months on a weekly basis in 4 specific sections of the targeted community. Of the 1,500 persons reached, most have been black, young adult males. 3,250 condoms, 800 bleach kits, and 2,600 brochures have been distributed. No merchant has refused to distribute the brochures. Three merchants are distributing bleach kits. Persons from the community use the local counseling/test site, and initiate requests to the "AIDS Ladies" for condoms and bleach kits. Conclusions. Although black IVDU's experience multiple barriers to health care and information, they are receptive to AIDS risk reduction information when educators come to "the streets" and develop relationships with the black IVDU's in their own communities.

Th.D.P.38 THE NEEDLE AND SYRINGE EXCHANGE PILOT PROGRAM IN NEW YORK CITY

Schultz, S.; Mahoney, Kevin; Zweig, M.; Eaton, C.; and Joseph, S. New York City Department of Health, New York City, New York, U.S.A.

Objective To evaluate the first government sponsored needle and syringe exchange pilot program in the United States so as to assess its potential for the control of HIV infection among intravenous drug users.
Methods The Needle Exchange Pilot Program of the New York City Department of Health began operation on November 7, 1988. As New York State is one of 11 states which requires prescriptions for the sale of needles and syringes the New York State Commissioner or Health has authorized this pilot study for the purpose of scientific research. In the absence of treatment on demand, the needle exchange program was considered as part of a multiphasic approach towards the issue of intravenous drug abuse and AIDS. Current IV drug users 18 years of age or older awaiting placement in drug rehabilitation programs throughout the city are eligible. A questionnaire is administered periodically for information on needle sharing behavior, in addition to other risk behaviors. Drug treatment referrals and intensive risk-reduction education is provided. Those who take part must return their used injection equipment before they can receive a sterile needle and syringe. One needle and syringe is distributed per encounter.
Results Within the first two months of operation, 56 persons have enrolled; 39 are men, 17 are women; 14 are Black, 28 are Hispanic, 13 are White, and 1 is Native American. The number of participants entered into treatment is 26.
Conclusions It has been possible to inititate and continue a pilot needle exchange program in New York City in the context of a "Bridge to Treatment" service program, despite misunderstanding of the program's objectives.

Th.D.P.39 RISK OF AIDS IN SERCONVERTER DRUG INJECTORS: A COMPARISON WITH OTHER RISK GROUPS.

Rezza, Giovanni, Menniti-Ippolito, F.; Lazzarin, A.; Zerboni, R.; Angarano, G.; Pristerà, R.; Sinicco, A.; Barbanera, M.; Ortona, L.; Costigliola, P.; Gafà, S.; Aiuti, F. and Tirelli U.
IMCSA (Italian Multiple Cohort Study on AIDS), AIDS Unit, Dept. Social Medicine (Ministry of Health) and National Institute of Health, Rome, Italy.

Objective. To estimate the risk of developing AIDS from HIV seroconversion in drug injectors and in a group of subjects with sexually acquired HIV infection.
Methods. A multiple cohort sudy has been conducted to follow subjects for whom the seroconversion period was identified (availability of a negative test preceding the positive confirmed one). Clinical evaluation was performed each 6 months. A modified CDC clinical definition was utilized to classify the clinical stage of patients. The disease progression was analysed according to estimation based on Kaplan-Meier survival curves, and differences between groups were assessed by Wilcoxon test.
Results. 255 subjects who acquired the infection by drug injecting and 122 by sexual contact (86 homosexual males and 36 heterosexual contacts) were enrolled until October 30, 1988. The estimate of AIDS progression rate by four years from seroconversion was respectively 14% in drug injectors and 16% subjects who acquired the infection by sex.
Conclusion. No statistically significant difference in the risk of developing AIDS was found between drug injectors and the other group.

Th.D.P.40 AIDS INCIDENCE AND RISK FACTORS FOR DISEASE PROGRESSION IN A COHORT OF SEROCONVERTER DRUG INJECTORS.

Rezza, Giovanni, Menniti-Ippolito F.; Lazzarin, A.; Angarano, G.; Sinicco, A.; Tirelli, U. et al.
IMCSA (Italian Multiple Cohort Study on AIDS), AIDS Unit, Dept. Social Medicine (Ministry of Health) and National Institute of Health, Rome, Italy.

Objective. To describe the natural history of HIV infection in drug injectors since seroconversion, and to evaluate risk factors associated to disease progression.
Methods. The enrollment criteria were represented by the identification of the seroconversion period (availability of a negative serological test followed by the positive one). Clinical and laboratory evaluation was performed each 6 months. Data collection on demographic and behavioural features was made by means of individual case reports. The disease progression was analyzed according to estimations based on Kaplan-Meier survival curves.
Results. 255 subjects fullfilling criteria entered the cohort. Male/female ratio was 4:1; mean age was 26 years. The mean period of follow-up until October 30, 1988 was 29 month-person; 13 cases of AIDS occurred up to that date. The actuarial incidence of AIDS was 2.8% by years and 14.5 by four years after seroconversion. The risk of developing increased significantly after two years since seroconversion (Mantel-Cox test).
Conclusion. The duration of exoposure to the virus seems to be the main factor in determinig the disease progression in seropositive drug injectors.

Th.D.P.41 HIV INFECTION IN INTRAVENOUS DRUG ADDICTS.

Stapiński A., Mazurkiewicz Walentyna,Ochelska B., Głaska T., Seliborska Z.
Medical Academy Warsaw, Poland

Objective.In the Institute of Venerology,2971 patients/71.5% of males,28.5% females/,who were addicted to narcotic drugs injected intravenously,have been tested for the presence of HIV antibodies in the period from Jan 1986 to Jan 1989.They were patients of detoxication wards and/or pensioners of drug treatment centers.Methods.HIV antibodies were determined by the EIA method,and positive results were confirmed by the Western-blot technique.Results.HIV antibodies were found in 21 patients /14 males and 7 females/,which accounts for 0.7% of cases.In 1986--1987,all tests were negative.The first positive HIV test was detected in Aug 1988 after testing of 2254 drug addicts.Since Aug 1988 to Jan 1989,21 sera were positive to HIV antibodies /2.9%/ among 718 patients studied. This indicates that HIV infection is spreading fast in this population.Infections of drug addicts with HIV represent 17% of total cases of HIV antibody--positive individuals in Poland.
Conclusion.Intensive education program should be performed among drug addicts,accompanied with the distribution of free disposible syringes and needles,as well as condoms.Furthermore, problems related to AIDS should be covered by special training program for staff of drug treatment centers in Poland.

Th.D.P.42 RISK BEHAVIOR AND ATTITUDES AMONG RECOVERING IV DRUG USERS

Schilling, Robert*; El-Bassel, N.*; Schinke, S.*; Botvin, G.**, Orlandi, M.***; and Nichols, S.****.
*Columbia University School of Social Work, New York City, U.S.A. **Cornell University Medical College, New York City, U.S.A. ***American Health Foundation, New York City, U.S.A.**** Beth Israel Medical Center, New York City, U.S.A.

Objective: To describe a study of how recovering IV drug users appraise risks associated with AIDS. Methods:The presenters describe findings from structured interviews with 248 recovering IV drug users. Variables included AIDS knowledge, social support, locus-of-control, self-efficacy, drug use, and sexual behavior. Structured interview data on Black, Hispanic, and white Anglo methadone patients were collected in nine clinics in New York and Northern New Jersey. Results: More than two thirds (68%) admitted to sharing needles in the past, and almost a third indicated that they had used heroin at least once within the past six months. One in five subjects reported having had sex with an IV drug user on at least six occasions during the past six months. Those who used IV drugs in the past six months reported significantly more IV using sexual partners, years using heroin, cocaine, crack, speedballing, and greater frequency of crack use. Among relapsers, older addicts and users with more years in treatment were more likely to have changed their needle cleaning habits. Current users who reported changing their needle hygiene, were less likely to be insulted if another user refused to share a needle and more often sterilized their needles after others used them. About half of respondents claimed to have altered their sexual behavior over the past six months. Persons who had one or more friends die of AIDS were significantly more likely than others to have changed their needle cleaning and sexual behaviors. Discussion: Consistent with other findings, these data suggest that past drug use, social attitudes related to needle sharing, and knowing persons who have died of AIDS, predict favorable behavior changes. Also correspondent with other investigators' data, this descriptive study found that sexual behavior is more difficult to change than many drug related risks.

Th.D.P.43 AIDS BELIEFS AND BEHAVIOR CHANGE IN MINORITY IV DRUG USERS

Andersen, M; Smereck, G; & Braunstein, Mildred
Personalized Nursing Corporation, P.C., Detroit, Michigan, USA

Objective. To identify the IV drug user's (IVDUs) beliefs regarding AIDS and related behaviors.
Methods. Nonprobability sample of IVDUs seen thru the emergency rooms and in the hospitals of 3 inner cities reporting a high incidence of IV drug use and AIDS. Structured interview -- fixed response and open-ended questions.
Results. Interviewed 721 IVDUs: 73.9% male, 26.1% female, 70.1% Black; 19.8% Hispanic, 7.7% White, 2.2% other, 86.9% unemployed. Multiple drug use: 92.5% use heroin, 79.4% cocaine, 69.1% speedballs. General knowledge regarding AIDS transmission; 78.6% report drug use, 82.9% report sexual activities, 61.4% report getting information about AIDS from radio or TV, 52.8% report getting from printed media. 75.7% report changing behavior to reduce risk: 71.9% avoid pregnancy, 43.6% stopped or decreased needle sharing, 41.3% use safer sex, 40.5% clean needles.
Conclusion. IVDUs report making efforts to change their behaviors to decrease their risk of getting/transmitting AIDS.

Th.D.P.44 COCAINE USE AND SEXUALLY TRANSMITTED DISEASES INCLUDING HIV

Minkoff,Howard*;McCalla,S*;Delke,I*;Feldman,J*;Stevens,R;**Salwen,M;*SUNY-Health Science Center at Brooklyn, NY*.NYS Department of Health,Albany, NY** U.S.A.

Objective: To study the association between cocaine use and sexually transmitted diseases (STDs), particularly HIV,in a community with a high prevalence of both cocaine use and HIV disease.
Materials and Method: Between 10/88 and 1/89, 1,270 women birthing at an inner city hospital in New York had otherwise discarded urines coded and stored. Demographic, Syphilis serology and HIV risk data was collected from 1028 of these patients, identifiers removed and code numbers corresponding to urines applied. In the latter part of the study 299 patients had blood (remaining after syphilis studies) stored and coded. After all identifiers were removed the urine was analysed for cocaine, and other drugs. The blood was analysed for HIV antibody by ELISA and Western Blot.
Results: 13.1% of urines had cocaine (cases) 1.3% marijuana and 1.4% opiates. 48% of cases denied drug use during pregnancy. 92.3% of acknowledged cocaine users denied intravenous use. 17% of cases had positive syphilis serologies compared to 2.8%(R.R.=7.1(95%C.I.3.8%-12.9)) of patients without cocaine (controls). Among controls 0.78%(2/255) had HIV antibody compared to 9.09%(4/44) of cases (R.R.=11.6(95% CI2.2-61.4)). No patient with HIV antibody had other drugs in their urine. One HIV infected case acknowledged intravenous drug use and one HIV infected control was from an endemic country.
Conclusion: 1) Cocaine use among parturients in the inner city is epidemic. 2) Preliminary results suggest a link between cocaine and STDs including HIV.

Th.D.P.45 THE EPIDEMIOLOGY OF AIDS AMONG NEW YORK STATE PRISON INMATES

Morse, Dale*; Truman, B.*; Mikl, J.*; Smith, P.*; Broaddus, R.**; Maguire, B.**
*New York State Department of Health, Albany, New York, USA
**New York State Department of Correctional Services, Albany, New York, USA

Objective. To describe the epidemiologic characteristics of AIDS among New York State (NYS) prison inmates.
Methods. We analyzed demographic, risk factor, disease and mortality data obtained from medical record reviews of all inmates developing AIDS within the NYS Correctional System from 1981-1988.
Results. Through December 31, 1988, 838 cases of AIDS had been confirmed among inmates in NYS correctional facilities, accounting for 1% of the U.S. and 4% of NYS AIDS cases. Cases increased from 3 in 1981 to 205 in 1987, with an incidence of > 450 cases per 100,000 inmates per year since 1985. While most cases (96%) have occurred in males, females have the same high incidence rates (compared to the general population where female rates are 1/9 those of males). Hispanics had the highest incidence rates (2 times other groups) and significantly higher rates of narcotic use and drug related sentences. Intravenous drug use (95%) was the major risk factor. Six percent of cases have had concurrent tuberculosis and 63% of TB cases since 1985 have had AIDS or HIV infection. HIV seroprevalence has been 17% and 19% among in- coming male and female inmates, respectively. To date, 69% of inmate AIDS cases have died and AIDS now accounts for 70% of inmate deaths.
Conclusion. AIDS is the preeminent health problem among New York State inmates and is primarily related to IV drug use.

Th.D.P.46 HIV-INFECTION AMONG IV DRUG ABUSERS IN BUENOS AIRES,ARGENTINA

Cahn,Pedro*;Pérez,H*;Casiró,A*;Vallejo,N*;Wolk,D*;Muchinik,G**
*Hospital Fernández,**IIHEMA,Academia Nacional de Medicina, Buenos Aires,Argentina.

Objective. To evaluate HIV-infection prevalence and related factors in an IV drug abusers (IVDA) population.
Methods. The sera of 338 spontaneously attending IVDA were studied thru ELISA HIV-1 (Abbott) and reconfirmed thru immunofluorescence. Presence of symptoms, time of addiction and sexual behavior were assessed.
Results. There were 253 men(74.8%) and 85 women(25.1%); 87.1% (294) was under 30 years of age, the average being 23 years old. The time of addiction average was 3.4 years. Seropositiveness was found in 204 patients(Pt)(60.3%); 55% of Pt showed 1 or more symptoms(fever > 38°C > 1 month, diarrhoea > 1 month, weight loss > 10% > 1 month, adenopathies, skin lesions, splenomegaly); out of the latter, 77% was HIV+ vs. 21% asymptomatic ones. Positive correlation was found between time of addiction and presence of symptoms(1 year = 12%; 3 years = 65%), and between the former and seropositiveness(40% HIV+ after 2 years; 59% after 4 years). Homo- or bisexual behavior was admitted by 23% of the Pt, which percentage did not significantly alter seropositiveness level.
Conclusion. A high proportion of IVDA is HIV+. Time of addiction and presence of symptoms were separately associated to seropositiveness while homosexuality did not involve additional risk for this young group. Greater educational efforts should be made in order to limit the epidemics growth within heterosexual population.

Th.D.P.47 SEXUAL ACTIVITIES OF IV DRUG USERS WITH MULTIPLE SEX PARTNERS

McCoy, H. Virginia*; Trapido, E.J.**; Inciardi, J.A.***; McBride, D.C.**** and McKay, C.Y.**. *Florida International University, Miami, FL, USA; **University of Miami School of Medicine, Miami FL, USA; ***University of Delaware, Newark, DE, USA; ****Andrews University, Berrien Springs, MI, USA.

Objective. To describe the types of sexual activities of IV drug users who have multiple sex partners and their association with serostatus.
Method. As part of a study which tests two interventions to reduce AIDS among IVDUs, 346 subjects were recruited from drug networks, interviewed and tested for HIV antibody. Bivariate analyses, using Gamma and Chi Square values, were conducted to determine the associations.
Results. While almost 90% of IV drug users in this sample had multiple sex partners, less than one-fourth admitted to having sex for money and one-sixth had sex to obtain drugs. The type of sex (except for vaginal sex) engaged in with their multiple partners was significantly associated with the number of sex partners and with serostatus, but only when condoms were not used.
Conclusion. The type of sexual activity is an added dimension to be considered for educational prevention information for IV drug users on HIV risk factors.

Th.D.P.48 MOBILITY, RISK CITIES, RISK BEHAVIOR, AND HIV STATUS OF IV DRUG USERS

McCoy, Clyde B.*; Chitwood, D.D.*; Page, J.B*.
*University of Miami School of Medicine, Miami, FL, USA.

Objective. To determine the mobility of IVDUs and its relationship to risk behaviors and HIV status of more than 400 IVDUs recruited from the streets of the Miami metropolotan area.
Methods. IVDUs have been actively recruited by outreach workers into a centralized assessment center at the medical school at the University of Miami where blood samples and extensive assessments were provided to IVDUs in conjunction with pre and post test counseling. Assessments of sexual, drug taking and other social histories were taken by trained, specialized interviewers. Blood was drawn by a trained phlebotomist, specialized in working with IVDUs.
Results. Of the 56% of IVDUs who traveled outside of their local area, a large majority reported having had sex and a lesser majority indicated that they had shot up with drugs during this mobility. Those having sex, and having said they shot up during this period have a higher rate of seropositivity than those who had less mobility and/or had engaged in fewer risk practices.
Conclusion. There is a potential risk of transmitting the HIV virus from the prime risk metropolitan centers to other areas as potentially high risk IVDUs travel to other cities.

Th.D.P.49

GENERATIONAL DIFFERENCES IN HIV RISK BEHAVIOR AND SEROPREVALENCE RATES AMONG IVDUs

McBride, D.C.*; Inciardi, J.A.**; McCoy, C.B.***; Chitwood, D.D.*** and McCoy H.V.****. *Andrews University, Berrien Springs, MI, USA, **University of Delaware, Newark, DE, USA; ***University of Miami School of Medicine, Miami, FL, USA; ****Florida International University, Miami, FL, USA.

Objective. To examine generational differences in AIDS risk behavior and seroprevalence rates among IVDUs.
Methods. This analysis is part of an AIDS Community Outreach Project funded by the National Institute on Drug Abuse. Over 500 IVDAs not in treatment were recruited and interviewed with a focus on needle using and sexual behaviors. Bloods were drawn and analysed for the presence of HIV antibodies using ELISA and Western Blot techniques. Generation was obtained by asking date of birth and categorizing age into three categories: Post baby boomers, those born after 1958; baby boomers, those born 1946-1958 and pre-baby boomers, those born prior to 1946.
Results. Generation differences in risk behaviors and seroprevalence exist. While post baby boomers have drug use patterns and sexual behavior patterns similar to the other generations, they are more likely to clean their needles and have fewer sexual partners. Associated with these behavioral differences is the finding that post baby boomers have a seroprevalence rate of 15.7% compared to 25-29% for the other two generations (significant at the .006 level).
Conclusion. Younger generations of IVDAs may be most receptive to AIDS prevention strategies and most ready to change high risk behaviors.

Th.D.P.50

IVDU CHARACTERISTICS ASSOCIATED WITH NEEDLE SHARING

Mandell Wallace. Vlahov D. Cohn S. The ALIVE Study. Johns Hopkins School of Hygiene and Public Health. Baltimore. MD. USA.

Objective Ascertain Characteristics associated w/needle sharing in cohort of active IV drug users (IVDUs).
Methods IVDU's were recruited for a prospective natural history study of HIV infection from street outreach. clinics. hospitals and drug treatment programs. Characteristics were compared among IVDU's who reported or denied needle sharing in the preceding 6 mos.
Results Among 1417 active IDVU's. 980 (70%) reported sharing needles in the preceding 6 months. Race. sex. age and marital status were not associated with sharing.

	Share + (%)	Share - (%)	X^2/Fisher
Daily user	45	30	<.0010
Cocaine + other drugs	96	91	.0020
Started before '85	87	83	.0500
Unemployed at least 1 yr	71	78	.0100
Pub. Assist. for 1 yr	75	65	<.0010
Homeless for a period	50	42	<.0100
Arrest in last ten yrs	82	72	<.0001
Serious withdrawal	35	23	<.0001
Used gallery	48	11	<.0001

Conclusions Most currently active IVDU's in this sample (70%) reported sharing needles. The inability to head off serious withdrawal symptoms. more frequent use and economic destitution may be driving forces for needle sharing and gallery use. Multivariate analyses are being carried out.

Th.D.P.51

COCAINE, MARIJUANA AND ALCOHOL AS RISK FACTORS FOR HIV INFECTION IN HOMOSEXUAL MEN: A PILOT STUDY

Loue, S.*; McCutchan, J. Allen **; Brysk, L.**; Spechko, P.**; Weinrich, J.**; Molgaard, C.* et al., UCSD AIDS Cohort Study
*San Diego State Univ., and **University of Calif., San Diego, USA

Objective. To study the association between use of cocaine, marijuana, alcohol and HIV infection in homosexual men.
Methods. Drug, alcohol, and medical histories were compared in 50 HIV infected (HIV+) homosexual men and 44 HIV uninfected (HIV-) homosexual men, all without a history of intravenous drug use. Sexual histories of 11 HIV+ cases and 11 HIV- controls with were compared for the 7-year period (1978-1984) during which infection occurred and before they were told their HIV status.
Results. Odds ratios and multiple logistic regression analysis revealed a significant association between number of years of cocaine use and HIV seropositivity (p=.013). Odds of being seropositive increased with more prolonged exposure to cocaine (OR=3.7). HIV was weakly associated with levels of marijuana use, but not with levels of alcohol consumption. Analysis of the sexual histories of the subsample suggested an association between high-risk sex and levels of cocaine usage.

Cocaine Use	HIV+	HIV-	Total	Odds (HIV+/HIV-)	Odds ratio
0	9	16	25	.56	1.00
1-3	16	16	32	1.00	1.78
4-15	25	12	37	2.08	3.70

Conclusion. Cocaine, in contrast to alcohol and marijuana, may contribute to risk of HIV infection by promoting risky sexual behavior.

Th.D.P.52

AIDS-RELATED KNOWLEDGE, ATTITUDES, AND BEHAVIOUR IN IDUs ATTENDING A TORONTO TREATMENT FACILITY

Millson, Margaret*; Coates, R.*; Devenyi, P.**; Franklin, T.**; Rankin, J.** *Department of Preventive Medicine and Biostatistics, University of Toronto and **The Addiction Research Foundation, Toronto, Ontario, Canada.

Objective: To describe AIDS-related knowledge, attitudes and behaviour in a group of Canadian injection drug users (IDUs).
Methods: Over a 3 month period, 90/100 (90%) attending a Toronto treatment facility completed an anonymous, self-administered questionnaire.
Results: Of the 61 male and 29 female respondents, 44% were under 30 and 90% were under 40; 90% were heterosexual; 56% reported more than one sexual partner in the past year, with 12% reporting 10 or more. Most had a drug problem for more than 5 years (62%). The commonest primary drug was heroin (61%), with 20% being mainly cocaine users. 71% reported needle-sharing within 5 years, 36% within the preceding month. 96% knew that needle-sharing was a risk factor for AIDS; 79% indicated some awareness about heterosexual spread of AIDS. 88% were personally willing to be tested for HIV and 20% already had been (all were negative). 20% would change their drug use behaviour if they received a negative test; 8% their sexual behaviour. 19% indicated uncertainty as to how they would deal with a positive test, while a further 12% would consider suicide or resume heavy drug use. Current needle sharers could not be distinguished from former needle sharers on selected demographic, attitudinal, and knowledge variables.
Conclusion: IDUs are sharing needles despite knowledge of the risk. For those testing positive, there may be a risk of self-destructive behaviour. Testing should be done only with excellent counselling and ongoing support.

Th.D.P.53

MODE OF HIV TRANSMISSION AMONG SEROCONVERTED INTRAVENOUS DRUG USERS (IVDUs): 1987 AND 1988 COHORT STUDY

Brown, Lawrence S.; Nemoto, T.; Primm, B.J.; Foster, K.; and Chu, A. Addiction Research and Treatment Corporation, New York City, USA.

Objective. To investigate mode of HIV transmission among seroconverted IVDUs, especially focusing on their drug and sexual behaviors.
Methods. A total 441 subjects (218 in '87 and 233 in '88); 62% males and 38% females; 51% Blacks, 42% Hispanics, and 7% Whites; mean age=32 years, were recruited from methadone clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western Blot techniques.
Results. The overall HIV infection rate was 60% in 1987 and 52% in 1988. In 1987 and 1988, respectively, 19 of 23 and 23 of 40 subjects, who admitted to a previous HIV seronegative result, were found to test HIV seropositive. These suspected seroconverters significantly differed from subjects who remained seronegative in frequency of sharing needle (p<.01), sharing cookers (p<.02), and use of shooting galleries (p<.06) during the last 5 years. Among 1987 cohort group, all those who remained seronegative stopped sharing needles, but 12 out of 18 subjects who seroconverted still shared needles.
Conclusion. Needle-sharing behaviors continue to be associated with HIV seroconversion among IVDUs. More effective education to stop needle sharing among IVDUs is needed.

Th.D.P.54

INPATIENT GROUPWORK WITH INNER-CITY MINORITY DRUG-USING AIDS/ARC PATIENTS: IT CAN BE DONE

Pousson, Rachel; Graham, V.; Kitchens, A.
King's County Hospital AIDS Team, Brooklyn, New York, USA.

Objective. To use a group approach to increase coping in a population often thought too unsophisticated, defended, and non-affiliative to benefit from such a modality. Purposes: 1) educate about diagnosis, services; 2)reduce isolation and depression; 3) bridge to aftercare services; and 4) optimize education and counselling services.
Methods. Large city hospital with daily AIDS census of 65 serves a poor minority community. Patient population is mostly past/present IV-drug/crack users. General nursing staff support adjunctly helps motivate patients to attend group. Two nurses and a social worker use supportive techniques to facilitate this twice-weekly, voluntary, confidential group.
Results. Group size ranged from 6-13. Patients freely self-disclosed and empathized, displaying a capacity to both give and receive support. Patients resolved confidentiality issues through discussion, and without reticence processed themes of atonement, sexual responsibility, stigmatization, and maintenance of hope. Patients rapidly developed a sense of ownership of the group, and acted as outreach to other uninvolved, newly-diagnosed patients.
Conclusion. Contrary to expected concerns that patients would have great difficulty allowing their diagnosis to be revealed among their peers, patients joined together to affirm their commonalities and to forge a constructive camaraderie. The stereotyped image of this population as being incapable of bonding and emotional interdependence is inaccurate. Thus, organized peer support is a necessary part of social work with this population.

Th.D.P.55 THE DISINFECTANT POTENTIAL OF VINEGAR SOLUTIONS USED BY GLASGOW IDUs TO PREPARE HEROIN FOR INJECTION.

David J Goldberg*, N Flynn**, ST Green*, S Jain**, H Watson* & E Keddie** CD(S)U & Infectious Diseases Unit, Ruchill Hospital, Glasgow, U.K.* and University of California, Davis, Sacramento, CA., U.S.A.**.

Objectives: Since 1986, many Glaswegian injecting drug users (IDUs) have been using vinegar (a popular condiment) to prepare heroin for injection. This study explores the prevalence and significance of vinegar usage and relates this, wherever possible, to HIV transmissability.
Methods: Fifty IDUs were asked how they prepared their heroin for injection. In addition, the vinegar solutions most frequently used in Glasgow were identified and examined for possible disinfectant activity against HIV.
Results: All 50 heroin users dissolved their heroin in a vinegar/water solution prior to injecting; the vinegar/water ratio varied between 1:1 and 1:3. The heroin/vinegar/water solution would usually remain standing within the IDU's syringe for between 1 and 2 minutes. Both white (distilled) and brown (malt) vinegar solutions inactivated cell-free HIV at concentrations 100 times the amount of virus needed to infect an assaying system containing 10^5 CEM cells. These vinegar solutions also inactivated cell-associated HIV at a concentration of 10^4 infected cells/ml solution.
Conclusion: These findings indicate that, in Glasgow, vinegar plays an important role in the preparation of heroin for injection. Furthermore, its usage might have contributed towards keeping the seroprevalence of HIV among Glaswegian IDUs at a relatively low level of 6%.

Th.D.P.56 SEROPREVALENCE AND DEMOGRAPHIC RESULTS OF INTRAVENOUS DRUG USERS AMONG INDIVIDUALS AT RISK FOR HIV INFECTION IN A COMMUNITY-BASED STUDY IN WINNIPEG, MANITOBA, CANADA.

Hammond, Gregory W.*; Buchanan, D.**; Malazdrewicz, R.**; Tate, R.**; Sekla, L.*; and Bhayana, V.***.
*Cadham Provincial Laboratory, Winnipeg, Manitoba, Canada, **University of Manitoba, Winnipeg, Canada, ***Mt. Carmel Clinic, Winnipeg, Canada.

Objective. To determine the seroprevalence and demographics of individuals at risk for HIV infections, specifically to compare intravenous drug abuse (IVDA) subjects to other high risk subjects in a community-based study.
Methods. A community-based study of 452 volunteers at potential increased risk of HIV infection was undertaken in Winnipeg, Canada, from 1986-1989.
Results. Overall seroprevalence of HIV infection was 3.1% (14+/452), similar to the rate of 2.6% (180+/6873) based on all diagnostic tests in Manitoba. No seropositives were identified in the 104 subjects at risk of HIV infection through IVDA in the community study and only 2.1% of IVDA subjects tested positive (13/627) in the province. Drugs most commonly abused intravenously were ritalin and talwin in 65%, and/or cocaine in 38%. Significantly more (p 0.001), 75% vs. 43% of non IVDA subjects had less than a Grade 12 education level, 53% vs. 28%, were of Native/Metis race (p 0.001). Fifty-seven percent of the IVDA subjects had more than one risk factor for potential acquisition of HIV while only 20% (p 0.001) of non IVDA subjects had multiple risk categories.
Conclusion. Local seroprevalence of HIV infection remains low in Manitoba. However, local IVDA subjects have important characteristics and must be considered in the design of drug prevention programs aimed to minimize the spread of HIV infections.

Th.D.P.57 INFORMATION ON HIV-1 TRANSMISSION AND SEXUAL BEHAVIOUR IN COUPLES OF INTRAVENOUS DRUG ABUSERS (IDAs).

Tor Jordi, Ginestà C, Muga R, Clotet B, Rey-Joly C, Foz M.
Infectious Disease Unit. Service of Internal Medicine. Hospital "Germans Trias i Pujol". Universitat Autònoma de Barcelona. Barcelona. Spain.

Objetive. To evaluate whether information on HIV-1 heterosexual transmission modifies the behaviour and sexual practices of IDAs partners without any known risk factors for HIV-1 infection than sex with a seropositive patient.
Methods. From May 1985 to December 1988, 127 IDAs couples having one of both no other risk factors for AIDS were included in a follow-up study on HIV-1 heterosexual transmission. Every 6 months they were evaluated by means of a questionnaire on sexual uses and received oral and written information about HIV-1 infection and sexual activities of major and minor risk, and we also analised the HIV-1 antibodies.
Results. At time of admission in the study, 66.7% of couples had received informative on HIV-1 transmission by sexual practice and only 8,3% took some prophylactic measure. the mean time of sexual relationship was 44.6 months (1-276m.) with a mean of 12.9±8.5 sexual intercourses monthly. 72/127 couples (56.7%) had 15.2 months follow-up (range 6-36 m.) and 52 are in the initial period. After the 1st control, 95% of couples (57/60) affirmed they have received information (p=0.007) and only 49% (34/69) had realised some prophylactic measures (p<0.001). There was a significative decrease of the sexual (p<0.001) and vaginal (p=0.005) intercourses and an increase in condom use (9.4% vs 42.0%; p<0.001). However, there weren't changes in orogenital and anal relations, semen swallowing and intercourses during menses. All of these without differences between seronegative and seropositive couples, during admission or at follow-up.
Conclusion. Although the information given about HIV-1 transmission was known for the greater part of couples in the follow-up, it has only modified some sexual behaviour in less than half of couples. The most significant changes were the decrease in the number of sexual intercourses and the increase in the number of couples using condoms.

Th.D.P.58 HIV SEROPREVALENCE IN TWO METHADONE DRUG TREATMENT PROGRAMS IN LOS ANGELES COUNTY, 1988

Kerndt, Peter R., Ford, W., Straatz, I., Kessler, J., Rose, T.
Los Angeles County Department of Health Services, Los Angeles, California, USA

Objective. To estimate the seroprevalence of human immunodeficiency virus (HIV) among intravenous drug users (IVDU) enrolled in methadone treatment programs in Los Angeles County (LAC).
Methods. Between August and December, 1988, consecutive clients enrolled at two methadone detoxification and maintenance programs were screened for HIV antibody (Ab). Repeat ELISA positives were confirmed by immunofluorescent antibody (IFA) and Western Blot. HIV Ab result was linked without personal identifiers to self-reported demographic and risk factor information.
Results. Of the 223 methadone detox and 66 maintenance clients, 2.4% (7/286) were confirmed HIV Ab positive; rates were 3.0% (6/198) in men, and 1.1% (1/88) in women. Seropositivity among blacks was 15.4% (2/13), whites 2.2% (3/139), and Hispanics 1.6% (2/125). Blacks comprised only 4.5% of those in drug treatment, but accounted for 28.6% of the seropositives. In contrast, whites and Hispanics made up 47.8% and 44.7% of the study population, and 42.9% and 28.6% of the seropositives, respectively. Only 1.7% of clients (5) identified themselves as gay or bisexual, and none were positive. Sixty-six percent (198/289) of clients reported needle sharing activities, while only 26.2% (78/298) reported the use of bleach to clean their needles.
Conclusion. HIV seropositivity among IVDUs in Los Angeles County remains low despite a high percent of needle sharing and provides a significant public health challenge. Effective intervention strategies are urgently needed to prevent the future spread of HIV within this high risk group, and will have their greatest impact if implemented when seroprevalence is low. On-site HIV testing and counseling is well accepted among methadone detox and maintenance clients, and should become an integral part of all prevention strategies in drug treatment facilities.

Th.D.P.59 LOW HIV SEROCONVERSION AND CHANGE IN HIGH RISK BEHAVIOR IN INTRAVENOUS DRUG USERS (IVDUs) FROM 1985-88 IN THE BRONX, N.Y.C.

Schoenbaum EE, Hartel Diana, Selwyn PA, Klein RS, Friedland GH. et al. Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, NY, USA.

Objective. To determine the seroconversion rate and changes in high risk behavior in HIV seronegative (SN) and seropositive (SP) IVDUs in the Bronx, NYC from 1978-88.
Methods. Since 6/85 701 methadone maintained IVDUs enrolled in a HIV natural history study had semi-annual interviews about drug use and sexual behavior, demography and tests for HIV antibody (Ab). HIV Ab results, education and counselling were provided.
Results. Of 661 enrolled in 1985-86, 425 (262 SN and 163 SP) have been followed for a mean of 30 mos. Twenty-five percent were black, 50% Hispanic, 25% white and 52% male. Fourteen of 262 (5.3%) SN acquired HIV Ab during a mean of 29 mos. follow-up (1.5/100 person-yrs). From 1985 to 1988 there was a consistent decrease in mean injections(INJ)/mo. in both SP and SN (p<.001) as well as a decrease in shooting gallery INJ in both groups (p<.01). Reduction in IV drug use began in 1984, continues through 1988 and on regression analysis was predicted by SN status (p=.03), white race (p=.05) and the presence of HIV related illness (p<.05). For 66% of SN and SP continuing to inject the % of cocaine INJ rose steadily from 1984-88 (p=.001). CRACK was used by by 89/425 (21%), started in 1985 and was associated with SP status (p=.04), females (p<.001) and continuing injections (p=.03). Heterosexual contact with IVDU sex partners declined 53% in SN and 51% in SP (p=.003) and prostitution declined 80% in SN and 40% in SP(p=.002) from 1985-88.
Conclusions. This cohort of IVDUs has demonstrated a significant decrease in high risk drug and heterosexual behaviors and a corresponding low HIV seroconversion rate (1.5/100 person-yrs).

Th.D.P.60 SOCIAL, SEXUAL AND DRUG USE PROFILE OF HIV (+) AND HIV (-) WOMEN WITH PID

Hoegsberg,Bente;Dotson,T;Abulafia,O;Tross,S;DesJalais,D; Landesman,S; Minkoff,H: State University of New York, HSC in Brooklyn and Kings County Hospital, Brooklyn, New York,U.S.A.

Objective: To develop a socio-economic, sexual and drug profile of women at risk for HIV infection. In 109 inner city black women admitted with pelvic inflammatory disease (PID), 14% were found to be HIV positive. 75% of the women were unemployed and 75% reported an income of less than $5,000 a year. Of the 11(10%) who reported an income of more than $20,000 a year, two had working husbands, two had well-paying jobs, two were on disability and three were drug dealers. Of 109 patients 56 (54%) admitted to crack use. Women using crack had twice as many sexual partners per month as non-users and were three times as likely to have more than four partners month.

	HIV(+)	HIV(-)	ODDS RATIO
N	15	94	95% CI
Crack use	13(87%)	43(46%)	7.1
IVDA	6(40%)	3(3%)	20.2
Previous STDs	13(87%)	37(39%)	10.0
sex for drugs	4(27%)	17(18%)	1.6
Contraceptive use	4(27%)	20(21%)	1.3
#sex partners/mo(SD)	2.4(1.9)	2.1(2.6)	NS

Conclusion: 1) HIV (+) patients with PID were more likely to use crack, to have used drugs intravenously and to have had sexually transmitted diseases previously. 2) Women using crack engaged in more sexual risk taking. 3) We hypothesise that crack use may contribute to the sexual acquisition of HIV infection among poor, minority women admitted with PID.

Th.D.P.61 ACCESS TO IV DRUG USERS (IVDU) THROUGH COMBINED EFFORTS OF A PUBLIC HEALTH DEPARTMENT AND INDIGENOUS OUTREACH WORKERS.

Penney, Frances.*; Brewster T.+; Davidson, A.*; Koester S.+; Burke G.+; Cohn, D.*; Denver Disease Control Service*, Addiction Research Treatment Services,+ Denver, CO, USA

Objective: To access previously untested active IVDU for HIV counseling and testing (CT) through combined efforts of a public health department and indigenous outreach workers.
Methods: In 1988 Denver AIDS Prevention (DAP), a CDC-funded demonstration project and Project Safe (PS), a NIDA-funded street outreach program to IVDU, initiated a working agreement. From August through December 1988, PS's indigenous street outreach workers couriered 164 IVDU to DAP's counseling and testing site (CTS). All IVDU received $5 following pre-test counseling and venipuncture and were scheduled for results and post-test counseling without monetary incentives for the return visit.
Results: Comparison of PS IVDU to other IVDU seen in DAP's CTS between August 1 and December 22, 1988 were [No.(%)]:

	PS	CTS
Total No. tested	164	175
Race/Ethnicity	B 102(62) H 22(14) W 39 (24)	B 10(5) H 26(15) W 139(80)
No. Homosexual-bisexual (H-B)	5 (3)	25 (14)
No. 1st Time HIV Tested	121 (74)	96 (55)
No. HIV Positive: Hetero/H-B	4 (2) / 2 (1)	3 (2) / 6 (3)
Total Returned for HIV Results	24 (15)	139 (79)
No. HIV+ Returned for Results	2 (33)	7 (78)

Conclusion: Indigenous street outreach workers were able to access minority IVDU, most of whom had not previously undergone HIV CT. Return of PS clients for post-test counseling was poor compared with other CTS clients. Whether the engendering of trust through outreach workers or the offer of monetary incentives improves access to and return of IVDU for CT needs further investigation.

Th.D.P.62 MODIFICATION OF NEEDLE USE IN OUT-OF-TREATMENT INTRAVENOUS DRUG USERS

Feldman, Harvey; Biernacki, P.; Knapp, T. and Margolis, E.
Youth Environment Study, Inc., San Francisco, CA, U.S.A.

Objective. To modify drug-using behaviors through ethnographic street-based AIDS health educators.
Methods. Five hundered and five intravenous drug users (IVDU's) were identified through chain referral and targeted sampling in a major urban county of 750,000 people and approximately 15,000 IVDU's, 15% of whom are HIV seropositive. Each was administered an extensive (45 page) structured interview regarding knowledge, attitudes and behavior about AIDS and drug use.
Results. This largely (>87%) opiate-using sample also combines heroin and cocaine (77%); amphetamines and crack have been used by about half the group. Results indicate use of condoms has risen from 23% in 1986 to 42% in 1988; cleaning of needles (usually with bleach) rose from 39% in 1986 to over 70% in 1988. One third of the sample always shoots up at home and 54% began shooting drugs when they were under 21 years old.
Conclusion. While needle hygiene has increased among the IVDU population, the consistency of cleaning and/or not sharing needles could be improved. Because this subculture depends upon oral communications, repeated delivery of health messages is the most effective way to impact behavior and reduce HIV transmission. (Funded in part by National Institute of Drug Abuse Grants #R01DA04319-03 and #R18DA05879-01)

Th.D.P.63 RISK BEHAVIOR IS COMMON AMONG DRUG USERS DESPITE KNOWLEDGE OF TRANSMISSION ROUTES, ACCESS TO STERILE SYRINGES AND HIV ANTIBODY TESTING.

Anne Eskild*, Ingela Lundin Kvalem*, Bente Nilsen**
*Dep. of Epidemiology, National Institute of Public Health, Oslo, Norway.
**Municipal outreach program among drifting youth, Oslo, Norway.

Objectives. To look at the prevalence of HIV and risk behavior among drifting, iv.drug using youth in Oslo.

Methods. The number of iv.drug users in Oslo is assumed to be 1700-3500. An earlier survey had shown that the level of HIV related knowledge was high in this group. At the time of this study syringes was sold without restrictions at pharmacies in Oslo. The municipal outreach program among drifting youth have each year contact with about 900 differant iv. drug users. In 1988 an anonymous questionnaire survey on prevalence of HIV testing, iv. drug use and sexual behavior was performed. The study included 70% (127) of all the iv. using clients of the outreach program during a 5 weeks period. The mean age was 22.

Results. HIV tested=87% (107/127). HIV positive=19%.
Borrowing used syringes past month=29%(37/127). Lending used syringes the past month=30% (38/127). Ever borrowed syringes used by someone they knew where HIV positive=23% (29/124). Median number of lifetime non-paying partners=10. 1/3 of the partners were also iv. drug users. 15% (19/127) reported to have used of condoms by last sexual intercourse with non paying-partner. Those who had the most partners, used condoms the least. 80% (50/63) of females and 30% (19/64) of males reported income from prostitution.

Conclusions. Risk behavior is common in this group of iv. drug users in spite of relevant knowledge, access to sterile syringes and high level of volunteer HIV-testing.

Th.D.P.64 PREDICTORS OF ATTEMPTED SEXUAL BEHAVIOR CHANGE IN A STREET SAMPLE OF ACTIVE MALE IV DRUG USERS IN NEW YORK CITY

Abdul-Quader, Abu*; Tross, S*; Des Jarlais, DC**; Kouzi, A*; Friedman, SR*; McCoy, E*.
*Narcotic and Drug Research, Inc., N.Y., N.Y., U.S.A.; **New York State Div. of Substance Abuse Services, N.Y., N.Y., U.S.A.

Objective. Inner city male IVUS's are the key bridge to heterosexual HIV transmission. Their resistance or amenability to sexual risk reduction practices is poorly understood. Thus, the objective of this study was to identify predictors of sexual behavior change in response to HIV infection in a street sample of active IVDU's in the lower East Side of Manhattan.
Methods. Two hundred seventy nine male IVDU's were recruited through street outreach contacts with neighborhood ex-IVDU workers. Paid face-to-face structured interviews were conducted to assess HIV-related risk behavior, beliefs, and behavior norms.
Results. Subjects were asked to report behavior changes that they have made because of AIDS. 55% of the sample reported making one or more sexual behavior changes (i.e. condom use, abstinence, reduction in number of parners, avoidance of "high risk" partners). In multiple logistic regression, significant positive predictors included having more than 1 partner during the average month of the past year (p<.018); having friends who made sexual behavior changes (p<.005); and having a relatively strong sense of self-efficacy about being able to make risk reduction behavior changes (p<.018). Ethnicity, being in a sexual relationship, knowing someone with HIV disease and perceived current or future risk of HIV infection were not significantly associated with behavior change.
Conclusion. The majority of a street sample of active male IVDU's reported making some sexual risk reduction. This result is consistent with rates of drug risk reduction obtained in other studies (Friedman, et al, 1987; Selwyn, et al, 1987). The present findings argue for the role of empowerment and normative influences in promoting behavior change.

Th.D.P.65 STREET OUTREACH STRATEGIES FOR INTRAVENOUS DRUG AND CRACK USERS, THEIR SEXUAL PARTNERS, AND ADDICTED PROSTITUTES AT RISK FOR HIV

Yolanda Serrano*, D Goldsmith **,*
*ADAPT (Association for Drug Abuse Prevention and Treatment) NY,NY,USA
**NDRI (Narcotic and Drug Research, Inc.) NY,NY,USA

Objective. To advocate for substance abusers and their families as an accessible street agency.
Methods. The Association for Drug Abuse Prevention and Treatment (ADAPT) has been established since 1980 and offers substance abuse information, counseling, referral services and advocacy for substance abusers and their families as a street agency. Access is by telephone hotline, drop-in, and street work. Street based interventions reach substance abusers at risk of exposure to HIV who are not in contact with any agencies or treatment programs. ADAPT's health education model was designed to first gain access to this high risk population and then teach them skills for reducing risk and to continue as an information resource. Teams of outreach workers cover specific geographic areas where services are otherwise not available. The outreach workers go into the shooting galleries (drug injection buildings) and crack (smoking) houses in these neighborhoods, meet drug using prostitutes on the stroll, and distribute risk reduction information, condoms, and bleach with instructions for their use to disinfect injecting paraphernalia.
Results. ADAPT has found that street outreach to this population is time-consuming and dangerous, and requires constant contact with the community and a constant presence on the streets. High risk locales must be regularly revisited in a regular pattern of movement that drug users can recognize so that they know how and when to find outreach workers and receive assistance. The outreach worker must initiate contacts in high drug trafficking areas and develop friendly relations with a network of drug users, always being open about what they are doing and why.
Conclusion. Advocacy and street outreach can create peer pressure and peer support, and help spread the risk reduction message among drug users, if the methods the workers utilize are open, respectful and culturally sensitive and combined with knowledge of street language and the street scene.

Th.D.P.66 ORGANIZING INTRAVENOUS DRUG USERS AGAINST AIDS

Samuel R. Friedman*, Y Serrano**, L Torres**, M Sufian*, Pat Nelson**, F Tardalo*** et al.
* Narcotic and Drug Research, Inc., NY, NY, USA. **Association for Drug Abuse Prevention and Treatment (ADAPT), NY, NY, USA. ***NY State Div of Substance Abuse Svcs, NY,NY,USA

Objectives: To organize IV drug users (IVDUs) to support each other in AIDS risk reduction.
Methods. Ex-user organizers with organizing experience (in religious, political, or public health activities) were hired to develop ways to organize IVDUs. Some initial acceptance by local IVDUs had previously been established by educational outreach by ADAPT; the organizers established deeper acceptance by street-level AIDS education, distributing bleach and condoms, and helping users get access to medical and drug treatment services. Persuading and pressuring emergency services and hospital administrations to provide services in ways acceptable to drug users helped win acceptance. Potential indigenous leaders were identified when they distributed bleach to others; helped organizers fill bottles with bleach for distribution; and allocated tasks during the removal of used syringes and other waste materials from an abandoned building containing shooting galleries. An IV drug using prostitutes collective was also organized by ADAPT. Attendance at meetings was encouraged by providing food and daily living supplies.
Results. 27 weekly meetings of an IV-drug-using prostitutes' collective have been held since summer 1988. Topics discussed include drug and sex risk reduction, how to get customers to use condoms, and handling customer violence. Observation by group leaders and ethnographers indicates that the women are developing a group consciousness, lend each other condoms or pick up condoms for each other, and protect each other against customer violence. Group organizing has been slower for male IVDUs; 3 meetings were held in late 1988.
Conclusions. "Outside" organizers can organize female IVDUs who are prostitutes to attend meetings at which AIDS-related topics and other problems they face are discussed. IVDUs who are prostitutes make condom use a group norm as a result. It remains to be determined whether male IVDUs can be organized; whether organization spreads; and whether organization leads to greater risk reduction among active participants and/or among other IV drug users in the area than does standard health education outreach.

Th.D.P.67 LONG TERM FOLLOW UP OF A COHORT OF DRUG ABUSERS OF THE AREA OF REGGIO EMILIA (NORTH ITALY)

Gafà S., Giudici M.G., Vezzani F., Tumma A., Calonghi G.F.
Divisione Malattie Infettive, Arcispedale S. Maria Nuova, Reggio Emilia, Italy.

Objective. To examine the natural history of the disease in the drug addict and ex drug addict. To value risk factors and progression in AIDS.

Methods. In May 1985 we began a long-term follow up programme of IVDAs and ex IVDAs with HIV infection, who live in the area of Reggio Emilia (North Italy). This study is being carried out on about 500 patients thanks to collaboration among the Department of Infectious Diseases, the Rehabilitation Units of the area and the prison.

We think HIV began to circulate among IVDAs in our area in 1982-1983.

170 IVDAs HIV+ with two AIDS cases were found out in December 1985. 504 HIV+ with 30 AIDS cases have been found out up today. The patients are followed with six-monthly check up in Day Hospital, wich consist in medical examinations an in serologic, immunologic, and instrumental tests.

111 drug abusers HIV infected, in II and III group of the CDC's classification, were enrolled from June 1985 to June 1986. 70 of them have completed 3 years of their follow up at least, 9 of them died (3 for AIDS), the remainder didn't present themselves for the following controls.

In this study we are describing these subjects in their clinical development (according to CDC classification) and on the ground of some parameters: beginning year of the used drug i.v., passing months from the first confirmed positive test for HIV antibodies, total number of lymphocytes, number of CD4, B_2-microglobulin, IgA, positivity of HIV-antigenaemia, other risk factors as homosexuality and/or prostitution.

Th.D.P.68 A STUDY COMPARING NON HIV-RELATED DEATHS AMONG HIV-SEROPOSITIVE IVDA'S WITH DEATHS AMONG SERONEGATIVE IVDU'S. THE HIV-PREVALENCE AND THE SERO-CONVERSION RATE AMONG IVDA'S.

Christian Sohlberg, Peter Kittelsen, Finn Jensen, Oslo City Health and Environment Department, Per Magnus, Norwegian National Institute of Public Health, NORWAY

OBJECTIVES. The Department of Aids Prevention runs a testing and counselling clinic as well as an out-patient clinic for hiv-positives. The clinics have since the epidemic among IVDA's became known been the most visited testing and counselling facility for IVDA's in Oslo. Between august 1985 and january 1989 approximately 1000 IVDA's have registered at the clinic. The sero-prevalence and the sero-conversion rate among the tested IVDA's will be presented. The main objective of the study is to estimate the mortality rate among all 1000 IVDA's registered, and to compare sero-positives and sero-negatives. The mortality rate will be studied with respect to other background factors.

METHODS. The 1000 IVDA's represent between 25%and 40% of the IVDA population in the Oslo area. All clients at the clinic seek it voluntarily. All information regarding deaths and causes of death are based on statistics obtained from The Central Bureau of Statistics. The hiv-serologic results are based on tests taken at the clinic, or first reported to us by the client and subsequentely confirmed by the department. The causes of death will be presented graphically. Survival-analysis utilizing Kaplan-Meier plots will be used to compare the hazard rates of the two groups.

RESULTS and CONCLUSIONS. Results, statistics and conclusions will be avaiable and presented at the conference.

Th.D.P.69 METHADONE MAINTENANCE IN HIV-INFECTED I.V. DRUG ADDICTS - MEDICAL AND PSYCHOSOCIAL EFFECTS

Walger, Peter, P. Baumgart, G. Wilke, U. Kupfer, P. Heyen, K. G. Dorst et al. Medizinische Poliklinik, University of Münster, F.R.G.

Objective: to study the effects of methadone maintenance in AIDS- ARC- i.v. drug addicts on medical, psychological and social parameters.

Methods: open prospective study; 30 i.v. drug addicts (CDC IV, WR 3-6) were enrolled before and during methadone maintenance. Clinical and labor, data, psychological and quality of life parameters and toxicological screening tests were evaluated. The study was based on cooperation between general practitioners, the HIV-outpatient department stuff and institutional psychosocial support.

Results: We evaluated data of 30 patients (20 m 10 f) mean age 29,3±3y, after an average methadone maintenance of 13 (3-24) month. 5 of 30 patients had relapsed, 2 of them only for several weeks. Medical parameters were improved in 20 of 25 patients (body-weight, secondary complications due to HIV and drug addiction, neoinfections). Psychological parameters were improved in 17 of 25 patients. Stabilization could not be achieved in 4 patients because of ongoing i.v. drug addiction of their partners. Drug-delicts stopped in all patients, proctitution in those, who remained in methadone therapy. Positive effects due to quality of life were noticed by all. Change of HIV-stage was observed in only 3 patients, in 2 of them after relapse.

Conclusion: chronical HIV-infected i.v. drug addicts do benefit from a controlled methadone maintenance. Most of them did stop i.v. drug addiction, drug delicts and prostitution as a necessary condition for medical and psychosocial stabilization. Cooperation of all medical and psychosocial institutions is of paramount importance. In addition this stabilization has its place in regard to prevent further spread of HIV-infection.

Th.D.P.70 THE USE OF STERILE SYRINGES AMONG IVDUs THAT HAD GONE THROUGH DETOXICATING TREATMENT AT HOME DIRECTED BY A CENTER OF HEALTH PROMOTION IN MADRID.

Matinez Barrios Juan Carlos *, P. Estébanez **, P. Vitores *** and R. Vallesas. - * Doctor, Health Center for D.U., Torrejon de Ardoz (Madrid); ** Doctor, Madrid City Council; *** Nurse ATS, Madrid City, SPAIN Council; **** City District Instructor, Madrid City Council, SPAIN

Objective: To study the influence of AIDS prevention campaign messages on 72 IVDUs that had been treated with clonidine, with regard to changing of habits and to permanence.

Methods: Health-epidemiological inquiry on the present situation of 72 IVDU who were treated with clonidine during 1986-1987, with regard to drugs dependence and AIDS risk habits.

Results: 53 (73%) out of the 72 IVDU answered the questions; 18 of them were 25-29 years old, 20 were 30-34 years; 45 of them (85%) were males and 8 (15%) females; 52.5% had been IVDU for 7-10 years. The economical level of the group was 49% under the minimum wage. In Jan '88 : 18 were abstinents, 8 relapsing periodically and 25 remained DUs. Habits regarding HIV risk infection: 80% have a better health control; 70% know and spread out prevention methods; 43% improve alimentation habits; 38% improve family relations. Out of the 25 staying DU, 5 sniffing, 11 occasionally users and 9 remained daily IVDU. As for the spreading of AIDS control methods, as health workers we point out: 45% bring new drug addicts to the Center, 30% recommend the use of steril syringes, 5% recommend the use of condoms. None of the 20 IVDUs use shared syringes, 2 of them exceptionally, and 18 of them use individual syringes.

Conclusion: The above reveals the importance of the detoxicating treatments even if there are relapses due to the influence on the subsequent health condition.

Th.D.P.71 SURVEY OF THE METHADONE TREATMENT PROGRAMME OF THE OUTPATIENT CLINIC OF THE VIENNA PSYCHIATRIC UNIVERSITY HOSPITAL

Hutterer, Judith**; Presslich, O.*; Pfersmann, D.*; Hollerer, E.*; Pfersmann, V.*; Gutierrez-Lobos, K.*.
* Psychiatric University Hospital, Vienna, Austria, ** Österreichische AIDS-Hilfe (Austrian AIDS Foundation), Vienna, Austria.

Objective: To present a survey of the structure and status of the patients in the programme mentioned above.

Methods: The outpatient clinic mentioned above has been carrying out a methadone detox and maintenance programme since October 1987 and has by now the largest number of patients in Austria. The data presented are results taken from routine documentation.

Results: The following data (average values) concerning the 99 men and 37 women treated were obtained: age at the start of the methadone treatment: 29 years; age at first contact with drugs: 15 years; length of opiate dependency: 12 years; in methadone treatment: 8 months; first methadone dose: 65,25 milligrammes; present-day dose: 77,77 milligrammes; HIV positive: 44% (75% men, 25% women); polytoxicomanic addiction of the HIV positive patients at the time of methadone adjustment: 50% (73,3% men, 26,7% women); working at the start of methadone treatment: 21,3%; working since methadone substitution: 30,9%; previous convictions (drug abuse offences): 64,7% (79,5% men, 20,5% women); initial drug: 69,8% hashish, 19,8% opiates, 5,9% medicants, 0,7% solvents, 3,8% unknown; couples in treatment: 13,2% (both are HIV infected: 33,3%, one partner is HIV infected: 22,2%, both partners are negative: 44,5%).

Conclusion: The programme promotes social and occupational reintegration.

Th.D.P.72 AIDS RELATED BEHAVIOR AND ATTITUDES AMONG IV DRUG USERS IN GREECE

A. Kokkevi, S. Alevizou, C. Stefanis
Department of Psychiatry, Athens University Medical School, Athens, Greece

Objective. Data presented in this study constitute an attempt towards the identification of possible factors influencing the low transmission rate (seroprevalence rates lower than 1%) of HIV among Greek IV drug users.

Methods. Behavior linked to the virus transmission such as needle and syringes sharing practices and sexual behavior have been investigated in a sample of 107 IV drug users who were in contact with health services. Subjects were additionally asked on the main sources by which they get information on AIDS as well as on their personal beliefs and attitudes related to the risks of infection.

Results and conclusions. Preliminary findings show that high risk drug using practices such as sharing of syringes and needles is reported by the majority of subjects (75%) while only 33% of them state having changed such practices due to the appearance of AIDS. Concerning their sexual behavior the majority (83%) use rarely (22%) or even never (61%) condoms during intercourse. From those reporting homosexual contacts (20%) the large majority has sexual contacts with both sexes. Half of the population stated not having changed sexual behavior after the appearance of AIDS. Low levels of awareness and sense of responsibility to HIV transmission dangers is further confirmed by the high rates of those who believe that it is very or even totally impossible to be infected by the virus (55%). Moreover respondents expressed the opinion that the level of awareness for HIV transmission among subjects in their environment is low to non-existent (30%) and that no change has occurred in behavior (47%). A minority only (9%) considered as main source for its personal information on AIDS health professionals, while for the majority (76%) the main source of information was the mass-media and mainly periodical press. Findings are discussed along with hypotheses on the possible reasons of low HIV prevalence among drug users in Greece and implications for prevention are considered. Data derived from this study have been used as a basis for the initiation of an ongoing more elaborate and extensive WHO supported study.

Th.D.P.73 STREET BASED NEEDLE EXCHANGE PROGRAMS: THE NEXT STEP IN HIV PREVENTION

PREVENTION POINT RESEARCH GROUP*
*Independent, Community Based Research Group, San Francisco, CA., U.S.A.

Objectives. To evaluate the feasibility of a street-based needle exchange program in a community at high risk for HIV infection via contaminated needles. To determine levels of participation in and demographic characteristics of potential client population.
Methods. Using ethnographic techniques, a high risk neighborhood in San Francisco was identified. Prevention Point began operating an anonymous, street-based needle exchange program one day a week. Used needles were accepted into a biohazardous waste container and sterile insulin syringes were dispensed on a one to one exchange basis. Syringes were marked and monitored for return rates. Demographic information was collected unobtrusively. Two methods of exchange were piloted concurrently. In one method, the exchange staff remained in the same visible, stationary location. In the other method, mobile exchange staff contacted IV drug users in locations where high risk activities were taking place.
Results. Preliminary results show that after three months of operation, a street based needle exchange is feasible. Over 225 clients were served, 456 syringes were collected and 456 were dispensed. Overall return rate of banded syringes was 22%. Return of marked syringes was over 50% during current week of operation for the stationary exchange. Problems with security of staff, supplies, and syringe disposal were not encountered. Demographic information and other data will be presented. Information and education about drug treatment was provided to those who requested it.
Conclusions. IV drug users when given the opportunity to acquire sterile injection equipment and return used syringes, in a anonymous, nonjudgmental, and accessible location will do so on a regular basis. The pilot needle exchange resulted in the reduction of the supply of discarded, used, and possibly HIV contaminated syringes in a high risk neighborhood of San Francisco. Administration of the needle exchange was simple, direct, inexpensive, and efficient. This pilot study suggests the need for an ongoing, prospective study of needle exchange as a method for prevention of HIV transmission among IV drug users.

Th.D.P.74 HISTORICAL ACCOUNT OF THE TACOMA SYRINGE EXCHANGE

David Purchase*, H Hagan**, D C Des Jarlais***, T Reid**.
*Point Defiance AIDS Project, Tacoma, WA, **Tacoma Pierce County Health Dept, Tacoma, WA, ***New York State Division of Substance Abuse Services, New York, NY, U.S.A.

OBJECTIVE To describe the history of the origins and operations of the Tacoma syringe exchange.
METHODS This history is provided by the founder (first author) of the syringe exchange (SE). Other authors include those who acted as consultants on research and evaluation, and those who led the effort to obtain public sanction for the SE.
RESULTS The first SE in North America was established in Tacoma, Washington in August, 1988. Close work with the Chief of Police, city government and the local Health Department laid the groundwork for this successful program. Once the SE had been operating for several weeks, the media assisted through positive and factual reporting, which was educational to the community and its policymakers. Concerns of liability and prosecution in the face of strict drug paraphenalia laws needed to be resolved before the SE could begin swapping syringes. Funding for the SE initially came from the pockets of the first author. Small private contributions followed, until January 1989, when the Health Department decided to fund the SE. The SE operates on a one-for-one exchange basis: one clean syringe for each used one. There are no lines to stand in, no forms to fill out. It currently serves approximately 300 injecting drug users (IDUs) per week, in a community with an estimated 3000 IDUs. The SE enables the Health Department's AIDS Outreach staff to gain access to IDUs and offer drug treatment information and detoxification coupons as well as AIDS education. With the promise of funding, the SE is able to expand its hours of operation and to set up additional sites in areas with high prevalence of intravenous drug use.
DISCUSSION The Tacoma SE has progressed from an officially tolerated operation to one that is officially funded. In providing another risk reduction option for IDUs who will continue to inject drugs, the SE fits into an overall scheme of providing choices for those at risk, in keeping with the harm reduction strategies successfully employed in Europe. Further evaluation of the impact of the SE on drug injection behavior and hygiene is necessary to ensure continued public support.

Th.D.P.75 AIDS EDUCATION AND THE TRANSITION FROM NON-INJECTING DRUG USE TO INJECTING DRUG USE

Don C. Des Jarlais*, C Casriel**, SR Friedman**, A Rosenblum***, R Rodriquez, E Khouri*** et al.
* New York State Div. of Substance Abuse Serv., N.Y., N.Y., USA, **Narcotic and Drug Res., Inc., N.Y., N.Y., USA, ***New York Hospital, N.Y., N.Y., USA

Objective: To assess the extent to which education about AIDS is sufficient to prevent the transition from non-injecting to injecting drug use.
Methods: 102 subjects were recruited through street outreach, personal referrals and newspaper advertisements for persons who were "sniffing" heroin (using intranasally). All subjects were sniffing heroin at intake, with 41% sniffing at least daily. 52 (51%) had previously injected, but none had injected for more than 2 months in the previous 2 years. Subjects were 58% male; 50% White, 23% Black, 27% Hispanic. All were given an extensive questionnaire about AIDS risk behavior, had their questions about AIDS answered, and received HIV antibody counseling and testing. Subjects were then randomly assigned to an experimental condition, with an additional 8 hours of AIDS education, or a control condition. Follow-up interviews were conducted with 82 (80%) subjects with a mean time of 8 months to follow-up.
Results: All subjects knew that AIDS was transmitted through sharing injection equipment at the intake interview. Fear of needles was given as the primary reason for not injecting by 63%, with concern about AIDS given by only 23% as a reason for not injecting. 10/82 (12%) of the subjects injected drugs during the follow-up period. Additional education was not significantly associated with less injection during follow-up, ($p<.16$). In a logistic regression, having a close personal relationship with a person who was injecting, and having a history of any prior injection were independently associated with follow-up period injection (both $p<.05$).
Conclusion: Intensive education about AIDS was not sufficient to prevent a sizable minority of heroin sniffers from moving to injection even within a relatively short follow-up period. The transition to injection occurs primarily within close relationships with current injectors; programs to prevent the transition to injection need to develop ways of isolating the individual from the effects of such close personal relationships.

Th.D.P.76 THE EFFECTS OF AIDS EDUCATION ON THE KNOWLEDGE AND ATTITUDES TOWARDS AIDS BY SUBSTANCE ABUSERS IN A DRUG DETOXIFICATION SETTING

Weber, John*; Dengelegi, L*; Torquato, S*; Kolakathis,A*; Yancovitz, S*
*Beth Israel Medical Center, N.Y., N.Y., U.S.A.

Objective. To ascertain the level of knowledge of substance abusers entering a major detoxification facility and the subsequent effects of different formats of AIDS education on their knowledge and attitudes towards AIDS and HIV transmission.
Methods. 100 consecutive admissions to the Beth Israel Medical Center Detox facility were pretested with a 30 minute interview, measuring their knowledge and attitudes about AIDS and HIV transmission. Patients were randomly assigned to different formats of education consisting of exposure to either a large group [≥25] 30 min. video tape presentation followed by 30 min. lecture, or small discussion group [≤8] formats. A post test was administered upon discharge.
Results. N= 100, 71 male, 29 female, 38 Black, 32 Caucasian, 29 Hispanic, Mean age= 35 Mean years of drug use = 13.2, 61 active IV drug users, 39 Non-IV drug users. At pre-test sujects demonstrated a substantial awareness of basic information concerning AIDS and HIV transmission. Although sharing needles was perceived as a major means of HIV transmission by 96% of patients and 50% had shared needles in the last year, these same IVDU's significantly minimized their own needle related risks vs. the risk of sharing needles in general[$p<.003$]. While 91% percent of subjects volunteered that condoms are an effective methods of protection, only 21% had used condoms at all. On post test, there was a significant increase in subjects estimates of their own drug related[$p<.004$] and sex related[$p<.002$] risk for infection and their faith in the effectiveness[$p<.001$] of and the willingness to use condoms in the future. [$p<.006$]. These increases in knowledge and attitudinal changes were not significantly related to format of education.
Conclusion. AIDS education in a detox setting can be an effective vehicle to address denial of risk for HIV infection among substance abusers.

Th.D.P.77 NEEDLE SHARING PATTERNS OF INTRAVENOUS DRUG USERS

Calsyn, Donald; Saxon, A; Whittaker, S; Freeman, Jr. G.; Veterans Administration Medical Center and University of Washington, Seattle Wash. USA

Objective: Examine needle sharing patterns of IV drug users in an attempt to explain lower than expected HIV seroprevalence rate. In Seattle the rate among male homosexuals is estimated at 25-35% and stable since 1985. Methods: In 1988, 273 IV drug users in treatment provided extensive personal interviews regarding drug use and needle sharing practices. HIV antibody testing was done on 169. The demographics of the sample were: male 186(68.1%), female 87(31.9%); (age,$\bar{X}$ =38.4); White 188(69.9%), Black 65(23.8%), other 13(4.8%); primary drug of abuse: opiates 208(77.1%), cocaine 31(11.4%), amphetamines 5(1.8%), ethanol 17(6.3%). Results: In the past year 187(68.5%) had shared needles, but only 55(20.4%) had shared in the past month. For those sharing, the mean number of people shared with in the past 30 days was 1.96, with 25% sharing with only 1 other person. The most popular way of obtaining needles was purchase in a drug store. Subjects admitting to IV cocaine use in the past 30 days shared with more people ($\bar{X}$=0.96,σ=2.3) than those admitting to other IV drug use ($\bar{X}$=0.48,σ=0.72). Only 2(1.2%) of those tested exhibited HIV antibodies. Conclusion: A majority of the IV drug users in this sample currently using IV drugs were avoiding needle sharing. This may relate to ease of obtaining sterile needles in Seattle where it is not illegal.

Th.D.P.78 USE OF CLINICAL CRITERIA TO PREDICT HIV ANTIBODY STATUS AMONG INTRAVENOUS DRUG USERS (IVDU) IN A PROSPECTIVE COHORT STUDY

Selwyn, Peter A; Hartel D; Schoenbaum EE; Klein RS; Buono D; Friedland GH; et al. Montefiore Med. Ctr./Albert Einstein College of Med., Bx, NY, USA.

Objective. To predict HIV antibody (Ab) status from history, symptoms, and clinical findings among methadone-maintained IVDU's in a prospective study of HIV infection.
Methods. Sensitivity (SNS), specificity (SPC), and +/- predictive value (PPV,NPV) in identifying HIV Ab status were calculated for subjects' history/symptoms and clinical findings from baseline data and clinical/research follow-up, [illegible].
Results. Of 672 subjects 274(41%) were HIV+, 398(59%) HIV-. Results (as percents):

History/Symptoms	SNS	SPC	PPV	NPV	Clinical Findings	SNS	SPC	PPV	NPV
Shooting gallery use	50	74	57	68	≥2 lymph nodes	11	97	71	61
Weight loss	43	72	51	35	bacterial pneumonia	15	98	83	63
Swollen glands	14	97	76	62	tuberculosis	4	100	100	60
Fever	9	97	65	61	oral thrush	23	100	100	65
Diarrhea	5	98	65	60	≥ 2 sx or findings	18	96	76	63
≥2 symptoms(sx)	16	96	73	62	≥ 3 sx or findings	5	100	100	60
≥3 sx	6	99	80	61					

Conclusion. History/sx and clinical findings were not sensitive in identifying HIV+ IVDU's, though the presence of multiple sx and certain findings had PPV ≥ 75%. Absence of symptoms/findings, while specific, had low NPV due to low overall frequency. PPV might be lower and NPV higher in populations with lower HIV prevalence. Clinical criteria, especially in combination, may aid decision-making in predicting HIV Ab in IVDU's, but insensitivity of these criteria and overlap of history/sx with HIV- IVDU's (excluding pathognomonic HIV-related conditions) require reliance on serologic tests to determine HIV Ab status in this population.

Th.D.P.79

CLINICAL SYMPTOMS AND MEDICAL HISTORIES OF A COHORT OF IV DRUG USERS: CORRELATION WITH HIV SEROPREVALENCE

Nelson, Kenrad E., Vlahov D., Solomon, L., Lindsay A., Chowdhury M., The ALIVE Study, Johns Hopkins University, Baltimore, MD, U.S.A.

Objective. To ascertain the frequency of clinical symptoms and histories of medical illnesses and their correlation with HIV seroprevalence in a cohort of active IV drug users (IVDUs).

Methods. A cohort of active IVDUs were recruited for a prospective study of the natural history of HIV infection from street outreach, STD clinics and ER's and drug treatment centers. Persons with AIDS were excluded. Reported symptoms and medical histories from baseline questionnaires were correlated with HIV serological data (ELISA and WB confirmation).

Results. Overall 441 (24.7%) of 1785 participants were HIV seropositive. Significant associations were as follows:

	HIV -	HIV +	P-Value (Chi-square/Fishers)
Dyspnea	7.4%	11.6%	0.007
Fatigue	18.9%	22.9%	0.073
Weight loss	28.7%	35.5%	0.007
Oral Thrush	1.9%	4.1%	0.011
H_x Bacteremia	0.2%	1.4%	0.009
H_x Endocarditis	0.5%	1.6%	0.053

Histories of the following were unassociated with HIV status: Diarrhea, Pneumonia, Tuberculosis, Hepatitis, Cirrhosis, Tumors, and Diabetes.

Conclusion. Although symptoms associated with AIDS-related complex are frequent among active IVDU's who are seronegative, several symptoms are significantly more common in HIV seropositive IVDU's.

Th.D.P.81

THE USE OF A MINIMAL BEHAVIOURAL INTERVENTION AS PART OF A RISK REDUCTION STRATEGY AMONG INTRAVENOUS DRUG USERS

Stallard, Anne, Dow, M.G.T.
Department of Clinical Psychology, Counselling Clinic, Ruchill Hospital, Glasgow, UNITED KINGDOM

Objective. To develop a minimal behavioural programme aimed at increasing behaviour change towards safer sex and drug use among intravenous drug users (IVDUs).

Methods. A booklet was developed following behavioural principles consisting of the following sections: Assessment and feedback; Knowledge test; Drug risk, monitoring and identifying client's own risk situations, using problem solving to find better ways to cope with risk, common risk situations and ways to solve them ; Sex risk choosing partners and using condoms, identifying risk situations and ways to cope with these ; Local information. The format of the booklet is written with local drug users in view. The booklet was developed with the help of groups of clients in residential drug treatment agencies who tested and commented on each section.

Results. A booklet has been developed successfully prior to formal evaluation.

Conclusion. Behavioural interventions offer a great deal to those who wish to change their behaviour but have difficulty translating their intentions into practice. No other educational package offers specific advice on monitoring and altering specific areas of difficulty which lie behind making such changes.

Th.D.P.83

COMPARISON OF SEXUAL BEHAVIORS AMONG WHITE IVDU AND NON-IVDU (NIVDU) HETEROSEXUALS IN SOUTHEASTERN NEW ENGLAND

Mayer, Kenneth; Zierler, S.; Feingold, L; Laufer, D., and Carpenter, C.
New England Behavioral Health Study (NEBHS), Brown University, Providence and Memorial Hospital, Pawtucket, RI, USA.

Objective: To compare sexual behavior and risks of HIV transmission or acquisition of White IVDU and NIVDU in an area where > 1/3 PWA's are IVDU and the prevalence of non-whites (~3%) is lower than the U.S. average.

Methods: Cross-sectional analyses of in-depth interviews and serologies from the first 175 White enrollees of a community-based prospective study of the heterosexual spread of HIV in S.E. New England among self-identified high risk heterosexuals. The full cohort is 81% White.

Results:	IVDU (N=62)	NIVDU (N=113)
HIV seropositivity	40%	4%
> 1 partner for the past year	41%	58%
> 30 lifetime partners	36%	21%
Sex with an IVDU	61%	21%
History of STD (ever)	45%	30%
Always used condoms for the past year	11%	5%
Never used condoms for the past year	45%	46%

Conclusion: Although White IVDU were more likely to be HIV+ than NIVDU and have sex with other IVDU, a higher percentage of IVDU always used condoms. Routine condom use was uncommon in both groups. Heterosexual transmission of HIV among White NIVDU was documented. HIV+ IVDU frequently had sex with NIVDU and a subset of HIV- NIVDU are continuing to place themselves at increased risk for acquiring HIV.

Th.D.P.80

RISK FACTORS FOR TRANSMISSION AND CHANGES IN RISK BEHAVIOUR AMONG IV DRUG ADDICTS (IVDAs) IN GENEVA

Robert, Claude F.*; Déglon JJ**, Hirschel B*. Policlinique de Médecine, *Div. of Infectious Diseases, University Hospital, and **Ermitage Foundation, Geneva, Switzerland, phone 41 22 22 64 16.

Objective: To evaluate risk factors and behaviour with regard to transmission of HIV.

Methods: IVDA serum samples were collected since 1981. From 1985 to 1988, IVDAs were interviewed once (225 IVDAs), twice (115), and more than twice (30).

Results: Among ambulatory addicts in a outpatient methadone maintenance program, seroprevalence increased from 7% (5/70) in 1981 to 36% 56/154 in 1988. In 1986-1988, however, 47/68 (69%) of IVDA inpatients were seropositive.

Table 1 Sharing of needles and syringes (sharers) and non-use of condoms.

	before 1987		1987 and 1988	
Hiv status	sharers*	no condoms	sharers*	no condoms
Seropositive	91% (64/70)	98% (94/96)	5% (2/43)	56% (39/69)
Seronegative	82% (28/34)	88% (46/49)	29% (4/14)	73% (22/30)

*among those still injecting

10% of men have had sexual relations with homosexuals, and 80% with other IVDAs. Among a subsample of 53 HIV+ IVDAs, 31 had a stable sexual partner. Of 18 partners tested, 11 were HIV+; in 5, sexual transmission was the only probable route of infection.

Conclusion: Among IVDAs in Geneva, sharing of needles and syringes has greatly decreased since 1985. However, there remains a potential for sexually transmitted infection. Future preventive strategies aimed at IVDAs must take this into account.

Th.D.P.82

A COMPARATIVE ANALYSIS OF HIV INFECTION AMONG IV DRUG USERS IN TREATMENT AND ON THE STREET

McCoy, Clyde B.*; Chitwood, D.D.* and Page J.B.*
*University of Miami School of Medicine, Miami, FL, USA.

Objective. To compare the seroprevalence of HIV among IVDUs in treatment and on the street and to determine the differences in distribution by sex and ethnicity/race.

Method. Two separate studies in the Miami metropolitan area have recruited 300 IVDUs respectively from drug treatment programs and from the street. Blood samples were drawn from the clients within the treatment programs, or for the street sample at a centralized assessment center at the medical school. Pre and post test counseling were provided in similar fashion to each of the groups as they were given similar assessments of their sex, drug and other histories.

Results. The street population indicates a much higher seropositivity (33%) than the treatment population (12%). Hispanic data indicate one exception, showing more males to be seropositive in treatment (26%) than in the street population (18%). The treatment population is predominately white (74%), whereas the street population is predominately black (83%). However, in each sample blacks are significantly more seropositive than whites(21% black versus 6% white in the treatment population, 35% black versus 17% white in the street). Overall, females are of greater seropositivity than males.

Conclusion. It is extremely important to actively recruit and establish prevention and control measures for the street population of IVDUs, as well as for those in treatment because of the potential high risk for transmission of HIV.

Th.D.P.84

PSYCHOEDUCATIONAL GROUP APPROACH TO AIDS PREVENTION WITH DRUG ABUSERS IN RESIDENTIAL TREATMENT: IMPACT 6 MONTHS AFTER INTERVENTION

Sorensen, James L; Gibson, DR; Heitzmann, C; Dumontet, R; Costantini, M; Melese-d'Hospital, I; et al.
Center for AIDS Prevention Studies, UC San Francisco, CA USA

Objective. To assess the impact of 6-hour psychoeducational groups on the AIDS knowledge and attitudes of drug abusers completing residential treatment.

Methods. 96 drug abusers in the latter stages of treatment were randomly assigned to receive a 6-hour group protocol or a set of brochures about AIDS. Assessment interviews occurred before randomization, after the intervention, and 6 months after the pre-assessment. Subjects averaged 84% attendance at training, 93% were reached for the post-interview, and 89% (of 79 due to date) have been reached for 6-month followups. Measures were designed to tap AIDS-related knowledge of risk, perceived threat, response efficacy, self-efficacy, communication skills, and social supports.

Results. There was a significant effect at the post-interview in the expected direction in knowledge of AIDS risk ($p=.006$) and a trend in the expected direction in self-efficacy ($p=.07$). By 6 months the knowledge difference had faded, but the differences in perceived self-efficacy had become more pronounced ($p=.02$).

Conclusions. Conducting AIDS education groups in a residential treatment setting can increase participants' knowledge and change some attitudes that put them at risk of acquiring or transmitting HIV infection; however, interventions are needed that are more focused, potent, and long-lasting.

Th.D.P.85

AIDS AND SUBSTANCE USE EDUCATION AND PREVENTION: A COMMUNITY-BASED APPROACH.

Riley, Diane*; McCrimmon, M.** and Shayka, K.***
*Municipality of Metropolitan Toronto, Toronto, Ontario, Canada.
**Alexandra Park Community Centre, Toronto, Ontario, Canada.
***Health Care Consultants (Intl), Toronto, Ontario, Canada.

Objectives: 1. To provide the information and behaviour change skills necessary for prevention of AIDS in substance users. 2. To train workers in effective training techniques for bringing about knowledge and behaviour change in substance users. 3. To ensure than all those in need have access to bleach and syringe-exchange education programs and related services. 4. To provide advocacy for substance users.
Methods: With personal financing, volunteer labour, donations and the minimal resources available to community groups, this program initiated AIDS and substance use education (including workshops for workers), provision of bleach-kits, opening of syringe-exchange education programs, and ensured advocacy for substance users. The program relied on community support and networking, free services from health-care and other professionals, and the donation of money, time and supplies form many sources. The key component of this program appears to be community concern and networking.
Results and Conclusion: Several thousand bleach-kits have been distributed through this program; a number of community groups now offer syringe-exchange education programs; a mechanism for formal training of trainers in AIDS and substance use has been established; general public education on AIDS and substance use is ongoing; advocacy for substance users is increasing in strength. In the absence of government leadership or funding, community groups can effectively provide AIDS education, prevention, and other services if they use networking and shared resources.

Th.D.P.86

MANAGEMENT OF HIV-INFECTED FEMALE IVDA'S

Schäfer, Axel*, Heckmann**, Eck*, Schwartländer**, Friedmann*
*Department Obstetric and Gynecology, Freie Universität Berlin
** AIDS Research Center, Bundesgesundheitsamt, FRG

Objective: To evaluate the effects of methadone treatment in a clinical center for Gynecology
Methods: Maintenance to abstinence by step wise reduction in three different groups of a total collective of 71 women.
Group 1: 31 HIV-negative pregnant women
Group 2: 19 HIV-positive pregnant women
Group 3: 21 HIV-positive non-pregnant women
Evaluate by clinical documentation and drug tests
Results: (Selection) in group 1 39 % reached total abstinence before delivery, in group 2 only 16 % and in group 3 67 % reached total abstinence during period of in - or outpatient care; significant differences were found between inpatient and outpatient care.
Conclusion: Maintenance programs are not very common in the FRG Results show, that indications of methadone treatment should be very selective. The sources of maintenance - to - abstinence depends on very different factors, such as drug status, social support, clinical program, personality, and serology of HIV.

Th.D.P.87

Counseling
Counselling

Th.D.P.88

CHANGES IN THE SEXUAL BEHAVIOR OF HIV INFECTED PATIENTS PARTICIPATING IN A GROUP PROCESS.

Rossi L*, Garcia L*, Salame E*, Hernández MR*
*Directorate of Epidemiology, Ministry of Health, Mexico

Objective: To induce changes in the sexual behavior and use of condom as a preventive measure for diminishing HIV sexual transmission in a group of HIV seropositive homosexual men.
Methodology: 36 seropositive, homosexual, asymptomatic, unmarried men, aged between 18 and 45 years old, requesting psychological support, were selected. The invidiuals were assigned to 3 groups: A (3 months), B (6 months), C (1 year), (90' session, 1 x wk). Several psychoanalytic group techniques, such as interpretation and free association, were used. Killing fantasies, uncapability to establish total object relations, hostile feelings towards homosexuality, uncertainty of presenting clinical symptomatology and dying were interpreted in group sessions with the purpose of promoting condom use and modifying risky practices. Changes were evaluated at the end of all sessions.
Results: The results are presented in the following table:

GROUPS	GROUP A (3 months)		GROUP B (6 months)		GROUP C (1 year)	
BEHAVIOURS	Pre No.	Post No.	Pre No.	Post No.	Pre No.	Post No.
Use of condom	0/12	11/12	0/12	12/12	0/12	10/12
Stable Couple	2/12	2/12	3/12	6/12	6/12	4/12
Hostile feelings for being homosexual	4/12	4/12	6/12	3/12	8/12	2/12
Uncertainty for presenting symptomathology	12/12	12/12	12/12	12/12	12/12	12/12

Discussion: 3 and 6 months groups were associated with changes in sexual behavior, the one year's group structural changes and in the condom's use.

Th.D.P.89

COUNSELLING AND EDUCATION ON AIDS.

Quinhões, Eleonora Pati; Rachid de Lacerda, M.C.; Menan, J.L.L.; Longo, P.M.P.; Moura, E.M.M.; Carvalho Neto, L.D. et al.
Gaffrée & Guinle University Hospital - University of Rio de Janeiro - Brazil.

Objective: To inform people about AIDS transmission/acquisition, prevention, safe sex and the disease.
Methods: Physicians, psychologists, social workers and nurses during private sessions at the "AIDS" outpatient unit of our hospital and at conferences in schools, churches, poor communities, banks, industries and other groups,deliver multiprofessional lectures where all aspects of AIDS are explained.We used slides and other projections with simple language to be easily understood. After the explanation there is an annonimous question session when all the remaining doubts are solved.
Results: The most common questions are about oral, anal, vaginal sex, kiss, manicure, mosquito bite, condom, vaccine, cure, blood transfusion/blood tested, where to find the AIDS test, where to find treatment. It was more difficult to explain, be understood and be accepted all information about condom/safe sex when talking to male adults. There is a greater concern among women than men about learning how to explain or talk about AIDS with their children. It was difficult to talk openly about sex and drugs with adolescents because teachers and parents are not prepared to cope with sex and drugs subjects.
Conclusions:
1. Despite being a volunteer work without any support, we are doing our best.
2. More support should be given for Counselling and Education on AIDS because they are the only way to stop the AIDS epidemic.
3. A special attention should be given to Adolescents because they are learning about life,love, sex and drugs at this very moment and they have the right to live long.

Th.D.P.90

HIV-AIDS Counselling: A Collaborative Project

Gowanlock, Gweneth and Findlay, Joel, Federal Centre For AIDS, Health and Welfare Canada Ottawa; Carballo, Manuel, Global Program on AIDS, World Health Organization, Geneva, SWITZERLAND

There is a growing need to enhance the availability and quality of counselling for persons with HIV infection, those with AIDS, their families and others affected.

The Federal Centre for AIDS Canada, in collaboration with the WHO/GPA and collaborating Canadian provinces has developed a planning approach for improving, expanding and maximizing existing counselling resources in order to increase the capacity for HIV counselling in any community. This initiative, a world first, examines, defines, and facilitates development of the common elements of counselling needed when dealing with HIV and AIDS. The approach looks not only at a common methodology for such counselling but at necessary co-ordination of existing services for the strengthening and expansion of counselling networks. Implicit in the approach is the enhancement of collaboration between health, social service and community based organizations.

This presentation will highlight training needs both in the formal health-social service system and in the broader community based non-governmental area, and provides for this training to be put in place.

Th.D.P.91 AIDS PREVENTION IN THE LEGALIZED SEX INDUSTRY

Overs, Cheryl*., Hunter, A.*
* Prostitutes Collective of Victoria , Australia

Having begun in 1983, the Prostitutes Collective of Victoria is one of the most well resourced organisations of sex workers in the world. By 1988 it was funded by a range of agencies to conduct several programs aimed at converting AIDS knowledge into safe work practices in all sections of a diverse, recently legalised sex industry. The programs and their rationales will be explained. They are:

The Safe House Endorsement Scheme : information and industrial relations in legal brothels.
The Sex Industry and the AIDS Debate : Ist National Sex Industry Conference.
Poverty Action Program : empowerment for safe working.
Worksafe/Playsafe : video for new workers and medical service providers.
Service Delivery to Female Sex Workers : making the system work for prostitutes too.
Hello Sailor : AIDS information for visiting sailors.
Needle Exchange : AIDS education of IV users. Drop-in Centre.
Ugle Mugs : A sheet of descriptions to violent and dangerous clients.
AIDS Education to male sex workers.

Th.D.P.92 SURVEY OF PHYSICIANS' NEEDS

Hulin Marg, Grondin M, Department of Public Health, City of Toronto, Toronto, Ontario, Canada

OBJECTIVE: To identify the role the DPH's can play in helping community physicians become updated on AIDS issues. To identify how important physicians perceive AIDS to be in their particular practice. To identify what AIDS information physicians want for themselves and for their patients. To determine from whom physicians would most like to receive AIDS information. To assess how often physicians want to receive AIDS information.
METHODS: A total of 49 physicians were surveyed by public health nurses. Physicians were selected from two sources, half were randomly selected from the Ontario Medical Directory. The other half were sentinel physicians who regularly report communicable diseases to the Department of Public Health. All the interviews were done on a personal basis.
RESULTS: 75% felt that it was important or very important to be informed about AIDS. The most often selected topics include testing, pre and post test counselling, treatment approaches and community resources. The majority of physicians chose the Department of Public Health as their first choice from whom they would like to receive information.
CONCLUSION : There is a need for more active outreach by public health units to community physicians on AIDS. Future planning will include a quarterly mailing to interested physicians on AIDS/HIV illness, the Department of Public Health will adapt an HIV counselling workshop to fit physicians needs, and develop a specific outreach strategy to community physicians to meet their educational needs. Presentation will give more information re findings.

Adolescents

D.501 EXTRAORDINARY WITHOUT ORDINARY SEXUALITY

Smith, Linda; Director Sexuality Division, Calgary Health Services, Calgary, Alberta, Canada

Objective: Education emphasizing negative aspects such as, AIDS, STD's unwanted pregnancy focuses on "extraordinary sexuality". When negative information is stressed, feelings and behavioral strategies necessary for the integration of information and utilization of preventive actions are missed. Policy makers need to shift from a focus on extraordinary to ordinary sexuality.
Method: The Board of Health approached Calgary School Boards to present facts on the extent of adolescent sexual activity, STD, and ectopic pregnancy. Current piecemeal and optional approach to sexuality education was compared to negative sequelae of sexual behavior. The Board of Health recommended that sexuality education programs be mandatory for all students.
Results: Both school boards accepted the proposal and schools will have a comprehensive, sexuality education curriculum provided to all students by 1990. The Board of Health committed funds to training, inservicing and support of teachers in the school system.
Conclusion: In order to promote safer sexual behavior, public health and school officals must ensure that all students receive not only cognitive information about sexuality, but also a comprehensive curriculum that will examine feelings and the behavioral skills in order to practice safer sex techniques. To accomplish this, AIDS education must be placed in the context of comprehensive,compulsory, sexuality education. Public Health agencies can have an impact of the decision to provide such education in a community.

D.502 TITLE: HIV SEROPREVALENCE AND DEMOGRAPHIC SURVEY OF INCARCERATED ADOLESCENTS

AUTHORS: *Baker, Charles J., *Re, O., *Morris, R., *Huscroft, S., *Roseman, J., and *Schultz, B.

*Juvenile Court Health Services, Los Angeles County, California, USA

OBJECTIVE: To determine HIV Seroprevalence and I.V. drug abuse factors in adolescent incarcerated within the Juvenile Halls, County of Los Angeles.

METHODS: Blood samples were collected anonimously from 2,005 youngsters. Also, the following were recorded: Age, Sex, Race, history of I.V. drug abuse and SGPT/SGOT testing.

RESULT: Only two samples were positive by Elissa and Western Blot tests. 90% of the youngsters were between 16 and 17 years of age. 92% of were males, 49% were hispanic, 31% were black and 15% were white. History of I.V. drug abuse was recorded in 2% and 3% received SGPT/SGOT tests.

CONCLUSION: HIV Seroprevalence this survey (0.099%) compares favorably with the 0.16% determined 1-1/2 years ago in the same type of pupulation. This difference may suggest greater awareness of high risk behavior for AIDS among adolescents.

D.503 THE USE OF ONE EFFECTIVE MEDIUM - TELEVISION TO EDUCATE CANADIAN YOUTH AND PARENTS ABOUT HIV AND AIDS

Liepold, Heidi M., Federal Centre for AIDS, Health and Welfare

As a result of the Canada Youth and AIDS Study conducted with 38,000 youth across Canada it was found that a high majority of Canadian youth received their information about AIDS from television. The Canada Youth and AIDS Study is representative of Canadian youth in grades 7, 9 and 11, first year University/College, dropouts and street youth. Television as a main source about AIDS was not only prevalent in the in-school population but also those out of school such as dropouts and street youth. In response to this, the Federal Centre for AIDS of Health and Welfare Canada commissioned to undertake three national film productions. Two of these film productions are focussed on youth and the third on parents. One of the youth productions will focus on the 12 to 14 year olds and the second on 14 to 16 year olds. The film production for the older population will have an original story and corresponding rock video segment that will be released separately and reinforce the messages of the film production. The parent film will provide parents with the needed information on HIV, AIDS and healthy sexuality but will focus on how parents can effectively communicate this information to their children.

D.504 A MODEL:TARGETED AIDS EDUCATION AND COUNSELLING FOR ADOLESCENTS IN AN HMO

Wibbelsman, C.J., MD; Schram, M., MD; and Long, O., RN*
*Kaiser Permanente Medical Care Program, San Francisco, California and Los Angeles California, U.S.A.

Objective. Within a pre-paid health plan population of over 5 million members nationally, a targeted intervention model has been developed to identify adolescents at high risk for becoming infected with the AIDS virus.
Method. All health plan members age 12-21 who present for a health care visit by appointment are given a brief questionaire to be completed in the examining room before the examiner enters. Eighteen (18) simple, brief questions about sexual activity and other risk behaviors are asked. A rapid review of the completed questionaire allows the examiner to determine if the adolescent is at risk, no risk, or potentially at risk for AIDS. The questionaire, once reviewed, is discarded, is not a part of the medical record, but allows a one to one confidential exchange between the teen and examiner. Those adolescents who are identified at risk are referrred to a prevention counsellor for evaluation of risk behavior, education on AIDS prevention and HIV testing, and most importantly, behavior modification. All adolescents referred in the model for counselling are re-evaluated in several months; behavior and risk taking is reviewed; education is reenforced. Adolescents not at risk are referred to an education component of the model.
Projection. Intervention effecting adolescent behavior change may be one of the most definitive methods of preventing high risk adolescents from becoming the next surge of the AIDS epidemic in the 1990's. Information alone is not effective in changing teens' risk behavior. Our model of intervention in a nationwide HMO has the potential of changing the behavior of over a million adolescents in the USA.

D.505 LE SIDA EN AFRIQUE CENTRALE : SYSTEMES D'INFORMATION, ROLE DES MEDIAS ET INTER-FACE ADOLESCENTS-ENVIRONNEMENT

Kewa-Ilunga,wa Bilond °; Nyengele, [illegible] °°
° Département de l'Information et de la Presse, Lingwala, Kinshasa, Zaïre; °° Département de l'Education Nationale, Gombe, Kinshasa, Zaïre.

Objectif. Evaluer la synergie du rôle des médias ainsi que des données et des systèmes d'information sur le SIDA parmi les adolescents en Afrique Centrale.
Méthodes. Une enquête par sondage d'opinion relative à la perception du message sur le SIDA était menée parmi 3000 adolescents à Kinshasa(Zaïre) dont une moitié scolarisée et une autre non scolarisée en 1988.
Résultats. L'enquête a montré que l'indice de performance et d'efficacité des campagnes d'information est très faible. Leur apport est insuffisant pour le besoin d'une fonction d'intégration d'une forte proportion des adolescents(34,6%). Les résultats sont significatifs(56,5%) pour les scolarisés en ce qui concerne la perception du message et moins(38%) pour les autres Cela se traduit aussi au niveau des canaux de communication.
Conclusion. L'étude a débouché sur un ensemble de recommandations en vue d'améliorer les systèmes d'information opérationnels sur les perspectives de prévention et de traitement du SIDA ainsi qu'au rôle des médias. Enfin, des suggestions quant aux variables immédiates à incorporer dans les programmes de santé publique sur le SIDA en Afrique Centrale.-

D.506 STRESSFUL LIFE EVENTS AND SOCIAL SUPPORTS AS MEDIATORS OF SAFE BEHAVIORS AMONG RUNAWAY AND GAY YOUTHS

Haignere, Clara; Rotheram-Borus, M.; Bradley, J.; and Koopman, C.; Mardin, M.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, NY, USA

Objective: To evaluate the effectiveness of stressful life events and social supports as mediators of safe sex behaviors among runaway and gay youths.
Methods: A review of the literature, focus groups, and a chart review in community agencies were used to construct measures of stressful life events and social supports for runaway and gay youths. Test-retest reliability and internal consistency appear high for each measure. Ninety-five runaways and 30 gay youths were interviewed regarding their sexual behavior in the last three months, life events, and social supports.
Results: Runaways have four times the number of stressful life events as reported by other studies of adolescents; 33% have had a family member die, 60% have moved, 15% were physically assaulted, and 20% raped in the last three months. The unsafe behaviors of those in the social support network is most highly correlated with the adolescents' unsafe sex and drug use behaviors. Gay youths perceived their networks as less supportive and themselves as needing support more than runaway youths. Neither life events nor social support were significantly correlated to high risk behaviors.
Conclusions: Life events and social supports may not be the most critical mediators of high risk behaviors among these groups.

D.507

RISK FACTORS ASSOCIATED WITH A HISTORY OF SEXUALLY TRANSMITTED DISEASE AMONG ADOLESCENTS

DiClemente, Ralph*; Forrest, K.**, Mickler, S.***
* University of California, San Francisco, California, USA
** Planned Parenthood of California, USA.
*** Vassar College, Poughkeepsie, New York, USA.

Objective. To identify a profile of risk factors associated with a history of treatment for sexually transmitted disease.
Methods. A national sample of 1,129 college undergraduates, ages 18-23, completed self-administered questionnaires assessing knowledge, attitudes about AIDS, prevalence, type and frequency of sexual behaviors, frequency of condom use and history of treatment for sexually transmitted disease.
Results. Women and minorities were twice as likely to be treated for an STD compared to males or Caucasians, (Prevalence Ratio (PR) = 2.0, 95% Confidence Limits (CL) = 1.4 - 2.8, P=.007; PR=1.9, CL=1.4 - 2.6, P=.001; respectively). Unprotected sexual intercourse was also associated with a positive history of STDs (PR=1.3, CL=1.0 - 1.4, P=.09). Students with multiple sex partners and a higher frequency of sexual intercourse were also more likely to have reported medical treatment for an STD (PR=1.7, CL=1.3 - 2.3, P=.003; PR=1.5, CL=1.1 - 2.0, P=.007, respectively).
Conclusion. Identifying adolescents' behaviors which significantly increase the risk of STDs permits development of more effectively targeted education programs.

D.508

A COMPARATIVE ANALYSIS OF RISK BEHAVIORS AMONG A SCHOOL-BASED AND JUVENILE DETENTION FACILITY SAMPLE OF ADOLESCENTS IN SAN FRANCISCO

DiClemente, Ralph; DuNah, R.
University of California, San Francisco, California, USA.

Objective. To describe a comparative risk behavior analysis of adolescents residing in a juvenile detention facility (YGC) and a school-based sample.
Methods. Adolescents, ages 14-18, attending high schools in San Francisco (N=802) and incarcerated at a juvenile detention facility (YGC; N=113) completed identical self-report questionnaires assessing AIDS-related risk behaviors. Surveys were anonymous and completed during the same time-period.
Results. Significant differences in the prevalence of AIDS-related risk behaviors were identified between the two samples. Adolescents at YGC report a higher lifetime prevalence of intravenous drug abuse (12.9% vs 3.7%, P=.0003, PR=3.5, 95% CL=1.8-6.7), more than three lifetime sex partners (86.4% vs 15.1%, P=.0000, PR=5.7, CL=4.6-7.0) a greater proportion with multiple sex partners in the past year (84.8% vs 46.0%, P=.0000, PR=1.8, CL=1.5-2.2) and an earlier age of sex onset (P=.0006).
Conclusion. Adolescents in juvenile detention facilities report a significantly higher prevalence of AIDS-related risk behaviors which substantially increases their risk of acquiring and transmitting HIV infection.

D.509

EVALUATION OF A TARGETED AIDS/HIV EDUCATION PROGRAM FOR SECONDARY SCHOOL STUDENTS IN A MEDIUM-SIZE USA METROPOLITAN AREA

Copello, A. Gene*; Sheets, R.*; Ross, S.*; and Curvin, M.*
*Vanderbilt University, Nashville, Tennessee, USA

Objective. To evaluate change in AIDS/HIV knowledge level among seconday school students following a targeted education program.
Methods. An education program was developed involving a minimum of two hours by trained health teachers. The curriculum stressed HIV modes of transmission and risk reduction measures. 500 students were pre- and post-tested with this intervention. The testing instrument asked five demographic questions and 15 cognitive questions. Instrument sheets were also coded by health teacher.
Results. There was an overall gain in knowledge with the mean of correct responses increasing by three points on post-test scores as compared to pre-test scores. Sex, race, age, grade level, and residential area did not account for differences in pre- or post-test results. Significant differences in student knowledge level were found in the post-test by teacher code; such differences on pre-test results were not significant.
Conclusion. A targeted education program for secondary school students can increase knowlege about AIDS/HIV. Differences in the success of the intervention by classical demographic variables were not significant. Significant differences in the success of the intervention were found in regard to teacher codes. Based on the study results, the curriculum itself was successful, however, this success was varied by teacher. Such variation suggests improved teacher training in the delivery of AIDS/HIV education.

D.510

KNOWLEDGE OF HIV TRANSMISSION AND ADOLESCENT SEXUAL BEHAVIOR

Ziffer, Judith*;Ziffer, A.*;Bywater, M.*;Bywater,L
*Rollins College, Winter Park, Florida 32789, U.S.A.

Objective. To assess how the knowledge of HIV transmission affects the sexual behavior of the adolescent.
Method. A survey of 210 students, 109 men and 101 women in 9th to 12th grade, was completed. Knowledge of transmission of AIDS, sexual activity, change in sexual behavior, and source of educational information on HIV infection was assessed.
Results. Of the adolescents surveyed, 67% of the men and 46% of the women were sexually active. Of those who knew the routes of HIV transmission, 56% of the men and 34% of the women had not changed their sexual behavior. Of those who did not know the routes of HIV transmission, 70% of the men and 42% of the women were sexually active. Only 8% of the men and 12% of the women admitted they lacked accurate information about transmission of HIV infection. A full 60% of those surveyed operate with misinformation. Regardless of sex, sexual behavior, and accuracy of information, radio/television and magazines were reported as the most frequent sources of information about HIV infection.
Conclusion. Adolescents are participating at alarming rates in high risk sexual behaviors. While those most likely to be involved in high risk sexual behaviors are those with inaccurate information, what is disturbing are the numbers who know the risks but fail to alter their sexual behaviors.

D.511

INTERVENTION MODEL : WORKING WITH GAY AND LESBIAN YOUTH AT RISK FOR HIV INFECTION

Hunter, Joyce MSW, CSW

Hetrick-Martin Institute, Inc. New York, New York,U.S.A.

Objective: To develop an effective, comprehensive intervention program for gay and lesbian youth who are at risk for HIV infection and train professionals to work with this population.
Method: The methods used are focus groups for youth, workshops, and community forums. We have worked with over 1,500 youth in the last year and a half. We also conduct semi-structured focus groups (four per week) and one per week for professionals. The young people that we work with are self-identified gays and lesbians. Seventy five percent of these adolescents are minority youth, ages 12-21 ($\bar{X}$=17).
Results: Development of training manual, printing and publication of articles and brochures.
Conclusions: Materials for this population must be specifically tailored for these adolescents and the professionals who serve them. In contrast to current U.S. government policy prohibiting explicit safer sex practice and guidelines instruction, these materials need to be extremely explicit sexually. Also, these materials need to reflect and acceptance of homosexuality.

D.512

REPORT OF CWLA S COMMITTEE ON SERVING CHILDREN AND YOUTH WITH HIV INFECTION IN RESIDENTIAL GROUP CARE.

Emery, L. Jean*; Anderson, G; Anderson, V.M.,MD; Horowitz; R.M., Esq.; Gitelson, P.; Annin, J.Burt,JD*, et.al.
*Child Welfare League of America, Washington, D.C. USA

Objective: To address issues of concern to Board members, executives, administrators, clinicians, child care staff and volunteers surrounding the care of children and youth who are emotionally disturbed, infected with HIV, and in need of therapeutic residential group care.
Method: A subcommittee of CWLA's Task Force on Children and HIV Infection undertook the challenge of writing a Guide for Residential Group Care Providers. Experts in legal, medical, and psychosocial issues associated with HIV met with experts in providing services to children who not only exhibit behaviors which put them at high risk for HIV infection, but who are also emotionally disturbed and who might have suffered abuse or neglect at the hands of their parents.
Results: The CWLA subcommittee 1) identified issues associated with administration, advocacy, and public policy, program procedures and prevention; 2) recommended effective responses to those issues; 3) suggested strategies to achieve them; and 4) published the findings and distributed them to the field of practice.
Conclusion: It is feasible and appropriate to provide care and treatment of HIV-infected children in residential group care.

D.513

Information et modification du comportement face au SIDA en milieu jeune : rôle des intervenants-relais

ESTOURNEL J.L.*, LEVEQUE D**, MAUREL H***, CORDONNIER J.P.****
* Administrateur MNEF, PARIS ; ** Président MNEF, PARIS ; *** Secrétaire Général d'APARTS, PARIS ; **** Administrateur FSEF. FRANCE

OBJECTIF: Prolonger l'action d'information menée par la MNEF depuis 86 par une réelle sensibilisation permettant de modifier les attitudes et comportements des jeunes.

METHODES : Constitution d'un réseau d'intervenants-relais : étudiants issus du milieu mutualiste (MNEF) et personnels médicaux et para-médicaux des centres de soins (MNEF, FSEF), dans le cadre d'une expérience pilote menée à PARIS en Avril 89 (formation initiale : 75 personnes).

CONCLUSIONS: Après évaluation, cette expérience sera étendue à partir du module de formation initial (éventuellement adapté) et permettra un travail en milieu jeune qui complètera le dispositif sanitaire et social mis en place par la MNEF, la FSEF et APARTS.

D.516

A NATION-WIDE NETWORK OF AIDS PREVENTION FOR ADOLESCENTS 18 MONTH EVALUATION

D. Jayle*, H. Richard*, A. Bunde-Birouste*, D. Guillemot*, D. Rayon*

*APS: Association pour la Prevention du SIDA, Paris, FRANCE

Objectives. 1) Design, implement, and evaluate a training program for AIDS prevention educators, 2) Create an interactive network of AIDS educators nation-wide.

Methods. Following a pilot project implemented in the Paris metropolitan region, APS (Association pour la Prevention du SIDA) enlarged its methods and activities of training AIDS educators to include interested persons throughout the country. To date more than 800 auxiliaries have been trained. The association headquarters in Paris serves as a central focus point for the organisation of training sessions, distribution of materials, consulting for educators in the organisation and implementation of their prevention activities.

Evaluation. An anonymous, self report questionnaire designed to evaluate the training and the educators' activities following the training sessions was sent to 300 APS members prior to the First National Conference in October 1988. Highlights of the evaluation follow: 80.4% of respondants rated training sessions 4 or above on a 5 point scale (5 being most positive); there was an 85% and above satisfaction rate on all questions concerning APS' services offered to network members (content of training sessions, consulting etc.), 74% of persons trained by APS implemented programs in their institutions, estimating an average of 200 personnes reached per program, 80% of the respondants judged that they received positive responses from participants in the programs they designed, 97% found the materials furnished by APS to be effective and well adapted to their audiences, 70% expressed interest in continuing to implement AIDS prevention programs and to work with the APS network.

Conclusion. The results of the evaluation show that the majority of persons trained appreciated the services offered by APS and were receptive to the idea an interactive network for AIDS prevention, indicating that this is a positive and effective approach to AIDS prevention. APS plans to publish a bi-monthly bulletin designed to further increase the level and quality of exchange between its members and continues to expand its training and consulting for prevention programs.

D.517

D.518

OUTREACH MODEL FOR HIV POSITIVE ADOLESCENTS AND ADOLESCENTS CURRENTLY AT HIGH RISK FOR HIV INFECTION

Hummel, Robert; Rodriguez, G.; Brandon, D.; Wells, D.
New Jersey State Department of Health, Trenton, New Jersey, U.S.A.

Objective. Careful analysis of current indicators of risk behavior suggest that adolescents may be the next group in the U.S. to be hard hit by the AIDS epidemic. In an attempt to determine needs and characteristics of high risk adolescents in New Jersey, a pilot survey of 27 youths was conducted on the streets of Newark, New Jersey.

Methods. Individuals were interviewed face-to-face between 10:00 p.m. and 2:00 a.m. for brief interviews. Data collected included demographics, living arrangements, health and risk behaviors.

Results. The 14 males and 13 females were 11 to 18 years old. 7 did not live with parents, 11 had been treated for an STD, 10 reported sexual preference as homosexual/bisexual, 7 reported drug use, 13 had dropped out of school, 4 reported having children.

Conclusion. Adolescents at risk for HIV infection and those already infected cannot be adequately served with existing intervention models. The authors proposed the following three-component model be implemented and evaluated for efficacy: 1) outreach to youths on the streets by workers both on foot and from vans for AIDS education, counseling and referral for physicals; 2) storefront youth centers located in high risk areas providing physicals, food, shelter and referrals for medical care and social services; and 3) a 15-20 bed residential facility for youths in need of short or long-term medical care. It is essential that this population immediately receives AIDS education and risk reduction information as well as concrete services.

D.519

FROM THEORY TO PRACTICE: A CULTURALLY, LINGUISTICALLY AND AGE-APPROPRIATE HIV RISK REDUCTION PROGRAM FOR ADOLESCENTS

Stoller, EJ*; Gibson, W. Paul*; Smyly, V*; Rojas de Colville, E*; Nestor, S** and Oliva, GE*.
*Department of Public Health, San Francisco, California, **Planned Parenthood, San Francisco, California,U.S.A.

Objective: To describe the "Wedge": a four-session educational strategy for HIV risk reduction among San Francisco youth.
Methods: Following six months of pilot testing, a four-session teaching model was launched in February of 1988. The model was designed to incorporate the strengths of existing education strategies: (1) use of established theories of behavior change in program design; (2) emphasis on attitude change and skill development through participatory activities; (3) culturally and linguistically appropriate information delivery; (4) tailoring of program delivery to accommodate youth in public, private, and parochial school settings, detention facilities and community centers; (5) representation of the consequences of HIV infection from a personal perspective. The cornerstone of the strategy is a session conducted by a person with HIV infection, ARC or AIDS. Training is provided for presenters of each of the four sessions.
Results: By June 1988, the program gained national attention. Program efficacy is measured in two ways: anonymous letters from youth participants, and a speaker evaluation form. Recent funding from the Centers for Disease Control will allow for a more formal program evaluation.

D.522

Comportement
Behavior

D.523

AIDS EDUCATION IN THE WORKPLACE AND THE FAMILY

Baldwin, W. and Cain, Virginia S.
National Institute of Child Health and Human Development, NIH, Bethesda, Maryland, USA

Objective. To investigate the impact of AIDS education as provided in the workplace on the level of correct knowledge about AIDS especially those dimensions relating casual contact as might occur in the workplace. Also, such education may have a secondary effect if parents then educate their children. Therefore, a second objective is to investigate the relationship between parents' knowledge about AIDS and their efforts to educate their own children about AIDS.
Method. Data come from the National Longitudinal Survey of Youth, a national survey of approximately 10,000 men and women aged 23-30 in 1988. Information is available on a variety of employer and individual characteristics including social and demographic information. The sample contains an oversample of Blacks and Hispanics. The analysis focuses on the 3000 school-age children who, by virtue of the sampling design, are disproportionately born of adolescent parents with high risk of being in disrupted families. The children are at higher risk of becoming sexually active at a young age. One of the concerns is the extent to which parents accurately assess their children's risks and steps they take to educate them.

D.524

THE RELATIONSHIP BETWEEN HEALTH STATUS AND PSYCHOLOGICAL WELL-BEING AMONG HEALTHY MEN AND MEN WITH ARC OR AIDS.

Schmidt, Robert M.* and Castro, F.P., Jr.**. *Center for Preventive Medicine and Health Research, San Francisco State University and Pacific Presbyterian Medical Center, San Francisco, California, and **Stanford University School of Medicine, Stanford, California, USA.

Objective. To evaluate the relationship between health status and psychological well-being among healthy men, men with ARC and men with AIDS.
Methods. Twenty-four homosexual men diagnosed with ARC and 22 homosexual men with AIDS were assessed for psychological well-being and compared with 24 healthy heterosexual male controls (obtained from the Health Watch program, a longitudinal prospective study of healthy aging). All participants completed the Health Watch Questionnaire which provides quantitative scores of health status and lifestyle habits in 7 areas. The psychological well-being scale measures the individual's current and prior stress. Each patient received a score between 0 (poor psychological well-being) and 100 (excellent). The results were analyzed using one-factor analysis of variance (ANOVA).
Results. ARC patients had significantly lower psychological well-being scores than the healthy control group. Psychological well-being scores for AIDS patients were not significantly different from those of the healthy control or the ARC groups, although mean values were intermediate between those groups.
Conclusion. This study provides evidence that homosexual ARC patients experience the highest level of psychological distress (the lowest psychological well-being) when compared to healthy heterosexual men and homosexual men with AIDS. Persons at high risk of developing HIV infection and those with ARC may benefit from stress reduction programs, allowing for a more competent immune response and less susceptibility to progressive disease.

D.525

D.526

PERSONAL AIDS-RELATED BEHAVIOUR AMONG PARTICIPANTS TO THE STOCKHOLM IV INTERNATIONAL CONFERENCE ON AIDS

Tirelli Umberto*, Mazzocco D., Serraino D., Lazzarin A**., Clumeck N***., Volberding P****., Franceschi S*. *Centro di Riferimento Oncologico, Aviano, Italy; ** L. Sacco Hospital, Milan, Italy, *** St. Pierre Univ. Hospital, Brussels, Belgium, **** San Francisco General Hospital, Calif., USA.

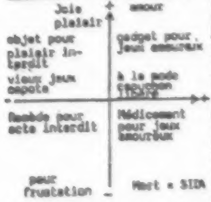
Objective. The present survey took advantage of the IV International Congress on AIDS to evaluate personal AIDS-related behaviour of health professionals from all over the world (60 countries). Methods A brief questionnaire exploring a number of AIDS-related items (i.e. HIV-testing, current and past condom use, etc.), was delivered to approximately 850 health professionals who referred to the information desk of the Conference. Results Although participants to the Conference were approximately 6000, it is worth stressing that the questionnaire was completed by the vast majority of those to whom it was delivered (97%). Overall, the same percentage (36%) of interviewed health professionals reported to have undergone HIV-antibody testing and to use condoms regularly. Such proportion was very similar in males and females and in individuals from different nationalities, whereas age below 35 was associated with almost two-times more frequent HIV-testing and condom use in comparison with age above 65. Physicians tended to use condoms one fourth less often than those who did not have a medical degree, while health professionals who were in contact with AIDS patients seemed to be more prone to serotest themselves than those employed in research. HIV-testing was also positively correlated to current use of condoms, but, interestingly, not to condom use five years earlier, reported by 22% of interviewees. Fifty-eight percent of interviewees stated that they would explicitly enquire about HIV-antibody status in new sexual partners. Conclusions One third of the interviewees from all over the world attribute an important role to the regular use of condoms and voluntary HIV-testing in the strategy against AIDS.

D.527

LE PRESERVATIF : ETUDE DES DIFFERENTS TYPES DE MESSAGES A PARTIR DES SYMBOLES TRADITIONNELS

Thierry TROUSSIER * Président ARPS - B.P. 1232
97494 ST DENIS CEDEX (Ile Réunion)
FRANCE

OBJECTIF : Analyse à partir de diagrammes géométriques des niveaux de conscience touchés dans une population lors des programmes de sensibilisation sur le préservatif



Joie plaisir
amour
objet pour plaisir interdit
gadget pour jeux amoureux
vieux jeux capote
à la mode capuchon
Remède pour acte interdit
Médicament pour jeux amoureux
peur frustation
Mort = SIDA

MÉTHODE : A partir des deux axes correspondants au double épanouissement de l'homme : axe horizontal étant le développement de l'individualité soumise aux conditions extérieurs, l'axe verticale aux différents niveaux de conscience (cf figure) et du schéma traditionnel de l'homme entre ciel et sol, rappel des différentes réactions psychiques (ethnique, rationnelle, émotionnelle) et comportementales (sociales et physiques) que suscitent les publicités réalisée en faveur du préservatif.
Etude des facteurs utilisés par les concepteurs de ces campagnes.

EVALUATION de la méthode par l'étude des rapports entre le contenu des campagnes et les processus psychiques et comportementaux provoqués. Cinq campagnes effectuée en 1987 et 1988 permettent d'illustrer cette analyse.

CONCLUSION : Cette étude complète les évaluations qualitatives et quantitatives avant et après une campagne de prévention pour déterminer le niveau et les objectifs à atteindre en fonction de la population ciblée.

Mots-clef - Préservatif, International, Comportement, Campagne, Evaluation.

D.528

SEXUAL DECISION-MAKING AMONG GAY/BISEXUAL MEN IN A LOW INCIDENCE AREA FOR AIDS

Beeker, Carolyn *; Rose, T.*
NYS AIDS Institute, Albany, New York, USA

Objective. To examine sexual decision-making under conditions of ambiguous risk among gay/bisexual men in a low-incidence area for AIDS.
Method. Participants in a CDC-funded AIDS prevention study were asked to estimate their likelihood of HIV exposure in twelve sexual scenarios. The scenarios, based on anecdotal accounts from study participants, were held constant on 4 dimensions: receptive for oral sex, no condom use, no ejaculation, partner's serostatus unknown. Variable dimensions included: setting, partner characteristics, and relationship to partner. For comparison, 2 scenarios were replicated, specifying anal rather than oral sex.
Results. In preliminary data from the first 124 (of 364) cases, mean risk scores range from 38 to 79 on a 100-point probability scale. Scenarios identified as high risk (64-79) involve anal sex, anonymous oral sex, or oral sex with a man whose steady partner is HIV-infected. Moderate risk situations (51-56) include oral sex with acquaintances and an alcohol-abusing friend. Low risk scenarios (38-44) involve oral sex with partners assumed to be monogamous.
Conclusion. The ranking of mean risk scores for 12 sexual situations is broadly consistent with risk reduction guidelines which emphasize avoiding unprotected anal sex and "knowing your partner". When information about serostatus is not part of that knowledge, men appear to make "educated" guesses about the likelihood of infection based on situational characteristics such as the setting for sex.

D.529

USING STRUCTURED SEXUAL DIARIES DATA TO ESTIMATE RATES, PREDICTORS AND CONTEXTS OF HIGH-RISK SEXUAL BEHAVIOUR

Coxon, Anthony P.M.*; Davies, P.M. **
*University of Wales, Cardiff U.K.
**South Bank Polytechnic, London U.K.

Objective: To assess the effects of Age and Type of relationship on the incidence of sexual behaviour of homosexual men in the United Kingdom, especially on the contexts in which high-risk behaviour occurs.
Methods: Analysis of 3950 structured "sessions" from sexual diaries kept for a month by a volunteer sample of 170 gay men.
Results: At most 20% of sexual acts are high-risk, but they are widespread. Thus, although 53% of men engage in anal intercourse, only 9.2% of sexual behaviour is accounted for by it. Type of relationship has systematically greater effect (= ×2) than age for the amount and variety of sexual activity, but interactions are strong for older (≥39) and under-age (≤21) men. No systematic significant effects occur for incidence/men data). Two important subgroups refer to sexual behaviour inside and outside a primary relationship: "Safe in / Unsafe outside" and "Unprotected (condom) in / Unprotected outside".
Conclusion: Rates of sexual behaviours and their relationship content are critical for assessing the extent and type of high-risk behaviour.

D.530

TALKING ABOUT SEX

Spencer, L*; Wellings, Kaye**; Faulkner, A*; Keegan, J*.
*Social and Community Planning Research, London, England
**Health Education Authority, London, England

Objective. Because sexual matters are rarely discussed publicly, little is known about the language people use to describe their own experience. The need for data to guide and inform the design of a questionnaire for use in the British Survey of Sexual Attitudes and Lifestyles has provided an opportunity to explore these communicational issues.
Method. Unstructured in-depth interviews were conducted with 40 individuals quota-sampled for selected demographic variables. Respondents' reactions to expressions used by interviewers was noted and their own choice of terminology recorded. Particular attention was paid to the meanings that terms had for respondents and their correspondence to standard definitions.
Results. Respondents were willing to talk about sexual matters but often lacked the language with which to do so. Passive understanding of sexual vocabularies was more extensive than active use. There was a general preference for formal scientific terms over informal colloquial ones, although there was some lack of familiarity with, and understanding of, many terms used in health educational literature.
Conclusion. These results highlight the need for those working in clinical, counselling, research and educational settings to take full account of the social content in which terms are used, and the extent to which their meanings are shared, in order to achieve optimally effective communication.

D.531

CHANGES IN SEYUAL BEHAVIOUR OF GAY MEN UNDER THE IMPACT OF AIDS. II

Bochow, Michael; Markert, Stefanie
INTERSOFIA, Berlin (West), FEDERAL REPUBLIQUE OF GERMANY

Objective. To analyze whether further changes in sexual behaviour of gay men are still taking place and whether those already identified in a previous survey (1987) have proved to be stable.
Methods. A questionnaire of 62 questions on different topics relating to sexual behaviour and lifestyle of gay men was circulated by the seven most important gay journals in West Germany in October 1988. The questionnaire is almost identical with the questionnaire distributed for a first investigation in 1987. The 1988 survey is therefore a replication study. The response amounted to 1122 questionnaires in 1988 (1987 : 924).
Results. A preliminary assessment shows a remarkable stability of changes in sexual behaviour of gay men in West Germany. Low risk sex has proved to be accepted by an important majority of gay men. Gay men with a stabilized gay identity are also the most successfull in coping with the risk of HIV infection.
Conclusion. Efforts in prevention activities targeting specific subgroups of gay men are still to be intensified, namely gay men with a lower level of education and men with covert homosexual activities.

D.532

MANIFESTATIONS OF AIDSPHOBIA AT AN OUTPATIENT CARE UNIT IN RIO DE JANEIRO - BRAZIL

Longo, Paulo Henrique Pinheiro; Carvalho Neto, L.D.; Sion, F.S.; Morais de Sá, C.A.
Gaffrée & Guinle University Hospital, University of Rio de Janeiro (UNI-RIO) - Brazil.

Objective: To study the ethiology and incidence of somatic manifestations of HIV negativ individuals concerned about AIDS who came to the AIDS Outpatient Care Unit at our Hospita presenting paranoid states and phobias related to AIDS.
Methods: The study comprised 23 HIV negative individuals (17,04%) with AIDSphobia selecte among 135 patients interviewed, from Feb 88 to Dec 88. We performed physical examination anu used non directive interviews, psychotherapic support and counselling.
Results: Somatic manifestations related to the anxiety are shown in the following table:

SYMPTOMS AND SIGNS	N	%
Sexual dysfunction	19	82,6
Diarrhea	15	65,2
Lack of concentration	12	52,2
Insomnia	10	43,5
Sweats	8	34,8
Skin Alterations	5	21,7
Fever	3	13,0
Trying Suicide	1	4,3

During the psychotherapic sessions it was observed that all the 23 individuals presented a pre-existing sexual conflict, basically comprising latent homosexual impulses, directed to an external object, as AIDS, a sexually transmitted disease.
Conclusions: A conflictive sexuality can reinforce the fear of AIDS, causing psychiatric states and somatic manifestations that can be confused with non specific symptoms of HIV infection. AIDSphobia should be considered when elaborating an AIDS prevention campaign.

D.533

IMMUNE MODULATION FOLLOWING THE DEATH OF A CAGE-COHORT AN ANIMAL MODEL OF PSYCHOLOGICAL STRESS IN AIDS

Yoshitatsu Sei, Phil Skolnick and Prince K Arora
Laboratory of Neuroscience, NIDDK, National Institutes of Health, Bethesda, MD, U.S.A.

Objectives. The psychological stress, experienced by AIDS patients following the death of their sexual partners or close friends, has been suggested to influence immune functions. An attempt was made in these studies to establish an animal model for this type of psychological stress.
Methods. We examined immune functions among several mouse strains (C3H/HeJ, AKR/J and BALB/cJ) following the death of a cage-cohort. Mice were housed in groups of five. At 48 hr intervals, one cohort was killed by cervical dislocation and returned to the home cage. Behavioral responses of the remaining cohorts were noted for 2 hr following each exposure. At the end of four such exposures, natural killer (NK) cell activity was measured in the remaining cohort.
Results. Fighting among the cohorts and biting carcasses were frequently observed in the C3H and AKR but not in the BALB/c mice. Eating carcasses, settling with carcasses were seen more frequently in C3H. NK cell activity was significantly suppressed in C3H, but not in AKR and BALB/c.
Conclusions. These results suggest that 1) the degree of psychological stress experienced following the death of a cohort differ between different haplotype strains, and 2) such behavioral changes can influence immune function.

D.534

RELIABILITY OF DATA COLLECTED ON SEXUAL HISTORIES IN HAITIAN IMMIGRANTS IN MONTREAL

Adrien, Alix°; Tousignant, Y.°°.
Community Health Department, Montreal General Hospital and °McGill University, °°Université de Montréal; Montréal, Québec, Canada.

Objective. To evaluate test-retest reliability of a questionnaire on sexual histories administered to Montrealers of Haitian origin.
Methods. Test-retest reliability of the questionnaire was assessed using 30 subjects (13f., 17m.) aged 15-39. The median of the interval between the two questionnaire administrations was at 15 days with 33,3% of intervals being 28 days or more. French illiterate subjects were asked orally 34 questions related to their sexual history. The 27 most sensitive questions were self administered for French literate subjects, the other 7 questions being administered by interview. Kappa statistic was used for the estimate of reliability.
Results. All obtained kappas were significant at the p<0,0001 level. The lowest values were 0,703 and 0,758 for questions on the change of number of casual sex and homosexual encounters. Six kappa values ranged between 0,800 and 0,900, 8 more were in the 0,900 to 0,999 range, and perfect agreement (k=1,000) was found for 18 variables. Kappas higher than 0,900 were found for number (k=1,000), proportion and type (casual/steady, k=0,959) of lifetime sexual partners and for frequency of condom use with those partners (k=0,912).
Conclusion. Sexual histories can reliably be obtained in the Haitian ethnic minority of Montréal whether these questions are self administered or asked orally.

D.535

BEHAVIOUR MODIFICATION STRATEGY IN AIDS PREVENTION

Bart WYNENDAELE, Msc, Consultant AIDS Task Force, E.E.C. Hedwig GOEDE, MD, Health Education, National AIDS Programme Surinam, Brussels, Belgium

Report on an experiment in Surinam and a discussion on methodology
Objective :To promote participative training models for health educators involved in AIDS prevention directed at behavioural change for specific target groups.
To determine the most effective method for each objective and target group.
Method : Theoretical background and practical experience lead to the use of participative methods by the training of health educators in Surinam. Representatives from different target audiences were trained in information, group work and communication.
Results : Experience indicates a close relationship between the training methods used and the output. Depending on the setting, the degree of personal involvement and the method procedures, changes are obtained in subsequent levels: knowledge, motivation, attitudes and behaviour. For example, a lecture or an article provoked a change in knowledge while attitudinal and behavioural change implied more involvement. A synthetic table indicating correspondence between method and output is proposed.
Conclusions :Prevention can be made more effective when methods correspond more to the expected outcome. A differential approach should also be used for outcome evaluation. The focus of the prevention campaign being behaviour modification, more resources are required for training of trainers, research to devise effective methods and evaluation of the outcome.

D.536

THE USE OF THREE BIOPSYCHOSOCIAL INTERVENTIONS ON THE STRESS LEVELS AND IMMUNE FUNCTIONING OF HIV POSITIVE INDIVIDUALS

Hamilton, Brian CSW,*; Dufault, Ethan**.
*Bellevue Hospital/Community Health Project., NY, NY USA, **Smith College School of Social Work, Northampton, MA USA

Objective. On the premise that personality coping styles are a co-factor in disease prognosis, we are assessing the effects of 3 biopsychosocial interventions on the stress levels and immune functioning of HIV patients.
Methods. 10 seropositive patients underwent an intensive 16-week intervention involving Bioenergetic Psychotherapy, Meditation designed to stimulate Thymus gland activity & a structured Journal writing program. Each patient received a complete immune profile & biopsychosocial questionnaires at start, mid & end points with 6 month follow-up planned. Results compared to data collected from comparison group not receiving independent variable.
Results. Preliminary data suggest a trend toward enhancement of immune functioning noting, eg.,correlations between overall mood profile including anxiety & depression, & such variables as cortisol and immunoglobulin levels. Therapeutic techniques used were successful in patients learning individual stress management-therefore reducing each patient's overall stress levels as measured by thorough assessment profiles throughout the study.
Conclusion. We anticipate finding a correlation between biopsychosocial interventions designed to promote stress reduction and positive, enhanced immune functioning. We further hope to show how these interventions can be successfully implemented in overall treatment protocols in the functioning of community-based AIDS Assessment Clinic Programs.

D.537

MAINTAINING FOLLOWUP IN PROSPECTIVE EPIDEMIOLOGIC STUDIES OF HIV INFECTION: EXPERIENCE IN THE BALTIMORE MACS STUDY

Fox Robin, Jones LT. The Johns Hopkins School of Hygiene and Public Health, Baltimore, MD, USA

Objective To describe methods of maintaining participation in the Baltimore MACS, a volunteer study of the natural history of HIV in gay men.
Methods During a sample 3 month period, methods used to remind study participants (Ps) of their followup (FU) appointments, and return rates for each method were assessed. FU rates from the original cohort were tallied. The effect of incentives such as prizes to maintain FU was evaluated.
Results. 407 Ps had FU visits scheduled between 10/88 and 1/89. 303(74%) responded to a mailed reminder notice by completing their FU visit. 41(10%) responded to a mailed notice plus ≥1 telephone calls. 31(8%) Ps rescheduled but had not yet completed their FU visit, and 25(6%) are being contacted/traced. 7(2%) declined further participation. FU since 1984 is:

Status Known: 870 seen in 1988 (29 with AIDS)
52 deaths (44 AIDS, 8 possible AIDS or non AIDS)
18 moved
57 followed by telephone (6 with AIDS)
Status Unknown: 62 (32% HIV+, 68% HIV- at last contact)
Active Tracing: 94 (3 with AIDS)

Of 1183 volunteer study Ps, 88% are accounted for in 1988. Ps reported that prizes were not a major reason that they continued to volunteer.
Conclusion In this volunteer population, 74% returned for FU visits with 1 mailed notice. In such studies, it is important to commit resources to maintaining FU. Since 1984, vital status is assessed in 88% of the population.

D.538

THE MINNESOTA GENERAL PUBLIC AIDS SURVEY: A BEHAVIORAL RISK FACTOR SURVEY SUPPLEMENT

Heckert, Karen; Shultz, J.; Salem, N.; Minnesota Department of Health (MDH), Minneapolis, MN, USA.

Objective. To assess AIDS-related knowledge, attitudes and behavior (KAB) among the Minnesota general public over time, using systematic samplin procedures of the CDC Behavioral Risk Factor Surveillance System (BRFSS).
Methods. During September-December, 1986-1988, the MDH conducted th Minnesota General Public AIDS Survey (MGPAS), an AIDS-specific KAB modul added to the BRFSS core survey (N=1,000+/year for MGPAS). BRFSS (and MGPAS uses a Waksberg multi-stage cluster design.
Results. Belief in having enough information to protect oneself from AID increased, 70% ('86) to 90% ('88). Knowledge of HIV sexual and needle-sharing transmission was consistently high (>93%). Incorrect perceptions o risk declined for blood donation, 45% to 25%; sharing a drinking glass, 21 to 12%; and kissing, 31% to 22%. Attitudes regarding permitting PWA's t continue employment increased from 67% to 85%. Most Minnesotans (84% believed that children with AIDS should be permitted to attend school. I 1988, among 22% who replied 'yes' to "Has AIDS changed your life in an way?", 46% reported taking sexual precautions, ranging from increase perception of risk to increased care in partner selection to adoption of safer sex behaviors.
Conclusion. [1] The BRFSS is an excellent vehicle for state-level AIDS surveys. [2] Compared to NCHS national surveys, Minnesotans appear to have comparable or higher levels of knowledge regarding HIV transmission, lower misperceptions of casual transmission, and a higher degree of acceptance of PWA's in school and work settings.

D.539

TRUST: PREREQUISITE FOR GAY HEALTH

Getty, Grace RN BN MN*; Stern, P. DNSc, RN, FAAN** University of New Brunswick, Fredericton, N. B., Canada,** Dalhousie University, Halifax, Nova Scotia, Canada.

Objective. To explore the perceptions of gay men regarding; a) the problems they encounter while maintaining their health; and b) their views on how these problems can be solved.
Methods. Data was gathered from a) unstructured interviews with 34 healthy gay men in the Maritimes; b) a log maintained while nursing people with AIDS; and, c) participant observation during 18 months of educating people about AIDS. A substantive conceptual framework was developed using the constant comparative analysis method of grounded theory.
Results. The basic social psychological process of trusting enables gay men to attain holistic health, as they achieve four developmental tasks: (a) unlearning the myths about homosexuality, (b) searching for lovers and friends, (c) reconciling their heterosexual network with their gay identity, and (d) managing health risks. The response of gay men to the threat of AIDS depended upon their achievement of these developmental tasks, and the amount of trust developed.
Conclusions. Recognition of the level of achievement of developmental tasks of gay men, allow educational programs and counselling approaches to be tailored to their particular needs.

D.540

"HOW AN AIDS PATIENT MANAGES HIR LIFE"-A study of seropositives to HIV patients In São Paulo city.

Teixeira,P*;Laurindo,L*;Gianna,M*; Kalichman,A*; Grangeiro,A*;Laurindo,J*;Munhoz,R*
*AIDS-Reference and Training Center-Health Secretariat of São Paulo-Brasil

For the enormity of cases in São Paulo city, 3213 until december, 1988, we think that is urgent a study trying to understand more about the AIDS patient's life.
General objectives-1)To provide subsides in the sense of to understand and deal better with the disease:2)To propose support measures for the patients in their itinerary to death.
Specific objectives-1)To make a evaluation of the social-economic profil of these patients:2)To know the changes of behavior patterns after knowing the positivity of the HIV test, from the social, affective, and familiar point of view.and also their situation in the work market.
Methodology-We have chosen a questionary to be applicatec in seropositives and sick patients that were being followed at the medical care in our service. These patients were chosen in a casual way, but they were all aware of their diagnostic.
Results-The universe obtained was composed by:homosexuals(33%), bisexuals(34%),heterosexuals(17%)drug abusers(23%) and blood receivers(3%). Even though our patients are still in the work market, they face their lives in a fateful and resignated way changing their sexual behavior in the sense of to abstain themselves of their relashionship. They look for support with their family. They also look for religiousity and faith.

D.541

AIDS BEHAVIOR RISKS IN WOMEN OF REPRODUCTIVE AGES IN A FAMILY PLANNING CLINIC.

Fast, Judith E. Baylor College of Medicine Population Program Houston, Texas,U.S.A.

As a corollary to an United States Centers for Disease Control seroprevalence study on women of reproductive ages 17-44, a survey was conducted between October, 1987 and November, 1988 on 438 mixed ethnic origin women (31% Black, 40% Hispanic, 27% White) entering into the Baylor Population Program Family Planning Clinic. A self-reported questionnaire consisting of 55 questions on behaviors associated with risk for AIDS in heterosexual women was used in addition to the routine questionnaire on reproductive and contraceptive history. The range of responses to all the risk behavior questions was 134-438.

Responses to single and multiple risk behaviors were examined. The seven high risk behaviors examined included: client--bisexual, IV drug user, IV needle sharer, blood transfusion between 1978-1985; client sex partner--bisexual,IV drug user,and HIV positive. The three low risk behaviors included: client--history of STD, multiple STDs, and multiple sex partners. For the single high behaviors, the positive responses ranged between 1 (n=366) and 22 (n=438). For the single low risk behaviors, the positive responses ranged between 25 (n=422) and 76 (n=215). For the double risk behaviors, the positive responses ranged between 1 (n=430) and 18 (n=420) with the higher numbers in the categoies of IV drug user and multiple sex partners for either client or sex partner. The results of this preliminary risk behavior catergorisation analyses were used to substantiate the need for an education and counseling program to encourage and measure behavior modification in these heterosexual women who are at risk for AIDS and for transmitting it to their partners and babies.

D.542

TITLE: PILOT STUDY OF KNOWLEDGE, ATTITUDE, OPINION AND BEHAVIOUR OR LAGOSIAN NIGERIANS ABOUT HIV INFECTIONS AND AIDS

SOMORIN, A.O., LEWIS, I., ODUNOWO, B., HUNPONU-WUSU, O.O.,*SOMORIN, J.E.
COLLEGE OF MEDICINE, UNIVERSITY OF LAGOS, NIGERIA
*COMMUNICATION EXPERT - EREKO METHODIST CHURCH LAGOS, NIGERIA

OBJECTIVE: To determine indices of Knowledge and Attitude of Lagosian residents using their Beliefs and Opinion, about contracting and preventing spread of AIDS in Nigerian.

METHODOLOGY: The study was carried out by interviewers using specially prepared coded Questionnaire Forms to screen 239 health looking Nigerians comprising of 110, 129, laymen and health personnel respectively in January - June, 1988.

RESULTS: 50% of the population have adequate knowledge of AIDS while 70% and 23% of the laymen and helath personnel believe that KISSING can spread AIDS. Only 50% of the population believe that AIDS has a COMMUNITY VULNERABILITY. 60% of either groups believe that AIDS educational programmes should be given to call girls, parents, teachers, health personnel and blood donors.

90% of the health personnel belief that short term training exposure in AIDS management, and incentives should be given to prospective AIDS health Care providers.

70% - 90% of the group feel that the government should legislate against the importation of AIDS into Nigeria.
CONCLUSION: There is therefore a need for a larger KAO population/study in Nigeria.

D.543

OCCUPATIONAL THERAPY ACTUATION AT A MULTIDISCIPLINARY TEAM TURNED TO AIDS .
MOREIRA, C.E.F.A.A.; TANNUS, L.K.N.; LIMA, K.P.J.S; BELLUCCI, S. B. B. .
Centro Corsini. (CCII).Campinas.São Paulo. Brazil.

CCII a philanthropic non governamental entity,multidisciplinary compound by: doctors,psychologists, nurses,dentists,physical education teachers and occupational therapists. Research based on individual attendances of HIV infected clientele from CCII, ambulatorial, hospitable, domiciliar. The clientele belongs to different risk groups at different infection stages. Their ages vary from 13 to 47. Besides the social stigma aggravation, the exacerbation of pre-existing psychological conflicts takes place,determining the Occupational Therapy actuation, being the main objective the quality of life improvement, defined from emerging individual needs, like expression and communication, psychological equilibrium maintenance which results in maintenance or improvement of patients organic state, and life or death process acceleration. The Occupational Therapist must consider the social-political-economical and cultural context in order to avoid the restriction of therapeutics process. Results will be discussed, in the presentation.

D.544

TOWARDS IMPROVONG CONDOM USE IN A SEXUALLY TRANSMITTED DISEASE CLINIC.
Beidas, Sary*; Byrnes,D.**. *Saint Michael's Medical Center, ** East Orange Health Department, Newark, N.J.,U.S.A.

Objective. To assess patient knowledge about condoms and spermicidals in a high risk setting for STD and HIV infection.
Methods. Twenty four patients (22 men, 2 women), mean age 25.8 ± 5.7(SD), were consecutively interviewed at an Inner City STD Clinic. Their knowledge of condoms and spermicidals was evaluated through a questionnaire.
Results. Fifteen (62 %) patients knew what the average cost of condoms was. Not one patient could identify any of the spermicidal brands available on the market, also none of the patients used them . Five (21 %) patients never used condoms, while 19 (79 %) patients used condoms only occasionally. Only three patients had preference to a certain condom type. Five (21 %) patients repoted occasional rupture of condoms while in use. One patient reported his use of vaseline for additional lubrication.
Conclusion.These results indicate that current counselling methods may need to be modified. One such modification is to provide each counsellor with a sampler rack of the available condoms and spermicidals in that particular geographic location. This would allow patients to handle each item individually in order to decide which is more appropriate for their needs. Such an approach will improve condom and spermicidal use in this population at high risk for HIV and STD infections.

D.545

THE BRITISH SURVEY OF SEXUAL ATTITUDES AND LIFESTYLES - A PILOT STUDY.
*E.J. Field, +Anne M. Johnson, ++K. Wellings, °J. Wadsworth, °B.A. Bradshaw, **R.M. Anderson. *SCPR, +UC & Middlesex School of Medicine, ++Health Education Authority, oSt. Mary's Hospital Medical School, Imperial College, London, U.K.

Objective. To assess the feasibility of a major national study of sexual attitudes and lifestyles in a random sample of the British population.
Method. A stratified multi-stage sample of addresses was taken from the Postcode Address File and one person aged between 16 and 59 randomly selected from each address. Respondents were asked about numbers of sexual partners in different time periods, contraception, homosexuality, sexual practices, drug use, prostitute contact and attitudes towards sexual behaviour. Sensitive questions were contained in a self-completion booklet and completed midway through the interview.
Results. From 1,495 eligible addresses, 974 productive interviews were achieved, a response rate of 65%. Preliminary analysis shows that the sample was broadly representative of the population although men were slightly under-represented. There was marked variability in numbers of sexual partners and specific sexual practices. Those in younger cohorts experienced first sexual intercourse earlier and had higher numbers of sexual partners than older cohorts. The proportion of respondents reporting homosexual experience was broadly similar to comparable European studies.
Conclusion. Good response rates with no serious biases were achieved relative to other surveys of this nature. This pilot study has established a methodology which will be used in a national study of 20,000 individuals.

D.546

THE HIV SUPPORT GROUP: AN ANALYSIS USING DIFFERENT SOCIAL PROBLEM MODELS AND DIFFERENT INSTITUTIONAL SETTINGS
Nessel, M.D., Jerry Thomas
Bronx AIDS Community Service Project, Director of Education, N.Y.C.
Samaritan Village, Inc., Health/HIV Coordinator, N.Y.C.,U.S.A.
Mercy College, Adjunct Professor, N.Y.C. & Bedford Hills Correctional Facility Extension and Taconic Correctional Facility Extension

Objective. To analyse HIV Support Groups in relationship to five social problem models: medical, social disorganization, value conflict, deviant behavior and labelling. To analyse HIV Support Groups at five types of institutions: residential drug treatment communities, methadone treatment programs, the criminal justice system (local lock-up, state incarceration, the police , the courts, parole and probation), mental health facilities ar general hospitals.

Methods. Personal observation and study based upon years of experience.

Results. Differences in HIV Support Groups are seen according to what model we use to understand them and the type of institutional setting.

Conclusion. To educate, change attitudes and change behavior, we need to consider what kind of model we use and the differences in the types of institutional settings. More study is needed in this subject.

D.547

SEXUAL BEHAVIOR AND ITS CHANGE AFTER HAVING KNOWLEDGE ABOUT AIDS AMONG BRAZILIAN UNIVERSITY STUDENTS.
Díaz, M.M.***, Aoki, Francisco H.*, Goodson, P.***, Díaz, J.* **, Vera, S.*** and Faundes, A.* **.
* State University of Campinas, Campinas, SP, Brazil; ** The Population Council, New York, USA; *** CEMICAMP, Campinas, SP, Brazil.

Objective: To assess the incidence of sexual behaviors that constitute risk of contracting AIDS among Brazilian University Students and the impact of information about AIDS on this incidence.
Methods: A structured questionnaire on sexual behavior and knowledge about AIDS was mailed to 2609 students of the first two grades of the State University of Campinas. Analysis was performed using SPSS PC.
Results: The percentage of respondents was 37.4%. The percentage of students not using condons, 77.2% before knowing about AIDS, lowered tc 45.6%. The incidence of oral and anal sex did not change after knowing about AIDS. The percentage of multiple partners, higher among males, was 19.5% before and 11.6% after receiving information on AIDS.
Analysing the group that had risky behaviors before, 86.5% persisted in anal sex, 58.4% not using condons and 55.6% continued having multiple partners.
Conclusion: Knowledge on AIDS did not modify substantially sexual behavior among students. Educational strategies appear as an urgent need.

Counseling
Counselling

D.548

A THREE COMPONENT AIDS ATTITUDE SCALE
Torabi, Mohammad R. and Yarber, W.L.
Indiana University, Bloomington, Indiana, U.S.A.

Objective. To plan, implement, evaluate and study AIDS education programs, development of a valid knowledge test and attitude scale is essential. The purpose of this study was to develop a valid, Likert-type scale to assess student attitudes towards AIDS and AIDS prevention. The three-component attitude model, consisting of feeling, belief, and intention to act which is known to be an appropriate way of measuring health attitudes was utilized for the above purpose.
Methods. By reviewing related literature, a table of specifications consisting of two conceptual areas was developed. A large pool of Likert-type attitude statements related to the table of specifications was developed using a variety of sources. These statements were reviewed by a jury of experts for clarity and content validity. Based on this collective analysis, a preliminary scale with 30 items was constructed. The preliminary instrument is being administered to a representative sample of 50 college students. The collected data will be subjected to Pearson correlation for criterion of internal consistency; t-test for discriminating analysis of the items and external criterion.
Results. As a result of these analyses, 15 of the most discriminating original 30 items on the preliminary instrument will be selected for the final scale. For validation purposes, the finalized scale will be administered to a representative sample of 300 college students in a major university in the United States. The collected data will be analyzed by using univariate and multivariate statistical techniques in order to evaluate scale performance, validity and reliability.

D.549

A METHOD FOR COUNSELLING PATIENTS WITH NEUROLOGICAL PROBLEMS ASSOCIATED WITH AIDS

Bor, Robert; Miller, R. and Willison, J.
Royal Free Hospital and School of Medicine, London, England.

Objective. To describe a method for counselling patients, family members, partners and health care staff for neurological problems at different stages of illness, associated with AIDS.
Methods. The 'Milan Approach' in family therapy was applied. Interventions by the counsellor, who may be a doctor, nurse or other member of the health care team, include: (a) contributing to the overall assessment of patients; (b) helping patients to solve problems at a stage when they are still able to make decisions; (c) engaging the support of family and friends;
(d) 'translating' the results of formal neurological assessments; and
(e) advising parents in the management of behaviour problems in children.
Counsellors also have a special role in advising and consulting to colleagues about the management of these patients.
Results. Staff stress is reduced in working with neurologically impaired HIV-infected patients. The family and social support systems are engaged at an early stage. Major crises are often averted through counselling at a stage before difficulties become intractable problems.
Conclusion. A coherent, teachable and consistent approach to counselling this patient group can reduce stress and elicit improved coping strategies in the patient, the family and health care team.

D.550

ERVOLINO COUNCELLING/AIDS PROGRAMME

Ervolino,L.A.*;Ervolino Neto,J.**;Carvalho Silva,A.***;
Invited presenter: Torres,M.Cristina****.
*,**,***Health Ministry,Brasilia,DF Brazil;****Health Secretariat,Porto Alegre, RS,Brazil.

Objectives. To improve the prevention level in HIV transmission.
Methods. The Ervolino Councelling/AIDS programme is a Human Resources training process. It uses self analysis to obtain an adequate balance of the individual emotions, which is viewed as a key factor for an effective change to a preventive behavior. Role playing is widely used to create hipothetical situations between the trainee and its peers, family, friends and patients involved with the HIV contamination process. This programme also includes specific training for "multipliers" and "instructors", which are the elements that give technical autonomy to the programme after its implementation.
Results. This programme was applied in Brazil over a period of one year, in 416 health professionals that work with coucelling of AIDS patients. A random sample of 70 professionals was evaluated, giving the following results: 90.6% felt they obtained a necessary emotional balence to deal with their daily problems. 94.4% said they improved their attitude when dealing with AIDS patients. 40.5% of AIDS patients, NOT YET trained, but treated by professionals trained by this method, believe that their attitude concerning AIDS has changed permanently.
Conclusions. The results obtained up to now support the theory that it is highly effective to identify and work the basic emotions of an individual before supplying him/her with technical information for behavior changes..

D.551

THE INTEGRATION OF SAFER SEXUAL PRACTICES AND VERIFICATION OF MEDICAL DIAGNOSIS IN PSYCHO-SOCIAL INTERVENTION AT THE COMMUNITY LEVEL.

William J. Ryan, MEd, MSW, RSW. Director of Support Services, Comité sida aide Montréal.,CANADA

Objective - To describe psycho-social interventions with People With AIDS or persons who are seropositive concerning safer sexual practices and verification of information concerning medical diagnosis. Literature has shown that both of these components have been underemployed in interventions at the point of diagnosis and at the level of community intervention.

Method - To present a therapeutic working group from a community based organization and its integration of safer sex counselling and verification of medical information in the context of crisis intervention at Comité sida aide Montréal.

Results - A population that is better informed about safer sex practices and medical information through the intervention of a community based organism.

Conclusion - It is feasible to integrate these two aspects into counselling intervention at community based organizations.

D.552

TRAINING OF INSTITUTIONAL PROFESSIONALS AS HIV INFECTION/ AIDS PREVENTION COUNSELING TRAINERS IN PERU

Bossio, Luis*;Cáceres, C.*;Goodfriend, N.**;Carovano, K.**
*Programa VIDA, Lima, Perú; **AIDSCOM/AED, Washington, U.S.A.

Objective. Developing a short program for training a multidisciplinary group of professionals, coming from several institutions, as trainers in HIV infection/AIDS prevention counseling, and leading them in the design of a working strategy within their institutions.
Methods. Thirty peruvian institutions, including National and Social Security Hospitals, Institutes developing AIDS research or services on AIDS, social organizations and HIV-screening Laboratories, are invited to send a participant to attend a three-day workshop where information about general issues on the pandemic and its prevention, preventive counseling, post-test counseling, the local history of AIDS and the ways it is being fought, will be presented and discussed. In addition, possible working strategies for each attendant within his/her institution will be pursued.
Results. Invited institutions participated by sending medical doctors, psychologists and social workers. The previous level of knowledge was heterogeneous among them in terms of quantity and quality. Attendants participated enthusiastically in the dynamics. At the end of the workshop, a standarization was obtained on the level of knowledge among participants; their involvement in further work increased, and the specific working strategies within each institution could be set.
Conclusions. The Training-of-HIV/AIDS-prevention-counseling-Trainers Workshop acccounts for an improvement in the level of knowledge among attendants, and an increase in their motivation for further work.

D.553

COUNSELLING WORKSHOP FOR HEALTH PROFESSIONALS

Grondin Mary, Hulin M, Department of Public Health,
City of Toronto, Toronto, Ontario, Canada

OBJECTIVE: HIV illness was becoming an issue for health care providers working for Public Health Departments. This workshop was instituted to provide Public Health Nurses with the tools to develop counselling skills re: HIV illness.
METHOD: A two day workshop for Public Health professionals involved in HIV counselling and education. The program used was one taken from material provided by Centre for Disease Control, Atlanta, Georgia. Material was modified to Canadian standards and for use by Public Health Nurses. Training includes role playing, use of videos and lecture material.
RESULTS: To date 48 Public Health Nurses have participated in this workshop. In many incidents, this was the only training available to them to meet the requirements for HIV counselling. Further follow-up regarding outcomes will be presented. There is a plan to make a telephone contact with each participant to determine the relevancy of the workshop. The workshop is presently being adapted to meet the needs of other professionals such as physicians and other health care providers.
CONCLUSIONS: There is a need for workshops to be developed and continued to be offered. Discussions enabled Public Health Nurses to be more aware of the psycho-social issues involved in HIV counselling. Certain principles need to be followed in this type of presentation which will be outlined.

D.554

A Comprehensive Program to Support Individuals Infected with HIV.

Williams, Janet L.*, Magruder, Charles D.*,
Sanchez, Jose L.**, Quattromani, Frank L.*,
*Womack Army Community Hospital, Fort Bragg, NC, USA,** Walter Reed Army Institute of Research, Washington, DC, USA.

Objective. To describe and evaluate a multi-disciplinary program designed to support people who have been infected with HIV.
Methods. The U.S. Government has a formal policy which states that all individuals on active duty status in the Armed Forces must have an HIV antibody test at least biennially. When an ELISA test comes back positive, a Western Blot is obtained. If this test is also positive, the individual sees a physician who explains its meaning and provides counseling. Immediately afterwards, each person is evaluated by a psychiatrist and given an opportunity to receive pastoral counseling and support. Repeat ELISA and Western Blot tests are then performed at a different laboratory. When the results become available, a physician provides follow-up counseling, formal contact interviews are performed and an internist, social worker and community health nurse are assigned.
Results. More than 100 people have been involved with this program since its inception. The vast majority of these individuals have found the social and emotional support indispensable in improving the quality of their lives. Though difficult to quantify, it is also felt this program has helped people modify or reduce certain high-risk behaviors, thereby reducing the possibility that further HIV transmission will occur.
Conclusion. This program provides a supportive environment for individuals infected with HIV. Similar efforts could be beneficial elsewhere.

D.555

A BEHAVIORAL APPROACH TO HIV PREVENTION AMONG SERO-NEGATIVE OR UNTESTED GAY/BISEXUAL MEN WITH A HISTORY OF UNSAFE BEHAVIOR.

Swarthout, David*; Gonsiorek, J.**; Simpson, M.*; Henry, K.****
*Hennepin County Red Door Clinic, Minneapolis, Minnesota, USA; **Twin City Therapy Clinic, Minneapolis, Minnesota, USA; ****St. Paul Health Department, St. Paul, Minnesota, USA.

OBJECTIVE To reduce the incidence of unsafe sexual behavior among gay/bisexual men who have either tested HIV antibody negative or whose serostatus is unknown.
METHOD A pilot program was conducted from 2/88 - 12/88 focusing on individuals who have a history of unsafe sexual behavior within the past year. Program goals were formulated to 1)explore the role of alcohol and other drugs in sexual situations so no sexual activity occurs under the influence of chemicals; 2)increase the number and diversity of non-insertive sexual behaviors; 3)desensitizing feelings about condoms by learning how to playfully and properly use them.
RESULTS Admission criteria was based upon a history of unsafe behavior rather than serostatus. Known seropositive individuals were referred to other programs. Approximately 332 gay/bisexual men were screened at local STD clinics, 106 were determined eligible and 47 were enrolled in the program. They were offered individually tailored treatment plans and participated in group counseling/educational protocols aimed at changing behavior. Participants completed an intake and goal setting session: >60% were able to identify situations that precipitated unsafe behavior in the past (i.e., work stress, loneliness or family arguments) and 75% reported alcohol/drug use concurrent with unsafe behavior.
CONCLUSION Participants who completed this pilot study reported more consistency in safe sexual behavior.

D.556

WORKSHOPS FOR PARENTS OF HIV ANTIBODY POSITIVE CHILDREN

Jennifer Ross. Judith Rosenakis. Haemophilia Foundation of Australia A.N.C.A. (Melbourne). Social Worker. Haemophilia Centre. (Sydney). and H.F.A.

Objective: The needs and concerns of parents of children with haemophilia and HIV are extraordinary, and appear to be greater than those of the children themselves. Many stem from the parents' isolation, both emotional and geographic (in Australia). Following requests the Haemophilia Foundation of Australia applied for a grant to fund workshops with the aim of bringing together people with this common problem to share their situation, and draw upon their own resources to give mutual support.
Methods: Funding was obtained through an Australian National Committee on AIDS Education Grant for the project. As it was implemented through the resources of the H.F.A. and Haemophilia Treatment Centre counsellors, the major costs were fares and accommodation.
An open, flexible format was prepared by H.F.A. and counsellors, and adapted to suit the participants at each workshop. Commitment to a Friday evening, and full Saturday was required each time, and the concluding optional social evening function was always well attended. A concurrent adolescent workshop was held in one city.
Results: Three workshops were held in major cities, with participants travelling long distances from country and interstate to attend. Facilitators were the counsellors from each patient group, allowing important follow up to deal with some of the profoundly emotional concerns raised and discussed. Information sessions on e.g. AZT were offered by H.F.A. resource people, (and always taken up), acting as a ventilation between heavier, more difficult discussion sessions. Following a brain-storming of issues, the groups set their own agenda by choosing discussion group topics. A problem-solving technique was applied to discussion to endeavour to give people a more positive outcome.
Summaries of brain storming sessions, prioritized topics and each group discussion were recorded in a non-identifiable way. These were summarized and sent to participants as reinforcement/reminder of the time together.
Conclusion: Great relief was expressed by participants at being able to share together. While the opening up of sensitive areas e.g. facing death/dying, was difficult for some the opportunity was still appreciated. The overwhelming response from those attending these workshops showed how meaningful and valuable it is for people to come together in this way. The H.F.A. and Haemophilia Treatment Centres plan further workshops for parents, couples, wives, and adolescents.

D.557

IMPLEMENTING AIDS PREVENTION COUNSELING SERVICES AT AN STD CLINIC

Gibson, Paul M.; Gibson, W.P.; Bolan, G.
Department of Public Health, San Francisco, CA, USA

Objective. To integrate AIDS prevention services into the treatment of patients at an STD clinic.
Methods. An organizational approach was taken in developing AIDS prevention services. An HIV Task Force was formed, staff and patients were surveyed and a standardized protocol was designed. All professional health care staff received training in the new protocol, and a staff retreat was held to provide support and resolve concerns.
Results. The clinic has provided comprehensive AIDS prevention services since November 1988. Patients are given a specially developed brochure with AIDS and STD information. This brochure also has a concrete risk assessment that staff review with patients to determine their risk of HIV and other STDs. All patients receive a condom demonstration, a "safety kit" with condoms, and prevention guidelines; bleach is distributed as needed. Staff complete an individualized, written health plan with patients including steps to reduce their risk. These services require 20 minutes in a one-on-one counseling session with each patient. Initial patient and staff response is positive with minimal disruption in clinic flow.
Conclusions. An organizational development approach is needed to implement AIDS prevention counseling services at STD clinics. Further evaluation will determine the long range impact of services on the clinic and patients in reducing their HIV and STD risk.

D.558

THE USE OF HYPNOSIS WITH ASYMPTOMATIC HIV INFECTED PEOPLE

Gochros, Jean S., Ph.D., HIV Unit, Tripler Army Medical Center, Honolulu, Hawaii, U.S.A.

Objective. To explore the use of hypnosis in assisting asymptomatic HIV infected people cope with stress and anxiety.
Method. This paper is based on the author's use of hypnosis with men she is seeing in individual therapy, the members of an HIV+ support group she facilitates, and on the feedback she has received.
Results. In both individual counseling and in support group sessions, hypnosis has helped people cope with interpersonal relationships and such issues as anxiety, fear of death and dying, sense of powerlessness and loss, and reaction to stigmatization. It has also provided techniques for coping with pain.
Conclusion. Observed behavioral changes and feedback from clients and group members suggest that hypnosis can be particularly useful in stress relief and the development of coping skills. At the same time, it must be emphasized that the use of hypnosis and such popular derivatives as "visualization" can also be harmful when used with the implication that it can "heal", cure,or prevent AIDS.

D.559

WHY VOLUNTEERS IN A WELLFARE STATE?

Madsen, Kirsten*; Kristensen, Jørgen Haahr**;
AIDS-linien, Copenhagen, Denmark.

Denmark is a socalled wellfare state. We live in the economically priviliged part of the World. We are known for taking care of people "from cradle to grave". We expect paid professionels to take care of our health and social problems. This means that we have a large staff of public servants. With this in mind it is unusual for Denmark that it was a political decision to financially support a private organisation to establish and run an AIDS hot-line with volunteers as councellors.

LBL (The National Gay Organisation) was granted money to give information about AIDS to the general public by means of an AIDS hot-line. This project has been very succesfull and so far we have had about 60.000 calls. We have a budget that has made it possible to hire 5½ staff members to support the 45 volunteers, administrate, educate and make publicity about safe sex etc.. The paid staff could actually almost cover the 14 hours of counselling we are doing every day. Yet we have chosen to use volunteers not out of necessity but as an active choise. This decision was made, because when it comes to councelling we find it important to focus on the human side of AIDS and not only the medical/professionel side. Also we think that a lot of what we are learning these years about support, information and behavioral changes very well could be adapted to improve many other areas within the social and medical field.

D.560

ANKALI* PROJECT: CLIENT EVALUATION OF A PROGRAM PROVIDING VOLUNTEER EMOTIONAL SUPPORT FOR PEOPLE WITH AIDS.

McCallum, L.*, Dykes, J.*, Watts, J.**, Buhrich, N.**, Turbitt, P.*.
*Albion Street (AIDS) Centre, Sydney Hospital, Sydney, Australia, **St. Vincent's Hospital, Sydney, Australia.

Objective. To evaluate the effectiveness of a volunteer emotional support program for people with AIDS from the clients' perspective.
Method. Clients who had been matched with a volunteer for at least three months were interviewed. An interview schedule was designed to collect information about the quality and quantity of clients contact with volunteers.
Results. Twenty males and one female were interviewed. All had full AIDS. In giving an overall assessment of the usefulness of their Ankali volunteer, seventeen found them 'very helpful, two 'moderately' and two 'slightly'. Volunteers were found most useful for providing friendship and support. Many stated that they used their volunteer as the first point of contact in a medical or emotional crisis. One third of clients had handed over a power of attorney to their volunteer. None had requested a change of volunteer.
Discussion. These results suggest that volunteers are able to provide emotional support for people with AIDS in their home environment, thereby reducing demands on health professionals. The success of the process of matching clients and volunteers is indicated by the low rate of rejection.
*Ankali - an Australian aboriginal word meaning friend.

D.561

A FORMULA FOR ASSESSMENT OF INDIVIDUAL RISK ACTIVITY FOR HIV INFECTION WITH MODIFICATION FOR BEHAVIOR

DeBernardo, Robert L., M.D., Yale University, New Haven, CT., USA

Objective. To develop a method capable of assigning a probability figure to an individual's risk of contracting AIDS, given his or her individual risk factors and preventive measures.
Methods. Numerous reports of clinical and epidemiological studies were analysed to determine the lowest common denominators for risk factors involved in the spread of AIDS.
Results. The probability of an individual contracting AIDS (IRF) is the product of the probabilities of three factors: 1. the transmission efficiency of the the activity (TE), 2. the prevalence of HIV in the area to which the contact belongs (AP), 3. the risk group of the contact (RG).

$$IRF = TE \times AP \times RG$$

This probability can be modified by utilizing the failure probability of each protective measure taken in the encounter, i.e. condoms, testing, etc. Utilizing this formula gives results comparable to the published observation that are available, and allows for predictions when they are not.
Conclusion. The calculated individual risk probability ratio may be a valuable tool to help assess an individual's risk, and help determine the best specific preventive measures to lower his or her risk to acceptable levels for counseling and educational purposes.

D.562

A TRAINING PROGRAM FOR INDIVIDUALS CONDUCTING COUNSELING AND TESTING

Authors: Rosenthal, S.; Fowley, C.; Solomon, Karen; James, R.; Rautenberg, E.; Schultz, S.
New York City Dep't. of Health, New York, N.Y. AIDS Program Services

Objective: To provide nurses, drug counselors, public health educators, social workers, physicians and other health and social service professionals with the skills needed for advising patients/clients about AIDS and conducting counseling related to HIV antibody testing.
Method: A counseling and testing training program was developed to help professionals overcome the barriers to talking about sex, drugs, the implications of HIV disease and death. A five-day, 35-hour course, led by two trainers and limited to 12-16 participants, provides complete and up-to-date information about HIV disease, basic counseling techniques, active listening skills, and development of referral resources. The program is run according to the small group dynamic model.
Results: There has been an overwhelming demand for this training from health and other professionals working in prisons, TB and STD clinics, hospital in-patient and out-patient settings, OB-GYN and family planning agencies, and drug treatment programs. Participants have found the course extremely helpful, and most feel the need for additional follow-up in view of the emotional intensity of the issues and the limited clinical supervision in their work place.
Conclusion: A manual containing the complete curriculum of the five-day course has been prepared for use by agencies in New York City and elsewhere. In addition, the training unit is planning 1/2-day follow-up sessions and 2-day second stage training programs which include case review and consultation, stress management techniques, refinement of HIV-related counseling skills, sharing of referral resources and more intensive training in such areas as addiction, death and dying and women's issues.

D.563

ART THERAPY WITH HIV POSITIVE PATIENTS, MOURNING, RESTITUTION AND MEANING

Fenster, Gail M. Art Therapy Section, Walter Reed Army Medical Center, and the Walter Reed Retrovirus Research Group, Washington, D.C., United States of America.

Objective. To present the importance and value of creative, expressive activities with HIV positive persons.
Methods. Didactic presentation and 20 minute video. The videotape features approximately 150 slides of art productions (by HIV positive military personnel) synchronized to 9 musical selections which match the primary emotions expressed in the art work. A poem written and read by a patient opens the slide program. One of the musical selections ("The Way We Were") is sung by a patient; others are music found meaningful by patients themselves. The didactic presentation describes distinctive features in art work of HIV positive persons and the characteristic changes as the disease progresses. Diagnostic value of drawings to screen for major depression, psychosis, suicide risk, and organicity will be outlined. Techniques found to be effective are described, with relevant hypotheses from the literature. Preliminary results using imagery (followed by drawing) to relieve anxiety, reduce pain, or gain insight into problems will be discussed.
Results. The presentation vividly informs how the HIV positive diagnosis and condition is experienced by patients. Effective interventions using art are presented.
Conclusion. It is important to assist patients to find some meaning for their lives, in order to regain a sense of control and self-esteem. Creative art activities allow patients to provide for their own needs for acceptance, life review, mourning and restitution.

D.564

UTILIZING A FAMILY INTERVENTION MODEL TO PREVENT AIDS WORKER BURNOUT WITH INNER CITY PATIENTS

Walker, Gillian* *The Ackerman Institute for Family Therapy, New York, New York, USA

In many large cities the majority of all new AIDS diagnoses are found in Inner City families. These families present as drug using, multi-problem families, most of whom sustain more than one loss from HIV infection. The complexity of family problems, the stigmatization of AIDS, and the overburdening of AIDS workers negatively affect the way in which these families are perceived and worked with. Furthermore, workers are demoralized by focussing on the individual patient who inevitably dies rather than seeing AIDS as located within a living system whose future s/he can influence. In two years of consultation to pediatric and adult AIDS projects in Inner City hospitals, the Ackerman AIDS team has devised a brief, problem-focussed model of family intervention which allows the worker and family to concentrate on problems of survival and future planning. In this model intervention identifies family strengths and adaptive problem-solving capacities. Members of the extended kin system or other natural networks are identified as resources and invited to become a part of the counselling context. As the worker comes to see the family as a resource, they become colleagues in care instead of entering into the adversarial relationship that feelings of powerlessness generate. David Reiss' illness/family research has shown that when a family can identify or utilize strengths, illness may provide an opportunity for transformation and change.

D.565

HIV POSITIVE SUPPORT GROUPS - A MODEL OF INTERVENTION

Solomon, Karen; Rosenthal, S.; James, R.; Santiago, D; and McLoughlin, S., NYC Department of Health, New York, N.Y.
AIDS Program Services

Objectives. 1. To provide group support for individuals who have tested HIV positive and their partners. 2. To provide barrier free group services to assist those who have tested positive more effectively cope physically, emotionally, and socially.
Method. The Department of Health provides professionally facilitated group services for people who have tested positive and their partners and for people with AIDS. All groups meet weekly and have an on-going, drop-in format. Participation is anonymous, and there are no fees or intake procedures. There is a strong emphasis on self help and leadership training. Peer support, effective confrontation and feedback are utilized in order to address relevant HIV issues such as safer sex, safer drug use (with an emphasis on drug free behavior including utilization of 12 step anonymous program ideology); health promotion and maintenance; partner notification; positive attitude towards self; and control over lives and HIV illness.
Conclusions. HIV support groups are effective models of intervention for those who have tested positive, particularly for those who are substance abusers and their sex partners. The groups serve as an appropriate arena to explore risky behavior including obstacles to behavior change, new and creative ideas regarding negotiating and practicing safer sex, partner notification and becoming drug free.
Results. 1. Participants have been helped to deal with the emotional crisis and transitions that a positive test result precipitates.
2. Services can provide groups education and information that is essential in slowing transmission and possibly symptoms of AIDS.
3. This model has helped to empower those who are HIV+ to become leaders of seropositive groups in other settings, and has provided training for HIV counselors who wish to replicate this model. By enabling them to work with HIV+ individuals and their partners on a long term basis, groups have reduced the burnout frequently observed among HIV counselors.

D.566

BEREAVEMENT ISSUES FOR SURVIVORS OF PERSONS WITH AIDS

Colburn, Kathleen A.; Malena, D.
Hospice of Central Iowa, Des Moines, Iowa,U.S.A.

Objective. To determine if survivors of persons who died of AIDS have a different social and emotional environment in resolving grief.
Method. Personal interview which surveyed what survivors were doing to handle their grief, what resources they had in the community and if they were accomplishing the tasks of grief.
Results. The four tasks of grief are discussed in terms of the social and emotional environment of PWA survivors. These environmental factors appear to interfere with the resolution of three of the four tasks of grief. The result is survivors experience physical and emotional symptoms stemming from unresolved grief.
Conclusion. A structure for a therapeutic group of PWA survivors is proposed. Grief resolution is the primary goal. Specific structured exercises for facilitating the goals of each task of grief are suggested.

D.567

D.568

INTEGRATED IDENTITY THROUGH THE EMOTIONAL SUPPORT APPROACH

Pelfini, Andrew. Program Coordinator: Emotional Support Program. Shanti Project, San Francisco, California, USA

Objective. To substantiate the impact of Emotional Support on identity integration for individuals diagnosed with AIDS.
Methods. One on one peer counseling contributes greatly to the emotional health of individuals facing an AIDS diagnosis. This diagnosis brings about a dual identity conflict in being an individual and being AIDS-identified. The diagnosis of a terminal illness qualitatively disrupts the cognitive, psychological and emotional aspects of the normative life cycle by causing increased stress coupled with physical and psychological readjustments.
Results. Active listening, non-judgmental support and affirmation are three tools of the peer counselor which are applied to increase self-awareness, help maintain homeostasis and provide a sense of stability where rapid change is inescapable for individuals diagnosed with AIDS.
Conclusion. Medical science has not yet replaced the effect of human contact on people diagnosed with AIDS -- nor will it. The Emotional Support approach engenders independent living for People with AIDS.

D.569

Répondre aux besoins de soins des séropositifs et des malades : rôle du multipartenariat associatif.

LEVEQUE D*, MAUREL H**, CORDONNIER J.P.***, ESTOURNEL J.L.**** :

*Président de la MNEF, PARIS ; **Secrétaire Général d'APARTS, PARIS ; ***Administrateur FSEF, PARIS ; ****Administrateur MNEF, PARIS, FRANCE

OBJECTIF : Répondre à la demande de suivi thérapeutique et social des jeunes séropositifs pour le V.I.H. ou malades du SIDA en Ile de France.

METHODE : Mise en place d'une structure de soins associant prise en charge médicale, psychologique et sociale ; structure qui soit également un lieu-ressource en matière de formation des travailleurs sociaux et des professions de Santé. Ce nouveau Centre est créé en multipartenariat associatif (MNEF, FSEF, APARTS) sous la forme d'un Centre de jour relais entre l'hopital et l'Action Sanitaire et Sociale de terrain facilitant l'accès aux soins, à la Prévention, au conseil et à l'orientation.

CONCLUSION : A côté des campagnes d'information et de prévention primaire, Ce Centre rend possible une activité de prévention secondaire répondant aux besoins de soins de l'après dépistage, dans une population jeune.

D.570

D.571

INFORMATION GROUP FOR PEOPLE WITH HIV INFECTION OR AIDS AND THEIR PARTNERS

Hedge, Barbara*; Glover, L.**
*St. Mary's Hospital, London, England, **Middlesex Hospital, London, England.

Objective: Many people with HIV infection or AIDS and their partners find it difficult to share their fears and feelings and so lack crucial social support. Such people often find it difficult to join support groups but are keen to learn more about HIV. It was proposed to use an "information" group to also provide social support.
Methods: Homosexual men with HIV infection or AIDS or their partners, who lacked social support were recruited from a genito-urinary medicine clinic to join a closed "information" group which met on a regular basis. Each session comprised an informative talk, a discussion and socialising time. The aims of the group were established by members in the first session and evaluated after twelve sessions.
Results: The group was positively evaluated by a majority of members on a number of measures. In particular it was found beneficial that the group was closed, that an informative topic was provided to stimulate conversation and that topics were presented with a practical rather than theoretical slant. These and other characteristics of a successful group are presented.
Conclusions: Social support can be provided and does prove beneficial to homosexual men with HIV or AIDS and their partners through a structured "informative" group. The usefulness of this approach is discussed with reference to other client groups.

D.572

SETTING UP AN HIV/AIDS COUNSELLING SERVICE

Green, John; McCreaner A;
National Aids Counselling Training Unit (NACTU), St. Charles' Hospital, Exmoor Street, London, U.K.

Objective: To compare two approaches to the organisation of HIV/AIDS Counselling services and the selection of the appropriate approach for a given setting.

Method: There are two possible approaches to organising a counselling service for HIV/AIDS. A centralised system can be organised in which a small specialist group of HIV/AIDS counsellors is set up. A decentralised service can be set up in which all hospital and community staff are trained to carry out basic HIV/AIDS Counselling. Key factors in choosing an appropriate model are: Numbers infected with HIV, financial and manpower resources available, transport available for patients, existing compatible health delivery systems, training resources and whether the bulk of care is hospital or community based.

Results: Three successful counselling systems in three countries are compared with respect to these factors and the models adopted.

Conclusion: A successful counselling service depends on choosing an appropriate model for local circumstances.

D.573

TRAINING IN HIV/AIDS COUNSELLING

McCreaner, Alana; Green J;
National Aids Counselling Training Unit (NACTU), St. Charles' Hospital, Exmoor Street, London, U.K.

Objective: To set out the key elements in training counsellors for HIV/AIDS work.

Method: NACTU has trained over 5,000 workers from the UK and abroad in HIV/AIDS Counselling. Based on experience and evaluation of each course run - a training format has been arrived at.
Results: A two-tier training approach has been adopted with (i) an initial training on factual aspects of HIV/AIDS. (ii) A second training programme based on experiential work aimed at imparting key skills. This is based on a pre-assessment of needs of course participants which then leads to a selection of key modules. Modules include pre and post-test counselling, sexuality and interviewing about sex, counselling persons with AIDS, counselling carers and families, death and bereavement, drug usage, ante-natal and obstetrics, problem-solving skills, identifying dealing with specific psychological problems and organising a system appropriate to local needs.

Conclusions: A successful counselling course for HIV/AIDS must identify key trainee needs, and current skill levels and provide a flexible, modular and skills-based approach to training.

D.574

THE ULTIMATE(?) CHALLANGE OF COUNSELLING - The Noah's Ark-Red Cross Model

Morfeldt, Jan-Olof, Noah's Ark-Red Cross Foundation, Stockholm, Sweden

This presentation will briefly describe the ongoing challange at our centre in Stockholm.

Humanity, solidarity, knowledge, understanding, behavioural modification are key works in our daily work. The ultimate(?) challange of counselling is built on our own and WHO's ideas that complete counselling can only be achived when information, education, AIDS-hot-line-activities, emotional and pratical support are well integrated.

The work also includes that done at our Guests House for HIV-infected people.
The Guest House service is a complement to the care offered at the AIDS-units and may even influence the development of a complete care needed by people suffering from other chronical and life threatening diseases.

The purpose of our activities is on one hand to create a climate of compassion and care in which we can help one another regardless of race, sex, creed, sexual orientation and of whether or not we carry HIV. On the other hand through information and education we try to reach out in wider circles to open up people's eyes for the consequences of HIV in order to create deeper understanding for those who are infected but also to help people stay uninfected themselves.

D.575

COUNSELLING : UNE STRATEGIE POUR L'INFORMATION DANS LES PAYS AFRICAINS FRANCOPHONES.

LEBAS Jacques* ; M'PELE P** ; O'DELL V*** ; AEBERHARD F* ; CARBALLO M***.
* Médecins du Monde. Paris. France. ** Comité National de Lutte contre le SIDA. Congo. *** G.P.A. WHO. Genève. Suisse.

Objectif : Dans le cadre des programmes nationaux à moyen terme de lutte contre le SIDA, des C.N.L.S. d'Afrique francophone, M.D.M. (O.N.G.) et l'O.M.S. (G.P.A.) organisent, ensemble, la formation de formateurs en counselling. Dans le but de freiner la transmission de l'infection à V.I.H. par l'information et l'éducation, de diminuer l'impact sociétal de l'épidémie en informant les personnes relais conformément au contexte socio-culturel et au niveau de ressources sanitaires de chaque pays.
Méthodes : 2 à 3 délégués par pays participent à un séminaire de travail organisé au Congo, précédant une série de séminaires nationaux. Le programme comprend : les aspects médicaux, sociaux, psychologiques et politiques de la crise mondiale provoquée par l'épidémie, les aspects concrets du counselling pré et post test, l'information sur les besoins médicaux et psycho-sociaux des personnes infectées, les données éthiques et juridiques sur la confidentialité et la préservation des droits de l'homme malade dans le contexte de l'épidémie. Le manuel de counselling édité par l'OMS est le document de référence. Les séminaires comportent des sessions plénières et des groupes de travail pour l'étude de cas concrets simulés. Deux animateurs par groupe de travail, un Européen et un Africain, familiarisés avec le counselling et les données locales encadrent le séminaire.
Conclusion : Le programme détaillé et les évaluations des séminaires seront disponibles lors de la conférence.

D.576

A Support Group Model For Counselling Couples Affected by AIDS

J. Stone*, W. Pawlowski**, Support Group Members***
*Johns Hopkins University/AIDSCOM and Whitman-Walker Clinic Support Group Facilitator, Washington, D.C. **Planned Parenthood of Metropolitan Washington and Whitman-Walker Clinic Support Group Facilitator, Washington, D.C.
***Couples affected by AIDS, Whitman-Walker Clinic, Washington, D.C, U.S.A.

Objectives: The AIDS epidemic forces couples impacted by the disease to face new issues in their relationships. In turn, therapists and counsellors around the world are forced to re-examine roles and relationships in providing therapy and support. The authors examine issues which couples have faced during the three and 1/2 years this support group has existed. Authors will also describe differences in leading a support group for couples impacted by AIDS then those groups for other issues.
Methods: Support groups have been set up throughout the world to help people who have been affected by HIV disease. For more than three years, couples in Washington D.C. have had the opportunity to attend a support group especially set-up to help them cope with the effects of AIDS on their relationships. They meet weekly to discuss and share with other couples. This has been an on-going, closed, support group.
Results: Support group members continue to rely heavily on weekly meetings to discuss issues between them-selves as couples and others. They find the group more meaningful the longer they are participants and find themselves working on their relationship long after the group session ends. Although members may participate in other support groups individually, they find the opportunity to relate as a couple more important. Facilitators also find themselves redefining their role.
Conclusion: It is important in designing support services to people affected by AIDS, to include special support groups for couples. It is equally important that traditional methods of facilitation be re-examined by professionals around the world.

D.577

GROUP PSYCHOTHERAPY WITH HIV+ DRUG USERS.

Upadhya, Gopalakrishna*; Rosen, F.M.*
*Bronx-Lebanon Hospital/Albert Einstein College of Medicine
Bronx, New York 10456 U.S.A.

OBJECTIVE: To describe the efficacy of group psychotherapy in caring for people with AIDS and HIV infection who are socioeconomically disadvantaged IV-drug users living in an inner city community of New York.

METHODS: The support group met weekly, led by a psychiatrist and a psychologist facilitating the members to articulate thoughts, feelings and frustrations in a nonrestrictive holding environment. Patients select content and direction of discussion, and exchange information/advice on medical care, social services and housing. A significant number of members are or have been homeless.

RESULTS: The group became a source of improved self-esteem, dignity, mutual understanding, consistancy, and trust. It contributed to efforts to remain drug-free and to mastery of HIV-related concerns about social isolation, stigma, rejection, and death. For many it became a surrogate family, providing unconditional love which had seldom been received from others.

CONCLUSION: The success of the group approach has proven itself on many levels; social, psychological, and medical. It has added to the quality and life span of the members.

D.578

A PROSPECTIVE QUALITY OF LIFE STUDY IN PATIENTS WITH HIV INFECTIONS

Geels, Rimke M.A.; Vrehen, H.; Bonsel, G.*; Jager, J.C.** and Borleffs, J.C.C.
University Hospital Utrecht, The Netherlands; *Institute of Public Health and Social Medicine, Rotterdam, The Netherlands; **National Institute of Public Health and Environmental Protection, Bilthoven, The Netherlands.

AIDS and other HIV infections are expected to have a serious impact on Quality of Life (QOL) of HIV infected patients; however, till now this has never been documented. In order to test this hypothesis, a method for monitoring and describing QOL for these patients has been developed 1) to measure QOL of HIV infected patients and 2) to describe possible changes of QOL in the course of the disease related to the degree of utilization of health care facilities. The method implies the measurement of variables on individual patients at intervals of 4 months by using fixed questionnaires of 100 questions. Data collected concern demographic situation, activities of daily life, Karnofsky score, Index of Well-being, specific AIDS related complaints, anxiety and depression (STAI, Zung) and expectations for the future. The questionnaire has been designed in such a way that the results can be compared with those of similar QOL studies in other patient categories, i.e. patients after liver or heart transplantation.
From June 1, 1988 35 patients entered the study. By the time of the conference the period of follow-up will have reached one year, which makes feasible first presentation of data.

D.579

EVALUATING PSYCHOEDUCATIONAL INTERVENTIONS IN THE HIV SEROPOSITIVE POPULATION

Landers, S., Keefe, C., Gross, M., and Kunches, Laureen.
MA Department of Public Health, Boston, MA., USA.

Objectives: To summarize evaluation strategies for a 3-session psychoeducational group for persons testing HIV antibody positive.
Methods: The group serves many purposes including the provision of (1) information about medical, mental health, treatment protocols, and other options for health maintenance, (2) information about personal relationships after testing positive, safer sex, needle cleaning, and disclosure of HIV status to family, friends, and partners, and (3) psychological and emotional support. We evaluated psychological changes using the Symptom Check List 90, a self-report mode of psychological assessment which has been tested extensively for reliability and validity.
Results: Overall, 89% of group participants felt the group met or exceeded their expectations. Pre- and post-group measures found group members generally have a reduced level of symptomatology but frequently become more anxious as a result of participation in the group. Among group participants, 66% experienced a reduction of reported symptoms and 64% experienced a reduction in anxiety, while 28% of group participants experienced an increase in each of these measures.
Conclusions: Although some group participants experience increased anxiety, there is a high level of satisfaction with the psychoeducational group for seropositives.

D.580

THE RISKS OF ABSTINENCE: SEXUAL DECISION MAKING IN THE ERA OF AIDS

Gochros, Harvey L.
School of Social Work, University of Hawaii, Honolulu, Hawaii, U.S.A.

Objective. To consider the ramifications of the advocacy of sexual abstinence in response to the threat of AIDS.
Methods. The author is a university based sex educator and counselor in addition to his work as president of the AIDS Foundtion of Hawaii. This paper represents observations from his clinical and educational activities.
Results. The risks of certain sexual acts are well documented. There has been less discussion of the real and potential risks of abstinence. Among these risks are a fast and feast syndrome, confusion about safer sex and the concept of probabilities, sexual guilt and fears, implications for developing and expressing love and intimacy and the interaction of sexual frustration and aggression.
Conclusion. Sex can be risky. Abstinence can also be risky. What is required in the era of AIDS is rational, deliberate and responsible sexual decision making rather than the imposition of a "freeze" on sexual activity for all those who have not been monogamously paired.

Infections chez les consommateurs de drogues par voie intraveineuse

D.582

ISSUES IN AIDS TRAINING FOR DRUG TREATMENT PERSONNEL

Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland, USA

Objective. To present issues and solutions for AIDS training for staff in drug treatment programs.
Methods. By anecdotal information gathered through the development of a systematic and comprehensive AIDS training program for personnel in drug treatment programs in the United States.
Results. The complexities of AIDS, new developments in the field, the challenges of a dual diagnosis of chemical dependency and AIDS, the stigma of the disease, fears of transmission and staff burnout make AIDS training a unique challenge. Training for drug treatment staff needs to be systematic and comprehensive. The National Institute on Drug Abuse has recognized five phases in the development of such a program: (1) the need for an AIDS training plan; (2) AIDS curriculum development; (3) trainer development; (4) training delivery; (5) evaluation. The components of the five phases include a needs assessment to determine problems that are amenable to training, developing a curriculum around skill enhancement, the use of a scripted curriculum, training the trainers, logistical issues in the delivery of training, and evaluation of training impact and implementation.
Conclusion. All of these phases are interrelated and a successful training program must involve all 5 phases.

D.583

AIDS INFORMATION CAMPAIGN HAS SIGNIFICANTLY REDUCED THE INCIDENCE OF ACUTE TYPE B HEPATITIS IN AN ENDEMIC AREA.

Bortolotti,Flavia*;Cadrobbi,P.**;Crivellaro,C.**;Carretta, M.**;Francavilla,E.** et Noventa,F.*.
*Clinica Medica 2,University and**Dept.of Infectious Diseases.Padua.Italy.

Objective.To evaluate whether AIDS information campaign has reduced the incidence of acute hepatitis B,which is transmitted by the same routes as AIDS.
Methods. In 1978 a prospective study of acute hepatitis was started in our Department of Infectious Diseases,which is a referral center for an average 81% of cases notified to the local health department.Diagnosis of hepatitis B was based on conventional criteria.
Results. 1106 acute hepatitis B cases have been observed up to 1988.Incidence of the disease and percentage of drug abusers in relation to spread of drug abuse and starting of AIDS information campaign are shown in the table:

	1978	'80	'81	'82	'84	'85	'86	'87	'88
incidence/10^5 inh.	18	24	26	29	20	16	14	4.7	4.9
% drug abusers	15	28	41	42	35	25	25	12	20
	spread of drug abuse					AIDS information camp.			

Conclusions. In our area incidence of acute hepatitis B peaked in the early eighties,coincident with spread of drug abuse.After 1982 it started to decline,probably due to a partial exhaustion of the susceptible population,but a second significant($p<0.05$) drop was observed in 1987-88.Since the number of subjects starting drug abuse in recent years did not decline and HBV vaccination to high risk groups has still little epidemiological impact,we suggest that AIDS information campaign has reduced exposure to HBV and HIV in both drug abusers and the general population.

D.584

SOROCABA AMBULATORY EXTERNAL SERVICE EXPERIENCE RELATED TO AIDS AND ACCOMPANIED WITH USERS OF INJETABLE DRUGS

RAMOS, T.F.; Gonçalves, V.L.C.; Dos Anjos, R.M.P.; Gomes, M.C.O.,BRAZIL

In a period going from August 14,1985 to October 31, 1988, after and epidemiological investigation 1 382 analyses were effected to detect anti HIV antibodies (through ELISA recombined methods) on individuals considered of Risk Behaviour.
From 309 (22,35%) users of injectable drugs, that performed the test, 182 (58,89%) positive (+) results were obtained. This group was composed by drug addicted individuals as well as individuals using injectable drugs periodically.
From 182 cases we verified:-
a) Age varied from 14 to 38 years (medium.age 22,21 years)
b) Males, the predominat sex, totaling 138(75,82%) cases.
c) 08 cases (4,39%) corresponded to CDC diagnostic criteria (Atlanta USA, publicized in May 1986) fro group IV.
d) In 14 months maximun attendance period, 10(5,49%) individuals were evolved to death.
e) 126(69,23%) persons were frequenting the External Service, during this period regulary or irregulary, being realized medical, psichiatric and psychologic attendance, with continuos educational work on AIDS.

Follow evaluation of the onew that desired to use injectable drug after knowing the results of the analysis and educational work of the multiprofessional team, we obtained the following results:
a) 66(52,38%) desired to use injectable drugs.
b) 31(24,60%) did not desired use injectable drugs.
c) 29(23,01%) were considered doubtful.

D.585

"UNIK". A PROJECT EMPLOYING FORMER IVDA'S IN HIV PREVENTIVE AND SUPPORT WORK.

Marit Engh, Anne Ringdal, Peer Nestande, Arnfinn Lien,
Jorunn Saatvedt, Finn Jensen, Dep. of Aids Prevention, Oslo City Health and Environment Department, NORWAY

OBJECTIVES: There is a need for new approaches in the hiv preventive and supportive work among drug users. This project, established by the Department of Aids Prevention in may 1987, employs, on a full time basis an with normal wages, both social workers and former IVDA's. The aim is to wor out new methods utilizing the special expertise the former IVDA's have, in cooperation with professional social workers.

METHODS: - Support groups for hiv positive former IVDA's, run by a former IVDA and a social worker in cooperation. Strictly for persons not in active drug use. Some of the groups are for women only. - Support groups for activ drug users. - Individual couselling. - Couple counselling. - Open doors in the daytime, with high tolerance for users under the influence of drugs. Informal conversation, coffee. - No formal notes taken, informality and confidence stressed. - The project is being evaluated during the spring of 1989.

RESULTS: By january 1989 the project has run 7 support groups, and been in contact with 70-80 hiv positive IVDA's which constitutes approximately 40% of the known hiv positive IVDA's in the Oslo area. A qualitative evaluation of the methods used will be presented in the paper.

D.586

A COMPREHENSIVE AIDS PROGRAM IN A METHADONE TREATMENT PROGRAM

Foss, Brian Mark*; Connolly, G.* Cassidy, P.*
*New Bedford Area Center for Human Services, Inc., New Bedford, Massachusetts, United States of America.

Our presentation will consist of an explanation of our methadone program and its six core components related to HIV infection. The components to be discussed are: AIDS education, HIV antibody testing, client advocacy, psychotherapy, and community and street outreach.

AIDS education is mandatory to all clients in our methadone treatment program. Three hours of education is provided within the first three months, and a minimum of one hour is provided every three months. HIV antibody testing is offered monthly on a free, voluntary, and confidential basis to all clients and significant others. This is done with pre/post counseling. Case managers can be utilized by all clients to assist with delivery of services (i.e., housing, legal, social, financial, etc.). Weekly one-hour counseling sessions are required of all clients. Within the context of these sessions, AIDS issues are continually addressed. Groups are offered to infected people and significant others. Support groups are also offered for professional and support staff. Outreach workers actively educate and refer I.V. drug users to community resources. Bleach, condoms, and educational materials are distributed freely within the community. Our presentation will demonstrate the effectiveness of this program as it relates to knowledge, attitudes, and behavior change.

D.587

COCAINE USE DURING PREGNANCY: VALIDITY AND ASSOCIATIONS WITH HIV RISK BEHAVIORS

Sackoff, Judith and Kline J.
HIV Center for Clinical and Behavioral Studies, NYS Psychiatric Institute and Sergievsky Center, Columbia University, New York, N.Y., U.S.A.

Objective: To assess the validity of interview data on cocaine use during pregnancy, and associations between cocaine use and risk behaviors for HIV infection.
Method: Over 150 women who delivered at a New York City hospital without receiving prenatal care completed a brief structured interview about their use of intravenous drugs, sexual partners at risk of HIV infection, and cocaine use shortly before delivery. The validity of self-reported cocaine use in the period immediately before delivery was evaluated against the results of a urine toxicology screen obtained from the infant at delivery. The association between HIV risk behaviors and cocaine use are studied.
Results: The sensitivity, specificity, and positive and negative predictive values of the interview data on cocaine use are presented. The odds of engaging in behaviors associated with HIV infection are compared for cocaine users and nonusers.
Conclusion: Associations between cocaine use and HIV infection may vary between populations. Within particular settings it may be important to develop means of identifying cocaine users so that they may be counselled appropriately.

D.588

OBSERVATIONAL AND NARRATIVE DATA ON PATTERNS OF INTRAVENOUS DRUG USE AS RELATED TO HIV-1 INFECTION

Page, J. Bryan*, Chitwood, D.D.*, Smith,
P.C.*, Kane, N.*, Inciardi, J.*, McBride, D.C.*, and Clyde B. McCoy*.
* University of Miami School of Medicine, U.S.A.

Objective. To demonstrate the utility of data collected in the natural habitats of drug users for constructing intervention strategies.
Methods. In a longitudinal study of 230 street-recruited Intravenous drug users (IVDUs) in Miami, Florida, the investigators include direct observation of needle using behaviors and elicitation of open-ended interviews on needle using behaviors and attitudes.
Results. In "safe house" settings, compliance with house rules shapes needle using behaviors, so enforcers of house rules are key targets for intervention to prevent HIV infection. Attitudes towards needles are apparently sufficiently flexible to allow change within groups of "shooters."
Conclusion. Data resulting from these procedures provide clear guidelines for intervention but pose problems for rigorous research design. Differential influence of participants in networks of IVDUs may affect demonstration studies that use random assignment strategies for testing impact of specific interventions.

D.589

DEMOGRAPHICS, DRUG USE AND SEXUAL BEHAVIOR OF INTRAVENOUS DRUG USERS (IVDU'S) WITH AIDS

Schrager, Lewis K.; Friedland, G.H.; Kahl, P.; Feiner,
C.; Klein, R.S. Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, New York, U.S.A.

Objective. Define demography, drug and sex behavior of IVDU's with AIDS.
Methods. Detailed standardized interview of hospitalized AIDS patients.
Results. 112 hospitalized IVDU's with AIDS participated from 10/84-2/88.
Demography: male 72%, female 28%; Hispanic 49%, black 33%, white 14%; Bronx residence 86%; mean age 35 years; unemployed 50%; <12 yrs education 45%; income <$10,000 71%; supporting ≥ 3 people 23%.
Drug Use: median age 1st IV use 17 yrs (range 11-39); 97% used IV heroin (for median of 9 yrs), 95% IV cocaine (median 7 yrs), 25% other drugs IV. ≥ daily IV drug use 62%, "shooting gallery" use 68%, needle sharing 88% (with homosexual men 20%, family members 28%). Other drugs: alcohol ≥ daily 35%, marijuana 86%, mood altering drugs 57%, stimulants 29%. Since 1978 only 31% participated in methadone Rx; 41% were incarcerated.
Sexual Behavior: All sexually active since 1978; mean of 2.6 sexual partners in year before AIDS dx (median 1); sex with other IVDU 54%, with other AIDS pt 7%, male with other male 17%, female with bisexual male 12%,; 17% received payment for sex.
Conclusion. In addition to many women and poor minorities, the "first wave" of IVDU's with AIDS is characterized by teenage onset of IV drug use, subsequent prolonged, frequent IV drug use, polysubstance abuse, infrequent drug treatment and co-existence of high risk drug and sex behaviors. Intervention to reduce transmission should address these complex interrelated issues.

D.590

SELF-REPORTED NEED FOR TREATMENT AMONG IV DRUG ABUSERS IN AN HIV-CLINIC

Toråker, Per*; Pehrson, P.O.** and Spångberg, L.*
*Karolinska Institute, Department of Psychiatry, Huddinge, Sweden,
**Karolinska Institute, Department of Infectious Diseases, Roslagstull Hospital, Stockholm, Sweden.

Objective. The aim of the study was to ascertain whether there is a self-experienced need for treatment of drug abuse at a HIV-clinic.
Methods. A questionnaire was filled out according to the responses of the patients. Patients were asked about present abuse, present treatment and perceived need for treatment.
Results. After 6 months 171 questionnaires were filled out. The mean age was 33 years and 27% reported no contact with a social worker and more than half (54%) reported no present treatment of abuse. Out of 117 reporting, 63% abuse heroin, 35% amphetamine, 23% alcohol, 11% benzodiazepines, 9% hashish with poly-drug abuse by 32% and 87% had intravenous drug abuse. 54% had a desire for treatment, wanting methadone treatment in a majority of the cases (73%), rehab centers (17%), clinics and detoxification (6%).
Conclusion. This study, shows that there is a significant self-reported need for treatment with a self-reported preference for methadone treatment. It is very important to improve and increase availability to specific treatment as needed. This is of utmost importance both from individual and epidemiological point of view and necessary to prevent an extensive spread of HIV infection.

D.591

A MAJOR INTERVENTION RESEARCH PROJECT AMONG PARENTERAL DRUG USERS NOT IN TREATMENT IN CHICAGO, ILLINOIS.

Horan, Hubert J.; Wiebel, Wayne W.; Chene, Douglas G.,
School of Public Health, University of Illinois at Chicago, IL, U.S.A.

Objective: Describe the effects of attempts to change drug and sexual behavior among this population, and differentiate among approaches attempted.
Methods: HIV testing; use of a national face-to-face interview; ethnographic fieldwork; public health outreach worker intervention.
Results: HIV status has varied considerably by ethnic group; interview results (approximately 1500 available) show a relative absence of heroin-only users; cocaine and alcohol are currently predominant; a wide variety of injected drugs are cited as drugs of choice. Some evidence to suggest that "street" IV drug users are in fact changing behavior; educational methods may be working in this population more readily than anticipated. Evidence of approaches most likely to be effective, by relevant sub-populations.
Conclusions: The parenteral drug using population not-in-treatment appears to be considerably more open to new information, and willing to change behavior, than many supposed. The possibility clearly exists that new incidence rates may be being significantly reduced by these means.

D.592

NEEDLE SHARING BEHAVIORS AND HIV SEROSTATUS IN MIAMI, FLORIDA

Inciardi, James A.*; Chitwood, D.**; McCoy, C.B.***; and McBride, D.C.****. *University of Delaware, Newark, DE, USA, **University of Miami School of Medicine, Miami, FL, USA, ***University of Miami School of Medicine, Miami, FL, USA, ****Andrews University, Berrien Springs, MI, USA.

Objective. To understand the relationships between the extent of needle sharing by IV drug users and their rates of seropositivity.
Method. As part of an AIDS prevention/intervention project funded by the National Institute on Drug Abuse, 500 IV drug users were recruited from several neighborhoods in Miami, Florida where rates of IV drug use were high. Prior to the subjects' exposure to risk reduction literature and counseling, interviews were conducted to solicit information on social and demographic characteristics, drug use, needle sharing, and other risk behaviors. In addition, blood samples were drawn to determine HIV serostatus.
Results. Rates of seropositivity were in excess of 50% within all cohorts of IV drug users who shared needles, and even higher among black males. These higher rates were typically associated with drug use in "shooting galleries," where needles were available for a fee and were shared by numerous users during the course of a day.
Conclusion. Needle sharing in "shooting galleries" carries a higher risk of exposure to HIV infection than other forms of needle use.

D.593

D.594

DOES METHADONE PROGRAM WITHDRAWAL (M.P.W.) RESULT IN AN INCREASE OF CRIME, OVERDOSE ACCIDENTS AND HIV TRANSMISSION AMONG I.V. DRUG USERS (IVDU)?

Mezzelani Paolo(*), Lugoboni F(**), Venturini L(*), Bricolo R(**).
* Istituto di Patologia Speciale Medica - University of Verona - Italy.
** Center for Drug Addicts -Local Health District 26 of Veneto Region - Bussolengo (Verona) - Italy.

Objective. In Italy 65% of all cases of AIDS are among IVDU. Italian experience shows the failure of methadone maintenance programs, therapeutic communities and naltrexone detoxification programs are promoted instead. This paper's aim is to ascertain whether M.P.W. results in an increase of crime, overdose accidents, and HIV transmission among IVDU. The question is if M.P.W. is a risky intervention while looking for other kinds of treatment.
Methods. The total estimated number of IVDU in the district is 700. The Center has taken care of 511 IVDU from 1981 to 1988. We evaluated all the records of the Police department, local hospitals emergency wards and Center for Drug Addicts of the Local Health District 26 of Veneto Region. Two comparable periods have been considered: 1st period, from October 1986 to September 1987 in which methadone program was widely used (356 IVDU treated). 2nd period, from October 1987 to September 1988 in which M.P.W. was extensively applied (only 89 IVDU treated), and methadone has been replaced with naltrexone or with psycological counselling alone. We compared the number of crimes, overdose accidents, and seroconversions.
Results. Results are summarized in the table.

	1st PERIOD (Methadone)	2nd PERIOD (M.P.W.)
OVERDOSES	16	30
CRIMES	31	27
SEROCONVERSIONS	6	1

Statistical analysis shows no significant difference between the two periods.
Conclusions. Our data indicate that M.P.W. does not result in a significant increase of crimes, overdose accidents and HIV transmission. We conclude that M.P.W. is not a hazardous initiative while looking for other kind of treatments for IVDU.

D.595

EVALUATION DE LA PEUR AU SIDA DANS LES ADDICTES A L'HEROINE

Saltó, C.+, Peri, J.M.+ et Bayés, R.++, SPAIN

Objectif. Connaître l'impact de la peur à l'infection par le virus d'immunodéficiènce humaine, en relation avec d'autres stresseurs.
Méthode. Dans un travail préliminaire nous avons étudié 20 stresseurs potentiellement importants pour les addictes à l'héroïne. D'entre eux nous avons choisi les suivants: être atteint d'hepatite; être mis en prison; se voir obligé a voler; être "porteur" du virus VIH; avoir le syndrome d'abstinence; et perdre l'affection du partenaire ou de la famille. Chacun d'eux a été comparé avec tous les autres par la méthode de comparaison de paire utilisée dans la confection d'échelles psychophysiques.
Résultats. Les resultats montrent que "perdre l'affection du partenaire ou de la famille" est chez nous la situation la plus stressante, plus encore que la peur à être "porteur". Par le reste, on trouve des différences entre les individus qui sont et qui ne sont pas en procés de desintoxication.
Conclusion. Ces résultats peuvent être utiles comme éléments motivationnels dans les programmes de prévention.

+ Hospital del Mar, Barcelona, Espagne
++ Universitat Autònoma de Barcelona, Bellaterra, Barcelona, Espagne

D.596

PREVENTION OF HIV-INFECTION IN A METHADONE MAINTENANCE PROGRAM

Huber, Felix and Haas H.

Department of Social Psychiatry University Hospital Zürich, Switzerland

Objective. Can a methadone maintenance program prevent HIV-neg. IV drug abusers from getting infected?
Methods. In a retrospective study 21 IV drug abusers being were again tested and the therapists were asked about the risk behaviour and social integration of their patients.
Results. We were able to show for 21 patients who were all HIV-neg. at the beginning of the methadone maintenance program of the Drop-In in Zurich that they remained HIV-neg. over an average period of 3 years. The social integration improved during the program from 48% to 90%. Preceding the program 43 % of these HIV-neg. patients were at high risk for infection. During the program 57 % showed to be clean of heroin and 76 % clean of cocain. The remaining obviously abstained - due to a continous information - from needle sharing.
Conclusion. A well structured methadone maintenance program with a close, consistent and enduring relationship between staff and patients can be of great importance in HIV-prevention.

D.597

AIDS AND I.V. DRUG USE IN PUERTO RICO

Carlos A. Iramain, M.D.
Drug Abuse Fdn. PR, P.O. Box 972, Saint Just, PR 00750 (USA).

As of 1/17/89, 2055 AIDS total cases (83 % males/17 % females) were officially reported in the Commonwealth of Puerto Rico, USA [623 cases/million]. Most important groups were: 1) heterosex. IVDUs: 1120 cases (56 %); 2) homo/bi men: 402 (20 %); & 3) homo/bi men IVDUs: 257 (13 %). So, 1377 (69 %) of our "adult/adolescent" cases (87 % males/13 % females) are i.v. drug-related [417 cases/million]; this "69 %" puts PR in 1st. place in this category in the USA, followed by the States of NJ (56 %), CT (42 %), NY (40 %) & FL (23 %). Table 1 shows significant increments ($p < 0.001$) of this condition in PR since 1982:

AIDS diagnosis	heterosex. IVDUs		homo/bi IVDUs	
Jan 1982 - Dec 1982:	3		0	
Jan 1983 - Dec 1983:	19	↑ 633 %	3	↑ 300 %
Jan 1984 - Dec 1984:	37	↑ 195 %	24	↑ 800 %
Jan 1985 - Dec 1985:	107	↑ 357 %	43	↑ 179 %
Jan 1986 - Dec 1986:	203	↑ 289 %	57	↑ 133 %
Jan 1987 - Dec 1987:	351	↑ 173 %	72	↑ 126 %
Jan 1988 - Dec 1988:	400	↑ 114 %	58	

(Note: No lesbian &/or bi women IVDUs cases yet). Now, 50 (85 %) of our official 59 children cases are also related to parental i.v. drug use; risk behavior as follows: both parents IVDUs: 21 cases (42 %); mother IVDU: 13 (26 %); father IVDU: 12 (24 %), and previous husband IVDU: 4 (8 %). Besides, initial HIV-1 seroprevalence data reveals: a) IVDUs "not in treatment": 50-73 % HIV+ (Elisa & W. Blot), & b) "in treatment" (methadone): 45-59 %. Also, research in progress shows some co-infection (HIV-1 & HTLV-I) in our IVDUs. Hopefully, 3 recently NIDA-funded preventive projects will improve PR's unique situation.

D.598

THE ADJUNCTIVE ROLE OF ADDICT DIRECTED SUPPORT GROUPS IN THE CARE OF HIV INFECTED ADDICTS

Comella, B., Project TRUST, Boston City Hospital, Boston, MA, USA

OBJECTIVE: To assess the contribution of motivational strategies and mutual support groups for the psychological, medical, and addiction related care of HIV infected addicts.
METHODS: Facilitator directed support groups, emphasizing AIDS related concerns, sexual, physical, and emotional responses to HIV disease. Focuses on the impact of addiction history and treatment, and on attitudes toward HIV and life quality. Participants are followed as to the impact of group participation in alleviating AIDS related fears through recovery based living. Compliance of group members with medical follow-up was obtained through contact with physicians.
RESULTS: Between October 1986 and December 1988,206 individuals have attended at least 1 session. 88 people (42%) have attended 40% of the meetings over a 2 year period. Significant reduction in AIDS related fears was observed as was enhanced addiction recovery in all 88. 58 participants receive medical care at Boston City Hospital, and a greater than 70% compliance rate to medical visits was noted in the last 18 months in 47 of these people. In contrast, 10 who attended only 1 meeting or dropped out had a less than 30% compliance for clinic visits.
CONCLUSIONS: Addict directed support groups can provide significant enhancement in addiction recovery, and a reduction in AIDS related fears. Participation can also enhance patient compliance with medical care.

D.599

NONVOLUNTARY TREATMENT OF INTRAVENOUS DRUG ABUSERS TO CURB THE SPREAD OF HIV INFECTION

Leukefeld, C., Battjes, Robert, Pickens, R.
National Institute on Drug Abuse, Rockville, MD, USA

Objective. To explore nonvoluntary drug abuse treatment under Criminal Justice System sanction (i.e. probation, parole or civil commitment) to reduce the spread of HIV among intravenous drug abusers (IVDAs).
Methods. The most recent research findings and the input of a convened group of expert consultants were used to develop consensus statements.
Results. It has been suggested that using the criminal justice system as nonvoluntary treatment could keep IVDA's in treatment longer and decrease drug abuse as well as needle use and sharing. Consensus statements included the advantages and the disadvantages of nonvoluntary treatment. Advantages included: helps get IVDAs into drug abuse treatment, keeps IVDAs in treatment longer, makes drug abuse treatment available before another crime is committed, and provides due-process as well as treatment. Disadvantages include: delays in processing, many IVDAs may be found unsuitable for treatment, is costly, and is cumbersome administratively.
Conclusion. IVDAs targeted for nonvoluntary drug abuse treatment might be chronic intravenous drug abusers who could benefit most from treatment. However, nonvoluntary treatment cannot be considered a panacea for dealing with the AIDS problem among IVDAs but could be used in combination with other prevention strategies.

D.600

TREATMENT MODALITIES FOR PREGNANT DRUG DEPENDENT WOMEN AS AN EFFORT TO PREVENT PERINATAL AIDS.

Finnegan, Loretta P.; Kaltenbach, K.; Weiner, S. and Wapner, R.
Thomas Jefferson University, Philadelphia, Pennsylvania, U.S.A.

The interface between AIDS and drugs is a key issue from the standpoint of perinatal transmission. Unfortunately, these women, who are already weakened by unemployment, illiteracy, homelessness, crime and other diseases, including their alcoholism and drug addiction, are now those at risk for the human immunodeficiency virus. Since treatment of this devastating disease in the perinatal patient is not available, prevention issues must be addressed most expeditiously. Family Center is a program designed to provide intensive medical and psychosocial services to drug and alcohol dependent women, in general, and to provide specialize care to those who are pregnant. Comprehensive medical services at Family Cente include a prenatal clinic at the Thomas Jefferson University Hospital which i staffed by obstetricians specifically trained in the field of addiction and high risk pregnancy. Additional treatment modalities include individual, group and family therapy. On site methadone maintenance is provided and in-patient detoxification i available for select patients. Educational services in the form of prenatal an parenting classes are also offered. Maternal medical and obstetrical complications are treated, therefore providing a similar intrapartum course in the drug dependent mother as is seen in the general population of the same socioeconomic and ethnic class. When some of the women arrive for prenatal services, they are already HIV positive. Numerous psychosocial issues emerge when the woman is advised that she is HIV positive. She will be aware of the fact that she and her newborn potentially have a low survival rate. This may limit the amount of emotional energy that she has to expend with regard to dealing with her pregnancy. She may not be able to complete the emotional tasks of the pregnancy and may have mixed feelings about delivering an infant that might be infected. Depression is commonly seen. In many instances, the spouse and other children of the woman also have AIDS so she must consider who will care for her children if she dies first. Options for either interruption of the pregnancy or methodologies for the prevention of future pregnancies are part of the counseling issues. Clinical services for pregnant women at risk for AIDS must be comprehensive and address addiction, the vital perinatal issues, and the high risk behaviors in which they are involved.

D.601

ECHANGE DE SERINGUE ET VIE SEXUELLE DES TOXICOMANES I.V.

ESPINOZA Pierre*, POLO DEVOTO J.**, BOUCHARD I.*, LEBOUC V.* D'HALLIVILLEE P.*, OHFOM***
*EHPNF Allée des Thuyas 94261 Fresnes Cedex France, ** APSP, *** OHFOM = Oeuvres Hospitalières Françaises de l'Ordre de Malte, FRANCE

INTRODUCTION : La forte contamination des toxicomanes IV par le VIH1 en région parisienne justifie la réalisation d'une étude de comportement sur leur vie sexuelle.
OBJECTIFS - METHODES : Questionnaire sur la sexualité par un médecin - consentement des patients - Confidentialité - Anonym - Information sur les maladies transmissibles - Proposition individuelle de dépistage VIH1.
POPULATION : Etude réalisée en janvier 87 - Exclusion : 6 cas (refus), 75 toxicomanes de sexe masculin sont inclus. Age moyen 27 ans, Héroinomanes exclusifs 74%, 4 injections IV/jour en moyenne - Durée de la toxicomanie entre 1 et 5 ans : 46%. Echange de seringue 78% dans diverses circonstances.
RESULTATS : Hétérosexualité 65 cas (88%), homosexualité 12%, prostitution 6%, sexualité active : relations sexuelles plusieurs fois par semaine 52%. Nombre de partenaires ≤5 : 55 cas (73%). 73% estimaient avoir une sexualité moins active et 44% un nombre de partenaires moins important du fait de l'usage d'héroine. Parmi les 65 hétérosexuels, 25 pratiquent la sodomie, 50 signalent des pratiques oro-génitales. La fréquence de la toxicomanie est élevée chez les partenaires sexuelles : 52% (39/75) avec échange de seringues dans 28 cas. Usage de préservatifs régulier 4 (5%). Antécédent de dépistage VIH 20 (27%). Taux de séropositivité 53% parmi les 56 patients testés.

D.602

RELATIONSHIP BETWEEN SOCIAL SUPPORT AND LONELINESS AND HOSPITAL SERVICE-SEEKING IN INTRAVENOUS DRUG-USING MALES

Hoffman, X.* and Winiarski, Mark**.
*Albert Einstein College of Medicine/Yeshiva University, Bronx, N.Y., USA,
**Spellman Center for HIV-Related Disease, St. Clare's Hospital, New York, N.Y., USA.

Objective. Psychoneuroimmunologic investigations demonstrate an integration between psychosocial response and immune function. This retrospective correlational study explores relationships between availability and adequacy of social support and objective loneliness on the seeking of hospital services among intravenous drug-using men in a large metropolitan area.
Method. 70 domiciled men with a history of intravenous drug use, an AIDS diagnosis and on a prophylactic regimen were administered the Revised Social Support Questionnaire and Revised UCLA Loneliness Scale. They gave permission for hospital-record review. Service-seeking behavior was defined as number of emergency room visits, number of AIDS-related hospitalizations and lengths of hospitalizations. A multiple hierarchical regression controlled for demographic data, pre-morbid health status and time elapsed since first AIDS-related hospitalization.
Results. Data indicates small support systems, compared with studies of similar groups in another U.S. city, a high degree of loneliness and no statistically significant relationship between these variables and service-seeking behaviors.
Conclusion. While not rejecting the null hypothesis, these data describe a psychosocially dysfunctional group that will seek AIDS-related services in ever greater numbers. AIDS may exacerbate the dysfunctions.

D.603 RESEARCH WITH INTRAVENOUS DRUG USERS. PROBLEMS AND PRACTICAL RECOMMENDATIONS.

Carballo-Dieguez, Alex*; El-Sadr, W.**; Gorman, J.*; Joseph, M.**; McKinnon, J.***; Sorell, S.***.
*HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University; **Harlem Hospital; ***St. Luke's/ Roosevelt Hospital Center; New York City, NY, USA.

Objective. To successfully recruit 300 IVDUs to participate as subjects in a 5 year study on natural progression of HIV disease.
Method. Several methods of recruitment were utilized: a poster campaign, informational meetings at methadone clinics and inpatient wards, and $10.-/hour payment.
Results. Payment was the main motivation for the initial 40 subjects recruited. This, however, created several problems. Eagerness to enroll led some candidates to falsify information and become aggressive, defiant, and manipulative with the staff. Researchers had to camouflage eligibility criteria, purport lottery selection system, seek exernal validation of information and strengthen internal communication among team members.
Conclusion. Close attention must be paid to the psychological dynamics and usual modus operandi of IVDUs to successfully recruit a cohort and minimize deceit and tensions.

D.604 PROFILE OF USERS OF THE DRUG IV IN THE PERIPHERY OF CAMPINAS

Lima, M.P.S.; Rocha, M.D.C.; Tanibata, P.R.; Mielle, A; Ferreira, R.P.; Lorenzetti, T.M. Hospital e Maternidade Celso Pierro da Pontifícia Universidade Católica de Campinas- S.P. Brasil.

The University Hospital of PUCCAMP attends a region of 1 million inhabitants. It is localized between various districts, the majority, without any infrastructure (water, sewer, health), which caracterizes it as the area most in need of the municipality.
Proceeding from that region a study was made of a group of 62 drug users IV, who spontaneously seeked the hospital, during a period of 10 months.
We observed the following facts: 45 men and 17 women with an average age of 25 years. Schooling: elementary level, all of them being workers without qualifications, and a monthly salary from 50 to 100 dollars.
We also detected that: cocaine was the drug most used, 41 persons, in association with other drugs (propoxifeno, codeine) 11, and the remaining 10 did not use it.

CONCLUSION:
We noted that in spite of the low socio-economic level, the majority of the population studied used cocaine, which in our midst costs 7 dollars a gram. We questioned, therefore, the source for such acquisition, once the income is insufficient for this addition, suggesting that this would be one of the reasons of the rejection of these persons (prostitution, theft). We concluded also that this same drug, by its own characteristic, induces at the use of inumerous daily applications, which explains perhaps our high rate of positiveness for the AIDS virus: 30 patients of a sample of 62.

D.605 PERCEPTION OF HEALTH AND AIDS RISK BEHAVIORS AMONG IV DRUG USERS.

E.J. Trapido*, C.B. McCoy*, D.D. Chitwood*, and H.V. McCoy**. *University of Miami Medical School, Miami, FL, USA; **Florida International University, Miami, FL, USA.

Objective: To relate the perception of health among a group of IV drug users to AIDS risk behaviors and indicators.
Methods: As part of a study which tests two interventions to reduce the risk of AIDS among IVDUs, 346 subjects were recruited from drug networks, tested for HIV-1 positivity, and interviewed. Bivariate analyses were performed to assess associations between variables, and relative risks (and 95% confidence intervals) were calculated.
Results: 20% of IVDUs reported their health to be excellent; 44% good, 30% fair, and 6% poor, yet 18.5% of IVDUs reported both that their health was excellent and they did not use condoms. The proportion of users who stated that they cleaned needles ranged from 42% of those stating they had excellent health, to 67% stating they had poor health. Even among those with "excellent health", 30% of IVDUs had recently rented needles or syringes that they thought had been used. Seropositives were 1.6 times as likely to report fair or poor health than seronegatives (0.9-2.7).
Conclusion: Perception of health by IVDUs does not necessarily translate into healthy AIDS/HIV practices.

D.606 PROMOTION OF HIV PREVENTION ACTIVITIES IN DRUG TREATMENT CENTERS IN THE UNITED STATES

J. Stephen Jones*, Gardom, J.C.*, Poppe P.O.*; Conlon, R.*; and Bowen, G.S.*.
*Centers for Disease Control, Atlanta, U.S.A.

Objective: To implement on-site HIV prevention programs for clients and their sex partners in drug treatment centers (DTCs) in the 24 states and cities with the largest number of AIDS cases in the United States.
Methods: HIV prevention in DTCs has been a major priority for the Centers for Disease Control (CDC) in fiscal years (FY) 1988 and 1989 cooperative agreements with State/local health departments. CDC provided specific service requirements, technical assistance, and a model joint plan to assist States/Cities to produce and implement their joint (Health Dept and Drug Abuse Agency) program plans for HIV prevention in DTCs. Program elements included a senior health or drug abuse official to lead the program; support of on-site voluntary, free HIV counseling, testing, and partner notification (CT/PN) services in the largest DTCs providing services to intravenous drug users (IVDUs); outreach to the sexual and needle-sharing partners of the clients; and provision of contraceptive services for DTC clients.
Results. In FY 1988, more than $12 million for CT/PN in DTCs was awarded to the 24 States/Cities with the highest number of AIDS cases. We will present data for FY 1989 for these States/Cities on the number o[illegible]s where CT/PN has been initiated, the median award per State/Ci[illegible] examples of the more advanced joint programs for HIV preventi[illegible]r this high risk population.
Conclusion. Provision of funds, technical assistance, and a model plan have been effective in initiating the provision of CT/PN services in DTCs to provide educational and risk reduction counseling and HIV testing to IVDUs in the 24 States/Cities with the largest number of AIDS cases.

D.607 BEHAVIOURAL CHANGES FOR HIV RISK-REDUCTION IN TWO COHORTS OF INTRAVENOUS DRUG USERS (IVDUs) IN NEW YORK CITY.

Chu, Alvin; Brown, LS.; Banks, S.; Nemoto, T.; Primm, BJ.
Addiction Research and Treatment Corporation, Brooklyn, NY USA

Objective. To assess those behavioural changes that are a response to the high risk for HIV infection experienced by IVDUs.
Methods. During 1987 and 1988, 218 and 223 subjects repectively were recruited from methadone clinics in NYC. Following informed consent, a standardized questionnaire was administered pertaining to behavioural factors and risk for HIV infection.
Results.

Behavioural Changes	1987 n (%)	1988 n (%)
Reduced intravenous drug use	76 (38)	20 (12)
Stopped needle sharing	118 (58)	58 (35)
Reduced sex partners	106 (53)	50 (31)
Increased use of condoms	55 (27)	44 (27)

In both 1987 and 1988 behavioural changes were reported by 93% and 74% of subjects respectively.
Conclusion: The finding of this study indicate that IVDUs are aware of the need for behavioural changes in order to reduce the risk for HIV infection. Continued efforts are necessary to promote greater and more consistent changes that will change the course of the AIDS epidemic.

D.608 HIV SEROPREVALENCE IN HEROIN USERS: A DEMOGRAPHIC AND BEHAVIOURAL ANALYSIS.

Banks, Susan; Brown, L.S.; Chu, A.; Nemoto, T.; Valdes, M.; Primm, B.J. Addiction Research and Treatment Corporation, Brooklyn, NY USA

Objective. To examine the association of demographic factors and heroin use patterns on the HIV serostatus of IVDUs.
Methods. Following informed consent, a questionnaire of demographics and drug behaviours was administered to patients in NYC drug treatment clinics in 1987. Of the 218 subjects, 7.8% were White; 45% Black; and 47.2% Hispanic. 35.8% were female, and 64.2% male. Serum specimens were also collected and tested for HIV antibodies using ELISA and Western Blot assays.
Results. Data analyses showed a 60.1 HIV seroprevalence rate, with 90% of these subjects reporting a significantly greater frequency of intravenous (IV) heroin use in the previous 12 months than seronegative subjects (p=.026). Males began regular IV heroin use at a significantly younger age than females (p=.003), and ethnicity and first regular IV use was significant (p=.052) with White subjects reporting regular IV use at a younger age than minorities. IV heroin users were more likely to be HIV seropositive than non-IV users (p=.040).
Conclusions. The data suggest a clear association between demographic and behavioural factors and the risk for HIV infection in heroin users. This argues the need for diverse educational interventions and early prevention efforts.

D.609

NEEDLE-SHARING PATTERNS AS A PREDICTOR OF HIV SEROPREVALENCE AMONG NEW YORK CITY INTRAVENOUS DRUG USERS (IVDUs)

Yee, Kathleen; Brown, L. S.; Primm, B. J.; Nemoto, T.; Foster, K. Addiction Research and Treatment Corp., New York City, USA.

Objective. To examine the association between patterns of needle-sharing and HIV seroprevalence among IVDU's in NYC.
Methods. Following informed consent, 218 patients, recruited from methadone maintenance clinics in Brooklyn and Manhattan, were administered a standardized questionnaire in 1987. This sample included 45% blacks, 47% Hispanics, and 8% whites, of which 36% were males and 64% were females. Sera were also collected and tested for HIV antibodies via ELISA and Western Blot assays.
Results. The overall seroprevalence rate was 60%. Respondents who did not clean their needles were more apt to frequent shooting galleries (p=.0005). Those who frequented shooting galleries, were more likely to share needles than those who did not (p=.0001). Those who shared needles with the same person for at least one year were more likely to be seronegative (p=.0262) and less likely to use shooting galleries (p.=0001).
Conclusion. This information suggests that interventions directed at reducing usage of shooting galleries, or at least, modifying behaviors in shooting galleries may reduce the incidences of HIV transmission associated with needle-sharing.

D.610

PATTERNS OF COCAINE USE AND ITS ASSOCIATION TO HIV SEROPREVALENCE AMONG INTRAVENOUS DRUG USERS (IVDUs)

Nemoto, Tooru; Brown, L.S.; Primm, B.J.; Chu, A.; Foster, K.; and Ajuluchukwu, D. Addiction Research and Treatment Corporation, New York City, USA.

Objective. To investigate patterns of cocaine use and its association to HIV infection among IVDUs.
Methods. In 1987, a total 218 participants: average age=33 years, 36% males and 64% females, and 45% Blacks, 47% Hispanics, and 8% Whites, were recruited from methadone clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western blot techniques.
Results. The overall HIV infection rate was 60%. The HIV positive IVDUs significantly more often injected cocaine intravenously (p<.003) and less often smoked cocaine (p<.05) than the HIV negative. Significant intercorrelations (p<.001) were found between frequencies of IV use of cocaine, heroin, and speedball (heroin and cocaine). Multivariate analysis revealed HIV positive IVDUs were older, more frequently used shooting galleries in the last 5 years, more frequently used IV heroin and cocaine, and less frequently skin-popped heroin (all, p<.05).
Conclusion. IV cocaine use were significantly associated with HIV seroprevalence. Also, patterns of drug use (IV, skin popping, and smoking) were differently associated with HIV infection. Research investigating polydrug behavior is needed for AIDS prevention.

D.611

BEHAVIORAL RISK FACTORS OF HUMAN IMMUNODEFICIENCY VIRUS (HIV) INFECTION AMONG INTRAVENOUS DRUG USERS (IVDUs)

Nemoto, Tooru; Brown, L.S.; Primm, B.J.; Foster, K.; Chu, A., and Ajuluchukwu, D. Addiction Research and Treatment Corporation, New York City, USA.

Objective. To investigate behavioral risk factors among IVDUs, especially focusing on their drug and sexual behaviors, and psychological status.
Methods. In 1986, a total 262 subjects; 162 males and 100 females; 107 Blacks, 116 Hispanics, and 35 Whites, were recruited from methadone maintenance clinics in Manhattan and Brooklyn, New York City. After informed consent, a standardized questionnaire was administered by trained interviewers. Also, blood was collected and tested for HIV antibody by ELISA and Western blot techniques.
Results. The overall HIV infection rate was 61%. A significant association between age groups and HIV status was found, p<.05. Frequencies of heroin and cocaine use before enrollment were positively correlated, p<.001. After enrollment in the methadone treatment program, the frequencies of using heroin, cocaine, and marijuana were significantly decreased, p<.001. The HIV positive subjects started using heroin significantly earlier in their age (p<.01) and reported significantly larger number of needle sharing partners at shooting galleries (p<.02) than those who were HIV negative.
Conclusion. Methadone maintenance programs may effectively cut the use of heroin, cocaine and marijuana. Also needed are AIDS prevention programs, focusing on younger age groups and behavioral factors, especially.

D.612

"PREVALENCE OF PROSTITUTION" AMONG FEMALE HIV +VE INJECTING DRUG USERS IN GLASGOW AND THE ESTABLISHMENT OF A HEALTH CARE DROP-IN CENTRE.

David J Goldberg, A Thomson, ST Green, JA Emslie, DH Kennedy; CD(S)U & Infectious Diseases Unit, Ruchill Hospital, Glasgow, U.K..

Introduction: Epidemiological studies in the USA and Europe repeatedly confirm that the major risk factor determining if an individual prostitute becomes infected with HIV is not sexual activity but if they are injectors. The "prevalence of prostitution" among 37 known HIV-positive female drug injectors (DIs) (those clearly stating that they had prostituted) attending one ID hospital was found to be 67% (25/37). However, most initiatives looking at HIV-positivity among prostitutes have come across few who inject drugs; this may result from sampling purely from genitourinary medicine (GUM) clinic attenders and could lead to underestimation of seroprevalence. Concern about HIV and the paucity of health care initiatives directed towards drug injecting prostitutes led to the setting-up of a volunteer-run drop-in centre in May'88.
Methods and Results: The centre operates 3 nights weekly (10pm to 1am) in premises near Glasgow's "red light" areas. It is advertised solely by "word of mouth". Refreshments are made available. Health care, health education (stressing HIV prevention) and access to detoxification centres, GUM clinics and contraception (such as long-acting intramuscular medroxyprogesterone acetate) is provided. All women take away a quantity of condoms, including non-lubricated "Durex Dry" (favoured by some for oro-genital sex). Up to January 1989, 71 female prostitutes had attended, the majority on several occasions. 76% of them were or had been DIs.
Conclusion: It is clear that some HIV-positive drug injectors will prostitute. Prostitutes who are DIs can be contacted through non-statutory initiatives.

D.613

HIV INFECTION IN A DETOXIFICATION UNIT

Muga Roberto. Tor J. Melus R. Ginestà C. Rey-Joly C. Foz M.
Service of Internal Medicine. Hospital "Germans Trias i Pujol".
Universitat Autonoma de Barcelona. Barcelona. Spain.

Objetive:The greater number of IDAs who start detoxification treatment in Spain come from primary assistance programs, are apparently asymptomatic and don't know the possibility of HIV infection nor its clinical status.
We studied, longitudinally, a group of IDAs admitted in a hospitalary detoxification unit to obtain a first selection of patients tributary of anti-HIV treatment.
Methods: We included 169 heroin abusers (130 males and 39 females), with an age of 25.6 ± 4.5 years and a time of addiction of 66.8 ± 36.5 months, admitted from February 87 to July 88. We analysed HIV antibodies (EIA test) and clinical search for physical signs and symptoms related to HIV infection.
Results: 116/155 (74.8%) were HIV+. 28/116 (24.1%) were included in group II. 37/116 (31.8%) in group III and 51/116 (43.9%) in group IV. The greater number (48/51) of group IV were included for infectious diseases not definite as AIDS (oral thrush and/or hairy leucoplakia)and the rest, (3/51) for opportunistic infections not previously known and AIDS criteria (esophageal candidiasis).
Conclusion: We observed important clinical disorders corresponding to advanced stages of HIV infection (groups III and IV) in the 75% of apparently asymptomatic patients. Efforts must be directed to this group with the aim to steadying their drug abuse as previous step for anti-HIV treatment.

D.614

COMPLIANCE OF MEDICAL FOLLOW-UP IN HIV POSITIVE PATIENTS.

*Cummins B, *Bisset C, ^Inglis JM, *Brettle RP. *HIV Counselling Clinic; ^Regional Virus Laboratory, City Hospital, EDINBURGH, Scotland, UNITED KINGDOM

OBJECTIVE: To review medical follow-up compliance in HIV positive patients.
METHOD: The City Hospital HIV Counselling Clinic offers confidential pre-post test counselling for self referrals. Risk activities were categorised as follows:- injecting drug users (IDU), IDU prescribed/not prescribed Methadone (IDU+METH, IDU no METH), homosexuals/bisexuals (HO/BI), heterosexual (HET), blood and unidentified (OTH). Attendance was divided into Regular (REG); Sporadic (SPO) - maximum of 3 attendances; failure to attend (FTA).
RESULTS: To date 1718 people attended of whom 271 tested positive for antibodies to HIV. All were offered regular medical review.

	TOTAL(%)	TOTAL MALE(%)	TOTAL FEMALE(%)	TOTAL IDU(%)	IDU + METH(%)	IDU NO METH(%)	HOM/ BI(%)	HET(%)	OTH(%)
REG	161 (59)	109(65)	52 (50)	139(62)	61(87)	78(51)	13(76)	4(18)	5(62)
SPO	56 (21)	25(15)	31 (30)	43(19)	9(13)	34(22)	1(6)	11(50)	1(13)
FTA	54 (20)	33(20)	21 (20)	42(19)	0(0)	42(27)	3(18)	7(32)	2(25)
	271	167	104	224	70	154	17	22	8

CONCLUSION: Individuals' compliance can be affected by a number of issues including fear, denial, practical and financial (inaccessibility of hospital, poor public transport, non-availability of child minder, etc.). These results suggest that IDU attendance is no worse than for individuals with other original risk factors.

D.615

SAN FRANCISCO SPEEDBALLS: AN ETHNOGRAPHY OF COCAINE AND HEROIN USERS AT HIGH RISK FOR AIDS

Biernacki, Patrick; Margolis, E.; Feldman, H.
Youth Environment Study, Inc., San Francisco, CA, USA.

Objective. To analyze the practice of speedball (combined cocaine and heroin) use in segments of San Francisco's intravenous drug using (IVDU) population.
Methods. Interviews with active IVDUs and Community Health Outreach Workers (CHOWs): coding, analyzing and evaluating this data.
Results. Speedball use is common among IVDUs in San Francisco, particularly among older career heroin addicts. It may involve greater injection frequency thar use of heroin alone. A significant portion of people on methadone maintenance continue to inject cocaine, and using a syringe to measure out two doses has been observed. All of these may put speedballers at higher risk for AIDS, in addition to needle sharing.
Conclusions. Focused ethnography can provide answers to questions about specific IVDU behaviors such as speedballing, and this is useful in designing outreach strategies to reduce the spread of AIDS.

D.616

Engaging the Client with Histories of Substance Abuse or Mental Illness

MESSINA, CHAPMAN, SILVA, GUTTERMAN, U.S.A.

Unlike many other ambulatory care settings, the AIDS Day Treatment of the Village Nursing Home in New York City has succeeded in engaging the client with histories of substance abuse or mental illness. Success in this engagement process is due to a specific set of program policies, including an assumption that some clients must be intensively nurtured before they can pusue any self-empowerment goals such as seeking new housing orentering a drug detoxification program. Further, program policy strictly limits institutional intrusions such as lengthy intake interviews, while providing immediate crisis interventionservices -- often within minutes of admission. After admission the client is encouraged to view the program staff as his family, substitutin for a dysfunctional street culture, and allowing a wide influence in the client's life.
In summary, immediate responsiveness to client need appears to engage the client with histories of mental illness or substance abuse. This paper should be of interest to all clinicians and administrators working with these difficult groups.

D.617

Support Groups for Drug Users Affected by HIV and AIDS

STEVEN CRANFIELD, MASSIMO RICCIO, SUSY HOGARTH, RAYMOND MALLOY, EDWARD BARACAT, et al., Drugs Education Group, Terrence Higgins Trust, London, England.

Objective. To establish effective support groups in London for drug users affected by HIV/AIDS and to recommend guidelines for good practice.
Methods. The Drugs Education Group (DEG) is a voluntary body of professionals working in the field of drug misuse which acts as an advisory group to the Terrence Higgins Trust, Europe's largest community-based AIDS organisation. The DEG has initiated a number of support groups in London for current, maintained and ex- users affected by HIV. A separate group has been set up for Italian-speaking people not in contact with other drugs/AIDS agencies.
Results. All groups have highlighted the multiple problems facing drug users in deprived inner city areas: lack of access to medical/drug treatment; poverty; isolation; and poor family and peer support. Locating groups in an AIDS organisation with access to medical/welfare advice and charitable funds allowed for a swift response to many of these issues. This attracted new members and enhanced the groups' abilities to support, educate and empower. All groups had a policy of not segregating current from ex- users. This did not result in relapse amongst drug-free members. Several people associated with the groups have "graduated" from facilitated support groups and gone on to initiate their own self-help groups such as Positive Partners and Mainliners which are establishing national networks for drug users with HIV.
Conclusion. Support groups for drug users with HIV must be adequately funded and initially facilitated by experienced and motivated people. As such they can play a vital role in health education and in empowering drug users.

D.618

SWEDISH AND INTERNATIONAL SYRINGE EXCHANGE PROGRAMMES: EVALUATION AND SWEDISH RECOMMENDATIONS

Robert Olin, National Board of Health and Welfare, Stockholm, Sweden.

During 1988 the Swedish National Board of Health and Welfare evaluated the ongoing syringe exchange programme (SEP) in the Malmö/Lund region. Available data from British SEP (Stimson) and Amsterdam (Bunning) is also considered in this report. The report also gives a picture of the HIV/IVDA situation in Europe. Swedish IVDAs were reached by HIV as late as 1983. Due to the now known variation of infectivity over time, the report discusses the threat of a second wave of HIV spread among Swedish IVDAs. Approx. more than 80% of Swedish IVDAs have been tested, which gives good baselines for prospective epidemiological studies. Although Swedish as well as British and Amsterdam SEPs have been operating for a short term and have had methodological difficulties, the following conclusions are reached:
a) Drug abuse does not appear to have increased in project areas. Nor has any new recruitment for drug abuse been reported.
b) In the Swedish SEP area there has been no further spread of HIV during the 15-month experimental period. However, it is an open question whether this can be put down to the project.
c) Many of the drug abusers getting in touch with the SEP do not have any current therapeutic contacts. Some establish such after contact with SEP.
d) Regular motivation in the therapeutic work of drug abuser rehabilitation services has not been disrupted by SEP.
e) No drop-outs from treatment have been observed in Sweden.
f) The drug abusers themselves view the activities in a positive light (concern for health).
g) All SEP report certain decline in risk behaviour.
h) The needle exchange ratio varies between 55-100 per cent.
i) The educational opportunities generated by SEP are apparent.
The following problem areas are discussed in the report:
1. Congregation of drug abusers intermittently causes disruptions.
2. Distribution of clean tools to IVDAs can be looked upon as an ambiguity at variance with a restrictive drug policy. This problem of two partly opposite goals is thoroughly discussed in the report.

D.619

OUTREACH PROGRAMS IN NORWAY - APPROPIATE INSTRUMENTS IN NATIONAL HIV/AIDS PREVENTION AMONG DRUG USERS.

Bente Nilsen, Municipal Outreach Program, Oslo, Norway.

Recent research reports an accumulation of HIV-infection among drugusers using streets and parks in Oslo city (Norway) as resorts. These groups often withhold from public care, and are not easily reached by the regular health and welfare system.
The main objectives of outreach programs are to seak out and establish contact with drugusers who are in need of help and support. Reaching out to these individuals implies an invasion of their "territories". This enforces a constant development of different methods in social work to ensure the stability of the contact with drugusers.

An important feature of the municipal outreach programs are the unique chance for social workers and psychologists to establish direct and long-term contact with drugusers who live at the streets and are at high risk for HIV-infection and for spreading the HIV-virus.

The outreach program in Oslo provide for syringes and condoms to drug-users in order to prevent the use of dirty syringes and participation in unprotected sex. This is perceived as necessary but not sufficient efforts in HIV/AIDS prevention. In the outreach programs most effort is made to bring drugusers off the streets and into treatment- and rehabilitation programs to ensure more lasting behavioural changes.

D.620

THE AIDS VANCOUVER ISLAND STREET OUTREACH PROJECT

Valerie G. Thompson Williams, Judith English.
AIDS Vancouver Island, Victoria, British Columbia, Canada.

Objectives. AIDS Vancouver Island Street Outreach Program investigated the prevalence of high risk behaviours among street youth, sex trade workers, and IVDU's on the streets of Victoria; evaluated their knowledge of and attitudes about HIV/AIDS transmission behaviours and assessed the effectiveness of the street counsellors in reducing high risk behaviours.
Method. One hundred and one volunteer subjects (48F, 53M; age range=14 to 53, $\bar{x}$=20.9) responded orally to an AIDS knowledge/risk questionnaire.
Results. Two thirds of the subjects reported engaging in high risk behaviour (vaginal or anal sex without condoms and/or sharing uncleaned injection equipment) in the previous month, despite high knowledge scores ($\bar{x}$=81.8% correct). The significant trust in the street counsellors was reflected in the 91.6% of subjects who would use them as a personal crisis support system. Subjects preferred to obtain condoms from street workers more frequently (68%) than from traditional suppliers (19%) and reported using condoms and bleach more frequently.
Conclusions. Significant high risk behaviours exist among the Victoria street population. A high level of AIDS knowledge was not linked to behavioural risk. Preliminary evidence suggests the street counsellors may be able to reduce high risk behaviour. Future research would investigate this.

PRESENTATION D'UNE BROCHURE EDUCATIVE A L'INTENTION DES PERSONNELS DES ETABLISSEMENTS DE SOINS

ABITEBOUL D.* MATHERON S.** PERNET M.*** et SCHNEEBERGER C.****
Groupe hospitalier BICHAT - CLAUDE BERNARD (ASSISTANCE PUBLIQUE DES HOPITAUX DE PARIS)
* Médecin du travail, ** Praticien hospitalier, *** Surveillante hygiéniste,
**** Infirmière générale, FRANCE

Objectif : répondre aux interrogations des agents sur l'infection HIV, en des termes simples, compréhensibles par tous.
Méthode : recenser, pendant un an, les questions lors des consultations de médecine du travail à l'hôpital Claude Bernard, et par autoquestionnaire ouvert à l'hôpital Bichat (400 réponses)
- les classer par catégories professionnelles,
- reprendre ces questions dans une brochure et s'efforcer que chaque agent soignant ou non y trouve une réponse adaptée à sa tâche.
Résultats : un fascicule de poche : "SIDA REPONSES AUX QUESTIONS DU PERSONNEL DES ETABLISSEMENTS DE SOINS", comprenant 85 questions-réponses, illustré, a été d'abord diffusé aux 3 000 agents du groupe hospitalier à titre de test (questionnaire d'évaluation joint à retourner). L'analyse des réponses [illegible] en cours et permettra de modifier, si nécessaire, le contenu de la brochure avant diffus[illegible] plus large à tous les personnels de l'Assistance Publique de Paris (65 000 agents), voire à d'autres établissements ou entreprises.
Conclusion : les premiers résultats de l'évaluation permettent de conclure que ce guide répond à l'attente des agents et permet de toucher rapidement un grand nombre de personnels de catégories professionnelles variées.

D.623

SURVEILLANCE ON OCCUPATIONAL EXPOSURE TO HIV AMONG HEALTH-CARE WORKERS IN ITALY.

Francavilla,E.*:Cadrobbi,P.*;Scaggiante,R.*;De Silvestro,G.**
Bortolotti,Flavia*** and Bertaggia,A.*.
*Dept.of Infectious Diseases,**Blood Bank and***Clinica Medica 2.Padua,Italy.

Objective.To evaluate the frequency of seroconversion in health-care workers exposed to HIV.
Methods.During a 22-months period,from March 1987,641 health care workers who had been exposed to potentially infectious body fluids were screened for anti-HIV by an ELISA test.Risk factors other than occupational were excluded. 298 cases who had been exposed to anti-HIV positive blood or to unknown body fluids (227 with history of needlestick and 71 who reported contamination of mucous membrane or nonintact skin) were followed up to 12 months after exposure.
Results. At first testing all subjects were HIV seronegative.Updated results of follow-up screening are shown in the table:

Type of exposure	N° cases during follow-up				HIV seroconversion
	1mo	3mo	6mo	12mo	
Anti-HIV+ blood(221)	217	116	83	21	0
Unknown body fluids(77)	64	45	37	28	0

Conclusions. These data show that accidental needlestick is by far the most common type of exposure to HIV reported by health care workers in our area. None of cases tested was seropositive at presentation and none became seropositive after exposure to blood who was known to be anti-HIV positive.

D.624

THE EFFECT OF A DEDICATED AIDS UNIT ON HOUSESTAFF ATTITUDES TOWARDS AIDS.

Bialer, Philip; Wallack, J; Perlman, D; Flegenheimer, W
Beth Israel Medical Center, New York, N.Y., USA

Objective: A number of previous studies have revealed housestaff anxieties and career changes due to the AIDS epidemic. This study was undertaken to demonstrate the impact of a rotation on a dedicated AIDS unit upon these attitudes.
Method: Interns from the Department of Medicine in a 1000 bed urban teaching hospital with a large AIDS population completed an original questionnaire at the end of their one month rotation on a 12 bed AIDS unit opened in July, 1988. The 18 item multiple choice and Likert type scale questionnaire was designed to assess the influence of this experience on attitudes towards caring for AIDS patients, fear of contagion, career decisions, and treatment options. To assure anonymity, demographic questions were not included, and results were not tabulated until all forms had been collected.
Results: We report on the first 6 monthly rotations from 7/88 to 12/88 of this continuing study. Eighteen questionnaires were completed for a return rate of 100%. A significant majority (95%) described the rotation as valuable, however of these, 78% felt the rotation should be elective rather than required. Over half of the respondents reported a positive effect on their attitudes towards caring for AIDS patients. The rotation had no significant impact on fear of contagion as 22% reported increased fear and 28% decreased; the rest were unchanged. When questioned about the influence of the AIDS epidemic on their future professional plans, 44% claimed they were less likely to remain in internal medicine and 50% felt less likely to practice in New York City. Only two interns claimed the rotation directly influenced their career decisions. Nearly 3/4 of the interns felt the dedicated unit was the best way to provide care for AIDS patients.
Conclusion: The AIDS epidemic is having a profound, often negative effect, on the recruitment, training, and attitudes of medical housestaff. Our study suggests that the establishment of a dedicated AIDS unit in a major teaching hospital may have a positive influence on this trend.

D.625

KNOWLEDGE, ATTITUDES AND BELIEFS OF PHYSICIANS REGARDING HIV INFECTION IN A LONDON HEALTH DISTRICT.

Golding, Simon Murray*; McEvoy, M. **
*Department of Health Education, Islington Health Authority, London, England
**Department of Public Health Medicine, Islington Health Authority, London England

Objective. To assess knowledge about, and attitudes towards HIV amongst hospital and primary care physicians in the Health District of Islington.
Methods. A self-administered postal questionnaire was distributed to all physicians in active medical practice within the Health district of Islington. Twenty questions were designed to seek details about: sources of information on HIV; quantification of degree of risk of infection from various activities; extent of contact with infected patients; and attitudes to confidentiality and counselling of patients.
Results. The data collected were stored in a VT103 computer and analysed using the minitab programme. 376 questionnaires were sent out; 293 (78%) were completed and returned after two reminders. Preliminary analysis suggests that medical journals were the most important source of information about HIV. 52% of hospital doctors but only 16% of primary care physicians had had regular contact with HIV infected patients. These physicians had higher levels of knowledge about HIV infection and were more likely to oppose routine screening or testing for antibodies to HIV without contact. Younger doctors were more up to date with specialist thinking on HIV than older associates.
Conclusions. Comprenensive results will be available by April 1989. Preliminary findings accord with those of other researchers in the U.K.

D.626

AIDS-RELATED KNOWLEDGE, ATTITUDES AND BEHAVIOR OF NURSES AND HOSPITAL ADMINISTRATORS: A COMPARATIVE ANALYSIS

Campbell, Scott*; Willenbring, K* and Henry, K.*†
Department of *Medicine, St. Paul-Ramsey Medical Center, †University of Minnesota Medical School, St. Paul Minnesota U.S.A.

Objective. To describe differences and similarities of AIDS-related knowledge, attitudes, and behaviors between registered nurses (RNs) and hospital administrators (HAs) located at one hospital.
Methods. In September 1987 an anonymous survey was delivered to all RNs and HAs at a 455-bed acute care teaching hospital. Included in the survey were scales measuring AIDS-related knowledge, attitudes, behaviors, homophobia, and homosexual bias, and items measuring other variables.
Results. Responses were obtained from 77 administrators and 629 registered nurses. The sample was 98% caucasian, 93% female, and mean age was 37.2 years. HAs were more likely to be male than RNs ($p < .000001$). Analysis revealed that the RNs and HAs did not differ in their AIDS knowledge, self- reported behaviors in relation to AIDS patients, or level of homophobia. As a group, HAs possessed a slightly higher AIDS-attitude score, a scale measuring positive attitudes towards PWAs ($p< .01$), and also demonstrated a slightly lower level of bias against homosexuals ($p<.05$). HAs were more likely to indicate confidence in the AIDS information given to the public ($p < .01$). In all, 82% of the HAs and 95% of the RNs indicated willingness to attend a 1-hour AIDS inservice program if this was offered.
Conclusion. It seems plausible that RNs would demonstrate a greater AIDS knowledge than HAs, and that the AIDS-related attitudes and behaviors of RNs would be at least equal to that of HAs. This was not true in this sample, possibly due to the RNs' higher level of patient contact, thereby increasing fear. It is noteworthy that HAs demonstrated a higher level of confidence in AIDS medical information than RNs. Since most RNs and HAs in this and other settings are likely willing to attend AIDS education programs, these programs should be provided in a manner which promote trust in the information provided. Methods to increase trust in AIDS information require further study.

D.627

IMPLEMENTATION AND EVALUATION OF UNIVERSAL PRECAUTIONS IN A LARGE COMMUNITY HOSPITAL

Lampson, Judith; Klimek, J.; Malo-Schlegel, S.; Traficanti, K., York, E.; Cooper, B. (Hartford Hosp., Hertford, CT, USA)

Objective. To develop and test a model educational training program for the prevention of blood borne diseases in health care settings.
Methods. It has been recommended that blood and body fluid precautions be consistently and universally used by health care workers (HCW) for all patients. The concept of "universal precautions" (UP) is a substantial departure from routine, established practices in the hospital and has generated confusion and indecision among HCW, administrators and educators. An educational program was developed for all HCW. Mandatory educational sessions, using video tapes, question and answer periods and a specially prepared brochure, were provided to all employees. A hospital wide advertising campaign using posters and newsletters announced the program. Teaching methods are being evaluated by post-education tests, followup surveys and by direct observations of HCW on the job utilizing "duck-blind" methodology. Employee needlestick occurances and other documented exposure to blood and body fluids will be reviewed. Cost implications of UP will be determined by comparing cost after UP to standard ("disease specific") isolation procedures.
Results. The educational program and evaluation activities are in progress. Dialogue with disciplines most effected by UP (OR, Laboratory, Nursing) has refined details and enhanced acceptance. Cost estimates on UP to date exceed $1.6 million for materials and personnel.
Conclusion. UP implementation can be expensive and disruptive, and should follow thorough planning and preparation.

D.629

HIV/AIDS PROFESSIONAL EDUCATION: PROGRAM DEVELOPMENT AND EVALUATION FOR PHYSICIANS, NURSES AND SOCIAL WORKERS

Hurley, Patricia M.; Malgady, R.; McGriff, E. and Grossman,A.
New York University, New York, New York, U.S.A.

Objective. To develop and evaluate a comprehensive program of AIDS education for primary care physicians, nurses and social workers.
Methods. A basic core curriculum (e.g.,immunology, epidemiology/virology, opportunistic infections) was developed and has been revised by clinicians and faculty experienced in HIV/AIDS care. Modules developed focus on minorities, nutrition, intravenous drug use, medicine, nursing and social work disciplines. Interventions included one- two- and five-day workshops, conferences, seminars and a lecture series.
Results. Since 1987, over 6,000 health professionals from New York, New Jersey, Connecticut, Puerto Rico and the Virgin Islands have participated. Pre- and post-tests of knowledge, attitudes, anxiety about working with AIDS patients, and satisfaction with the educational programs were administered. Results indicated that participants demonstrated significant increase knowledge, more positive attitudes, reduced anxiety and high levels of endorsement of the program. Findings varied by participants' prior personal and professional experiences with AIDS, and with geographic location (high/low incidence areas) and profession.
Conclusion. This program has effectively reached a significant number of health professionals in an area of high AIDS prevalence. It has been favorably received and has impacted on professional behavior. Geographic location, as a factor in the level of education needed to maintain HIV expertise, needs further exploration.

D.631

DEVELOPMENT AND RESULTS OF A NEEDS ASSESSMENT SURVEY FOR HEALTH CARE PROFESSIONALS AT A MUNICIPAL HOSPITAL.

Akpan, Sandra*; Noel-Connor, J.* and El-Sadr, W.*.
*Harlem Hospital Center, New York, N.Y.,U.S.A.

Objective: To determine attitudinal and/or cultural factors that influence the care administered to HIV-infected patients. This was of particular interest since the HIV-infected population at this institution primarily consists of intravenous drug users (IVDUs) and of minorities.
Methods: Informally, we found out that the general consensus was that AIDS patients were stigmatized by the risk factors that cause the disease. As a result of these discussions, we decided to formally assess the attitudes of the health care givers and base our educational approaches on the results. Incorporated into the survey were questions to determine what areas they wanted to learn more about, including behaviors and psychodynamics of homosexuality and I.V. drug abuse. We also included questions regarding the ethnicity of the medical house staff/nursing staff in order to determine if cultural and societal attitudes were influencing attitudes towards the AIDS patients.
Results: The survey was pre-tested among a group of doctors and nurses who cared for the most AIDS patients before implementation. The results of the pre-test indicate strong feelings about the personality and behavior of the IVDA that negatively influences care.
Conclusion: The full results of the survey among medical house staff and nursing staff will be presented.

D.628

ESTIMATED RISK OF HIV INFECTION AMONG SURGEONS PRACTICING IN THE NEW YORK CITY AREA.

Wormser, Gary P.; Jain, R.; and Lowenfels, A.B. New York Medical College, Valhalla, New York, USA.

Objective. To estimate the occupational risk of HIV infection in surgeons.
Methods. Surgeons from several hospitals in the New York City area were surveyed by telephone or by mail between July and October 1988 regarding puncture wound injuries occurring within the past 1 year.
Results. 100 (91%) of 110 surgeons contacted by phone and 102 (53%) of 191 contacted by mail agreed to participate. Since there were no significant differences in responses of the 2 groups, the data were combined. 173 (86%) reported at least 1 puncture injury within the past 12 months, with a median of 2 injuries per year. 76% of injuries occurred during surgery with a median injury rate of 4.2/1000 operating room hours. 53% of all injuries involved the index finger of the non-dominant hand. Injury rates were independent of age, sex, type of practice, operative work load, or type of hospital.
Conclusion. If the prevalence of HIV infection in surgical patients is 5% and if the rate of HIV seroconversion per puncture injury is 0.42%, then the estimated average 30 year cumulative risk of HIV seroconversion per surgeon is 1-2%. This risk could be reduced by approximately 50% if an apparatus were developed to protect just the index finger.

D.630

USING LEARNING DOMAINS TO TRAIN HEALTH CARE WORKERS (HCW)

Berman, Caryn*
*University of Illinois at Chicago, Chicago, Illinois, U.S.A.

Objective: To help trainers improve health care workers learning in three domains; cognitive, attitude and skills.
Methods: Analysis from observations of over 50 training programs conducted between 1985 and 1988 for multi-discipline health care workers. Programs (experiential exercises and small group discussions) were conducted in community settings and health care facilities. Observations included participants' and conductors' comments and written evaluations of training programs.
Results: COGNITIVE ISSUES, 1) "What is believable?" Obtain information from credible sources. Acknowledge the unknown. Stress the consistency of new and existing information, development of expanded knowledge base. 2) "How much occupational risk is there?" Inform on research of HCW exposures vs infections, compare to other diseases and other risks HCW accept. ATTITUDINAL ISSUES, 1) "This disease is scary." Acknowledge fears and concerns of HCW and their families before trying to change them. 2) "People who get HIV are bad people." Challenge personal biases, promote tolerance for differences. 3) "It's not my responsibility to work with these people." Develop and/or reinforce professional ethics. 4) "They can't change their behavior." Reinforce belief in ability of people to change; HCW can adopt universal precautions, change attitude; patients can change risk behaviors. 5) "People like me don't get HIV." Identify and acknowledge HCW personal risk. 6) "This is depressing." Convey hope in scientific research, explore potential of disease to transform patient and HCW, reinforce acceptance of HCW's limits and spiritual needs. SKILL ISSUES, 1) "I don't have the skills." Reinforce ability of HCW with training, emphasize adoption of universal precautions, identify relevance of prior skills, provide role models. Conclusion: Research is needed to substantiate the commonality of these learning issues and the value of techniques to provide their resolution.

D.632

SOURCES OF STRESS AMONG AIDS CAREGIVERS

Mandel, Jeffrey S.*; Jacobs, R.**; Grade, M.*, and Lewis, A.*, University of California at San Francisco, Schools of Medicine and Nursing, California, USA; **Young Adult Institute, New York, New York, USA.

Objective. To determine common sources of stress among AIDS caregivers.
Methods. Participants in "care for the caregiver" workshops were surveyed by self-administered questionnaire to identify sources of perceived stress in the provision of AIDS care.
Results. Although a wide range of health care providers were targeted by these workshops, physicians chose less frequently than did nurses and mental health professionals to attend. Most commonly cited sources of stress were (1)organizational problems; (2)lack of resources; (3)loss of friends/loved ones; (4)distress associated with death and dying; (5)inability to set limits on work; (6)overidentification with patients; and (7)feelings of helplessness/inadequacy.
Conclusions. AIDS caregivers experience in common several sources of stress in their work. Limitations in organizations' capabilities of responding to the demands of the AIDS crisis are perceived to be as stressful as the emotional demands of patient care.

D.633

THE EFFECTS OF AN EDUCATIONAL PROGRAM ON CHANGING DENTAL CARE WORKERS ATTITUDES AND KNOWLEDGE REGARDING HIV

Andriolo, Mario; Gerbert, B.*; Sumner, J.*; Maguire, B.*.
St. Clare's Hospital and Health Center, New York, NY, USA and *University of California San Francisco, Dept of Dental Public Health, San Francisco, CA, US

Objective. To assess the change in dental care workers attitudes and knowledge about HIV after attending an educational seminar.
Methods. Dental care workers were invited to attend a 3 hour seminar which provided information on transmission, etiology and epidemiology of HIV, oral manifestations of HIV and infection control protocols. Sessions were limited to 20 participants, each of whom were administered a pre and post test.
Results. Completed pre and post tests were received from 117 participants. Knowledge and ability to identify HIV related oral lesions improved significantly (pre 17.7 vs post 45.3). Dentists were less apt to support an individualistic position regarding their right to decide to treat HIV patients (pre 84.6% vs post 56.6%) and were more likely to accept standards of care set by professional organizations (pre 58.1% vs post 71.0%). Change in risk perception was not significant although slight positive changes were seen in general attitudes about HIV.
Conclusion. The seminar was effective in educating dental care workers about the oral manifestations of HIV and changing attitudes about professional obligation. The seminar was less effective in changing general attitudes about HIV and perceived risk of transmission. Future seminars should include a stronger psychosocial component.

D.634

AIDS Education and the Health Worker: A Planning Workshop

Nathan L. Linsk*, (Organizer), Erma J. Wright**, Gordon Youngman***, Riva Miller****, Phyllis Hefron*****, L. Chen******.
Midwest AIDS education Center, Univ. of Illinois, Chicago; **Delta Region AIDS Education Center, Tulane University, New Orleans; ***Toronto, Canada; ****Royal Free Hospital, London, UK; *****U.S. Public Health Service; ******Harvard University School of Public Health. U.S.A.

Objectives: (a) Share information about education of health workers in countries of high prevalence of AIDS/HIV; (b)identify critical issues--e.g. curriculum, delivery systems, social & occupational context; national information campaigns; (c)establish global linkages between AIDS health professional educators; (d)formulate an action plan & an organization for continuing communication & development & evaluation of educational methods.
Methods: Two to 2 1/2 hour planning workshop. Panel participants will outline programs, issues, and impact evaluations of specific programs or problem areas. Scholars, public health officials, & health workers at the conference will participate in developing the action plan.
Results: Discussion will include: (a)Current knowledge about education of health workers to deal with HIV issues. (b)Surveys and curriculum of programs to provide information and inform attitudes and behavior of health workers with regard to AIDS. (c)National & small scale training programs & educational delivery systems. (d)How health workers are prepared to deal with HIV infection in terms of stress and patient outcome. (e)Reaching & helping health workers to deal with AIDS & HIV related issues, e.g. access and receptiveness of health workers, belief systems and emotional reactions, & institutional commitments. (f)Local, national, & international structures needed to insure adequate preparation of health care workers as well as ongoing information.

D.635

TEAM-BASED MODEL: AIDS TRAIN THE TRAINER PROGRAM FOR HEALTH CARE PROFESSIONALS

Bisaillon, Denise A.*; Fitzsimmons, M.J.*.
*Massachusetts Hospital Association, Burlington, MA, U.S.A.

Objective. To describe and evaluate a model AIDS Train the Trainer Program for teams of health care providers in hospitals.
Method. The Massachusetts Hospital Association in conjunction with the Massachusetts Department of Public Health and The New England AIDS Education and Training Center designed and implemented a team-based AIDS 101 training program for health professionals in areas such as infection control, nursing, social services, etc. Seven two-day training programs were conducted for 152 participants from 34 hospitals. The training combined a cognitive-developmental approach with substantive content in the following areas: support for the care giver, educational principles, HIV testing, clinical information, personal and occupational transmission and risk reduction, and psychosocial issues. A comprehensive manual, mirroring the program, was developed to provide a resource for the participants.
Results. Pre and posttesting indicated positive change across all content areas. Periodic follow-up workshops revealed that the teams of trainers implemented a variety of activities: formal and unit-based programs, support groups, and one-on-one interventions as AIDS resource specialists.
Conclusion. A developmental, team-based approach to a Train the Trainer program, which involves the hospital administration in the selection of a representative team, can strengthen the likelihood that training activities are brought back to the hospital.

D.636

ATTITUDES AND BEHAVIOURS OF HOSPITAL PERSONAL : EVALUATION OF THE AIDS PREVENTIJON CAMPAIGNS IN SWITZERLAND

Dubois-Arber Françoise*; Hausser D.; Lehmann Ph.; Gutzwiller F.
Inst. univ. de méd. sociale et préventive, Lausanne, Suisse; ISPM, Zürich, Suisse.
SWITZERLAND

Medical staff in hospitals plays an important role in patient care and in assuming opinion leadership within the population. AIDS related attitudes and behaviours of medical personal may positively or negatively affect the course of AIDS prevention. Estimation of professional and private risk of contamination is an important attitude to evaluate.
Methods. Data have been collected within 13 departments (emergency, surgery, delivery, general care, AIDS-centers) of different sized hospitals in Switzerland in 1988, using focus groups discussion combined with an individual questionnaire.
Results. The staff overestimate the risk of contamination at workplace and has insufficient knowledge. Health personal doesn't downplay, however, risk in private life situations. The fears of contamination while being in touch with AIDS patients diminish as experience with such cases increases. Major concerns of AIDS-experienced professionals in general care units relate to adequate care. Fears are still present in departments such as emergency, surgery and delivery rooms. The staff of these services attempts to identify HIV+ patients on the basis of their belonging to a risk group. This may lead to stigmatisation problems.
Conclusions. AIDS cases are well taken care of in general medical units. Overestimation of the risk of contamination at work may create problems regarding quality of care. Such inadequate attitudes may also influence negatively AIDS prevention in general. Information and support for medical care taking units are to be improved.

D.637

D.638

EMOTIONAL ASPECTS OF THE RELATIONSHIP BETWEEN MEDICAL STUDENTS AND AIDS PATIENTS AT A UNIVERSITY HOSPITAL.

Talberg, J.; Morais de Sá, Carlos Alberto; Ferreira, L.E.M.; Magalhães, M.C.; Miguez, L.A.; Guimarães-Dias, M.
Gaffrée & Guinle University Hospital - University of Rio de Janeiro (UNI-RIO) - Brazil.

Objective: To improve the relationship between medical students and AIDS patients in a University Hospital ward.
Methods: Study conducted in a general medicine ward, where up to 50% of the 22 patients load is occupied by AIDS patients. Third-year medical students initiating hospital practice participated, during their first 6 months in the ward, in weekly psychosomatic sessions which focused on the student/AIDS patients relationship. The program was based on the spontaneous development of discussions, sugestions and elaboration of material coming from the group itself. The group was formed by 8 to 10 third-year and 1 to 2 sixth-year students and 1 staff cardiologist with personal experience in psychoanalisis as the co-ordinator.
Results: Initially the group discussions centered around complaints and feelings of anger and revolt directed towards the health team in charge of the care of AIDS patients. It was decided that the students should attempt to write down their complaints. The coordinator tried to elaborate and examine thoroughly the group emotions that surfaced: prejudice against homosexual patients, fear, guilt and frustation related to the disease and to the terminal phase. After 2 months it was possible to observe an important change in the reports with an increasing awareness of the patients feelings and the development of a warm caring relationship with them. The improvement of the students performance was noticed and remarked upon by other members of the health team who were unaware of the group discussions.
Conclusions: The existence of group discussions with medical students in charge of AIDS patients where the emotional aspects can be throughly examined and discussed is very important for the improvement of the relationship and the better acceptance of these patients.

D.639

CARE FOR THE CAREGIVERS - A TRAINING MODEL

Jacobs, Raymond *; Lewis, A. **; Mandel, J.**
*Young Adult Institute, New York, N.Y; ** University of California, San Francisco, Schools of Medicine and Nursing. U.S.A.

Objective. To develop an educational vehicle which addresses the stress experienced by those who provide AIDS care over time.
Methods. Simple techniques in recreational and drama therapy have been integrated into a workshop format. These techniques are used to facilitate discussions among participants focusing on feelings of sadness and exhaustion, as well as inherent rewards that are related to the AIDS crisis.
Results. A two hour didactic and experiential, insight-oriented workshop which addresses the psychosocial needs of health care providers who work in AIDS has been developed and used with over 1,000 participants in eight countries. During the course of the workshop, providers learn to recognize sources of stress as well as acknowledge rewards in their work. Participants are able to use these methods and techniques as well as adapt the model from the prospective of their own training and discipline for use in their own professional and paraprofessional settings.
Conclusion. On-going support and care for AIDS caregivers is vital to the process of reaffirmation, commitment to work, and work productivity, in AIDS service delivery systems.

D.640

IMPROVING THE SKILLS OF HEALTH CARE PROVIDERS WHO TEACH

Downer, Ann*; Chapman, L.*; Kaetz, S.*; Mandel, L.*
*University of Washington, WAMI AIDS Education and Training Center Program, Seattle, WA., USA

The University of Washington AIDS Education and Training Center Program (AIDS ETC) was established in 1987 to prepare health care workers to teach others about HIV/AIDS. In addition to content on HIV/AIDS, the program offers instruction using the AIDS Teaching Skills Curriculum. This curriculum includes chapters on Creating a Climate for Learning, Curriculum Design and Planning, Teaching Methods, Preparing Visual Aids, Recognizing and Responding to Resistance, Leadership and Training Styles, and Delivery. Each chapter contains lecture material, visual aids and suggested learning activities, each designed to prepare participants to provide effective HIV/AIDS instruction to health care professionals. Approximately one-half of the week-long course is devoted to the AIDS Teaching Skills Curriculum and teaching concepts. To date, 250 providers have attended. Examination of the instructor training course is underway. The curriculum package and evaluation results will be displayed during the poster session.

D.641

UTILIZING MEDICAL STUDENTS IN A UNIVERSITY-BASED COMPREHENSIVE AIDS EDUCATION AND COUNSELING PROGRAM

Copello, A. Gene*; Schaffner, W.*; Sheets, R.*; Lindsay, L.*; Nixon, L.**; and Sy, F.***
*Vanderbilt University, Nashville, Tennessee, USA, **University of South Florida, Tampa, Florida, ***University of South Carolina, Columbia, South Carolina, USA

Objective. To successfully involve medical students in the delivery of AIDS/HIV educational and counseling services as part of the academic program.
Methods. First, second, and fourth year medical students at Vanderbilt Medical School were enrolled in the elective course, AIDS Education and Prevention. This course is coordinated through the Vanderbilt AIDS Project and involves a two-day intensive seminar, weekly supervision sessions, and bibliography. The practice section includes curriculum development, providing education programs, and working with symptomatic HIV clients. Course content includes epidemiology, medical and psychosocial aspects of HIV infection, legal and ethical concerns, human sexuality, and counseling and education methods.
Results. 100 medical students have participated in this program since 1985. Student evaluations indicate the program has increased their knowledge of AIDS/HIV, human sexuality, and pyschosocial issues. The program has also provided them with practical counseling and patient education methods which will be of value in later practice.
Conclusion. Medical students should be provided with an opportunity to participate in AIDS education and counseling as part of their academic program. Such courses should be focused on practice issues and well supervised.

D.642

RELUCTANCE OF HEALTH CARE WORKERS TO TREAT AIDS PATIENTS - AN ANALYSIS

Currey, Charles; Ogden, B.; Johnson, M.P.
University of Florida, Gainesville, Florida, USA

Objective: To evaluate association between willingness to work with AIDS patients and knowledge of how AIDS is transmitted, ethical beliefs, and fear of contagion.
Methods: Ninety health professionals were surveyed about their willingness to work with AIDS, their attitudes towards AIDS related ethical issues, and understanding of AIDS epidemiology.
Results: 34.4% of respondents expressed reluctance to work with AIDS patients. This was significantly associated with a belief that working with AIDS increased risk for the disease, a belief that health professionals should have the right to refuse to work with AIDS patients, and an unwillingness to treat homosexuals and I.V. drug abusers. No significant differences were noted between those willing and unwilling to treat AIDS patients with regards to professional status, demographics, understanding of how AIDS is transmitted, compassion for AIDS patients, or agreement with certain basic principles of medical ethics.
Conclusion: Reluctance to treat AIDS appears to be based on irrational fears of contagion rather than ignorance about the epidemiology of the disease or a lack or ethics. AIDS education of health professionals should include strategies to reduce fear and to humanize the AIDS patient.

D.643

AIDS EDUCATION AND TRAINING FOR HEALTH CARE PROVIDERS IN VIRGINIA

Kaplowitz, Lisa; Bradford, J., and Lesniak, L.
Medical College of Virginia-Virginia Commonwealth University,
Richmond, Virginia, United States.

Objective. To plan, implement, and evaluate a program of AIDS education and clinical training tailored to the needs of health care providers throughout Virginia.
Methods. Through cooperation with the Virginia Department of Health and the Mid-Atlantic AIDS Regional Education and Training Center, a multidisciplinary team of trainers with expertise in the care of HIV-infected patients was organized with specialties in infectious diseases, psychiatry, social work, substance abuse, nursing, counseling, dentistry, obstetrics-gynecology, and pediatrics. Outreach, publicity, and program planning was accomplished with the assistance of professional organizations and state hospital associations. Free educational programming is available to physicians, counselors, social workers, nurses, prehospital care providers, support staffs, funeral directors, and students in all health fields. A comprehensive baseline needs assessment encompassing knowledge, beliefs, and attitudes was completed by the University's Survey Research Laboratory for physicians, dentists, counselors, nurses, emergency care workers and funeral directors.
Results. Between Jan. 1, 1987, and Dec. 31, 1988, over 15,000 health care workers in Virginia received AIDS educaiton and training tailored to their individual areas of interest and level of need. Serial surveys are planned on a biannual basis to evaluate the effectiveness of the educational intervention, identify program changes needed, and develop impact objectives for subsequent years.
Conclusion. A comprehensive AIDS education program can address the needs of health care workers from a wide range of fields. When combined with ongoing needs assessments and evaluation, such a program can be modified to address specific educational needs as these change over time.

D.644

ANALYSE DES COMPORTEMENTS BIOLOGIQUES ET MEDICAUX FACE A LA RELATION SEROPOSITIVITE TOXICOMANIE (ENQUETE DANS LA REGION ILE DE FRANCE)

Naudin.Claude*;Neumann,C.*;Malamud,P.*;Labayle,D.*;Rabine,C. Debiez,C.**
*Association HIV 91.Hôpital de Bligny.91640.FRANCE.**DDASS EVRY 91000.FRANCE

Objectifs.Analyser au niveau du Département de l'Essonne, l'implication des Praticiens dans l'accueil et le suivi des sujets HIV séropositifs et toxicomanes.Proposer des solutions aux problèmes rencontrés par nos confrères.
Méthodes.L'Association HIV 91 a mis en place en Décembre 88, grâce à une subvention du Ministère de la Santé et à la collaboration de la Direction Départementale de l'Action Sanitaire et Sociale, une enquête adressée aux 2592 Confrères (Médecins et Biologistes) de l'Essonne.Un système de gestion de données type DBase (PC compatible XT, disque dur File Card 30 Mo Western) permet d'évaluer des filières de soins médicaux et d'apprécier les problèmes rencontrés avec les tests biologiques.
Résultats.Le taux global des réponses est élevé (48 %).Pour le questionnaire Médical 65 % des généralistes et 35 % des spécialistes ont répondu.Parmi eux 45 % suivent des séropositifs, 30 % des toxicomanes. La fuite du malade et les pathologies intercurrentes sont les difficultés majeures.Pour le questionnaire Biologique 1/4 ne sont pas concernés, 30 % pratiquant le dépistage assurent la confirmation par Western Blot.Les problèmes sont posés par les faux positifs et le dialogue avec le patient.Une lettre d'informations,régulière, est souhaitée par la majorité des Praticiens.
Conclusion.Le taux de réponses très important à cette enquête confirme la nécéssité de mettre en oeuvre une action associative et pluridisciplinaire.

D.645

MULTIDISCIPLINARY AIDS TEAM ROLE IN MORALE AND STRESS REDUCTION AMONG HEALTH CARE WORKERS (HCWS)

Bulkin, Wilma; O'Dowd, M.A.; Callan, M.; Friedland, G.H.; Gordon, L.; Klein, R.S.; et al. Montefiore Medical Center, Albert Einstein College of Medicine, Bronx, New York, U.S.A.

Objective. To describe a multidisciplinary team's role in maintaining morale and reducing stress among AIDS HCWs.
Description. Complexity of AIDS clinical care requires expertise from many disciplines and is associated with HCW stress. Stressors include: cruelty of AIDS, youth of patients(pts), inadequate social and family resources, issues of confidentiality, discrimination, discomfort with patient life styles, ethical dilemmas, death and dying, unrealistic expectations, fear of infection, sense of isolation, and lack of resources.

Over the past 6 yrs, a multidisciplinary AIDS team, initially formed to provide pt care, has functioned to reduce stress and provide support for HCWs. The core team consists of MDs, MSWs, RNs joined by psychiatrists, nutritionist, lawyers, and clergy. Functions include: 1. creation of group identity 2. stable leadership 3. frequent meetings to educate, foster trust, optimism, cooperation and communication 4. allow expression of feelings including grief 5. promote cross cultural awareness 6. support research and attendance at professional meetings to enhance personal growth and sense of achievement 7. memorial services for patients 8. social events to promote cohesiveness 9. permission to care for oneself as priority.
Conclusion. An AIDS clinical care team can enhance staff morale and reduce stress by formal and informal group mechanisms, but requires commitment to team building and maintenance from the onset.

D.647

AIDS & HEALTH CARE GIVERS: KNOWLEDGE, ATTITUDES AND INFECTION CONTROL PRACTICES

Sy,Francisco;Burris,J;Garrison,C and Addy,C.
University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective. To determine the knowledge, attitudes and infection control practices among health care givers.
Methods. 241 health care givers, consisting of registered nurses, licenced practical nurses, nursing assistants and technicians, medical technologists and phlebotomists, responded to an AIDS survey in a South Carolina hospital. Scores for knowledge, attitudes and infection control practices were calculated. Data were analyzed using stepwise regression , one-way ANOVA and Tukey's multiple comparison procedure.
Results. In general, knowledge about AIDS appears to be high among these health care givers. However, they still have fear and increased risk perception concerning AIDS. 32 to 72% of the various study groups believed that they can get AIDS by taking care of AIDS patients. Over 60% of the respondents reported that they would prefer to avoid caring for people with AIDS. Only 51 to 64% of the participants wear gloves at all times.
Conclusion. Although health care givers in this study were quite knowledgeable about AIDS, they exhibited fears and increased perceived risk of acquiring HIV infection. A substantial number did not follow the universal precautions recommended by C.D.C..

D.649

SUPPORT FOR STAFF ADDRESSING HIV/AIDS ISSUES IN A DRUG REHABILITATION CENTRE.

Mary Burgess, King's College Hospital, London, U.K.

Objective: To enable staff at a drug rehabilitation centre to identify sources of stress arising from their treatment of clients with HIV/AIDS and to generate management solutions.
Methods: A facilitated support group was set up for all staff, many of whom are themselves ex-users. Forthnightly meetings were held over a six month period.
Results: The principal causes of stress were found to be
(i) ORGANISATIONAL- poor communications; outmoded operational policies.
(ii) CLINICAL - relating HIV to drug abuse: the need to address death; loss of ability to reassure clients about better health after drugs.
(iii) INDIVIDUAL - feeling de-skilled; fear of infection; feeling isolated; quiet over own past drug use.
Solutions included setting up formal and informal forums to ventilate problems. Attempts were also made to clarify stall roles. A training programme was implemented, both to provide clinical updates and to address counselling issues surrounding death. As a result of the group, staff reported feeling better able to acknowledge and control stress.
Conclusion: Staff support groups can be seen as a useful forum for problem solving.

D.648

HIV EXPOSED HEALTH CARE WORKERS AT MSKCC

Carrow, Melanie J.; Campbell, S.W.; Blevins, A.; Sobeck, K.A.; Gold, J.W.M. and Armstrong, D.
Memorial Sloan-Kettering Cancer Center, New York, New York, U.S.A.

Objective. To examine compliance of Health Care Workers (HCW) to CDC guidelines for significant exposure (SE) to HIV infected patients.
Methods. All HCW reporting significant exposures (needlestick or mucous membrane) to employee health service between June 1986 and December 1988 were referred to an Infectious Disease nurse for interview and follow-up.
Results. Of the 46 referred 11 refused any follow-up, 20 continued follow-up for one year, 25 requested HIV testing, all were negative. The total number of reported SE including known HIV exposures was 418. We suspect under reporting of all SE including those involving patients with HIV infection.
Conclusion. Fewer than one-half of HCW who report SE comply with follow-up. Reasons may include: concern for lack of confidentiality, inconvenience, knowledge deficit, and fear of results. A need for education about risks of needlesticks and methods of reducing the number of occurrences is seen. Concerns about confidentiality need to be addressed.

D.650

NEEDS ASSESSMENT OF STAFF AIDS EDUCATION PROGRAM IN TERTIARY CARE AND INNER CITY COMMUNITY HOSPITAL

Lefkowitz-Korenblit, Pearl; Foley, M; Walther, V; Rothenberg,A; Martas, M; and Epstein, I.
Mount Sinai School of Medicine, New York, NY, U.S.A.

Objective. To develop an AIDS staff education program in 2 hospitals serving East Harlem, an inner city community: Mount Sinai Hospital, a tertiary care center and North General Hospital, a minority-run community hospital.
Methods. A comprehensive needs assessment was performed at both sites by 2 AIDS Education Coordinators through interviews of staff in selected hospital areas, which serve the targeted high risk population, women of childbearing age. A broad spectrum of health care providers and workers were interviewed ranging from physicians and nurses to social workers and clerks.
Results. Greater than 200 staff were interviewed. Despite more extensive prior staff training in the tertiary care center, gaps in basic AIDS knowledge were found. Most staff were concerned about their risk of AIDS transmission regardless of their knowledge level. With the stress of working with high risk patients and with the changing role of staff toward education and counseling, there was a great need identified for ongoing staff support. The need for linkages with other AIDS education activities in the hospital and community was voiced.
Conclusion. An effective AIDS staff education program requires intensive planning and must be responsive to documented staff needs. Staff knowledge should not be overestimated, and training must go beyond information to staff support. The curriculum will be organized in modules and will be customized to the needs of the particular staff of each hospital area. (This effort was funded by the Alfred P. Sloan Foundation).

D.651

A SUPPORT GROUP CAN HELP PRIMARY CAREGIVERS KEEP PACE WITH THE INCREASING IMPACT OF THE HIV EPIDEMIC

Makadon, Harvey J* **; Frost, JC* ***; Judd, D*; Lee,S*; O'Neill, SF*; Paulsen, RH*. *Healthcare Associates and the Departments of Medicine, Social Work and Psychiatry, Beth Israel Hospital/Harvard Medical School. **The Center for Policy and Education of the Harvard AIDS Institute at Harvard School of Public Health. ***The Boston Institute for Psychotherapy, Boston, MA, USA.

Objective: To describe a multidisciplinary support group of health care providers working with people with AIDS in a primary care group practice within a general medical hospital.
Method: A 15 member group of clinical and administrative personnel met with a mental health group facilitator for 15 weeks. The members discussed their personal experiences with HIV infected patients presently in their caseload.
Results: Sessions included both educational and emotional content, focussing upon both personal and professional concerns such as: feelings about and lack of knowledge regarding alternative lifestyles, IV drug use, or cultural differences; ethical and moral concerns raised by treatment decisions; the impact of the rapid growth of information and technology; and their feelings about caring for people their own age or younger with a terminal illness.
Conclusion: Caregivers who had previously felt isolated, overwhelmed by their experience, and worried about the impact of their own emotional experiences expressed feelings of greater support and community, and an increased interest and capacity to care for people with HIV infection.

D.652

DENI DE LA REALITE ET FORMATION DES PROFESSIONS DE SANTE

Jean-Florian METTETAL*, Frédéric EDELMANN**, M BARY***, A JOURDAN***
*Hôpital Necker, ARCAT-SIDA,CNRS, **ARCAT-SIDA,CNRS, ***ARCAT-SIDA, FRANCE

Objectif analyse du déni de la réalité par les professions de santé
Méthode mesure statistique des demandes d'information, évaluation des demandes de formation, évaluation du comportement et des connaissances des stagiaires en cours de formation, questionnaires
Résultats
1) Le déni de la réalité du problème du sida par les professions de santé suit exactement l'attitude de la population générale et son évolution. Le corps médical n'a, au regard de ses responsabilités, ni une connaissance sérieuse de la maladie, ni un meilleur comportement psychologique, et ne perçoit que très vaguement la complexité des situations auxquelles il risque d'être confronté
2) Ce déni, comme celui de la population générale, est fonction de la situation médiatique, mais le statut de savant du médecin le conduit à relativiser le problème pour lutter contre ses propres inquiétudes: peur de l'épidémie, crainte de ne pouvoir y faire face avec ses connaissances, sentiment que les frontières entre les différentes parties du corps médical perdent leur consistance
3) Le déni de la réalité dans les professions de santé est proportionnel au manque de formation adaptée au problème du sida: information insuffisante au niveau universitaire, hésitation et imprécision de la "grande" presse médicale, soumise au même stress que les individus; les conférences ne rattrapent pas certaines lacunes scientifiques et n'atténuent pas le stress psychologique; la formation continue ne prend pas en compte les problèmes sociaux, juridiques, éthiques rencontrés par les médecins; les stages intensifs sont encore construits sur le mode du rattrapage hâtif, où le technique stérilise maladroitement le psychologique et le vécu
Conclusion Seule une conception globalisante de la formation, intégrant tous les paramètres à tous les niveaux, et anticipant la demande du public général évitera une situation de rupture dans les années à venir

D.653

EFFECTS OF HIV AND AIDS WORK ON STAFF INVOLVED IN CARING

L Sherr - St Mary's Hospital/Roehampton Institute: H George - St Mary's, London, U.K.

Introduction - Staff Stress and burnout has been well documented. HIV involves health care staff in screening, clinics,counselling and high intensity care. This study examined the impact on staff, how they coped and to see if coping styles and avenues were predictive of adjustment to stress.
Method - Twenty one staff from front line work in the area of highest incidence in London completed the study investigation. Mean age was 28.6 yrs (range 23-40). Mean work with AIDS/HIV was 16.1 mths. Mean years of qualification was 8.4 years. Staff rated current stress, coping avenues and perceived and experienced stressors.

Results - No subjects were unstressed - 29% fairly,38% moderately and 33% very. All subjects found it desirable to seperate work and outside life, yet one fifth were not very effective at doing this. No subjects turned to groups outside the hospital for support. This has important implicatons for service provision. Low stress subjects attended educational courses whereas high stress subjects did not (mostly used crisis intervention). Educational courses may provide stress innoculation or may be the choice of input for low stress subjects. Information is a key tool in this area and such groups may be ways of equipping staff or provide a forum for informal networks. Stressors were varied. Although they were associated with the death of a patient and ill patients and relatives, a considerable proportion of stressors were associated with interpersonal and practical issues which could easily be addressed.

D.654

COOPERATION BETWEEN PHYSICIAN AND PSYCHOLOGIST : AIDS - A CALL FOR PSYCHO-SOMATO-SOCIAL TEAMWORK

Leiberich,P.[1]; Herrmann,Claudia[3]; Reiser,J.[2]; Porsch,U.[2]; Hunzelmann,N.[4]; Olbrich,E.[2].

University of Erlangen, [1]Medical Clinic I, [4]Medical Clinic III,[2]Dept. of Psychology I, FRG; [3]AIDS-Center of Federal Health Administration, Berlin.
FEDERAL REPUBLIQUE OF GERMANY

Objective. To describe several ways of cooperation between physicians and psychologists caring for HIV-seropositive persons and AIDS-patients.
Methods. 100 physicians and psychologists completed an inventory asking (1) for their experiences with HIV-positive persons and (2) their expectations of the other profession.
Results. 40% of the psychologists and 95% of the physicians had experiences with the treatment of HIV/AIDS-patients. No significant differences were found in both groups' judgements of the importance of counselling patients with regard to their life style, informing them about their prognosis, and teaching them relaxation techniques. Physicians endeavoured to talk supportingly with their patients, they recognized, however, their own lack in techniques of counselling and psychotherapeutic intervention. Major tasks for psychologists, therefore, would be the training of physicians and other professionals, supervising e.g. theme-centered or Balint groups, offering relaxation and meditation courses, and developing psychotherapeutic intervention programs.
Conclusion. HIV/AIDS-patients need special psychosocial care; new forms of co-operation between professionals must be developed in order to minimize stress.

D.655

PICTURAL INFORMATIONS ARE A GOOD WAY TO CONTRIBUTE TO HEALTH CARE WORKERS (HCWs) EDUCATION.

Henrivaux,Ph.; Thioux,C.; Fairon,Y.; Bruninx,G. ; Sercot,E.; Boland,AM. and Renard,H.
CHU - Sart Tilman, State University of Liège, BELGIUM.

OBJECTIVE. Working with AIDS can induce stress, anxiety and overwork as well as intellectual stimulation. This psychological impact could be linked to the lifestyles associated with AIDS, distress over the youth of the patients, neurological complications and dying patients. Also, individual assessment of HCWs remained still anxious about the risk of a nosocomial HIV contamination. Therefore, it will be interesting to give informations about AIDS and lifestyles related to AIDS in order to facilitate the contacts of HCWs with the patients and, also, to give directives in order to minimize the risk of HIV contamination during professional activity.
METHODS. Manuscripts with recommendations were provided. However, behaviours were not sufficiently modified. Therefore, on the occasion of the World AIDS Day, we delivered a pictural information.

RESULTS. For the first time, we were requested on materials and attitudes regarding AIDS patients.
CONCLUSIONS. Specific informations to HCWs are needed to reduce staff's discomfort and to facilitate care to AIDS patients. Specified practical recommendations contribute to a feeling of more security. A pictural information is more attractive than a manuscript and could be a good way to reach this goal.

D.656

PSYCHOLOGICAL STRAINS IN A MULTIDISCIPLINARY TEAM TAKING CARE OF AIDS PATIENTS IN BRAZIL

Souza,Alicia*; Queiroz,A.*
*School of Medicine, Federal University of Rio de Janeiro, Brazil

Objective. To identify and work through, by an experience in group dynamics, the anxieties and conflict tensions felt by a health team treating AIDS patients.
Method. The investigation was done through the structure of the multidisciplinary team dealing with the group dynamics. Weekly meetings with the research subjects (MDs, dentists, nurses, nutritionists, social workers), were conducted by two dynamically oriented psychiatrists,for one year,in a university hospital. All meetings were recorded and an interpretative reading was done.
Results. The anxieties more frequently seen in the group were generated by the therapeutic limits,the dealing with transgressive behavior of the patients associated with sexuality and drug addiction, and the fear of contamination. The anxieties identified in the group were shared by the different subjects, and provided the elaboration of more adequate defenses.
Conclusion. AIDS associated death, sexuality, and transgression behavior, intensifies conflict tensions in patient care. The limitations of medical knowledge makes multidisciplinary approach a must in AIDS. The group work was a valid instrument to identify and work on anxieties of health team, to develop the psychotherapeutic function, and to improve integration among the health team.

Minorities

D.657

D.658 KNOWLEDGE ABOUT HIV TRANSMISSION IN HISPANICS IN SAN FRANCISCO: ACCULTURATION EFFECTS

Marin, Barbara*; and Marin, G.**
*University of California, San Francisco, San Francisco, California, USA, **University of San Francisco, San Francisco, California, USA

Objective. To describe knowledge about AIDS and HIV in a representative sample of Hispanics from San Francisco. Methods. A random-digit-dialing telephone survey of 470 Hispanic adults residing in areas with 10% or more Hispanic population was conducted using items from the National Center for Health Statistics. Results. Results indicated generally excellent knowledge of the true modes of transmission of HIV, but also many erroneous beliefs in "casual" modes of transmission. Acculturation was strongly associated with knowledge, with the less acculturated being much more likely to believe that mosquitos, public toilets, eating utensils and sneezes could transmit HIV. The less acculturated were also less aware that those infected with HIV could look healthy. Women were found to be generally less well informed than men. Conclusion. Knowledge about AIDS and its transmission may be associated with acculturation status in the Hispanic population, since more acculturated Hispanics have more access to AIDS information through English-language media as well as generally having more education.

D.659 AIDS KNOWLEDGE LEVELS AND RELATED SEXUAL PRACTICES AMONG INNER-CITY SEXUALLY TRANSMITTED DISEASE (STD) CLINIC PATIENTS

Sambula, Sorina; Naillia, M.; Patrick, S.; Fordyce, E.J.; and Stoneburner, R.
New York City Department of Health, New York, U.S.A.

OBJECTIVE. To determine the levels of AIDS knowledge and attitudes and the sexual practices of a high risk predominantly black and Hispanic population attending STD clinics in NYC. METHOD. 1178 self-administered questionnaires were completed in STD clinic waiting rooms during a three month period in 1988. Information on basic knowledge about AIDS and modes of HIV transmission, attitudes toward antibody testing, sexual practices, risk reduction behavior and demographics was obtained. RESULTS. 84% of blacks and Hispanics correctly answered questions about AIDS and HIV transmission. Despite high knowledge levels, 66% of blacks and 31% of Hispanics incorrectly identified giving blood and insect bites as risks for acquiring AIDS. Some condom use in the last month was reported by 47% of black and Hispanic males. Sixteen percent of black females ages 20-29 reported exchanging sex for drugs, money or a place to stay. Of these, 39.6% reported some condom use in the last month. Mandatory reporting of HIV status without patient anonymity would deter 21% of black and Hispanic patients from seeking testing. CONCLUSION. These results suggest that further research on the psychosocial, socioeconomic dynamics and sociocultural forces which impinge upon risk reduction behaviors is required.

D.660 A COMMUNITY APPROACH TO HIV PREVENTION IN MINNESOTA'S COMMUNITIES OF COLOR

Fletcher, P.; Heckert, Karen; Moen, M.; Finn, M.; Beniak, J.; The Four Minnesota Minority Councils, Minnesota Department of Health (MDH), Minneapolis, MN, USA.

Objective. To mobilize intergovernmental and multi-agency collaboration to limit the spread of the human immunodeficiency virus (HIV) among persons of color in Minnesota.
Methods. In Minnesota, as elsewhere in the U.S., the communities of color are disproportionately affected by HIV. In January 1988, MDH developed a HIV prevention plan which acknowledges four racial populations, each with diverse subpopulations and distinct cultures that influence attitudes and behaviors. A unique and effective working relationship was established with the four legislatively-mandated minority councils that advocate to state government on behalf of their communities. With MDH funding, each council sponsored HIV education conferences for community leaders, developed HIV action plans and convened representative task forces.
Results. In May, 1988, MDH made available $400,000 from state and federal funds designated for HIV prevention in the communities of color. Ten American Indian, Asian, Black agencies and one multi-agency Hispanic consortium were funded to provide HIV prevention and risk reduction programs.
Conclusion. The plan stimulated funding of HIV prevention programs, fostered unprecedented collaborations between and within the communities of color and may serve as a model for intergovernmental and multi-agency collaboration elsewhere.

D.661 MEETING THE HEALTH CARE NEEDS OF MINORITIES WITH HIV INFECTION

** [illegible], B.; * Sherrington, W.; * Strand, F.;
** Bailey, L.; ** Walker, E.; *** Scott, R.

* Bay Area Black Consortium for Quality Health Care, Inc.; ** AIDS Minority Health Initiative;
*** Critical Care Medical Group, Inc. U.S.A.

Objective. To examine the effectiveness of case management services as a primary needs assessment tool for AIDS agencies in planning and implementing non-hospital based AIDS services.

Method. A demonstration project was established to assess and identify the health care needs, psychosocial needs, and cost of caring for persons diagnosed with AIDS/ARC. Between July 1, 1988 and December 30, 1989, we examined the psychological/behavioral, medical, cost, social service, and demographic characteristics of seventy-four racial and ethnic minorities followed in a non-acute care setting.

Results. Demographic Characteristics: Race - 80% Black, 14% Latino, 1% Native American, 1% Asian, and 1% White; Sex - 85% Male, 15% Female; Risk Factors - 54% Homosexual/Bisexual, 13% IVDU, 4% Homosexual/IVDU, 5% Heterosexual, 1% Hemophiliac/Transfusion Disorders, 19% Multiple Factors; Deaths - 13% died within six months after entering the program; Cost - $2,333/Client; Social Services - Housing, food, clothing, transportation, legal, drug treatment programs, and advocacy; Psychological/Psychiatric Emotional support, character disorders, individual and group therapy, and psychotropic drugs; Medical Diagnosis - PCP, Kaposi's sarcoma, HIV encephalopathy (AIDS Dementia), Histoplasmosis, Primary Lymphoma, Mycobacterium tuberculosis, HIV wasting syndrome, Coccidioidomycosis, and Toxoplasmosis, Herpes simplex, Candidiasis, Cryptococcosis, Cryptosporidiosis, Cytomegalovirus, Interstitial pneumonia, and Renal failure

Conclusion. Racial and ethnic minorities require a complete range of medical, psychological, and social services to maintain them in non-acute care settings. Case management services play an important role in assessing need, identifying appropriate resources, and reducing health care cost.

D.662 AIDS EDUCATION TO MALE SEX WORKERS : Working at the Risk Interface

Hunter, Andrew*., Overs, C.*
* Prostitutes Collective of Victoria, Melbourne, Victoria, Australia

Male sex workers are mostly gay and a significant proportion are IV drug users. Many, particularly the young, don't identify with or become adequately serviced by their communities and relevant organisations. An aim of this project is to involve and educate such groups so that the risk gap presented by male sex work is minimised. The program for male sex workers operates within an existing prostitutes' rights groups and provides direct provision of safe-sex information, condoms, needles and the skills and support necessary for converting knowledge to safe work practices. Male workers involved in the project visit agencies and groups to participate at policy level. We contribute an experiential knowledge of the affects on susceptibility to HIV infection of the prostitution sub-culture issues, i.e., homelessness, police and community violence,transsexuality, poverty, illiteracy, drug dependency and the James Dean ethic - live fast, die young.
Direct services provided include some casework and referrals, as well as the drop-in centre in which social contact forms the basis of a supportive peer network.
Conclusion: A potentially dangerous gap in AIDS services has been redressed by facilitating an interface of services in combination with support and direct health and welfare provision on a peer level.

D.663

ASSESSING THE IMPACT OF AIDS INTERVENTION PROJECTS

Janowitz, Barbara* and Williamson, Nancy E.*
*Family Health International, Research Triangle Park,NC, USA.

Evaluating projects designed to increase knowledge or to change attitudes about AIDS is fairly straightforward. This is not the case if project is designed to prevent HIV transmission. For example, having a control group might make sense scientifically in order to assess what might have occurred without the program. But rarely is this practical with AIDS projects and many consider it to be unethical.

If incidence is low in the target population, there may be too few cases of transmission over a project's duration to measure its effectiveness. In this instance, multiple indicators can be used, including incidence of other STDs, practice of safe sex or other desirable behaviors, and knowledge and attitudes. If the prevalence is high, there may be little opportunity for the program to have an impact on the infected group. But the intervention may significantly reduce transmission to sexual partners.

If the focus is on individuals with high risk behaviors (often the most cost-effective public health approach), it may be hard to reach individuals who do not identify themselves as being at risk or do not frequent places where programs can be implemented. Follow up is also difficult, especially if the target populations are highly mobile (commercial sex workers, IV drug users, and transportation workers). Finally, it is difficult to ascertain whether participants are practicing safer behaviors. This paper gives examples of these problems and proposed solutions based on planned and ongoing AIDS programs in Africa, Latin America, and Asia.

D.665

MARRAIGE, STD AND PROTECTION FROM HIV

Clark, Charles F* and Kuhn, Austin C.**
*U of South Florida, Tampa, Fl **US Clinic, Ansbach, Germany

As the realization has grown that the AIDS Epidemic is unlikely to be controled anytime soon by either a vaccine or a drug treatment, interest in social behaviors that reduce STD rates has increased. The most acceptable sexual behavior occurs within marraige, and the relative absence of marraige in the young sexually active black subculture is cited as a contributing cause to the high rate of HIV seropositivity (twice the white rate as shown in the US Military recruit data). US Army studies of syphilis rates done prior to World War II, before the introduction of penicillin, showed that marraige had a protective effect against syphilis.

To examine the possibility that marraige might serve as a protection against STD's and therefore against infection with HIV, a pilot survey was conducted among US Military personnel. The analysis showed a significant difference between the white enlisted married rate of STD's of 13%,and the black enlisted married rate of STD's of 32%, and no significant difference of the latter from black enlisted unmarried rate of STD's of 35%.. Blacks, married or single, engaged in more risky sexual behaviors than did married whites. This preliminary study suggests that marraige as an institution may not be protective against HIV infection, and that fundamental sexual issues must be addressed with all members of a minority.

It is of interest to note that in this age of antibiotics and health consiousness, 13% of these white married males have had an STD and must also be considered candidates for HIV infection. Only 32% of white married males met the Judaic-Christian ideal of monogamy.

D.667

FOCUS GROUPS AS AN EDUCATIONAL INTERVENTION FOR BLACK GAY MEN

Ballinger, George, Jr.* Mays, V. M.,** and Cochran, S.D.***
*Black C.A.R.E. Project, Los Angeles, United States;
University of California, Los Angeles, California, United States;
**California State University, Northridge, California, United States

Objective. In order to develop effective strategies for AIDS education and prevention efforts with Black gay and bisexual men, information was gathered from diverse groups across the United States.
Methods. Six focus groups of 2-5 hours in length, each composed of 8-10 Black gay and bisexual men, were convened in New York, Chicago, Los Angeles, Atlanta, Omaha, and Pittsburgh. Methodology based on marketing and group dynamics was used to assess relevant factors, including language, level of knowledge and cultural determinants in HIV-related behavior.
Results. While the initial purpose of the focus groups was to assess information from the subjects, its impact was that of an educational intervention. Participants reported a desire to continue in a group format and to organise similar types of groups. Individuals previously reluctant to become involved in AIDS-related activities appeared motivated to participate because 1) the facilitator did not reside in their city and 2) networks used to compose the group were so diverse that most members knew few if any of the other participants.
Conclusion. Focus groups appear to be a potential model for increasing participation by Black gay and bisexual men in AIDS-related risk reduction.

D.664

FACTORS INFLUENCING AIDS RISK PERCEPTION OF BLACK GAY MEN

Mays, Vickie M.*; Cochran, S.D.** and George Ballinger, Jr.*
*University of California, Los Angeles, California, United States **California State University, Northridge, California, United States

Objective. As AIDS continues to disproportionately affect Blacks in the U.S. (CDC, 1988; Mays & Cochran, 1987), accurate assessment of their perception of risk is needed to design effective risk reduction interventions. One HIV at-risk group for whom we have little empirical knowledge of their lifestyles (Cochran & Mays, 1988) are Black gay and bisexual men. The present study is a pretest effort to design an assessment instrument for a national study of HIV-related behavior.
Methods. Six focus groups, each composed of 8-10 Black gay and bisexual men, were convened in New York, Chicago, Los Angeles, Atlanta, Omaha, and Pittsburgh. Methodology based on marketing and group dynamics was used to determine subjects' AIDS knowledge level, perceptions of AIDS information credibility, and the influence of perceived discrimination on AIDS prevention services utilization.
Results. While knowledge of AIDS and its modes of transmission was high, distinctions regarding HIV, medical treatment and protective behaviors were more diffuse and less well understood. Utilization of AIDS preventive services within the White gay community were generally low.
Conclusion. Current methods of AIDS education, if they are to be effective must be attentive to the role that ethnic minority status plays in illness prevention and health care utilization.

D.666

A PUBLIC HOSPITAL AND THE AIDS EPIDEMIC IN OAKLAND, CALIFORNIA

Edward Allen Seidel; J Wofsy; T Rose. Highland Hospital, Dept. Internal Medicine; Oakland, California, USA

Objective: To compare diagnoses, ethnicity, and transmission risks of 55 patients presenting to a newly formed outpatient subspecialty HIV clinic at Highland Hospital, Oakland, CA, with similar data already existing for California.
Methods: Diagnoses, ethnicity, and risk of all 55 patients (51 males and 4 females) seen in a newly formed subspecialty clinic for HIV infection, are reviewed for the period 3/16/88 through 9/30/88. Pts. were provider or self-referred into the clinic.
Results: 46 (84%) of patients had diagnoses of AIDS or ARC, by Walter Reed and CDC criteria, and 4 (7%) patients had symptoms of HIV infection. 63% were Black, with AIDS/ARC dx's: (n=46)

Ethnicity	Homo.	Bi	IVDA	Combined	Total %
Black	26%	7%	24%	6%	63%
White	17%	--	10%	4%	31%
Hispanic	2%	--	--	2%	4%
Asian	2%	--	--	--	2%
Total	47%	7%	34%	12%	100%

Conclusion: When compared with existing statistics for California, and the San Francisco Bay Area, this outpatient sample, represents a large proportion of Black individuals, presenting with AIDS or ARC. Homosexual/bisexual risk, and IVDA are the most common transmission risk factors in this cohort of outpatients seen at Highland Hospital, Oakland, California, USA.

D.668

WHERE BOTTOM-UP AND TOP-DOWN APPROACHES MEET: THE DEVELOPMENT OF A COMPREHENSIVE AND INTEGRATED HEALTH PROMOTION/AIDS PREVENTION PROGRAM ***

Rose, David *, Lefkowitz, P.*, Belville, R.*, Barrett, E.*, Indyk, D.*, Newman, H.** and White, G.**, Mount Sinai School of Medicine* NYC, NY, USA., East Harlem Block School** NYC, NY, USA.

Objective: The paper provides a model for the development of a long-term, dynamic, comprehensive and integrated community based AIDS education/prevention program.
Methods: A multi-agency CBO was sought which would provide a strategic program site targeted to the multiple needs of young at-risk families and the schools in which they are served. This program was developed in partnership with a multidisciplinary research team. The process which led to the identification, participation and on-going needs-assessment of The East Harlem Block School, Inc., a multi-agency umbrella organization in a deprived inner-city community, is described.
Results: This umbrella organization includes 5 agencies with overlapping memberships - an alternative elementary school, 2 nursery schools, 2 day-care programs, a Youth in Action Program for adolescents and a staff of over 100. It thus provides multiple opportunities for interventions targeted at the various segments (staff,families and students).
Conclusion: The case clearly identifies the need feor a bottom-up, top-down approach in order to develop an effective continuum of integrated AIDS education and primary, secondary and tertiary care prevention programs.

**Funded by the Aaron Diamond Foundation

D.669

STOCKHOLM COUNTY COUNCIL AIDS PREVENTION PROGRAM ected towards ethnical minority groups

Luis Abascal, Sweden

Sweden is an immigrant country. Out of 8 million inhabitants, around 1 million are immigrants. Some 400,000 of them live in Stockholm County. To reach this group consideration should thus be taken to the ethnical and multicultural aspects such as language, culture, religion, and different views on sexuality.

What is done today in Stockholm could serve as a pilot experience to be profited by in other multicultural countries.

Stockholm County has around 70% of the HIV-carriers in Sweden. The spread of the virus largely follows that of the U.S.

The aims of Aids Prevention Program are:

- to prevent the spread of the HIV-virus in Stockholm County
- to give information about sexually transmitted diseases and AIDS from a perspective that treats sexuality and relationships between individuals in a positive and open manner.
- to counteract intolerance against risk groups and enhance understanding for individuals infected with the HIV-virus.

The Aids Prevention Program is divided into four different subprojects prioritizing youth, special groups, health staff and information dissemination.

D.671

STEREOTYPE DU SIDA EN ETUDIANTS UNIVERSITAIRES

Bayés, R., Call, J., Losilla, J.M., Aldavert, L. et Costa, D.

Universitat Autònoma de Barcelona, Bellaterra, Barcelona, Espagne.

Objectif. Connaître le stéréotype du SIDA chez les étudiants de notre université et les possibles variations de ce stéréotype en fonction d'avoir, ou non, une expérience directe avec la maladie.

Méthode. Questionnaire avec 5 maladies (la grippe, le cancer, les maladies de transmission sexuelle, les maladies cardiovasculaires et le SIDA), 16 échelles (p.e. "c'est mortel") et 5 possibilités de réponse: toujours; presque toujours; quelquefois; presque jamais; jamais. On compare le stéréotype du SIDA avec celui des autres maladies, avec ou sans une expérience directe.

Résultats. Les résultats préliminaires indiquent que le SIDA est encore pire que le cancer. Le contact direct avec les malades ne semble pas changer le stéréotype.

Conclusion. Il faut étudier les moyens pour éviter la consolidation de ce stéréotype.

D.673

UNDERSTANDING PRECAUTIONARY AND RISK-BEARING BEHAVIOR; A MODEL FOR THE DEVELOPMENT OF HIV-PREVENTION PROGRAMS

Sandfort, Theo*; Vroome, E.de*; Paalman, M.**; Tielman, R.*.
*Utrecht University, **STD Foundation, Utrecht, The Netherlands.

Objective. A sequential phase model has been developed, to understand sexually risk-bearing behavior as well as the adoption of safe sex practices. Behaving precautionary is seen as a result of a conscious decision, reached in several sequential steps, determined by a variety of factors. Putting the decision into actual behavior may likewise be facilitated or inhibited by several factors. The model elucidates that precautionary and risk-bearing behavior can have divergent backgrounds, depending on the phase a person has arrived at. Depending on these phases the aims of prevention policies differ.
Methods. The model will be illustrated by the results of a telephone survey in a random sample of 1229 Dutch citizens.
Results. Seven % of the sample run the risk of infection without labeling this as risk-bearing. To a large extent this risk stems from having unprotected sex with several partners, or from the sexual contacts of their steady partner with other people. This group needs a different prevention approach than the 27 % of the people who realized the risk-bearing character of their behavior, but were not able to change it in a consistently safe way. Compared with the people who adequately changed their behavior, the former distinguish themselves by a less favorable attitude towards condoms, which weakens their decision to behave in a safe way. If they plan to use condoms they are also less irrefutable in their decision than the latter.
Conclusion. The model is useful to specify aims for differentiated prevention policies and to locate the subgroups at whom these should be directed.

Psychology

D.670

PSYCHOLOGICAL AND SOCIOLOGICAL CORRELATES OF DEPRESSION IN PATIENTS WITH AIDS.

Adinolfi, Anthony; Suarez, E.; Dideriksen, P.; Bartlett, J.A.
Duke University Medical Center, Durham, N.C., U.S.A.

Objectives. To investigate the relationship between psychological traits and situational factors, and state depression in patients with diagnosed AIDS.
Methods. Subjects (N=22) were recruited from patients attending our AIDS clinic. All subjects had a diagnosis of AIDS as evidenced by opportunistic infections or wasting syndrome. Patients were interviewed by trained clinicians to assess psychosocial variables. Patients completed the following psychometric assessment battery: NEO Personality Inventory, Trait Personality Inventory (TPI), and the Beck Depression scale in addition to a personal background questionnaire.
Results. Correlational analyses showed that scores on the Beck Depression scale were positively and significantly correlated with trait measures of depression ($r=.57$) and anxiety ($r=.64$), in contrast to a significant and negative correlation with trait measures indicating a positive outlook on life ($r=-0.54$) and agreeableness ($r=-0.51$). State depression was not correlated with age ($r=-0.15$), length of time with AIDS diagnosis ($r=-0.01$), and quantity of social support ($F(4,13)=1.07$, $p=.43$).
Conclusions. We present evidence to suggest that psychological traits factors may be important variables in determining increased depression in patients with AIDS. In contrast, other psychosocial factors, age, length of time with diagnosis and quantity of social support may not play important roles. Therapeutic interventions must therefore take into account personality characteristics in the treatment of depression in AIDS patients.

LES VECUS PSYCHOLOGIQUES A L'EGARD DU TRAITEMENT PAR ZIDOVUDINE EN SUJETS HIV POSITIFS.

Maria Assunta, Vicini; Meraviglia P.; Valsecchi L.; Isabella L.; Mezzenzana M.A.; Cargnel A.
II Service de Maladies Infectieuses, Hôpital L.Sacco, Milan, Italie.

Objectif: Exposer les vécus psychologiques à l'égard du traitement par Zidovudine dans un group de 20 sujets HIV positifs (6 LAS, 9 ARC, 5 AIDS) en traitement ambulatoire.
Méthodes: On a conduit des colloques psychologiques ambulatoires en concomitance des contrôles médicaux (1 fois par semaine le premier mois, 2 fois le deuxième mois et après, 1 fois par mois). On a aussi effectué des tests psychodiagnostiques (Baumtest, test de Machover et de Rorschach).
Résultats: On remarque que, bien que le médicament soit perçu comme indispensable, souvent les patients revèlent des doutes sur son efficacité. Ce fait montre, à notre avis, le lien entre ce médicament et le besoin du patient de nier sa maladie qu'il est obligé à rappeler tandis qu'il doit prendre son comprimé. Le temps-intervalle entre les doses représente symboliquement le temps-intervalle qui le sépare de sa morte.
Conclusion: On souligne la nécessité pour le médicin de connaître et de considérer l'interférence des vécus envers ce médicament si l'on veut assurer l'efficacité du traitement même. Cet étude montre aussi l'importance du support psychologique au cours de traitement par Zidovudine.

D.675

ÉVALUATION COGNITIVE-COMPORTEMENTALE DES SUJETS POSITIVES À L'HIV.

Zamperetti Marco*; Ivric D.*; Mastrangelo F.*; Vergani D.*
* Servizio Psichiatrico di Diagnosi e Cura "Origgi I°" e Centro di Medicina Comportamentale (Responsabile Prof.G.F. Goldwurm), Ospedale Cà Granda Niguarda, Milano, ITALY.

Objectif. Nous avons voulu étudier les aspects psychologiques des sujets positives à l'HIV pour structurer des programmes de support psychosocial.
Méthodes. À ce moment nous avons examiné 70 sujets positives à l'HIV avec le Cognitive Behavioural Assessment-2.0. Après nous avons analysé les données obtenues avec un programme spécifique pour notre ordinateur. On a consideré comme groupe de contrôle la population (720 sujets) sur laquelle le test a été taré. Enfin nous avons évalué la significativité statistique des résultats avec le test du chi carré.
Résultats. De l'analyse des tests il a émergé que le 40% des sujets a des problemes psychologiques. L'anxiété est au niveau pathologique dans le 23% des cas. Aussi la dépression a frappé le 23% des patients et il faut remarquer que ces dépression ont un risque suicidaire très élevé. Le trait de la personnalité qui a apparu le plus commun parmi les toxicomanes(t.) a été le psychoticisme (39% des cas). Il a aussi apparu, bien que sans significativité statistique, une plus grande vulnerabilité psychologique et un plus mauvais adaptation social des t. en comparaison des homosexuels. De toute façon aussi le 30% des homosexuels utilise des drogues. Pour réduire l'usage des drogues, les renseignements et l'éducation sanitaire, après la découverte de la positivité à l'HIV, paraîtrait utile au 50% des t..
Conclusions. Donc un support psychosocial paraîtrait indiqué dans le 40% des sujets positives à l'HIV et, nous croyons, pas seulement pour des raisons psychiatriques mais aussi pour des possibles négatives implications sur le plan psychoneuroimmunologique.

D.676

SUICIDAL THOUGHTS AND ACTS IN HIV INFECTION SUSPECTS

Francisco J. Parga, Sexually Transmitted Disease Control Programme, San Juan, Puerto Rico.

For many persons, infection with Human Immunodeficiency Virus means the immediate development of AIDS and an early death. Suicide becomes a viable alternative to avoid long illness and to obtain control over the situation. In many cases, AIDS will not be developed in years. In order to evaluate the occurrence of suicidal thoughts, 400 subjects were evaluated within 4 categories through the use of a questionnaire: 1) Persons who go to get tested for antibodies against HIV for the first time; 2) Persons who go to receive their results for the first time; 3) Repeat testers; and 4) Persons who attend a testing site but do not get tested. Results indicated various patterns related to the persons at increased risk for suicidal thoughts and acts.

D.677

INFLUENCE OF LONELINESS AND SOCIAL SUPPORT ON THE EFFECTIVENESS OF A BEHAVIORAL INTERVENTION WITH HEALTHY MALES AT RISK FOR AIDS

Ingram, Fred*; Laperriere, A.*; Ironson, G.**; Antoni, M.*; Fletcher, M. A.*; and Schneiderman, N.*; et al.
*University of Miami, Miami, FL, USA; **Stanford University, Palo Alto, CA, USA

Objective. Increased anxiety and depression have been associated with receiving a positive diagnosis for the human immunodeficiency virus (HIV-1). This may serve to further compromise an already vulnerable immune system, resulting in an increased risk for opportunistic infection and worsened disease prognosis. Aerobic exercise training appears to have a buffering effect on the distress associated with receiving one's anti-HIV-1 status. A reasonable question is whether aspects of being in a group intervention per se influence these effects.
Method. To investigate this we assessed self-reported loneliness and social support at three times in the course of the intervention. Healthy gay males (N=46) at risk for the acquired immune deficiency syndrome (AIDS) wishing to know their anti-HIV-1 status participated in this study. Subjects were randomly assigned to no-contact control (N=18) or exercise (N=28) groups. The exercise group received 45 min of aerobic training 3 times per week for 10 weeks. All subjects learned their anti-HIV-1 status at week 5.5 and completed the UCLA Loneliness Inventory and the Social Provisions Scale at baseline and again at weeks 5 and 10. A 2x2 factorial analysis of variance was performed for each of the measures at all of the timepoints.
Results. There were no interaction effects between anti-HIV-1 status (+ vs -) and group (exercise vs control) on either measure at any timepoint. Further, the only significant main effect was at week 5 where the anti-HIV-1 (+) reported greater loneliness than the anti-HIV-1 (-) [(41.25 vs 34.89, F(1, 34)=4.25, p<.05)].
Conclusion. The overall lack of discrimination among the groups at the various timepoints of the intervention suggests that loneliness and perceived social support have minimal influence in the reduction of psychological distress reported for the intervention with individuals receiving their anti-HIV-1 status. This strengthens the notion that it is the specific intervention, aerobic exercise, per se, rather than merely the effect of being in a group administered intervention which accounts for the salubrious effect reported. Supported by NIMH, P50MH42455-03.

D.678

EVOLUTION DES REACTIONS PSYCHOLOGIQUES CONSTATEES CHEZ LES HETEROSEXUELS SEROPOSITIFS (ANTI-VIH) ASYMPTOMATIQUES.

Betscher, Sophie; Pesce, A.; Vinti, H.; Dujardin, P.; Bonhomme, P.; Cassuto, J.P.
Ligue Régionale Française de Lutte contre le SIDA - C.H.R.U. Nice, France.

En 1989, le nombre de séropositifs asymptomatiques est estimé en France à 300 000. Les deux régions les plus atteintes par les infections à VIH étant l'Ile-de-France et la Provence-Alpes-Côte d'Azur. La proportion d'hétérosexuels exclusifs est en constante augmentation, tant en ce qui concerne les cas de SIDA avéré (10,3% en France au 30/09/88) que les porteurs asymptomatiques. Parmi une cohorte de 100 hétérosexuels asymptomatiques, 16 (11 femmes/5 hommes) ont fait l'objet d'un test de dépression (échelle d'Hamilton-Pelicier), d'un test d'anxiété (échelle F.A.R.D.), d'un test de l'arbre (Renée Stora) et d'un entretien semi-directif. 3/16 n'ont aucun symptôme dépressif. 8/16 présentent une dépression mineure. 4/16 ont une dépression légère et 1/16 une dépression grave. Part rapport à l'annonce de la séropositivité, un taux d'anxiété élevé apparaît en général après une période de sidération de durée variable. Ce taux d'anxiété élevé dure jusqu'au 12e mois et lui succède une phase de réorganisation (psychologique et comportementale) où l'anxiété décroît. L'intensité de l'anxiété semble plus marquée chez les hommes et elle augmente nettement après 26 ans dans les deux sexes. Cette anxiété est plus importante dans le pôle relationnel. Lors de l'entretien directif, ce sont les thèmes de préjudice (y compris d'ordre médical), de victime, d'inculpation de la société (carence d'information), d'exclusion qui émergent le plus fréquemment. Le test de l'arbre dénote une quête d'équilibre personnel et un besoin d'acceptation par l'entourage.

D.679

DEVELOPMENT OF A QUESTIONNAIRE TO DETERMINE KNOWLEDGE, ATTITUDES AND BEHAVIOUR TO HIV INFECTION

Francisco J. Parga, Sexually Transmitted Disease Control Programme, San Juan, Puerto Rico.

HIV infection has been called by many a behavioral condition. As long as there is no cure or vaccine, the only alternative to avoid infection with the Human Immunodeficiency Virus is avoiding the practices employed by persons at increased risk for infection. In order to develop educational campaigns, it is necessary to evaluate the levels of AIDS knowledge and attitudes.

A questionnaire was developed and validated using a group of judges.

Item validity was determined. Then, a pilot study was done using 430 subjects of which 43% were at increased risk for infection by HIV.

A final form of the questionnaire was developed after the pilot study.

The questionnaire is directed to Spanish-speaking subjects.

D.680

LES ATELIERS SUR LES ACTIVITES SEXUELLES A RISQUES REDUITS: UN NOUVEAU MODE DE VIE INTEGRE A SA SANTE SEXUELLE

Sourdif, Isabelle*; Laroche, F.**.
*Comité sida aide Montréal, Montréal, Québec, Canada; **Université du Québec à Montréal, Montréal, Québec, Canada

Objectif. Décrire l'organisation des ateliers et présenter les données évaluatives recueillies de février à mai 1989.
Méthodes. Des groupes de 15 personnes sont formés et animés par un sexologue et un assistant-technique. Les participants sont des hommes ayant eu des contacts sexuels avec d'autres hommes (gais et bisexuels). Ils recoivent 2 sessions de 3 heures dont les objectifs sont 1) d'acquérir des connaissances sur les act. sex. à risques réduits, 2) développer des attitudes positives, 3) développer et maintenir de nouveaux comportements et 4) améliorer la qualité de sa vie sexuelle. Le matériel utilisé comprend des dépliants, affiches, vidéos et la distribution d'une trousse. Un questionnaire est distribué au début et à la fin des ateliers.
Résultats. Les résultats provenant des questionnaires concernent les objectifs et analysent les connaissances acquises, la modification des attit., les cpts., et la place de la sexualité dans la vie personnelle.
Conclusion. Nécessité de ce type d'intervention. Besoin de l'implication des participants. Situer les act. sex. à risquer réduits dans un contexte de nouveau mode de vie.

D.681

AEROBIC EXERCISE TRAINING ATTENUATES THE STRESS OF A POSITIVE TEST FOR ANTI-HIV-1

Laperriere, Arthur*; Ironson, G.**; Antoni, M.*; Klimas, N.*; Schneiderman, N.*; and Fletcher, M.A.*; et al.
*University of Miami, Miami, FL, USA **Stanford University, Palo Alto, CA, USA

Objective. Receiving a positive test for the anti-human immunodeficiency virus (HIV-1) has been associated with increases in anxiety and depression. This could lead to a further suppression of an already compromised immune system resulting in an increased risk of opportunistic infection and a worsening of disease prognosis.
Method. Forty-six healthy gay males, never tested and therefore not knowing their HIV-1 status, were randomly assigned to either an exercise intervention (N=28) or control (N=18) group. HIV-1 antibody status was determined at week 5 and subjects received their diagnosis 72 hrs later. The Profile of Mood States (POMS) was administered at baseline, week 5, 7, 8, and 10, while an aerobic fitness evaluation was conducted at baseline, week 5 and 10. The intervention, consisting of 45 min of aerobic exercise training 3 times per week for a 10 week period, resulted in a significant improvement in fitness levels in both anti-HIV-1 (-) and (+) subjects after 5 weeks.
Results. Anti-HIV-1(+) controls displayed a significant increase in Tension-Anxiety (10.7 to 18.2, t(1,6)=18.75, p<.01), Depression (9.3 to 26.8, t(1,6)=2.6, p<.05) and Confusion-Bewilderment (5.3 to 11.8, t(1,6)=6.2, p<.05) scales of the POMS in response to their diagnosis (week 5 to week 7). Conversely, anti-HIV-1(+) exercisers did not show such changes in the Tension-Anxiety (11.8 to 12.6, t(1,11)=.37, p>.05), Depression (10.4 to 14.0, t(1,11)=.58, p>.05), and Confusion-Bewilderment (7.2 to 8.7, t(1,11)=.70, p>.05) POMS scales over the same period.
Conclusion. These findings indicate that a training program of modest aerobic exercise buffers the detrimental mood changes that accompany receiving news of anti-HIV-1(+) test, thus providing a promising behavioral approach to helping those infected with HIV-1.

Supported by NIMH, P50MH42455-03.

MEASURING AND REDUCING RISKS OF HIV TRANSMISSION AMONGST FEMALE PROSTITUTES IN BIRMINGHAM, ENGLAND

Kinnell, Hilary; Griffiths, R K G
Community Medicine Department, Central Birmingham Health Authority, UNITED KINGDOM

Background. Birmingham is a city of 1 million, with a surrounding conurbation of another 2 million. In 1987 police arrested about 2000 individuals for prostitution offences, 898 in Birmingham.
Project. To measure and reduce risks of HIV transmission amongst female prostitutes, an outreach team was employed, assisted by ex-prostitutes. 258 female prostitutes were interviewed.
Results. 25% had injected drugs since 1983, or had injecting boy-friends. 77% of services to clients involved penetrative sex, including oral sex, but condom use was high (90%). Sexual "risk events" were reported more frequently by injectors and their partners and by prostitutes who did not solicit on the streets. 33% did not know anal sex for women is high risk. The prostitutes average 22 clients per week. 16% had never been arrested. We estimate at least 1200 prostitutes in the city, providing 26,400 episodes of commercial sex each week. At £10 a time this industry must turn over at least £13 million a year.
Conclusions i) Prostitution is a potential multiplier for the HIV epidemic unless condom usage can be kept very high,
ii) With this level of demand from clients risk reduction through policing or harassment is unlikely.
Data will be presented on prostitutes knowledge of HIV, together with further analysis of activities with their clients and boyfriends.

D.683

SEROPREVALENCE AMONG A LOW HIV PREVALENCE POPULATION: HIV SCREENING DATA FROM A FAMILY PLANNING POPULATION

Newstetter, Amanda** Eversley, Rani B.* Biernes, Denise, L.**

** Planned Parenthood of San Francisco- Alameda, San Francisco, USA
*The Center For AIDS Prevention Studies, UCSF, San Francisco, USA

OBJECTIVE. To identify HIV seroprevalence among family planning patients, and to enable family planning providers to plan prevention strategies.
METHODS. HIV screening data from a voluntary screening program of 1310 female family planning patients attending San Francisco Bay Area Planned Parenthood Clinics was analyzed to determine seroprevalence among this population . Data was collected between January 1988 and January of 1989. As the number of seropositives is too small for tests of significance, the demographic and risk spread will be reported.
RESULTS. Six women were determined to be seropositive for HIV. This constitutes .46% of the total female population tested. Among these seropositives were 3 Whites infected by high risk heterosexual partners, 1 Black who had a history of IV drug use, 1 Asian with a bisexual male partner, and one Native American whose only risk was heterosexual multiple partners. While these numbers are small, they may be under-estimates of the true seroprevalence in this population, as only a third of the women found to be at risk through routine risk screening chose to seek HIV testing.
CONCLUSION. Given the ethnic diversity of the seropositive population, and the fact that 5 out of the 6 women were infected through heterosexual contact, these data suggest that there is a small but significant pool of HIV in the sexually active heterosexual community in the San Francisco Bay Area. This indicates a need for continued screening as well as a need to include more of this at risk population .

D.684

ETHNICITY AND HIV RISK
SCREENING DATA FROM A FAMILY PLANNING POPULATION

Eversley, Rani B.* Newstetter, Amanda** Biernes, Denise, L.**
*The Center For AIDS Prevention Studies, UCSF, San Francisco, USA
** Planned Parenthood of San Francisco- Alameda, San Francisco, USA

OBJECTIVE. To identify ethnic predictors of HIV high risk behaviors in a family planning population, and to enable family planning providers to plan prevention strategies targeted toward specific ethnic groups
METHODS. Behavioral risk screening data collected from 512 female family planning patients attending San Francisco Bay Area Planned Parenthood Clinics was analysed to determine the ethnic correllates of HIV high risk behaviors. Data was collected during December 1988 and January of 1989. Analyses included tests of proportion and chi-square.
RESULTS. Twenty seven percent of the population reported some HIV risk.Whites, who constituted 59.52% of the total population, comprised 74.07% of the population at risk. Blacks who constituted 23.25% of the population accounted for 12.40% of the population at risk. Latinas who constituted 9.38% of the total population accounted for 8.76% of the risk population. Asians who constituted 7.16% of the total population accounted for 3.64% of the risk population.Within the population at risk , Black, Latinos and Asians were more likely be at risk due to multiple sexual partners than White, whereas Whites were more likely to be at risk due to having bisexual partner. Whites with multiple partners were significantly more likely to report multiple risks (p< .001), including IV drug use and IV drug using partners than were the ethnic minorities.
CONCLUSION. These data suggest that within this population Whites demonstrate more allover risk than do ethnic minorities. This needs to interpreted with caution, however, as there may be a significant bias toward minorities underreporting HIV risks, due to cultural patterns, and since this screening was not anonymous, fear of discrimination.

D.685

RAPID CONDOM DAMAGE BY COMMON SEX LUBRICANTS.

Voeller, Bruce;Coulson,A.H.**;Bernstein, G.S.***; Nakamura,R.M.***.
*Mariposa Foundation, Topanga, CA, **UCLA Medical Center, Los Angeles, CA, ***USC School of Medicine, Los Angeles CA. USA.

Objective. To evaluate the degradation kinetics of sex lubricants upon the strength of latex condoms.
Methods. Condoms were lubricated along the distal half and tested at intervals for change in their strength. Standard US (ASTM) tensile strength and elongation tests (T&E) were conducted, as were standard international (ISO) air burst tests.
Results. Sixty seconds' exposure to mineral oil (common to many widely used sex lubricants) caused approx. 90% lowering of tensile strength and elongation values (T&E) and air burst volume and pressure values of test condoms. T&E and air burst values were also significantly affected by Vaseline Intensive Care, Johnson's Baby Oil, Crisco, Nivea Hand Lotion, Vaseline Petroleum Jelly, Mazola (corn oil), Wesson (soybean) Oil, and olive oil. Some silicone oils significantly affected T&E and air burst values after 45 min. or longer exposure times.

Twenty-four hour exposure to 20% aqueous nonoxynol-9 spermicide did not affect either air burst or T&E values. However, 15 min. exposure to some spermicidal preparations and to KY jelly caused significant reduction in T&E elongation values.
Conclusions. The rapidity of the effect of commonly used sex lubricants upon condoms is far greater then generally appreciated and may be the source of considerable breakage of condom during sexual intercourse.

D.686

HIV TRANSMISION TO STABLE FEMALE PARTNERS OF INFECTED MALES.

Baratucci, Jorge*; Zarate, S*; Gómez Carrillo, M**; Corti, M*; Bases, O*; Astarloa, L*; Boxaca, M**; Weissenbacher, M**.
*Muñiz Hospital; **Department of Microbiology, School of Medicine, Buenos Aires, Argentina.

Objective. To determine the prevalence of HIV infection in female sexual partners of HIV-positive men.
Methods. A group of 52 women who had consulted the Infectious Diseases Hospital in Buenos Aires City was selected. Their common feature was to be the stable and exclusive sexual partner of a HIV-positive man. These women neither were drug addicts no declared other risk factors. Their ages ranged between 17 and 35, median 23 years old. In 25% of the cases it was possible to determine the period of the sexual relationship with the HIV-positive male partner, which ranged between 6 and 72 months, median 24 months. 98% of the HIV-positive men presented as risk factor IVDA. Anti-HIV antibodies were screened by EIA methods and confirmed by Western blot.
Results. Among the 52 women studied, 7 presented antibodies in the first test performed (13.4%) and 45 were negative at the time. They were advised to take control measures, especially condoms. Further on, only 19 women were studied: in 2 of them anti-HIV antibodies were detected in the second test 8-14 weeks later. Among the remaining 17, one was positive 24 weeks later. The sera of 11 women who could be followed 6-18 months later were negative.
Conclusion. the incidence of heterosexual HIV transmision was at least 19.2% in stable female partners of HIV-positive males.

D.687

THE MEDICAL AND EMOTIONAL/SUPPORT NEEDS OF WOMEN WITH HIV

Dobko, Theresa* & Benedik, B.**
* AIDS Committee of Toronto, Toronto, Ontario, Canada
** Hassle Free Clinic, Toronto, Ontario, Canada

Objectives. To describe the medical needs and psychosocial concerns of women with HIV. To describe a model for support groups for women.
Methods. Initial findings were obtained from 8 members of a support group for women. A further 12 women were given a structured interview.
Results. Qualitative analysis revealed the following issues:
I. Medical Needs -- Women reported difficulty in obtaining an accurate diagnosis of HIV infection and immune status. Two-thirds of the women reported increased symptoms specific to their hormonal and reproductive physiology, but only vaginal candidiasis was accepted by physicians as a marker of HIV status.
II. Emotional Needs -- Women were more likely to experience shock at diagnosis, and to feel anger at the infecting partner. Isolation within their own support networks and even within the AIDS community was noted. Stress levels increased for those involved in the caregiving of HIV-infected men, those with infected children and those mourning the loss of child-bearing possibilities.
III. Support Group Issues -- Despite varying backgrounds, common concerns were found on issues such as reactions to diagnosis, disclosure, relationships with men and the need for improved access to medical and treatment information and services.
Conclusions. That researchers have not fully investigated the medical needs of women with HIV. That support groups for women can be effective, where tailor-made to their specific needs.

D.689

On being HIV - positive, European, female, and "non - existent".

Amanda Heggs. Copenhagen, Denmark. Positive Women's Support Group, Copenhagen. Denmark

The main topic of this paper will be the situation of HIV-positive women, (non IV drug abusers) in Denmark, and the trials and tribulations of this group in establishing self - help groups.

The underlying theme of the presentation will be the struggle of this group for recognition in a community which, until quite recently, refused to recognize that heterosexual HIV - positive people even existed.

The paper will attempt to discuss the social isolation experienced by HIV-positive women in this country, and the attempts made, by means of selv - help groups and our own presentations in the media, to break this isolation. The following is an extract from a speech held by the author at WHO's regional office in Copenhagen on World Aids Day, 1988:
"To be a Positive woman is incredibly lonely. Heterosexual circles are simply not used to the idea. When I was diagnosed, I contacted the Aids - Hotline, looking for support and information for women with HIV / Aids. There was absolutely nothing for us women. Today the situation is not much better - but now we've started our own support group - we're getting stronger".

The paper is based upon the author's own personal experiences as an HIV - positive woman.

D.691

WOMEN AND AIDS IN LATIN AMERICA: LESSONS FOR THEIR FUTURE

K CAROVANO, F STONE

Johns Hopkins University/AIDSCOM, U.S.A.

Objective: To illustrate the importance of developing AIDS prevention interventions targeting non-prostitute women in Latin America.

Methods: An examination of existing AIDS prevention programs in Latin America reveals a complete absence of programs targeting women not engaged in prostitution. The epidemiology of AIDS throughout most of the region currently mirrors that of the early years of the epidemic in the U.S. with over 90% of cases region-wide occurring among men. The changing epidemiology of AIDS in the Dominican Republic, where over 40% of cases reported in 1988 occurred among women, suggests that this pattern is likely shift.

Results: An unmeasured number of women have more than one sexual partner, placing them at risk for HIV/AIDS. The fact that an unknown percentage of men have multiple partners, including female and male prostitutes and other men, also places "monogamous" female partners at risk. These risks must be acknowledged and addressed. To date, targeted prevention interventions in Latin America focus primarily on reaching men who engage in sex with men (primarily self-identified "gay" men) and female prostitutes. Program planners tend to ignore that non-prostitute women are also at risk.

Conclusions: Program planners must recognize that non-prostitute women in Latin America are also at risk for HIV/AIDS. Programs are needed that provide them with the information and skills needed to enable them to modify their behavior to reduce their risk of exposure to HIV.

D.688

CLINICAL ASPECTS IN THE FIRST 81 AIDS CASES AMONG WOMEN IN MILAN

d'Arminio Monforte,Antonella*; Galli,M.*; Vigevani,G.M.**; Viganò,P.**; Saracco,A.*; Rizzardini,G.** and Valsecchi,L.**.
*Infectious Diseases Clinic, and **Infectious Departments,L.Sacco,Milan,Italy

Objective. The main risk-factor for AIDS in Italy is IV drug use (IVDU). A considerable number of cases occour in women. Objective of this study is to describe clinical aspects of AIDS in women.
Methods. 478 cases of AIDS (16.4% of total italian cases) were recorded from 1984 to 1988 in L. Sacco Hospital, Milan. All informations have been collected from clinical records.
Results. 81 out of 478 (16.9%) AIDS cases were diagnosed among women. 46 of them (56.8%) were IVDUs, 16(19.7%) were previous IVDUs (ex-IVDUs),17(21%) were sexual partners (SP) of anti-HIV pos. men (15/17 recorded from 1987) and 2 (52.5%) were transfused (all before 1985). PCP was significantly more frequent as indicator-disease in SP (10/17) and ex-IVDUs (7/16) than in IVDUs (6/46) (p 0.001 and p 0.01 respectively), while deep mycosis (DM) was more frequent in IVDUs (15/46 vs. 3/33, p 0.05). Kaposi's sarcoma (KS) was observed in 7 cases (8.6%) and lymphoma in 2. ADC was present in 6 cases (5/6 IVDUs).
Conclusions. DM have been confirmed to be more frequent in IVDUs, while ex-IVDUs have clinical course similar to SP. KS is relatively frequent among women.

D.690

NICE GIRLS DO GET AIDS: A SUPPORT SYSTEM FOR MIDDLE CLASS WOMEN WITH HIV INFECTION

Nichols, Stuart*; Prager, M.*
*Beth Israel Medical Center, New York City, USA

Objective: To present a rationale for and a model of support needs for middle class women in the US: identifying needs, establishing services, and making them available to patients.

In early 1988, two seropositive professional women requested that a supportive network be created for middle class women. Existing support groups focused on IV drug problems and did not meet their needs. At times, attending these groups made them feel even more estranged from other patients. A survey of treatment agencies and individuals showed that a need for this service existed. A support group began meeting twice monthly in August 1988. As of January 1989, 35 women have attended the group or social activities. The problems which have surfaced will be discussed along with the measures taken to address them. Recently services have begun for the husbands and boy friends in a separate group. Guidelines for creating similar services in other lacalities will be offered.

D.692

PREVALANCE OF ANAL INTERCOURSE IN WOMEN AT A COUNSELING-TESTING SITE

Connolly, Doris; Brennan, A. Winters, D. Gocke, D.
Robert Wood Johnson Medical School, New Brunswick, New Jersey, United States of America.

Objective. The high risk of HIV-1 transmission by anal intercourse is well-recognized for homosexual men, but the frequency of this activity in heterosexuals is not well known.
Methods. We questioned 100 consecutive female clients of our HIV counseling and testing service about their participation in anal intercourse and other risk activities using a directed questionnaire. Their ages ranged from 17-46 years. 82 were white, 9 black, 7 Hispanic and 2 Asian.
Results. Twenty-one reported anal intercourse at some time in their life. Eleven reported the frequency to be "occasional", 5 reported varying frequencies as often as once weekly, 1 reported a preference "all the time", and 4 declined to report frequencies. The 6 individuals reporting frequent or preferred anal intercourse also admitted to multiple sexual partners and unprotected sex.
Conclusion. Thus, 21% of an unselected sample of heterosexual women attending an HIV counseling center had experienced rectal intercourse at least once. 6% who did so frequently also engaged in other high risk behavior. This study supports the need for health care providers to recognize the frequency of anal intercourse in heterosexuals and to provide topic specific counseling.

D.693

EVOLUTION
AMBULATORY
SOROCABA AMULATORY AIDS EXPERIENCE WITH PROSTITUTES

GONCALVES, V.L.C.- Dos Anjos, R.M.P.- Ramos, T.F.- Gomes, M.C.O., BRAZIL

Our study has been realized with 54 promiscuous sexual life women, in a period going from January 1986 to November 1988, and among the following was observed:-

1. Medium age 26,68 years (14 to 41 years).
2. 24 women have children, and among them 67% have more than 01 and less than 05 children
3. 28 women (51,85%) mentioned and/or was confirmed that had Transmissible Sexual Disease in some period of their life.
4. 15 women (27,7%) used or are using injectable drugs.
5. 13 women (24,07%) present B type Hepatitis positive marking.

From the mentioned 54 women, 15(27,7%) presented positive HIV (ELISA recombined method)

1. Medium age 23,66% (14 to 31 years).
2. 07 women have children (medium 3,14 children).
3. 09 women (60%) among the ones of positive HIV, mentioned and/or was confirmed, had some transmissible sexual disease in some period of their life.
4. 10 women (66,6%) used or are using injectable drugs.
5. 03 women (20%) present B type Hepatitis positive markings.

None of the said women presented AIDS symptoms.

D.695

ASIAN WOMEN AND AIDS - RESEARCH ISSUES
Yoon, Soon-Young, PhD in Anthropology, New Delhi, India

This paper identifies behavioural research issues on Asian women and AIDS. It points out that current Information/Education for Health strategies used to educate female prostitutes and women about AIDS are often oblivious to the main problem of women's powerlessness. Research is needed on sex tourism and how it contributes to the vulnerability of women and children to AIDS. Also, more information is needed on the "veil of ignorance" which puts women into a communications "purdah" or seclusion. Even when confronted with health information about sexuality, women may not acknowledge it with a behavioural change as it would violate cultural rules of this communications "veil". Efforts to mobilize women's groups at community level can help to bring women out of this "seclusion", but these efforts have yet to gain widespread support. The paper identifies a number of research/action areas which would help Asian AIDS programmes to support women who are struggling to translate knowledge into behavioural changes.

D.697

THE SEX INDUSTRY AND THE AIDS DEBATE - Australian Conference
Overs, Cheryl.,* Bates, J.*
*Prostitutes Collective of Victoria, Australia.

The Conference aimed at AIDS, to disseminate information to the community and the sex industry and to consolidate and develop the policy required to maintain low infection rates.
Conference participants included a range of sex workers and managements, service providers, administrators and policy makers. Keynote addresses and workshops covered subjects including: testing policy; education strategies and health and welfare issues. Extensive "special" interest workshops were held (i.e., transsexual workers' issues, condom design).
Speeches and workshop recommendations have been published and widely disseminated. Groups were formed of workers from each state where none previously existed.
(4) An exchange of information occurred and a network established which will effect greater consistency and effectiveness in policy and program development aimed at limiting the spread of HIV in the sex industry.

D.694

LES KINOISES FACE AU SIDA: UNE TOPOGRAPHIE DE RISQUE
Bukarangira wN*; Walu Engundu**, Schoepf, B.G.**, Payanzo N***
* Harvard School of Public Health, Boston, USA; ** Projet CONNAISSIDA, Kinshasa, Zaire; *** Institut Pedagogique National, Kinshasa, Zaire.

Objectifs. Les femmes et enfants sont particulièrement à risque du SIDA en Afrique. Comprendre les causes sociales profondes des risques et des contraintes aux changements de comportements. Evaluer les risques des femmes dans des circonstances diverses.
Méthodes. Observation-participante, entrevues en profondeur et analyse institutionnelle qui lient la macrosociologie au comportements des individus.
Résultats. Une topographie des relations sociales avec leurs circonstances matérielles et psychosociologiques particulières permettent d'évaluer les risques différentiels des femmes différement situées dans la société. Il ressort des liens précis démontrant comment les comportements individuels sont médiatisés par les institutions socioculturelles.
Conclusion. Des changements socioculturels qui augmentent les ressources dont disposent les femmes de toutes les conditions sociales sont nécessaires à la prévention du SIDA chez les mères et leurs enfants à naitre.
Mots clefs: risque, femmes, ressources, changement

D.696

AIDS RELATED KNOWLEDGE AND ATTITUDES IN FEMALE CLIENTS OF SELECTED HEALTH DEPARTMENT CLINICS, HOUSTON, TEXAS
Tortolero S*, Crane, Martin, Fornasini M*, Smith D*, Nardikar S**.
* University of Texas Health Science Ctr, Houston, Texas, U.S.A
** Department of Health and Human Services, City of Houston, Texas, U.S.A

Objective to determine AIDS-related knowledge and attitudes in women attending selected City Health Department Clinics in Houston, Texas.
Methods. Between 2/29 and 9/30/88, 959 women attending Family Planning, Maternity and Sexually Transmitted Disease (STD) clinics completed an anonymous, self-administered risk assessment questionnaire and a brief knowledge (9 questions) and attitudes (4 questions) questionnaire.
Results. Overall, 68% of the questions were answered correctly. Questions concerning modes of transmission (parenteral, perinatal, sexual) were known (89% correct), but knowledge of natural history of the the disease was limited (44% correct). Women with < 6 years of education did worse (p<.001) than those with >6 years; Hispanic women (68% correct) had fewer correct (p<.001) than blacks (86% correct) or whites (87% correct). Hispanic women who completed the questionnaire in Spanish were especially disadvantaged (57% correct). After controlling for education by multiple linear regression, ethnic differences remained. Eighty-two percent (82%) of respondents believed an IV-drug using partner should "always" wear condoms but only 38% indicated their partner would do so.
Conclusion. Overall knowledge was limited in this population. Hispanic women completing the questionnaire in Spanish and women with < 6 years of school were at a distinct disadvantage with respect to knowledge about HIV.

D.698

CONDOM INSTRUCTIONAL BOOKLET FOR FEMALE SEX WORKERS (An Integrated Process)
Pareja, Reynaldo, Rosario, Santo. PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic

For the development of a Condom Instructional Booklet nothing was assumed. A study was first made to determine the knowledge, attitudes and habilities that female sex workers of Santo Domingo, D.R. had in regards to condom use and correct placement steps. Once the errors, negative attitudes, and patterns of use with their clients were determined and analyzed, a pilot instructional booklet was designed with a creative focus group of female sex workers and an artist.
This pilot was pre-tested. Results showed very low grasp of key message, "condom protects against AIDS." Two simplified versions were done and pre-tested again. With the results, a combined final version will be printed in sticker format to be placed in motel, hotel, and brothel rooms.

The whole process and materials will be shown.

AFFECTIVE DISORDERS AND HIV INFECTION IN INTRAVENOUS DRUG ABUSERS (IDAs).

Jocas Carlos, Tor J, Muga R, Llistar R, Pascual J, Planas P.
Service of Internal Medicine. Hospital "Germans Trias i Pujol". Universitat Autònoma de Barcelona. Barcelona, Spain.

Objective: To evaluate if affective disorders (anxiety and depression) are associated with HIV seropositivity in IDAs that presumablelly adquired HIV infection by sharing needles practices.
Methods: We tested anxiety (STAI-Trait) and depression (Beck's Depression Inventory) in 201 inpatients IDAs (156 males and 45 females) admitted in a detoxification unit, from January 87 to December 88. Patiens were tested the first day of admission. Furthermore co-factors as schooling level, prison, social status, and daily heroin doses were evaluated. HIV antibodies were analysed by EIA test.
Results: Sharing neddles was the only risk practice, dismissing by clinical anamnesis other risk practices. 143/201 patiens (71.1%) were HIV+ and 58/201 (28.9%) were not. Differences for seropositivity were on time of addiction (74.81 ± 32.52 m in HIV+ and 55.81 ± 39.91 m in HIV- (p<0.001)) and social status (p<0.0001) being the series homogeneous in sex, age, schooling level, prison, daily heroin doses and use of other drugs.
Anxiety was high (direct scores)1.5 type deviations) in both groups (58.6% in HIV- and 47.6% in HIV+) (p=NS), being moderate or important depression also similar in both groups (61.4% for HIV+ and 56.1% for HIV-)(p=NS).
Conclusions: Anxiety and depression are frequent in heroin abusers but the affective disorders are not related to HIV serostatus. Thus, the infection resulting of sharing neddles does not seem to be influenced by affective disorders.

D.700

CONDOM USAGE DECISIONS AMONG GAY MEN

Levine, Martin*; Brooks, C.**; Siegel, K.**
*Bloomfield College, New Jersey, U.S.A.;
**Memorial Sloan-Kettering Cancer Center, New York City, U.S.A.

Objective. To understand gay men's decisions to use or not use condoms.

Method. Focused interviews.

Results. Analysis of qualitative data from an ongoing study of sexual decision-making among gay men expands our understanding of condom usage within this population. The initial 80 interviews indicate that varying appraisals of the risks associated with insertive and receptive intercourse (anal and oral) highly influence condom usage. Men who believe that condoms prevent transmission of HIV during anal and/or oral intercourse are likely to use condoms. However, men state the following beliefs as reasons for not using condoms during fellatio and anal sex: 1.Receptive anal intercourse without ejaculation or preseminal fluids does not transmit HIV. 2.HIV is not transmitted to the insertive partner during anal intercourse. 3.Receptive oral sex without ejaculation or preseminal fluids does not transmit HIV. 4.Receptive oral sex even with ejaculation or preseminal fluids does not transmit HIV because saliva and gastric juices kill the virus. Furthermore, some men decide to abstain from oral and anal intercourse because they believe that condoms decrease erotic pleasure or are ineffective protection against HIV transmission.

D.701

CONDOM USE AMONG HOMOSEXUAL MEN

Golombok, S.*; Rust, J.**.
*City University, London, U.K., **London University, Institute of Education, U.K.

Objective. To investigate condom use during sexual activity and to identify any problems associated with the use of condoms.
Methods. A postal questionnaire survey of 262 homosexual men.
Results. It was found that, in spite of the general move by homosexual men towards safer sex practices, half of the men continued to engage in insertive anal intercourse. Almost 90% ejaculated during this activity of whom one third did not use a condom. Additionally, 90% of those who ejaculated during oral sex did not use a condom. Thirty two percent of those who had used a condom during anal intercourse reported at least one incident of condom breakage. When looked at in terms of frequency of individual condom use, it was found that 1 in 27 condoms break during this activity. Examination of the reasons reported for breakage indicated that physical stress on the condom was almost always thought to be responsible for these incidents.
Conclusion. Given that current condoms have been designed for vaginal use, these results indicate the need for an investigation of a separate specification for homosexual anal intercourse.

D.702

SEXUALITE DES PERSONNES DEVENUES SEROPOSITIVES ANTI-VIH

Rochet-Rossello Sophie*, Dutey P.**, Retornaz G.*and Trépo C†
*Hôpital HOTEL-DIEU ;**Faculté des Sciences, Lyon, France.

Objectif : La sexualité des personnes devenues séropositives anti-VIH nous a paru importante à explorer du fait des difficultés sexuelles relatées et de l'absence d'étude de référence sur ce thème.
Méthode : En 1988, nous avons distribué un questionnaire anonyme à 86 personnes séropositives anti-VIH suivies dans les centres spécialisés de Lyon. Une centaine de questions portaient sur leur vie sexuelle, affective, relationnelle, leurs représentations corporelles et leur caractère.
Résultats : Les résultats montrent que cette population remplit volontiers un questionnaire sexologique complexe (5 refus dénombrés seulement). Dans les suites de la découverte de la séropositivité anti-VIH, l'individu se perçoit comme dévalorisé avec un vécu corporel de mort, de salissure, de transformation irrémédiable. La sexualité est anéantie du fait d'une sidération importante du désir relatée particulièrement chez les homosexuels. Les sujets en couple initialement décrivent une chute de la communication dans leur relation à l'autre tandis que 50 % des couples évoluent vers la rupture ou l'amoindrissement relationnel. L'information sur la séropositivité anti-VIH est donnée au partenaire sexuel unique dans 80 % des cas, et dans 3 % des cas si les partenaires sont multiples.
Conclusion : Cette population semble dans l'attente d'une écoute et d'une reconnaissance de ses difficultés. 30 à 40 % demandent une aide sur le plan sexuel qu'il nous paraît indispensable de proposer, associée au cadre de suivi médical de ces personnes.

Consommateurs de drogues par voie intraveineuse
IV Drug Addicts

D.703

COUNSELLING INTRAVENOUS DRUG ABUSERS ABOUT AIDS AND HIV-TEST IN THE OUTPATIENT METHADONE CLINIC

Haas, Henriette and Kurz, T.

Department of Social Psychiatry University Hospital, Zürich, Switzerland.

Objective. Should the test be recommended to methadone patients and how to deal with ill patients.
Methods. Therapeutic consultants of 2 centres for drug-addicts were questioned about 97 well-cared for patients.
Results. Desperate reactions about a positive test were rare.
In 2 of the 3 observed cases the positive test was combined with first symptoms of AIDS. Negative as well as positive patients protected themselves an others better and showed increased compliance in medical care after knowing their status. Patients however who had avoided the test changed their behavior less during the period of evaluation inspite of numerous public savety campaigns. The severly ill patients tend to deny their situation (often with the help of drugs) most of the time. However at those rare moments when denial breaks down and yields to despair the need very much an open discussion with a person they can trust.
Discussion: The most important issue is to combine methadone treatment with professional counselling and medical care. Only within a good relationship to the therapist can a normal cathexis of the body and the object relations be reestablished in the former IVDA, which then results in better prevention.

D.704

ACCESSIBLE HEALTH CARE FOR IV DRUG USERS

Elovich, Richard and McCarthy, M. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective. To discuss new case management strategies for HIV-infected IV drug users (IVDUs). Methods. Interviews with recovering and active addicts, drug treatment professionals, physicians and community based health care workers, ADAPT. Discussion. In evaluating treatment for HIV-infected IVDUs, we need to question existing models for treating IV drug use. Methadone maintenance programs are characterized by an emphasis on controlling and monitoring the addict rather than on effective treatment of the disease. This strategy is inappropriate for treating HIV infection. The centralized research model has an inadequate treatment capacity and is inaccessible to most IVDUs. Flexible, community-based treatment, mobile support service units, and outreach programs for IVDUs are underfunded, while research programs are designed to interest established funding sources. There is a need to make drug treatment available on demand in combination with health care for HIV infection: an active IVDU who is not dealing with his/her addiction cannot be expected to keep doctor's appointments. Because most IVDUs live outside the health care system, they do not have access to prophylactic treatments for HIV infection. They enter the health care system after they are symptomatic. IV drug users, routinely handled with prejudice and coercion, need to understand informed consent and patients' rights before receiving experimental AIDS therapies. Support services must accompany the HIV test. Conclusion. Workable strategies for case management of HIV-infected IVDUs should be flexible, community-sited, accessible, and together with drug treatment, available on demand.

D.705 EVALUATION OF A SUPPORT PROJECT FOR IV DRUG USERS WITH AIDS IN AMSTERDAM

Boom, Frans van den; Derks, Jack; Driessen, Anita
Netherlands Institute of Mental Health, Utrecht, Netherlands

Objective: evaluate effectiveness, feasibility and endurance of a support project for IV drug users with AIDS
Method: Often ivdu do not have stable relationships or supportive networks. Contact with family of origin may often be disturbed. Referral from the hospital to the 'home'situation can be difficult, because of the absence of a home(life) and/or a supportive network. In Amsterdam a support project for IVDU has been operative since January 1989. The program will be evaluated with respect to feasibility, endurance, effectiveness and client satisfaction, using Goal Attainment Scaling, Problem Oriented Records, and psychiatric screening instruments.
Results: The first results of the study will be presented.

D.706 Socials characteristics of drug-addict and seropositive female patients for human immunodeficiency virus.

AUTHORS: Macias José R.*, Gómez Angela**, Franchi María**, Matar Pablo**, Federman Liliana** and Astarloa Laura***.-Francisco J.Muñiz Hospital. Buenos Aires. Argentina.
OBJECTIVE: Analysis of the differents socials characteristics in females patients seropositive for human immunodeficiency virus (VIH) and drug-addiction antecedents.
METHODS: Analytic and critic investigation. Socials relations studies of 55 female patients seropositive for human immunodeficiency virus (VIH), who at their entrance had symptoms of infectious diseases and drug-addiction antecedents , between 10/1/87 and 12/31/88.
ABSTRACT: According to Clinic Classification of diseases caused by VIH proposed by CDC in May,1986: one patient (1,82%) belongs to Group I: eleven patients (20%) belong to Group II; 40 patients (72,73%) belong to Group III, and three patients (5,45%) belong to Group IV.
All of the mentioned patients were drug-dependent.
The age of these patients oscillated between 16 and 38 years.
One of them was homosexual (1,82%), seven were bisexual(12,73%) and fourty-seven heterosexual (85,45%).Twenty eight of them (50,90%) had had sexual relations , and shared needles, with people infected with AIDS, and 44 (80%) used to have this kind of relations with several people.
Many of them (85%) had antecedents of one or more sex-transmisible diseases and/or viral hepatitis B.
The serology of VIH was investigated. Confirmatory tests laid out a 100%positive.
We found three groups of differents socials characteristics.
In accord with the authors classification, they propose three groups: A-B-C
CONCLUSION: Group A: 4 patients (7,27%)

Group B: 39 patients (70,91%)

Group C: 12 patients (21,82%)

D.707 HIV TRANSMISSION IN SIMULATED CONDITIONS OF SHARING OF HYPODERMIC EQUIPMENT

Newmeyer, John*; Drew, Lawrence**; Minor, Richard**
*Haight-Ashbury Free Clinic, San Francisco, USA; **Mt. Zion Hospital, San Francisco, USA

Objective. To examine transmission of HIV under simulated conditions of sharing of hypodermic equipment by intravenous drug users.
Methods. In a laboratory setting, hypodermic equipment was exposed to HIV (free virus) in medium. Attempts were made to culture virus in medium after eight conditions of exposure:
(1,2) contaminated needle-and-syringe left lying for an interval of one minute or one hour after exposure ("Shooting Gallery"); (3,4) exterior of needle exposed and left lying for 15 seconds or a minute ("Needle Stick"); (5) liquid medium exposed to HIV-contaminated needle ("Shared Cooker"); and (6,7,8) complete or incomplete decontamination with bleach and/or water ("Decontamination"). Three separate trials were made under each condition.
Results. HIV was successfully cultured under all three trials each of the "Shooting Gallery/One Minute Interval", the "Needle Stick/15 Seconds Interval", and the "Decontamination Twice With Water" conditions. HIV was not cultured from any of the three trials of each of the "Shooting Gallery"One Hour Interval", the "Needle Stick/One Minute Interval", the "Shared Cooker", the "Decontamination Twice With Bleach", or the "Decontamination Once With Bleach" conditions.
Conclusion. HIV contagion from empty, contaminated syringes, or under needle-stick conditions, appears to be time-dependent. HIV would appear to be viable for a longer period (minutes as opposed to seconds) in the interior of hypodermic equipment than on the exterior surface. HIV decontamination by bleach rinsing appears to be efficacious; mere water rinsing does not appear to be effective.

D.708 CONTRIBUTION DE LA PHENOMENOLOGIE ET LA PSYCHANALYSE A LA PRISE EN CHARGE INSTITUTIONNELLE ET INDIVIDUELLE DES TOXICOMANES INFECTES PAR LE VIH.

Charles-Nicolas A.* et Cordonnier J.P.**
*Psychiatre, Médecin-Directeur du Centre Pierre Nicole, Croix Rouge Française, Paris. **Psychiatre, Médecin-Consultant au Centre Pierre Nicole, Croix Rouge Française, et Délégué Médical d'APARTS (Paris).

L'approche phénoménologique temporelle des difficultés psychologiques rencontrées par les toxicomanes confrontés au sida illustre le défaut fondamental que représente l'atemporalité chronique chez le sujet présentant des conduites addictives toxicomaniaques. Les aspects spatiaux et corporels sont étudiés. La clinique analytique permet de mieux appréhender les mécanismes de défense mis en place par le sujet toxicomane séropositif pour le VIH ou déjà en traitement pour le sida. Le concept de la conduite ordalique donne une explication à l'intégration du sida comme une nouvelle conduite de risque chez le toxicomane.Ces deux approches sont complémentaires et dégagent de nouveaux axes psychothérapeutiques en matière de prise en charge institutionnelle et individuelle des toxicomanes infectés par le VIH.Plusieurs cas cliniques de patients suivis pendant deux années minimum sont exposés.

D.709 HIV INFECTION IN I.V. DRUG ABUSERS :

Leite, E.A.; Hamerschlak, N.; Szterling, L. ; Carvalho, M.B.; Lima, M.P.J.S.; Bellucci, S.B.B. . Centro Corsini.(CCII). Campinas.Sao Paulo.Brazil.

Objective: To measure the prevalence of the HIV infection in I.V. drug abuse. (spontaneous request).

Method : The I.V. drug abusers in attendance of CCII are tested for HIV (E + WB). The patients are oriented by a multidisciplinary education and assistencial program and the seronegatives are retested more or less in each 3 month.

Results : 81 I.V. drug abusers, 43 (tested positive with HIV infection) were seropositives between 11 and 35 years of age (32.5% less than 20 years of age) and 43% with less than one years of I.V. 36 patients have been attended drug user. 01 from group I, 13 from group II,14 from group III, 03 from group IV and 05 which have not been classified.

Conclusions : The risk of an acquisition of HIV between I.V. drug abuses is extremilly high, where me can see that most of the seropositives an contaminabed with less than one years of I.V. drug user.

D.710 AIDS AND PSYCHOSOCIAL TREATMENT

Orgnero, Irene; MSW,Private Practice, Calgary Alberta, Canada.

Objective. An exploratory study systematically examined the hypothesis that a specific social work intervention, Heimler's Social Functioning, would provide effective psychosocial care to persons with AIDS. Methods. The method employed to test the hypothesis was a single system design, specifically, the ABA model.The study was replicated with seven subjects, five of whom were homosexual males, one a bisexual male and one a female intravenous drug user. Four subjects completed the study, two died and one withdrew because of memory loss. The instruments used to measure needs and response to treatment across the three phases included Heimler's Scale of Social Functioning (Heimler, 1967) and a Self-Anchored Scale specifically designed to measure the person's feelings and perceptions of memory and body images changes. Results. Findings revealed that distress permeated all dimensions of the person: physical, emotional, intellectual, social and spiritual. The intervention alleviated perceptions of distress and promoted coping that increased quality of life.

Psychologie
Psychology

D.711

USE OF PROPRANOLOL FOR AGITATED BEHAVIOR IN AIDS

SHENKMAN, CARL
St. Vincent's Hospital and Medical Center , New York, USA

Objective. Although AZT is useful for the treatment of HIV encephalopathy, behavioral disturbances in these patients may remain during treatment with this drug. Propranolol has been described to be useful for agitation and other behavioral disturbances associated with Huntington's chorea, a disorder which also affects primarily subcortical structures. Propranolol was used to treat agitated behavior in a patient with AIDS dementia.
Methods. A 29-year-old homosexual man had progressive gait and cognitive impairment over a 3-month period. He became doubly incontinent and confined to bed because of poor balance. After 3 weeks of therapy with oral AZT he became able to ambulate. However, he was hypomanic and disruptive. Incontinence persisted. Propranolol (120 mgs in two daily doses) was added to the therapeutic regimen.
Results. Addition of propanolol resulted in marked improvement within 10 days. Incontinence, paranoia and outbursts of agitation disappeared. Propranolol was discontinued after 10 weeks and improvement persisted. The patient continued to take care of himself at home and was fully ambulatory and oriented. A mild attentional deficit persisted.
Conclusion. This clinical observation suggests a role for propranolol in the treatment of the behavioral disturbances observed with HIV encephalopathy. Experience with a cohort is needed to substantiate this observation.

D.712

Coping With the Psychological Effects of an HIV Infection in Patients in Obstetrics and Gynecology

B.WEINGART-JESSE, A.SCHAEFER, Berlin
Universitaetsfrauenklinik Rudolf-Virchow
Standort Charlottenburg FU-Berlin, Bundesrepublik Deutschland

Aim
The influence of various psychological and sociological factors such as drug addition of female patients with an HIV infection and/or their partners, sexual contacts, personality characteristics on their mastering the illness.
Group examined
Out of 111 patients with an HIV infection who had special counselling from 1985 to 1988, 45 were interviewed on a volunteer basis.
Method
Besides the interview a neurological-psychatric examination and behaviour analysis were conducted between interview and in-patient treatment.
Results
In the group of drug addicts, we saw counter-productive forms of coping with the illness. This was shown by deceit, behaviour which was inappropriate to the illness, outbursts of anger and despair.
Conclusions
The psychological and sociological programmes accompanying medical treatment, including a partial maintenance programme using polamidone as a substitue drug can influence the negative manner in which drug addicts cope with being HIV positive in an positive way.

D.713

ANGER: AN IMPORTANT PSYCHOLOGICAL MEASURE IN HIV DISEASE?

Levy,Elinor*;Knapp,P.*;Linde,R.**;Mayer,K.**;Stoddard,A.*** and McCusker,J.***
*Boston University School of Medicne, Boston, MA, USA,**Fenway Community Health Center, Boston, MA, USA,***Univeristy of Massachusetts, Amherst, MA.

Objective. To establish baseline values and associations for psychosocial and immune parameters in a cohort of sexually active gay and bisexual men.
Methods. The first 130 members of a cohort from the FCHC were given a battery of psychosocial questionnaires (including Anger Expression Scale, Hardiness Test, and Profile of Mood States) and had blood drawn for immunological measures (quantitation of CD4 and CD8 subsets, lymphoproliferative assays). Thirty two of these subjects were HIV antibody positive and 8 had developed HIV disease related symptoms.
Results. Differences between groups were found for the number and % of CD4 lymphocytes and % of CD8 lymphocytes and the response to the mitogens PHA and ConA using one-way ANOVAs. Suprisingly, the groups did not differ in any of the psychological measures. However, there were intriguing differences in correlations between the groups. The most interesting involved the anger expression scales as indicated in the table below. (* $p < 0.10$, ** $p < 0.05$)

	HIV-	HIV+A	HIV+S		HIV-	+A	+S
Ang-In v CD4#	0.22	-0.45*	-0.55	Ang-In v CD8%	-0.01	0.23	0.78**
Ang-Out v CD4%	0.05	-0.29	-0.42	Ang-Out v T8#	-0.20	0.42	0.79**
Ang-Out v PHA#	-0.04	0.31	-0.85**	Ang-Out v CD3%	-0.0	0.41*	-0.75**

Conclusion. Both anger-in and anger-out were associated with fewer CD4 and greater CD8 cells in the HIV+ groups. Furthermore, anger-out was associated with lymphocyte function. The expression of anger may be an important variable for longitudinal studies of psychosocial co-factors in AIDS.

D.714

PSYCHOLOGICAL IMPLICATIONS AMONG PATIENTS WHEN RECEIVING ANTI HIV POSITIVE

Marques,M.M.;Fontana,M.A.S;Gouvêa,S.G.E.;Rossi,G. ; Lima,M.F.J.S.;Bellucci,S.B.E..
Centro Corsini (CCII). Campinas,São Paulo, Brazil .

In the holistic vision of the work with patients HIV positive, the Psychology division has been developing a global work that has its aim in the patients emocional stability and better quality of life. This approach, plus a therapy that helps the patient to receive the positive results from HIV test, allowed us the conclusion that when working established stages, there are no reactions such as suicide, psychiatric scaring and deliberate intention to transmit the virus like it is shon by the press. Obseved among 82 patients in this case from the initial shock with responses such as effective cry or psychological numbness (emotional blocking), having perceptions interlaced with : improper thougts, emotions generated by events and fixation of non resolved situations. Having as reaction continuons anxiety or disphoria and showing as a constant a necessity of affective integration. We also notice that these patients show difficult to have the correct understand of being an assymptomatic carrying of the virus but by not being sick. These patients when working properly, will modify internaly their state of shock.

D.715

PSYCHOSOCIAL ASSESSMENT OF MINORITY WOMEN AT RISK FOR AIDS: A PSYCHOMETRIC PILOT STUDY

Nyamathi, Adeline*; Flaskerud, J.**
*University of California, Los Angeles, U.S.A., **University of California, Los Angeles, U.S.A.

Objective. A pilot study to describe the psychometric evaluation of several instruments designed to assess the major stresses experienced, the coping responses used, the factors affecting these responses and psychosocial outcome with 73 minority drug abusing and homeless women.
Methods. Reliability, content, convergent and divergent validity was assessed on the following instruments: Inventory of Current Concerns, Coping Scale, Social Support Questionnaire, Profile of Mood States, Social Self Esteem Inventory and Locus of Control Scales.
Results. Factor analysis isolated five dimensions which accounted for 72% of the variance. These dimensions included Emotional Distress, Coping Responses, Social Support Perceived as Useful, Situational Attributions and Personal Attributions. The alpha reliability coefficient for all subscales was .82. Content convergent and divergent validity was established. Contrasting groups analysis on a small sample of low-risk women indicated statistically significant differences in the majority of subscales assessed.
Conclusions. The psychometric investigation of instruments which provide a multidimensional approach to assessing coping and psychosocial adjustment of minority women at risk for HIV infection can enhance the assurance that subsequent nursing interventions are implemented based on reliable and valid information.

D.716

THE AIDS DEMENTIA COMPLEX (ADC) AND IMPAIRMENTS OF AMBULATORY ACTIVITY

Keilp, John G.*; Tryon, WW.**; Brew, BJ.*; Sadler, AE.*; Aronow, HA.*; Price, RW.*; Sidtis, JJ.*. * Memorial Sloan-Kettering Cancer Center, NY, NY, USA; ** Fordham University, Bronx, NY, USA.

Objective: To assess the relationship between symptoms of the AIDS dementia complex (ADC) and decrements in overall ambulatory activity.
Methods: 16 HIV-1 infected patients with early symptoms of the ADC were evaluated with the Neuro-AIDS Study Group neurological history, examination and neuropsychological (NP) battery. Each then wore a 2" x 3" electronic motion detector [Actigraph (TM): Ambulatory Monitoring Inc., Ardsley, NY] on the waist continuously for a period of 7 days. Minute-to minute recordings of waist movements greater than 0.1 G were obtained.
Results: Subjects with abnormal reflexes and limb incoordination showed lowered levels of overall ambulatory activity ($t=1.94$, $df=14$, $p=.07$), as did those with marked abnormality of either smooth pursuit or saccadic eye movements ($t=2.57$, $df=14$, $p=.02$). The number of these abnormalities correlated significantly with decrements in activity ($r=-.60$, $p=.01$). NP tests assessing speed of planned, coordinated motor movement were also correlated with activity level (timed gait, $r=-.54$; Trail Making A, $r=-.52$, and B, $r=-.59$; Grooved Pegboard dominant, $r=-.49$, non-dominant $r=-.51$: all $p<.05$), but self-ratings of both mood and psychiatric symptomatology were not.
Conclusions: Analysis of this initial sample of ADC patients indicates that activity decreases markedly as motor control becomes impaired. A more detailed analysis of 24-hour variability in activity is currently in progress on a larger sample, to further investigate these relationships.

D.717 IMPACT DE L'ATTITUDE DES SOIGNANTS SUR L'ETAT PSYCHOLOGIQUE DES PATIENTS ATTEINTS DU SIDA.

Cournoyer,C.*; de Montigny,J.**; Charpentier,S.***
* Infirmière, Hôpital Hôtel-Dieu, Montréal, Québec, Canada;
** Psychologue en pratique privée, Montréal, Québec, Canada;
*** Personne atteinte du sida, Montréal, Québec, Canada.

Dans le but de saisir l'influence des attitudes des soignants sur l'évolution physique et psychologique des sidéens, un échange entre infirmière, psychologue et personne atteinte du sida sera animé autour de la question de la perception, de la signification d'une maladie terminale tant pour les patients que pour les soignants. L'expression des réactions individuelles et collectives nous permettra d'évaluer l'ampleur des mécanismes de défense contre la peur d'une mort transmissible.

L'approche systémique préconisée vise essentiellement à explorer les besoins de sollicitude, de compassion et de contribution entre soignants et patients dans le processus de survie à une maladie terminale et à démontrer les bénéfices secondaires d'une attitude humaniste inscrite dans une approche multi (ou inter) disciplinaire comme soulagement de la douleur globale.

LE SOUTIEN PSYCHOLOGIQUE COMME EXERCICE.

VERTADIER, Alain.
Association AIDES, Comité de Paris, France.

Objectif. Diminuer l'anxiété en enrichissant la "visualisation positive" des personnes séropositives HIV ou malades.
Méthodes. Groupe de six à huit personnes dont deux séronégatifs.
Chaque réunion comporte exercices et échanges d'expériences entre les participants et feedback.
Exercices : relaxation musculaire et mentale, expression graphique (dessins) et rêve éveillé. Thème des exercices : les aspects considérés comme négatifs (la mort, la souffrance, la déchéance physique) et les aspects positifs (la résolution des difficultés physiques, morales et sociales).
Cette méthode modifie la "vision globale du monde" de la personne, de son environnement à travers les organes des sens, les représentations des rôles dans son entourage (médical, familial ou professionnel), les conceptions sur la maladie, la guérison, la santé. Elle invite chacun à découvrir sa force intérieure. Nous appelons cette technique "vision force".
Résultats. Trois groupes, soit 28 personnes ; durée d'appropriation de la méthode : 4 séances de 4 heures tous les 15 jours. 25 disent utiliser cette méthode seuls un an après le début des exercices pour mieux gérer des situations difficiles et ont enseigné cette méthode à d'autres.
Conclusion. Cette une approche peut être caractérisée de "formation-conseil" (formation : il s'agit d'apprendre quelque chose de nouveau. Conseil : cet apprentissage est accompagné).

D.721 LE COMPORTEMENT SEXUEL A-T-IL CHANGE A CAUSE DU SIDA ? ETUDE DANS LA POPULATION ZAIROISE.

Lusakulire N*, Moore Melinda*,**, Bertrand WE*,**
Hassig SE*,** et T.D.Kashala*.
*Ecole de Santé Publique, Université de Kinshasa/Zaïre
**Tulane SPHTM, New Orleans, LA, USA.

Objectif:Evaluer les changements dans le comportement sexuel à cause du SIDA au Zaïre et en étudier le "comment".
Méthodes:Les répondants ont été selectionnés informellement vu les difficultés pour avoir l'information sur les habitudes sexuelles d'une personne utilisant les méthodes traditionnelles d'enquêtes. Les enquêteurs ont été choisis dans les différentes couches socio-économiques du pays. Les répondants sont un voisin ou ami avec qui la causerie sera avec moins de réticence sur son comportement sexuel. A la fin de causerie, l'enquêteur note les informations enregistrées par coeur sur un questionnaire à l'insu du répondant.
Résultats: Sur les quelques cas vus, les tendances semblent refléter la situation telle que connue empiriquement dans le parler quotidien des gens. Les filles non-mariées ont tendance de réduire le nombre de partenaires sexuels. Les hommes (mariés et non-mariés) utilisent de plus en plus des condoms.
Conclusion: Ces résultats préliminaires suggèrent que la population au Zaïre est en train de changer ses pratiques sexuelles. Ceci ne fait qu'accroitre notre optimisme dans le grand combat pour vaincre le fléau du SIDA.

D.718 IMPACT PSYCHOLOGIQUE DU SIDA ET STRATEGIES D'INTERVENTION AUPRES DES SIDEENS.

de Montigny, Johanne, M.Ps. Psychologue en pratique privée, Montréal, Québec, Canada et Consultante en psychologie au Comité Sida Aide Montréal (CSAM).

Les données cliniques présentées visent à analyser et à évaluer l'impact des réactions psychologiques chez des patients atteints d'une maladie terminale afin de permettre l'élaboration de stratégies d'adaptation à la situation paradoxale de survivre à la menace d'une mort imminente.

Par le biais d'exemples de cas cliniques suivis en bureau privé, à domicile et à l'hôpital, on pourra nuancer les méthodes d'approche et élaborer un modèle d'intervention adapté aux étapes évolutives entre le diagnostic, le pronostic et la phase terminale de vie. Il sera question des particularités entre les thérapies individuelles et de groupes ainsi que des particularités entre les groupes de personnes atteintes du sida, de personnes séropositives et des proches de ces deux groupes.

Les éléments de contenu tentent de clarifier le rôle du psychologue et d'orienter d'autres professionnels et/ou intervenants face à la problématique psychologique du sida.

Sexologie
Sexology

D.720 SEXUAL DEVELOPMENT AND THE SERO-POSITIVE GAY MALE

Marcotte, Glen*; Valentich, M.**
*AIDS Calgary, Calgary, Alberta Canada, **The University of Calgary, Alberta, Canada.

Objective: To describe the impact of sero-conversion upon the sexual development of the gay male. Implications for the involvement of social work are discussed.
Method: A literature review and intensive, unstructured interviews with 3 Western Canadian sero-positive gay males. Additionally, the senior author draws on background knowledge gained while working with an AIDS community group.
Results: The use of the Eriksonian developmental schema and Marcia's identity status models were found to be useful in understanding the concurrence of thanatos and eros. After a positive diagnosis, the sero-converted gay male seeks to resolve these essential forces representing the end and beginning of life. The integrity vs. despair crisis is brought forward into early adulthood. Issues related to identity achievement and intimacy are also discussed.
Conclusion: Sero-conversion impacts seriously on the sexual development of gay males. Social work and other helping professions require knowledge of the gay male's developmental dilemmas as well as the norms of the gay subculture. Dialogue between sero-converted gay males and the social work profession may result in more effective clinical social work service as well as better designed and implemented community-focused services. Social work can take a leading role in destigmatizing and diffusing the health crisis and bridging the private need for confidentiality and the public issue of quarantining.

D.722 FREQUENCY OF SEXUAL INTERCOURSE ACCORDING TO MARITAL STATUS IN THE GENERAL POPULATION.

Per Magnus, H Stigum, JM Sundet, IL Kvalem, JK Grønnesby, LS Bakketeig. Department of Epidemiology, National Institute of Public Health, Oslo, Norway.

Objective. To understand the potential for HIV spread in the general population, empirical data on patterns of sexual behavior are needed. We here present data on the relative frequency of sexual intercourse in heterosexual relationships with respect to present marital status.
Method. The results are based on the responses to an anonymous postal questionnaire sent to a simple random sample of 10.000 Norwegians aged 18 through 60 years. The response rate was 63%. The analysis is restricted to single and married (including cohabiting) subjects reporting heterosexual activity during the past year. The dependent variable is the mean number of intercourses in the past month according to own and last partners present marital status, regardless of number of partners.
Results. The mean number of intercourses per month was 4.3 for singles whose last partner also was single (N=898), and 2.0 if the last partner was a married person (N=94). Married subjects with extramarital partners during the past year report a monthly frequency of 6.7 with spouse (N=279), and 1.7 with extramarital partners when the last partner was single (N=122) and 1.3 when the last partner was married (N=140). Married subjects without extramarital affairs in the past year report a frequency of 7.0(N=3743). The present data elucidate patterns of sexual activity and may used as data input in mathematical models for understanding and predicting the HIV-epidemic.

D.723

SEXUAL PRACTICES AND HIV INFECTION IN SOME ZAMBIAN PRISONS

Maboshe,M*;Simooya,O*;Hira,S**;Chimfwembe,E*;Perine,P***;
Mukunyandela,M* et al.
*Tropical Diseases Research Centre, Ndola, Zambia;**University Teaching Hosp., Lusaka, Zambia;***Uniformed Services University of Health Sciences, Bethesda.

Objectives.1.To establish seroprevalence of HIV infection among inmates in 5 urban prisons in Zambia. 2.To study their sexual practices.
Methods.All inmates who had been in prisons for atleast 3 months were entered in the study and their clinical, social and sexual information was collected. Serum samples were screened for HIV-1 antibodies using ELISA (Abbott) and those tested positive were confirmed using Recombigen (Cambridge) and Immunofluorescent assay. In Lusaka, rectal smears were taken from prisoners and controls (STD clinic attendees) for gonococcal cultures.
Results.The overall HIV-1 seroprevalence was 256 (16.1%) of 1593 prisoners and rates varied among the prisons:

Prison	HIV prevalence %	Homosexuality %
Mukebeko Maximum	9.2	13.8
Mukebeko Medium	15.2	13.3
Kamfinsa,Kabwe	14.8	18.2
Lusaka Central	29.0	4.7
Lusaka Remand	19.8	0.0

The overall prevalence of homosexual activity was in 203 (12.2%) of 1668 inmates. 15 (9.6%) of rectal smears taken from prisoners were positive for gonococcal cultures while none of the smears from control men were positive.
Conclusion.HIV infection is prevalent among inmates in some Zambian prisons and homosexuality exists under deprived sexual conditions.

D.724

Overview of WHO/UNESCO experience in intiating school health education programmes to prevent AIDS and other STDs.

Pokrovsky, Alexis*; Barrett D.**;
*UNESCO Education for the Prevention of AIDS Programme, UNESCO Paris; **World Health Organization, Education Systems Specialist, Health Promotion Unit, Geneva

The National AIDS Plans of developing countries will be analysed with a view of identifying the extent to which they include formal school AIDS education programmes; the dimensions of the problems these programmes are intended to address; and the essential results, if any, that have been obtained by these programmes up to date.

In parallel with the above study, the AIDS-education materials available at the WHO/UNESCO School AIDS Education Resource Centre (UNESCO, Paris), and addressed, in particular, to students, teachers, school authorities, and parents, will be reviewed and a critical and comparative analysis of their approaches to AIDS education content; and teaching/learning strategies and methodologies, will be presented, along with sample illustrative materials.

D.725

ALCOHOL AND HIV DISEASE PROGRESSION IN INTRAVENOUS DRUG ADDICTS.

Lake-Bakaar, G. and Rao, R.S. SUNY-Health Science Center, Brooklyn, N.Y.

Alcohol weakens ego controls and is lymphocytotoxic. It might therefore increase the risk of exposure to HIV as well as accelerate disease progression.
Objectives To evaluate the effect of alcohol on the rate of HIV infection and on HIV disease progression.
Methods Alcohol history evaluated prospectively in 201 IVDA using a questionnaire. Good correlation with CAGE responses, serum GGTP levels and repeat random interviews. HIV antibody detected by repeat ELISA testing (Abbott).
Results

	HIV negative	HIV positive	AIDS
n	52	106	42
Age(M±SD)	35.8±7.9	35.4±8.2	36.9±4.9
Females	20 (38%)	33 (31%)	13 (33%)
Alcohol (40g/d and over)	34 (65.3%)	63 (60.4%)	36 (85.7%)

Alcohol abuse is significantly greater in AIDS than non-AIDS IVDA (P = 0.016: Fisher's exact test). In contrast there is no significant difference in alcohol use between HIV negative and HIV positive patients (p 0.05).
Conclusion Alcohol does not significantly increase the risk of HIV exposure but may affect the rate of progression of disease in HIV positive subjects.

PLANIFICATION D'UN PROGRAMME D'INFORMATION ET D'EDUCATION POUR LA PREVENTION DU RISQUE D'INFECTION A V.I.H. A PARTIR D'UNE ENQUETE C.A.P.

AUTEURS : DIOUF Ousmane* ; NDOYE Ibra* ; PETITGIRARD Anne**
* Ministère de la Santé Publique - SENEGAL
** GPA/OMS - GENEVE -

OBJECTIF Définir une stratégie globale d'Information et d'Education pour la Prévention de l'infection à VIH et du SIDA.

METHODOLOGIE L'enquête CAP a combiné la méthode d'entretiens de groupe et de questionnaires individuels à partir d'une base de sondages (645 personnes). Les résultats ont été suivis d'une planification d'activités par programme.

RESULTATS Définition de principes directeurs
. situation à risque par rapport à groupes à risque
. articulation des activités de terrain autour d'une dynamique participative
. nécessité de prendre en compte aussi bien le milieu urbain que rural.
- approche multimédia
- Définition des étapes de conscientisation-sensibilisation, motivation et action (changement de comportements)
- choix des objectifs et stratégies, modalités de supervision et d'évaluation
- définition d'un cadre organisationnel.

CONCLUSION
Le lien entre la recherche et l'action assure la pertinence des programmes et renforce la dynamique participative.

M.E.0.8

THE ROLE OF HEALTH EDUCATION IN PREVENTION OF AIDS (UGANDA'S EXPERIENCE)

Gaifuba, J.K., Ministry of Health, Uganda Government. Uganda

This paper outlines the strategies and objectives of the Health Education programme in attempts to prevent and control the spread of AIDS in the country. Emphasis in this paper is put on the utilisation of different government and non-governmental organisations and their involvement in control measures and also the role of the community members in the preventive activities.

Secondly, the paper also outlines different methods and approaches of the educational strategies in educating the masses for a change in behaviour.

Thirdly, the paper discusses the misconceptions held by the people on the mode of transmission of AIDS in the community and how to dismiss these misconceptions for a change in behaviour.

Finally, the paper also highlights the impact of the educational programmes in different target groups in the population.

M.E.0.9

STREET TEENAGERS AND AN AIDS PREVENTION PROGRAM IN BRAZIL

Wiik, Flavio Braune*; Filgueiras, A.**; Castro, M. L.***.
*Brazilian Interdisciplinary Aids Association; **S.O.S. Child;***street kids educator.

Objective. To describe and contextualize the living conditions of poor teenagers who live on the streets and/or in institutions in Brazil's large urban centers, in particular, Rio de Janeiro. Present estimates number 30,000 street kids in Rio de Janeiro alone. A recently developed prevention program for the street teenagers will also be presented.

Method. People who work with the street teenage question were invited by the Brazilian Interdisciplinary Aids Association-ABIA to discuss the urgent need for designing a informative and educational program on Aids prevention in view of the alarming statistics on HIV infection and Aids in this population. Street kids educators were used to bridge the gap between social researchers and the teenagers, whereby prevention measures were introduced in culturally appropriate language. A audiovisual show, posters, folders and cartoons were produced in view of this reality.

Results. The program was developed in 5 street teenage groups in Rio de Janeiro. The informative material and its discussion was based on the idea of what it is to be healthy and how important it is to prevent Aids from their own point of view and experience.

Conclusion. Aids prevention programs are more efficient in transmitting prevention measures if the target group's socioeconomic and cultural background is known and if this knowledge is used as a base for introducing humanitarian values such as self-respect, solidarity and group support.

M.E.0.10

AIDS EDUCATION FOR YOUNG PEOPLE IN A MULTILINGUAL SOCIETY

Diouf, G.*; N'Doye, I.*; M'Boup, Souleymane**; Sow, A.*; Sow, P.G.*; MDiaye, M.***; et al. *Association Jeunesse Anti-Sida et MST (A.J.A.S.); **Universite of Dakar, Senegal; ***Ministry of Health, Dakar, Senegal

Objective: To develop an increase in AIDS awareness among the young people in Senegal, West Africa, to help prevent the sexual transmission of HIV.

Methods: Since many individuals may or may not alter their future sexual behavior by simply reading a pamphlet or by viewing an information poster, we created a young organization in Senegal (A.J.A.S.) to develop other means of communication to help educate young people about the transmission of AIDS. We enlisted the help of various departments at the University of Dakar and of the National AIDS Committee.

Results: 1) Small group meetings were organized to meet with young people in the schools and youth organizations to discuss AIDS and other sexually-transmitted diseases and how to prevent them. 2) We have invited young artists to disseminate information about AIDS in a creative way to the general public at sporting or cultural events. 3) We have enlisted actors and musicians to write plays and songs about the dangers of unprotected or promiscuous sexual activity in relation to HIV transmission. These have been performed in various districts of Dakar to help reach those individuals who may not have access to or even be able to read information pamphlets. 4) We have developed slide shows and video presentations to visually help facilitate discussions about the issues surrounding AIDS.

Conclusions: To deal with the need for public education concerning AIDS, new and vigorous efforts need to be made to reach young people who will be entering their sexually-active years. Techniques used must address the cultural, language and literacy barriers which may be present in a specific country or region.

M.E.0.11

THE GAGA BAPTISM OF THE CONDOM: FOLKLORE AND RELIGION AS ADJUNCTS OF AIDS PREVENTION AMONG HAITIAN MIGRANT AGRICULTURAL WORKERS IN THE DOMINICAN REPUBLIC

Didiez, Nelson; Arbaje, M; Rosario, S; Guerrero, E; De Moya, E.A.; Troncoso, I; et al.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To show how folklore and religious feelings can be used in order to promote participation in the struggle against AIDS, community organization and condom use adoption among Haitian migrant agricultural workers in the Dominican Republic.

Methods. A Haitian Creole-spoken AIDS prevention program was launched in July 1988 by the Ministry of Public Health and the Dominican Institute for Social Security focused on migrant agricultural workers in the sugar mill fields. Pre/and post intervention CAP studies are carried out in each community. Intervention comprises mobile units and local radio stations emission of AIDS prevention messages, formation and training of community health committees, collective baptism of the condom during yearly Easter Gagá rites, and universal availability of subsidized condoms at grocery stores.

Results. Pre/and post intervention CAP studies show a significant increase in the levels of awareness of AIDS and in condom use adoption. Eighty-eight health committees have been formed in order to consolidate and amplify the gains through interpersonal influence. The baptism of the condom in Gagá rites incorporates its use into culturally accepted behavior.

Conclusion. Cultural understanding and respect of the mores and beliefs of Haitian migrant workers has brought about an enthusiastic response on their part to the AIDS prevention program.

M.E.0.12

LESSONS LEARNED FROM FAMILY PLANNING COMMUNICATION PROGRAMS

Piotrow, Phyllis T.*; Coleman, P.*; Liskin, L.*
*Center for Communication Programs, The Johns Hopkins University School of Hygiene and Public Health, Baltimore, Maryland, USA

Objective. To identify key lessons from family planning programs relevant to AIDS education.

Methods. Evaluation of specific IEC interventions on related behavior.

Results. More than twenty years of experience in family planning programs worldwide demonstrates that well-designed information, education, and communication interventions not only increased knowledge and influenced attitudes, but also changed behavior. Major lessons learned from family planning communication programs to date are: 1) initial research is essential, both to reach target audiences and to persuade media gatekeepers; 2) mass media can motivate people to seek information and services. The impact is multiplied by promoting intermediate steps, such as: calling a hotline, entering a contest, joining a group activity, or attending a health facility; 3) popular entertainment can incorporate messages about sexual responsibility in a way that will be perceived and acted upon; 4) peer group counseling and services are effective in reaching both high and low status groups; 5) morale of service providers is a crucial factor that can be enhanced by appropriate IEC interventions.

Conclusion. Much can be learned from previous family planning IEC experience which is applicable to AIDS education programs.

Les proches et la famille
Close Friends and Family

M.E.O.13

AIDS AND THE FAMILY

Bor, Robert; Miller, R.; Goldman, E.; Johnson, M.; Lee, C.; Kernoff, P.
Royal Free Hospital and School of Medicine, London, England.

Objective. To describe the impact of AIDS on families presenting for counselling in a London Teaching Hospital over a four-year period (1984 - 1988).
Method. Families have been interviewed in different hospital units (Haemophilia, S.T.D., AIDS Counselling, Casualty, Medical Wards) over a period of four years. The 'Milan Method' of family therapy has guided the interview approach. Families have been seen at all stages; from the time of diagnosis of an individual, to the period of bereavement. Two thousand interviews have been conducted. Common themes have been recorded.
Results. AIDS is a potentially powerful source of stress on relationships between family members and between the family and other social systems. It exacerbates existing relationship difficulties and leads to new problems. Over 40 common themes emerged from these interviews. These related to (a) dynamics within the family (20); (b) stresses in the structure of the family (5); (c) problems in the family after someone has died from AIDS (5); and (d) problems betweenthe family and other social systems (10).
Conclusion. AIDS has a profound effect not only on the HIV-infected indivdual but also on his or her relationships with others. This includes increased stresses within the biological family and the family of affiliation. Counselling approaches which address these may help to reduce psychiatric morbidity in the survivors.

M.E.O.14

GAY MEN WITH AIDS: FAMILY OF CHOICE VS. FAMILY OF ORIGIN

Patten, John,* Walker, G.** * **The Ackerman Institute for Family Therapy, New York, New York, USA

Objective: A gay man diagnosed with AIDS needs to resolve the disjunction between his gay partnership and friends and his family of origin.
Description: Gay people, in order to establish a gay identity in accord with their sexual orientation, frequently leave their family of origin and sustain long-term cut-offs while establishing a gay family of choice which may or may not include a long-term partnership. When the gay man is diagnosed with AIDS, he often feels a need to resolve this disjunction. His desire or attempt to reconnect to the family of origin may create intense stress as the gay person reenters a world which can reinvoke longstanding internalized conflicts. This stress may generate vulnerability to increased illness.
The workshop will deal with the delicate balance between forging reconnections and maintaining gay identity in the face of life-threatening illness and will include a discussion of issues of gay identity, techniques of working with families of origin to create bridges between parents and gay children whose values they may or may not share as well as techniques of working with the gay couples when one partner makes a decision to reconnect with his original family. The area of reconnection requires a high degree of clinical sophistication and extensive knowledge of gay issues. The workshop will analyze the dangers as well as the possibilities for success in reconnection. Videotape excerpts from Stages of Illness, an Ackerman AIDS training tape, will be used to illustrate themes.
Conclusion: Psychotherapeutic understanding and themes can significantly help in the area of reconnection to family of origin.

M.E.O.15

THE DEVELOPMENTAL AND FAMILY SERVICES UNIT - A MODEL AIDS PROJECT SERVING DEVELOPMENTALLY DISABLED CHILDREN AND THEIR FAMILIES

Hopkins,Karen; Gross, J.
Albert Einstein College of Medicine, Rose F. Kennedy Center, Bronx, New York, USA

Objective: To assess the developmental needs of HIV infected children to provide rehabilitative and psychosocial services inorder to improve the quality of life by optimizing developmental functioning.

Methods: This paper describes a model pediatric program that uses a multi - disciplinary team to assess the developmental and psychosocial needs of HIV infected children and their families. The unit includes developmental pediatricians, social workers, psychologists, a medical ethicist, physiatrist and occupational, physical and language therapists, each of whom perform complete evaluations. The weekly multi - disciplinary conference results in the formulation of an Individual Family Services Plan (IFSP) for each child and his family.

Results: 30 children and their families have been evaluated and are in the program. Family compositions were non - traditional and varied. The disabilities and rehabilitative needs differed as well. The most frequently required services were occupational therapy and psychosocial intervention to increase parental coping skills in handling developmentally disabled, chronically ill children.

Conclusions:Children who are HIV+ are living longer and will have serious deficits. The need to develop services to address the unique developmental and psychosocial needs of these children and their families is paramount.

M.E.O.16

Effectiveness of a Support Group with Families of HIV infected children: A One Year Follow-up. S. Crandles*, A. Sussman**, M. Berthaud**, A. Sunderland** F. Cancellieri*. *Kings County Hosp.; Brklyn, NY, U.S.A; **SUNY-Health Science Center at Brooklyn, Brklyn., NY; U.S.A.

Objective: To examine the effectiveness of a weekly support group for the caregivers of HIV infected children in 1) reducing social isolation and depression, 2) increasing self esteem and education regarding HIV, and; 3) developing a support network.
Method: This report describes the group's development over a 1 year period (46 sessions). 31 families of 36 HIV infected children were invited to attend the weekly support group held in an urban hospital. Participants are referred by staff and by group members. Members include parents, grandparents, and foster parents. Two social workers, a physician assistant and a psychiatric resident facilitate the group while a third social worker leads a children's play group concurrently. Traditional group psychotherapy techniques are utilized.
Results: Groups size ranged from 3 to 13 participants. The average number of participants increased from 6 to 8. Seropositive mothers who acquired HIV heterosexually comprise the largest subgroup; they also attended most frequently. Males failed to attend or remain in the group. Themes such as members' concerns about their health, sexuality and relationships, and struggles with being single parents emerged. With time, these women came to focus more on their own emotional struggles and issues and less on more practical concerns of the care of their children. Members attended funerals and visited grieving families at the time of the death of children. They also celebrated the childrens' birthdays and went on group outings.
Conclusion: A support group for the families of HIV infected children was found to help them cope with the stress and pain of pediatric AIDS. Seropositive mothers demonstrated the greatest need and interest in this intervention. The authors retain their recommendation that this modality be an integral part of comprehensive care.

M.E.O.17

MULTIPROFESSIONAL EXPERIENCE WITH HIV INFECTED PATIENTS'FAMILY MEMBERS GROUP IN RIO DE JANEIRO, BRAZIL.

Moura, E.M.M.; Carvalho Neto, Lahire Dutra; Menan, J.L.L.; Longo, P.M.P.; Rachid de Lacerda, M.C.; Morais de Sá, C.A.
Gaffrée & Guinle University Hospital, University of Rio de Janeiro (UNI-RIO) - Brazil.

Objectives:
1) To inform family members of HIV infected individuals about transmission/prevention and follow up of the patient.
2) To give emotional support.
3) To estimulate family members and friends to participate in the Social and Health Politics in Brazil.

Methods: Since July 1987 when it started, the study group included psychologists, two social workers and one (female) doctor that meet weekly for one and half an hour with family members and friends of our patients. During this time period 60 family members and friends of 36 patients were included. Eleven family members continue to participate on the study group even after their patients death.
Results: Among the 60 family members and friends followed, including those who came exclusively for information, 54 (90%) could cope better with the difficulties of living with an infected person, in 49 (83%) it was observed a clear decrease in the anxiety and depression process. Finally in October 1988, 5 (8,5%) decided to organize an Association Group of Family Members of AIDS Patients in Rio de Janeiro to discuss and fight against negative situations generated by the AIDS.
Conclusions: The objectives were achieved notwithstanding the enormous social stigma of AIDS. The preliminary results suggest that is possible to extend this experience to other hospitals or centers with AIDS care, as happened in 1988 when doctors from other states of Brazil coming for training on AIDS care participed on the group and felt the importance of the experience.

M.E.O.19

SAMM-Stepping AIDS is My Mission-A Minority Adolescent AIDS Education Program.

Cargill, V.A. Assistant Professor of Medicine, University Hospitals of Cleveland, 2074 Abington Road, Cleveland, Ohio 44106 216-844-1278

SAMM is a two year old minority adolescent AIDS education program. Targeted to predominantly black adolescents at risk, SAMM uses peer pressure to provide a supportive environment to maintain safer behaviors. Founded on volunteerism, SAMM utilizes community persons, black health and parahealth professionals, and adolescents to provide AIDS education. Sites are not limited to schools, but rather target adolescents at community centers, detention homes, and Job Corps. Education is provided in a nonjudgemental style, using familiar street terms, as well as black adolescent jargon. Slides of black persons in various stages of HIV infection are also used, in addition to a panel of black PWAs/PWARCs/HIV positives who interact with the teens and answer questions. At the end of each session is a social event (dance when permitted), where the SAMM volunteers as well as the disc jockey serve as undercover AIDS educators. By providing free tee shirts, caps, refreshments and entertainment, SAMM's message is not only to stay safe but to be proud. We believe that our teens are each unique, valued individuals. AIDS education in our format is linked to self-respect and empowerment.

M.E.O.20

Triple Jeopardies - Reaching Ethnic and Racial Minority Youth who are Gay - Identified and/or IV Drug Users

Gayle, Jacob A. Kent State University American School Health Association, Kent, Ohio, USA.

American youth are identified as one of the next waves of individuals greatest at risk for HIV infection. Black and Hispanic youth are of special concern regarding increased incidences of HIV infection due to disproportionate HIV antibody seropositivity rates in these racial and ethnic groups. Furthermore, those "minority" youth who are intravenous drug users and/or homosexually active (gay or bisexual) may be at even greater risk because of practices often associated with these behaviors. This presents challenges beyond those singularly identified with reaching either "minority" youth or gay/drug-using youth alone. Very few school-based educational initiatives target such youth in particular.

The American School Health Association has developed strategies to train school-based professionals to prepare for the challenges here-described. This presentation will present some of these strategies.

M.E.O.21

AIDS EDUCATION IN COMMUNITIES OF COLOR: HOW TO MAKE A DIFFERENCE

Hassan, Rashidah Lorraine. Bebashi, Philadelphia PA. USA.

Those individuals most at risk for HIV infection are also most at risk for a cadre of other maladies which have not as yet been successfully addressed in the past by health education. Heart disease, diabetes, hypertension, unplanned adolescent pregnancy infant mortality, all have been addressed in health education targeted toward poor, under educated people of color with very little success. AIDS education can not be successful in altering behavior without defining cultural sensitivity, recognizing cultural mores, consideration of language and cultural/ethnic communications.

A model of education will be presented which incorporates the principals of education blended with the realities of cultural influences. The "how to's" of accessing the community needs, targeting specific populations and developing realistic education and service programs will be highlighted.

M.E.O.22

INTEGRATING HIV/AIDS INFORMATION INTO SCHOOL HEALTH EDUCATION FOR MINORITY STUDENTS

Warren, Rueben C. Centers for Disease Control Atlanta, Georgia, U.S.A.

Health education has been taught in the public school system for many years. Unfortunately, strategies to assure relevant and meaningful information have been limited. In fact, much of the school curricula, in general, serve as a barrier rather than an enabler to learning for minority students.

Minority and/or low income students often have limited financial and/or geographical access to health care. Consequently, health issues are low on the priority scale for many of these students. Therefore, innovative models are needed if school health education is expected to influence the knowledge, attitudes, or behaviors of minority students.

This presentation focuses on integrating HIV/AIDS information into a salient health education model for minority students. Emphasis will focus on the students' health goals, other conflicting goals, and competing values and beliefs. Recommendations will be made to assure that the health messages are relevant to the total life circumstance of the students. The relationship between knowledge, attitude, and behavior will also be reviewed.

M.E.O.23

AIDS AND MINORITIES: STRATEGIES FOR PREVENTION

Dumpson, James R.; Fraser-Howze, Debra; & Lopez, Mary Louise Black Leadership Commission on AIDS, New York, NY, USA

Objective: To pose innovative approaches to reduce AIDS-related risks of poverty, addiction and educational deficiencies, and therefore the risk of AIDS.
Methods: 1. Include minority leaders in policy formation and decisions. 2.Review and restructure operations of and financial support to municipal hospitals in urban centers overwhelmed by minorities with AIDS. 3.Development of culturally-sensitive approaches to adolescents to reduce experimentation with "unsafe" sex and drugs. 4.Focus on the hub of the epidemic--minority women of childbearing age and their infants--with a high-saturation education/prevention campaign. 5.Focus on the IV drug abusing population, the majority of which is Black and Hispanic, and provide new and radical outreach programs.
Results: Currently, in New York City, the Black Leadership Commission on AIDS has mobilized and now is advising the city, state and federal health systems. BLCA programs are now seeking funding for adolescent outreach and education/prevention centers for African-Americans.
Conclusion: The belief is increasing among African-Americans in the U.S. that AIDS was introduced into this community by outside forces in an attempt to kill off the race. This view of biological genocide is a serious barrier to the implementation of AIDS prevention efforts by governmental, health care and educational systems which are not trusted by minority communities. The way to correct this situation is to utilize minority leadership in decision-making, and minority staffing in direct service. By placing special culturally-sensitive concentration on minority women of childbearing age, their infants, IV drug abusers and adolescents reaching the age of sexual and drug experimentation, prevention can attain some success. Only the full and active participation of minority leaders in all systems can make this possible.

L'entraide : Une stratégie d'adaptation
Self-Help: A Coping Strategy

M.E.0.24

SELF HELP GROUPS AND THE AIDS PATIENTS

HECTOR BALTHAZAR
Canadian Council on Social Development, Ottawa, Canada.

There is a paucity of evidence showing the Aids Community is fully aware of the potentials of the self-help group model in dealing with many personal, emotional and social problems the condition gives rise to. This session will present a range of possibilities the self-help group model offers Aids Patients, their Families and their Friends.

Also treated will be the gains the Aids Community can draw from associating with the Self Help Community as well as the contributions the Aids Community can make to it. The reasons why the Aids Community does not work closely with the established centers such as Self Help Clearinghouses will be explored.

The work that a number of self help groups with an advocacy agenda will be presented with the view of exploring both the applicability of such an option for Aids Patients and the strategies groups have used in dealing with specific concerns.

SELF-HELP: A PERSONAL PERSPECTIVE

Kowalski, Alex. Vancouver Person's with AIDS Society. Vancouver, Canada

M.E.0.26

THE AIDS PREVENTION CONCEPT OF THE DEUTSCHE AIDS-HILFE CO-OPERATIVE MODEL

Ian Schäfer, Norbert Specht, Deutsche AIDS-Hilfe e.V.
Nestorstr. 8 - 9, 1000 Berlin 31, West-Germany

Objective: To describe planning, realization and monitoring by a nationwide working non-governmental organization in the Federal Republic of Germany. Methods: In 1985 non-governmental groups were founded as AIDS-Hilfen in the sense of self-help groups. The distance to governmental health authorities was essential for the access to target groups as gays, i.v. drug users and prostitutes (in the sense of anti-discrimination). Brochures in an open and explicit language were published. The motto was "if you have a sexual disease you have to talk about sex and sex can still be fun". The acceptance of different kind of lifestyles is another main rule for the successful work of non-governmental organizations. Deutsche AIDS-Hilfe is the umbrella organization now of 80 local counselling centers which are well accepted by target groups and the general public. Results: Continuous discussion, expert meetings and feed-back by people with AIDS/HIV and numbers of target groups led to promising results in risk reduction and social acceptance of people with HIV and AIDS. Conclusion: To reach specific target groups you need a specific language especially for discreminated minorities. A non-governmental organization seems to be the best educational partner.

PHYSICIANS SELF SUPPORT GROUP

Chateauvert, Michel Ville Marie Social Service Centre, Montréal, Québec, Canada.

Under the auspices of Comité SIDA Aide Montréal I have been facilitating for the past 6 months a self-support group for physicians who have a significant proportion of people with AIDS as patients.
I will present the difficulties in getting such a group off the ground and attempting to keep it focused on meeting some of the emotional and educational needs of the participants. Issues such as the following will be addressed: the alleged reluctance of physicians to share their feelings; the difficulties in exercising leadership amongst a group of highly autonomous professionals; emotional impacts of having a large practice of people with AIDS.

M.E.O.31 WORLDVIEWS AND SEXUAL PRACTICES IN SRI LANKA: THE ROLE OF ANTHROPOLOGICAL APPROACHES IN A GLOBAL PROGRAMME

Weeramunda, J.+; Carballo, M.*; Mehryar, A.*.
+ Department of Sociology, University of Colombo, Sri Lanka
* Social and Behavioural Research Unit, Global Programme on AIDS, World Health Organisation, Geneva, Switzerland.

Objective. The objective of the paper is to highlight the complex interplay between culture as a boundary-maintaining mechanism and high risk sexual behaviour as one which tends to erode such boundaries.
Method. The paper will focus on the difference in values between youth and adult groups in relating to the tourist industry in Sri Lanka, taking into account the potential the latter has for spreading HIV through male homosexual tourists. A combination of quantitative and qualitative survey data on KABP (WHO model) and on boy prostitution will be employed. The quantitative analysis forms the background for the explanation of behaviour as moderated by the caste system and by the cultural mechanisms for the integration or rejection of those whose behaviour deviate from the norm.
Results. The age of respondents is inversely related to the level of knowledge of HIV/STD aetiology as well as to degree of risk behaviour. Apparently the young have a better capacity for adapting their sexual behaviour to new situations even though they are aware of the dictates of traditional sexual mores. The caste and caste network serve as a regulating mechanism for: (a) initial access to the sexual trade and, (b) eventual reintegration into traditional society and life style.
Conclusion. The implications of the findings for the national STD/HIV control programmes are discussed. The need for a micro-social approach to an understanding of the problems of boy prostitution and other forms of high risk behaviours is emphasised.

M.E.O.32 COMPORTEMENTS SEXUELS ET CONTEXTE CULTUREL
UNE APPROCHE METHODOLOGIQUE DE LA PREVENTION DU SIDA

Philippe ENGELHARD, Moussa SECK, ENDA-TM, BP 3370 - DAKAR

OBJECTIFS : *concevoir une méthodologie souple et peu coûteuse capable de donner rapidement une physionomie des comportements sexuels et de leur contexte culturel dans une région ou un pays. A partir de ces données définir des messages préventifs et des canaux de communication efficaces pour atteindre les zones géographiques et les groupes sociaux segmentés de façon pertinente.*
METHODE : *Elle consiste dans un premier temps à déterminer d'un point de vue heuristique les segments de population et les zones géographiques à risque "élevé" et à les comparer à des "groupes témoins". Dans un deuxième temps on procède grâce à des tests statistiques simples à une segmentation plus fine. Le pays testé a été le Sénégal. Au total 1.500 personnes ont été touchées en zone urbaine au moyen de questionnaires, et en zone rurale au moyen de "FOCUS GROUP".*
RESULTATS : *Il apparait que l'information nécessaire à la mise en oeuvre d'un plan de prévention est moindre qu'on ne l'imagine généralement. Le concept de groupe à risque est beaucoup trop restrictif notamment celui de "Prostituées" auquel il faudrait substituer la notion de "Femmes Libres". Par ailleurs 15 % des hommes et des adolescents ont un comportement très risqué.*

CONCLUSION : *L'interface des régions ou des groupes à "Risque" avec la "Population moyenne" exige une grande attention. La réponse à la complexité des segments réside dans la décentralisation à la base de la communication.*

M.E.O.33 REACTION DE LA SOCIETE ZAIROISE ENVERS LE SIDA.

Rukarangira wa Nkera,Harvard School Of Public Health,Boston,U.S.A.

Objectif:Comparerles résultats des études C.A.P. faites à Lubumbashi deuxième ville du Zaire,en 1987 et en 1988 afin d'évaluer les connaissances acquises après une année de campagne nationale contre le SIDA.

Résultats:Un apercu de changement des connaissances d'attitudes et de comportements révele des contraintes persistantes,et permettent de voir les liens entre le SIDA et l'économie,la culture et la société.

Méthodes:Deux échantions dont les réponses libres ont été codées et analysées statistiquement.

Conclusions:Les campagnes de masse doivent être soutenues par des interventions directes au niveau de la communauté afin de créer des réseaux de soutien aux changements de comportement.

Mots Clés: Evaluation,C.A.P.,Changements,Contraintes.

M.E.O.34 CROSS-CULTURAL TRAINING FOR AIDS PROVIDERS SERVING CULTURALLY DIFFERENT PATIENTS

Noel A. Day,* Amanda Houston-Hamilton DMH,* Patricia Evans MD,** (*Polaris R&D, **Department of Public Health, San Francisco, USA)

Objective To increase the sensitivity of AIDS services providers to the cultural aspects of serving ethnic minorities who are HIV infected or at-risk of AIDS
Methods Written guidelines based on the cultural values of seven minority ethnic groups were developed and a training program designed for providers addressing the AIDS-related health, social, emotional and supportive service needs of Black, Hispanic, Indian, Filipino, Chinese, Japanese, and Vietnamese patients and their families. Guidelines and training focussed on the values clients bring to their interactions with providers and the effects of those values on their behaviors and their expectations regarding provider behavior. Attention was devoted to values affecting establishment of rapport, diagnosis and treatment planning, and cultural values regarding topics like sexuality, homosexuality, abortion, dying, and disease etiology. Training aimed at increasing provider's awareness of their own cultural values and of the range of possible behaviors conditioned by client cultures
Results 368 providers were trained including nurses, AIDS educators, emotional support counselors, hotline volunteers, social workers, prison staff, drug counselors, and agency administrators. Evaluations show increased understanding of behavioral differences and willingness to consider cultural issues in planning and delivering treatment and services
Conclusion Providers can be more effective and experience less frustration if they provide service in culturally appropriate ways

M.E.O.35 IS THERE A UNIQUE ROLE FOR ANTHROPOLOGY IN THE STUDY OF AIDS?

Feldman, D.A.
Department of Epidemiology and Public Health (R-669), University of Miami, School of Medicine, P.O. Box 016069, Miami, FL 33101, USA.

Anthropologists have become increasingly involved in AIDS social research and activities. This paper will briefly review some of the major contributions by anthropologists to the study of AIDS, in the areas of epidemiology, health education, evaluation of social services and health care delivery, analysis of social change, explanatory models, and risk reduction programs. The central role of the ethnographic method in anthropological research will be assessed within the context of AIDS-related investigations. Experiential data through participant observation may provide the essential framework for understanding the cultural context of AIDS-related behavior. Anthropologists may offer a unique role in the study of this global pandemic.

M.E.O.36 LES ENQUETES CAP SUR LE SIDA. EXPERIMENTATION D'UNE TECHNIQUE D'ENQUETE PAR DISCUSSIONS DE GROUPE SUR UN ECHANTILLON D'ETUDIANTS ZAIROIS

Verbeke, Ronald[*] et Katengaza-Lahaye, Amina[**]
[*] Université de Mons, Belgique, [**] Université catholique de Louvain, Belgique

Objectif: élaboration et expérimentation d'une technique d'enquête CAP (Connaissances, Attitudes, Pratiques) en matière de SIDA dont les modalités se veulent adaptées au contexte socio-culturel de l'Afrique centrale.

Méthode: nous avons mis au point une technique d'enquête consistant en (1) discussions de groupe, (2) impliquant peu de directivité, (3) déclenchées par le récit d'anecdotes relatives au SIDA et (4) se déroulant dans un contexte familier et une atmosphère détendue. Ces modalités d'enquête ont été expérimentées sur 42 étudiant(e)s zaïrois(es) résidant à Bruxelles, répartis en 9 groupes de 4 à 6 sujets. Parallèlement, nous avons procédé auprès d'un groupe contrôle à une enquête classique consistant en entretiens individuels à l'aide d'un questionnaire standardisé.

Résultats: les informations obtenues par la technique originale d'enquête basée sur des discussions de groupe se sont avérées significativement plus riches (en quantité, en originalité, en diversité et en nuances) que celles obtenues par une méthode traditionnelle impliquant des réponses individuelles à un questionnaire.

Services sociaux : expériences et évaluations
Social Services: Experiences and Evaluations

T.E.0.1

NEW YORK STATE'S RESPONSE TO AIDS: A ROAD MAP FOR HUMAN SERVICES

PRESENTERS: Cesar A. Perales, Commissioner, NYS Department of Social Services; Barbara J. Sabol, Executive Deputy Commissioner, NYSDSS; Jeffrey L. Carples, Deputy Commissioner, NYSDSS; Nicholas A. Rango, M.D., Director, AIDS Institute, NYS Department of Health; and Dennis P. Whalen, Deputy Director, NYS Division of Substance Abuse Services, New York, NY, U.S.A.

This forum will describe the development and operation of New York State's (NYS) integrated network of health and human services for people with AIDS, and will suggest ways to establish similar interagency systems in other places. Approximately 20,000 AIDS cases were reported in NYS by January 1989, including a growing number of cases among women and children. The overall numbers are expected to rise to 90,500 by 1995, requiring a significant expansion in health and human services. In this forum, representatives of three NYS public agencies will discuss the coordinated human services model that serves the needs of thousands of individuals and families with HIV-illness. HIV has afflicted a diverse population in NYS. State agencies provide a continuum of care that meets the differing needs of gay men, IV-drug users, individuals and families, women and children, adolescents, minority and non-minority groups, the homeless, urban and rural dwellers. Governor Mario Cuomo's Five Year Plan (to be given to participants) outlines the requirements for case management and provision of medical, non-medical, and substance-abuse services. Panelists will describe the system of Designated AIDS Care Centers; child foster care programs, such as Leake and Watts; health-related facilities for substance-abuse treatment; shelters for homeless people with AIDS, and other programs. They will also highlight unresolved issues and challenges.

T.E.0.4

OBSTACLES TO USE OF PUBLIC SOCIAL SERVICES AND WORKERS IN AIDS PREVENTION AND CONTROL PROGRAMMES

Lloyd, G. Tulane University, New Orleans, LA USA

Objective: To assess potential usefulness of training workers in the public social services for prevention education and casefinding in AIDS prevention and control programs, and to identify obstacles to such efforts. Methods: Informal discussions were held with trainers and supervisors in public social services in six settings-two each in Pattern I, II and III areas. Results: although public social services offer a pool of workers with some degree of training in counseling or education, obstacles and constraints in both developed and developing countries seriously restrict adding roles/functions related to HIV/AIDS. Public social services are almost universally:
(a) accorded low status; (b) prone to high personnel turnover; (c) subject to chronic mismatch of service demand and resources; (d) apt to narrowly define problem area and restrict clientele; (e) operate in rigid hierarchical structures; and (f) vulnerable to political interference. Taken altogether, these variables are powerful obstacles in the way of training and using public social service workers for carrying out additional tasks related to AIDS prevention and control. Additionally, in many places, workers see any AIDS-related activity as intensifying the stigma or low status of their work and resist training. Conclusion: Training existing public social service personnel for roles in AIDS prevention and control programs may be more expensive and less effective than recruiting and training personnel in new HIV/AIDS-specific public social service agencies.

Lapointe, Bernard.

T.E.0.8 PLUSS, AN ORGANIZATION OF BODY POSITIVES IN NORWAY ENCOMPASSING ALL GROUPS.

Arne N. Husdal, Sylvia Kalbakk, the board of Pluss and members, Oslo, Norway

Objective: Having an active organization, unique compared to similar groups throughout the world, we would like to present our ideas, our achievements so far and our methods and aims.
Methods: Positives must fight two major evils, the virus and the difficult enviroments. Both evils seem extremely to conquer, but they are related and not impossible. Many people, experts and humanists fight with us, but there are no recepies for either way; towards getting well or creating justice. Nobody can fight better than positives. In Norway we fight along with the government and we are supported by the official institutions and other organizations. But just as important is our independence. In Pluss, positives support each others, we offer alternative treatments, we consider information vital for each individual and we stand forward and exhibit ourselves to show force of will of living - as we also have to fight public fear, prejustice and discrimination.
Results: It is too early to present a complete evaluation. But already we have become an important suppliment for each individual member, to the traditional health and sosial services and to the society. We keep in touch with all primar health stations and hospitals throughot the country. We have 170 members (equals 25 per cent of all registered positives). By june we will be able to pre sent more results.

T.E.0.9 Michel Galto, AIDES, Federation Nationale . Paris, France

T.E.0.10 THE ROLE OF AIDS SERVICE ORGANIZATIONS IN DEVELOPING PUBLIC HEALTH POLICY AND SERVICES FOR HIV DISEASE.

Hymes, James P.* Philadelphia Department of Public Health, AIDS Activities Coordinating Office, Philadelphia, Pa.

This presentation will present a model of a large urban Health Department interfacing with AIDS Service Organizations (ASOs) in the provision of education and direct services to communities and individuals with HIV disease. These various programs will include: prevention activities, HIV testing and counseling, coordination of service delivery, and policy and planning. The Philadelphia Department of Public Health is unique. The AIDS Activities Coordinating Office (AACO) is a comprehensive department defined as a separate entity. All services mandated under the aegis of public health exists with AACO (Surveillance, Prevention, Policy and Planning, and Service Delivery). An additional component, AIDS Agency Services Unit, combines all of the above functions on a contractual basis through ASOs. These ASOs serve as active participates in their role as conduits for effective public health activities within the local communities. This level of involvement empowers the larger community to address its own needs rather than through a select group of bureaucrats defining the community needs. This presentation will provide a model for ASOs to impact the local department of Health for the enhancement of AIDS resources, services, and policy development. ASOs who are beginning or having difficulty with local health authorities will be given a model to work more effectively with local authorities.

T.E.0.11 INFORMATION FOR EMPOWERMENT

Delaney, Martin. Project Inform. USA.

T.E.0.12 THE LEARNING ABOUT AIDS PROJECT - A PARTICIPATORY APPROACH TO HEALTH EDUCATION ABOUT HIV INFECTION AND AIDS

Peter Aggleton, Department of Education, Bristol Polytechnic
Bristol, England

Objectives - To identify a rationale for participatory education about HIV and AIDS and to describe the processes of development, dissemination and evaluation on the Learning about AIDS project.

Methods - The Learning about AIDS project is a national project developing and disseminating innovative health education materials for use in adult education about AIDS. Interim materials were disseminated by the Health Education Authority in 1987, and a considerably enhanced training package will be published in February 1989. A major dissemination of these materials has commenced in the 14 health regions in England involving health educators and trainers working in the health service, in education, in social services and in the voluntary sector.

This paper will identify a rationale for participatory education based on group work and describes the manner in which Learning about AIDS materials were developed. It discusses the value of such an approach in fostering self-empowerment, community development and social change.

The dissemination strategy will be described as well as the steps that have been taken to use process and product evaluation to assess the outcomes of the project.

Problèmes de la communauté gaie
The Gay Community Issues

T.E.0.13 LES HOMOSEXUELS ET LE SIDA

Pollak, Michael. Paris, France

T.E.0.15 NETWORKING: A PREVENTION AND CARE STARATEGY FOR THE GAY MINORITY IN SOUTH AFTICA.

Pegge, John* **, Isaacs, Gordon* **, and Miller, Steven**.
*GASA 6010 Counselling Services, Cape Town, and ** AIDS Action Group, Republic of South Africa.

Objective. To secure an effective preventive and care strategy for the gay minority in South Africa, a group without legal status.
Method. An analysis has been made of the impact of government policy, legis- and practice on behaviour modification and care of the HIV-infected in the gay minority.
Results. Government and official bodies have failed to recognise HIV infection and its prevention in the gay community. They have failed to consult with gay community groups and have not provided financial and educational resources. Widespread antibody testing and epidemiological research has been afforded the highest priority. Confidentiality has not been guaranteed, and no legal constraints have been placed on pre-emplyment testing. Legislation has been enacted allowing for the detention if HIV-seropositive persons. Social Security is inadeqaute to meet the survival needs of single persons. No provision has been made in the health budget for antiretroviral therapy. The effect on the gay community has been the emergence of powerful politcal consensus regarding oppression. Networking has been the most strategic method to identify and utilise human and material resources. This has secured large-scale sexual behaviour modification and community care of the infected.
Conclusion . Despite a lack of legal status and the failure of government to contribute and collaborate networking between volunteer groups and individuals has secured behavioural change through education and care for the infected.

T.E.0.17 ORGANIZATIONAL PRECONDITIONS FOR COMMUNITY ACTION: A REPORT OF GAY AND MINORITY COMMUNITIES IN NEW YORK CITY

Melinda A. Cuthbert, Yale University, New Haven CT, USA.

Objective. To identify the preconditions for gay and minority communities to initiate and sustain action in response to AIDS.
Methods. Structured interviews were conducted with 60 key respondents from 53 organizations in New York City: 17 from non-profit organizations; 4 from religious organizations; 17 from community based organizations; and 22 from government agencies.
Results. Analysis revealed that gay leaders and organizations were able to develop extensive networks between organizations to deliver services, transmit valuable information to network members, organize and politicize clients, mobilize resources, as well as, lobby the government for coverage of this new illness under existing programs and extension of services. Respondents from organizations in the minority community were involved almost exclusively in direct service, had no resources to commit to network building or lobbying, had much less information about government programs and funding cycles, and felt they had no impact on programming or policy development.
Conclusion Comparative analysis of these communities suggests that the key preconditions for the mobilization of community action include: 1) the existance of pre-existing recruitment networks, 2) diverse funding bases, 3) priority of AIDS issue in community, 4) developed client and external constituencies, and 5) definition of AIDS as a socio-medical rather than a moral issue.

T.E.0.14 COVERAGE OF SELECTED DRUGS UNDER STATE MEDICAL ASSISTANCE (MEDICAID) PROGRAMS IN THE U.S.A.

Schatz, Benjamin
* National Gay Rights Advocates, San Francisco, California, USA

Objective. To determine whether seven medications are covered by U.S. state medical assistance (medicaid) programs for people with HIV infection, and to analyze policy consistency among differing states.
Method. Survey of medicaid agencies in all 50 states and Washington, D.C.
Results. State medicaid agencies have broad discretion to determine which drugs they will provide; thus, levels of coverage for HIV+ people vary widely by location. Differing practices exist regarding coverage of specific drugs, need for prior authorization, reliance on physician recommendation, and willingness to provide medication to asymptomatic HIV+ person. 90% of states routinely fund AZT for persons with AIDS; 74% for asymptomatic HIV+ persons. 65% routinely fund aerosolized pentamedine for persons with previous pneumocystis; 49% for HIV+ persons with no previous pneumocystis. Most but not all states (73%) fund all federally licensed drugs in survey (AZT, acyclovir, septra, dapsone, and fansidar) if physician prescribes for persons with AIDS; only 25% cover unlicensed drug (ganciclovir). 29% indicate that certain drugs available to persons with AIDS are not available to asymptomatic HIV+ persons.
Conclusion. Standards governing availability of drugs to HIV-infected individuals under U.S. medical assistance (medicaid) programs vary dramatically from state to state. National coordination would increase consistency and fairness.

T.E.0.16 HOMOPHOBIA IN THE DEVELOPMENT OF PUBLIC POLICY ON AIDS IN THE UNITED STATES OF AMERICA

Rosenthal, Eric*; Ziegler, A.** *Human Rights Campaign Fund, Washington, D.C.; **Public Health Foundation, Washington, D.C., U.S.A.

Objective: To examine the effects of homophobia in developing public policy on and combatting AIDS in the United States.
Methods: To interview public policy makers inside and outside of the United States government. To examine case studies in which government policy has been affected by homophobia.
Results: AIDS is a disease which in the United States primarily affects gay and bisexual men. The political process, which determines most funding levels for AIDS research and prevention, is influenced by homophobia.
Conclusion: Homophobia has played a role in developing AIDS policy in the United States. Homophobia is an impediment to sound public health policy on AIDS. It has slowed progress in preventing the spread of the disease. Methods must be found to remove the influence of homophobia in the development of AIDS strategies in order to formulate and implement the most effective AIDS policy.

Rôle des ONG dans la lutte mondiale contre le SIDA
The Role of NGOs in the Global Response to AIDS

W.E.0.1 THE KEY ROLE OF A NATIONAL NON-GOVERNMENTAL AIDS EDUCATION PROGRAM IN CANADA

Walters, David J; Wardrop, K.; Burr, R.; Gemmill, I.
Canadian Public Health Association, Ottawa, Ontario, Canada.

Objective. To describe a unique AIDS Education Program based in a Public Health Organization which takes a lead role in Health Promotion in Canada.
Methods. As a multidisciplinary professional Association of 3,000 public health workers, the Canadian Public Health Association is active in programming on local, national and international levels. In 1986, the CPHA undertook a contract with Health and Welfare Canada for a comprehensive AIDS Education Program. CPHA assembled an Expert Advisory Committee, professional staff, and initiated five Program Components: Research, Consultation & Coordination; Media & Advertising; National Clearinghouse; Seminars/Conferences; & Educational Resources.
Results. The CPHA Program took the lead in stimulating Canadian AIDS education initiatives. It established the first multi-media campaign in Canada in March 1987 which included TV public service announcements highlighting the risk of sexual spread of AIDS and urged the use of condoms for the first time on major networks in Canada and indeed North America. A series of regional and national conferences advocated attention to AIDS education on a broad, multisectoral level. Education resources have included 4 million brochures, 500,000 fact booklets, videos for the Workplace and Schools. The Clearinghouse has answered to thousands of requests for tailored education resource packages.
Conclusion. A non-governmental Public Health Association approach provides a responsive and effective resource to AIDS programming which mobilizes the expertise and credibility of a well established professional membership and administration.

W.E.0.2 SIGNIFICANCE OF THE AMERICAN RED CROSS ROLE IN HIV/AIDS ED

Carole Kauffman*, M. Cotton*
American Red Cross, National Headquarters
Washington, D.C. USA

Objective: To describe factors contributing to the successful and far reaching HIV/AIDS education programs of the American Red Cross (ARC), as well as challenges facing organizations to sustain these efforts over time.

Methods: Working in consultation with the U.S Dept. of Health and Human Services, the ARC initially mounted a nation-wide public information campaign consisting of videos, PSAs, and pamphlets. This campaign shifted to targeted educational programs for youth, minorities, and the workplace and now includes intensified interventions with hard-to-reach populations. Utilizing quantitative and empirical data, details of the program's growth and factors contributing to successful implementation are described.

Results: As a trusted organization, ARC has HIV/AIDS education programs in all 50 states, trust territories and military stations world-wide. These educational materials have also been used and translated by other Red Cross Societies including Russia and South Africa.

Conclusion: The role of non-governmental organizations has been identified as critical in helping stop the spread of HIV infection and providing needed services. Sensitivity to religious, multi-cultural, and minority concerns has been complex but central to success. The need to monitor and evaluate programs will increasingly be needed to justify the sustained financial and human resources required. Many other organizations have become involved in these efforts.

W.E.0.3 SWIFT...AND SURE? THE UK VOLUNTARY RESPONSE TO AIDS

Stephanie Malach*; J Grimshaw**; Dr S Mansfield*; U O'Brien*.
*London Lighthouse, London, UK
**Director, Landmark, London, UK

Objective To describe and analyse the response of UK voluntary organisations to AIDS since 1981, and assess their impact on service delivery.
Method From a small base, AIDS non-governmental, voluntary organisations have grown dramatically. They now number approximately 200 and are arranged in a pyramidical structure (defined in terms of paid staff and budget size). An analysis of the history, management structure and scope of service provision of a select sample of these organisations was carried out.
Results Most were set up after a major UK Government advertising campaign on AIDS. Traditional collectivist structures predominate, typified by lack of internal cohesion, planning and direction. However some organisations are developing new managerial structures which combine traditional hierarchical structures with collectivist ways of working. Services provided by the latter grouping are responsive, flexible and able to meet the needs of people with HIV, ARC and AIDS, who in turn form a significant proportion of their volunteers and paid workers.
Conclusion The UK voluntary response to AIDS was swift but development has been hampered by little or no structured planning. The effectiveness of organisations, their ability to develop and sustain services, and to nurture the role that people with AIDS play within them, is linked to management structure.

W.E.0.4 Role of non governmental organisations and NGO networks in the control of HIV infection.

Lucas, Susan; Poore, P. UK NGO AIDS Consortium for the Third World.
UNITED KINGDOM

Non governmental agencies (NGOs) in both developed and developing countries have taken a leading role in responding to the AIDS/HIV epidemic. Their impact has been reinforced by formal and nonformal groupings or networks. The UK NGO AIDS Consortium for the Third World was one of the first of these networks, and activities of member agencies illustrate the richness of the NGO response.
Activities include:
1) Expansion of existing programmes. NGOs involved in health care have intensified efforts to provide steril equipment, and preventive care. Agencies involved in education and development have expanded their role to include dissemination of information on HIV infection and AIDS.
2) Helping to establish and fund local agencies, as a result of local initiatives.
3) Provision of appropriate information. Agencies which have already specialised in wide dissemination of appropriate information resoponded to the need of a variety of audiences for information on HIV transmission and prevention.
4) Provision of manpower and training facilities; particularly integrated into existing services. Some NGOs from the UK have trained or funded staff specifically working on AIDS/HIV.
5) Funding of specific AIDS-related projects.
6) Creation of networks; the main roles of the UK network have been;
  - -information exchange, sharing of experience
  - -pressure group/campaigning role, strengthened by the joint approach of 30+ member agencies
  - -Representation of NGOs at international meetings; many agenceis are small, with few staff, and do not attend.
  - -Acting as focal point for communication (with Global Programme on AIDS (GPA), U.N. agencies, British Government departments, othe NGO networks, etc.)

Roles of NGOs vs GPA.
The importance of NGOs is now recognised, but a mechanism has still to be established which will ensure that the individual strengths of each NGO are used effectively. Creation of NGO networks will improve cooperation.
Conclusion:
Networks can offer valuable experience to NGO members. Members of such groups will always tend to be those already involved, and there are concerns about adding further layers of administration. The experience in the UK so far has been positive, and encourages the creation of networks elsewhere.

W.E.0.5 ROLE OF NON-GOVERNMENTAL ORGANISATIONS IN THE STRUGGLE AGAINST AIDS. CASE STUDY - UGANDA RED CROSS SOCIETY

Lubega, Juliet*; Mueller, O.**; Senoga, J.*; Sebbowa, R.*.
*Uganda Red Cross Society, Kampala, Uganda; **League of Red Cross and Red Crescent Societies, Geneva, Switzerland.

Objective. To describe the efforts, impacts and problems of the work of non-governmental organisations in a developing country in the struggle against the AIDS epidemic.
Methods. The Uganda Red Cross has contributed to the nation wide government guided AIDS Control Program in the fields of information/education, blood donor recruitment and protective material distribution for healthworker. Information materials, based on a KAP study carried out before, have been produced and translated into major languages. Red Cross Fieldofficers have been trained in dissemination.
Results. Uganda Red Cross Society through her grass root levels network with the technical and financial support of her sister societies is contributing largely to major parts of the AIDS Control Program in Uganda.
Conclusion. The work of non-governmental organisations in AIDS control has a large impact in developing countries. The Red Cross movement with its infrastructure and networks has the power to contribute positively.

W.E.0.6 DEVELOPING A PROGRAMME OF WORLD HEALTH ORGANIZATION SUPPORT FOR NON-GOVERNMENTAL ORGANIZATIONS IN THE FRAMEWORK OF NATIONAL AIDS CONTROL PROGRAMMES

Grose, Robert, Mann JM
Global Programme on AIDS, World Health Organization,
SWITZERLAND

Objective To promote and support the involvement of non-governmental organizations (NGOs) in national AIDS control programmes (NACPs).
Methods At country level, WHO and NACP staff and NGOs consult to determine mutual interests and areas of opportunity. NACPs and NGOs exchange technical data and feedback on implementation. A mechanism for funding NGOs from NACP funds has been developed. With international NGOs, WHO exchanges information with a wide range of organizations, using their networks to disseminate appropriate material and as a focus for channelling information to the Global Programme on AIDS.
Results NGOs have been responding to AIDS since the first unrecognised patients began arriving at NGO-run health centres and hospitals. AIDS service organizations arose spontaneously and often in advance of local or national governmental responses. The need for collaboration felt by NGOs, governments and intergovernmental organizations is resulting in increased complementarity and integration.
Conclusions Collaboration among NGOs, governments and intergovernmental organizations exists and is developing rapidly in support of national AIDS control programmes. The momentum needs to be maintained with active support from all parties.

Rôle des ONG dans la lutte mondiale contre le SIDA
The Role of NGOs in the Global Response to AIDS

W.E.O.7 COMMUNITY ORGANIZATION FOR HIV PREVENTION: PROGRAMS AND PRIORITIES OF THE CENTERS FOR DISEASE CONTROL

West, Gary R.*, Kohmescher, R.N.*, Schindler, S.E.*, Cahill, K.*, Bowen, G.S.*, Johnson, R.**, et al. *Centers for Disease Control (CDC), Atlanta, GA, U.S.A. **United States Conference of Mayors, District of Columbia, U.S.A.

Objective: To provide financial and technical assistance to community-based organizations (CBO) to carry out HIV prevention programs targeted to individuals whose behavior places them at increased risk.
Methods: CDC, in coorporation with State and local health departments, The U.S. Conference of Mayors, national and regional organizations has begun a financial and technical assistance program to assist CBOs (especially those that represent and serve minority populations) to plan, implement, and evaluate HIV prevention activities which meet the needs of local communities. Financial and technical assistance are provided through closely-monitored CDC cooperative agreements.
Results: Since 1987, over $50 million has been awarded to more than 400 CBOs throughout the U.S. for HIV prevention programs and activities. The U.S. Conference of Mayors has also awarded CDC funds of over $2.5 million to 86 CBOs. CDC has begun an additional program of direct assistance to CBOs in the 27 areas most affected by HIV. Collaboration and coordination among health departments and private organizations involved in HIV prevention have increased as a direct result.
Conclusions: CBC has established several mechanisms for providing financial and technical assistance to CBOs. The authors will provide an overview of the national program, report on experience to date, discuss technical assistance and other needs of community organizations, and discuss problems and issues relevant to implementation and evaluation of such programs.

La lutte communautaire contre le SIDA dans les années 1990
The Community-Based Response to AIDS into the 1990s

W.E.0.8 ROLE OF COMMUNITY BASED ORGANISATIONS IN THE AUSTRALIAN RESPONSE TO AIDS

Whittaker, Bill*
*Australian Federation of AIDS Organisations, Australia

Objective: To discuss the development of the community response to AIDS in Australia, including achievements and difficulties encountered. Comparisons will be made between the Australian response and initiatives in other countries. The challenge of developing a community response to AIDS in Asian, African and other regional countries using aspects of the Australian model will be examined.
Discussion: Community based AIDS organisations have played a vital role in Australia's response to AIDS. The Australian community response is one of the most successful in the world. Each Australian State has established an AIDS Council, which are volunteer oriented community based organisations. These Councils' provide AIDS education, support services and advocacy on key issues. The Australian AIDS Councils have in turn set up a peak body called the Australian Federation of AIDS Organisations. Australia is now at the point where special AIDS education programs and support services for those affected by AIDS are required outside principal cities. This is presenting new challenges for community organisations in overcoming geographical problems and limited human and financial resources.

W.E.0.9 THE COMMUNITY BASED AIDS RESPONSE IN THE 1990's.

Holm, Jim. National Aids Network, Washington, D.C. USA

The community based response in the United States has been unprecedented. Affected communities provide a continuum of services to care for people living with AIDS and to prevent the spread of HIV. Over 650 community based organizations, receiving a mix of private, public, and individual funding, are either registered with or members of the National AIDS Network (NAN). NAN's strategic plan for the 1990's includes an assessment of the community based response. NAN believes no single funding source can provide the necessary support. One necessary step is to replace Federal demonstration projects with a long term commitment to funding prevention and care. However, leaders of the community based response must accept greater responsibility for accountability when working with funders. As the epidemic becomes more mainstream, leaders ask why we should expend special resources we don't spend for other diseases. If we do not, the U.S. medical system's infrastructure will be overwhelmed. AIDS will force reform of the system.

W.E.0.10 INNOVATIONS IN HEALTH CARE DELIVERY FOR HIV INFECTED INDIVIDUALS

Breslow, Judith B.; Hostetter, C.; Horner, M.; Dolecek, G.; Hutchings, J.; Health Resources and Services Administration, Public Health Service, Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective To highlight examples of innovative HIV service related programs developed by grantees of the Health Resources and Services Administration (HRSA) of the U.S. Public Health Service (USPHS)
Methods HRSA is the agency within the USPHS responsible for supporting health care delivery programs for various populations with special needs, including those infected by HIV. Among the HIV service grants awarded to date are 21 service demonstrations focusing on improved case management, 13 projects focusing on out of hospital care of children with AIDS, 19 projects designed to provide intermediate and long term care facilities for people with AIDS, and 13 training programs which focus on improving the quality of HIV services delivered by health service providers of various disciplines.
Results Among the above projects, there are examples of innovative service delivery and training approaches which will be highlighted in this presentation. The value of those selected is the potential for replication in other settings.
Conclusion Optimal use of public funds is achieved when they are applied to the development of unique, community responsive models of health care delivery, and when such models are made available for application in other settings. While each community's needs are unique, lessons learned in one area may often be applied in others.

W.E.0.11 COMMUNITY GROUPS INTO THE 1990's

Mantell, Mary. Network of Voluntary Organizations in Aids and HIV. United Kingdom.

W.E.0.12 COMPARATIVE STUDY OF COMMUNITY-BASED AIDS SERVICE ORGANISATIONS

Morrison, Ken. McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

Objective: To describe a comparative survey of community-based AIDS service organisations from Sweden, Holland, Denmark, West Germany, Belgium, France, Norway and Canada.
Method: An analysis grid was developed and utilised for a comparative analysis and review, based on interviews and published reports of the operations and structure of these organisations. The analysis grid permitted both lateral and vertical comparisons in all details entered.
Results: The analysis grid included parameters such as operational structures, budget, sources of financing, epidemiological circumstances, socio-political climate, case load, programmes or services delivered, target populations, institutional cooperation, developmental changes and decision-making mechanisms.

Similarities include the common circumstances of rapid development and change, in target populations served and basic services offered (some services were restricted to speific groups or were offered in conjunction with those of other organizations).

Critical distinctions occurred in the areas of use of volunteer labour force, membership decisionary powers, executive discretionary powers, means and levels of financing, cooperation with other AIDS service organizations, legal and social atmosphere, and level of interaction with public institutions.
Conclusion: Community groups operated more effectively if one or more of the following conditions were met:
1. maintenance of close contact with community infrastructure (their community base);
2. close co-operation with already existing health and welfare networks and with other community organisations;
3. adequate and diverse funding arrangements;
4. a social climate of acceptance and/or tolerance around such issues as homosexuality, discussing sexuality and drug use.

W.E.0.13 DISCUSSANT

Paltiel, Freda. Health and Welfare Canada, Ottawa, Canada.

Le SIDA en milieu de travail
AIDS in the Workplace

W.E.O.14

AIDS AND THE WORKPLACE: UNITED STATES POLICY AND EDUCATION INITIATIVES

Bunker, John F., The Circle, Inc., McLean, Virginia U.S.A.

Objective: To describe public, private, and labor union efforts to address AIDS workplace policy development, employee education, and supervisory training in the United States.
Methods: Extensive literature search and personal communication with leaders in the public, private, and labor union sectors. As a participant in two recent GPA/WHO sponsored AIDS in the Workplace consultations, the author has conducted extensive interviews on topic area.
Results: The majority of American workplaces have not adopted a formal policy in response to the HIV epidemic. A minority of corporations and public sector institutions have established workplace policies. A relatively small number of large corporations have instituted educational programs and supported collaborative efforts to increase awareness of the issues in the business community.
Discussion and Conclusion: Several excellent models for workplace policy development and employee education have been developed in the United States. However, several critical issues have not been addressed: a collaborative leadership initiative on the part of the public, private, and labor union leaders to focus on AIDS in the Workplace issues; the unique needs and challenges faced by small businesses in dealing with HIV infection; and the lack of evaluation efforts to monitor the effectiveness of AIDS policy and employee education initiatives.

W.E.O.15

HIV/AIDS - A PSYCHOSOCIAL TASK FOR MANAGERS.

I. Osterberg, Anita Sandblom, G. Rehnstedt, J-Å. Gunnarsson, Personnel and Organisation Department, Stockholm, Sweden.

Objective. To carry out an HIV policy for the 60.000 employees of the city of Stockholm.

Methods. In december 1987 the Board of Personnel and Organisation in Stockholm decided on an HIV policy. The policy is to work against the spread of the infection, against prejudice and discrimination and to promote a sense of responsibility, compassion and respect for our fellow human beings. The political decision on the policy was followed by an information project run by the Health and Environment Policy Unit. The aim of the projekt was threefold: to introduce and put into practice the policy, to create a psychological preparedness in the workplaces and to increase the knowledge about HIV. In planning the projekt two conditions seemed essential: 1) the support of the top managers of the Departments and 2) a positive climate for attitude change. The primary target group were managers and in each Department top management was first approached. With their active participation three-hour seminars were arranged for small groups of up to 20 participants. The idea was to create a situation where meeting with and talking to others would go along with the message. In the seminars basic facts have been presented about the virus, the progression of the infection and its ways of transmission. Sexuality, responsibility and prejudice as well as global aspects have been discussed. The policy emphasizes fear, not risk of transmission, as the serious problem at work. This has been the basis for the discussions about the psychosocial consequences the infection might have unless we actively fight them.

Results. By the summer of 1989 200 seminars will have taken place for about 3000 managers (about 80 % of the total). The wide perspective on HIV/AIDS and the opportunity to discuss questions of their own have made the seminars appreciated by the participants.

Conclusions. The method used to implement the policy has proved to be successful. In every Department where the top manager has given his support to the project the message has been received and the anxiety seem to be reduced.

W.E.O.16

AN AIDS PREVENTION PROGRAM DESIGNED FOR CIVIL CONSTRUCTION WORKERS IN RIO DE JANEIRO

Ramos, Silvia*; Afonso,C.**; Gomes,C.*** and Ramos,M.J.***.
*Brazilian Interdisciplinary AIDS Association; **Audiovisual Training Center; *** social workers of civil construction companies. Rio de Janeiro, Brazil.

Objective. To describe the socioeconomic profile of 350,000 civil construction workers in Rio de Janeiro, showing the risks they face due to the AIDS epidemic, and present a prevention program especially designed for this population.
Method. Formation of a multidisciplinary task group to develop the prevention program; research of the cultural patterns, linguistic codes and sexual behaviour of the target population; production of audiovisual and printed materials; and, preparation of a instruction manual for use by social workers and health professionals who work in the construction companies.
Results. The program was developed in 10 civil construction companies in Rio de Janeiro during a 6-month period. The workers responses were analyzed in meetings with ABIA's staff and the professionals who implemented the program in the companies.
Conclusions. The program's ability to sensitize the target population and transmit prevention measures was considerably higher than former AIDS campaigns. Emphasis on solidarity, humor and culturally appropriate language are key instruments in communicating AIDS prevention measures. Multidisciplinary task groups should be a model for further programs directed to specific social groups.

W.E.O.17

AIDS in the Workplace:
An African Model from Uganda

D STONE*, J Kasawara**, D Weeks***, Paul Cohn****
*Johns Hopkins University/AIDSCOM, **Federation of Uganda Employers, ***Consultant AIDSCOM, ****USAID/Kampala. U.S.A.

Objective: The AIDS epidemic has forced employers around the world to confront controversial and sensitive subjects. Since education and counselling are the best known defense for slowing the rate of HIV infection, creative methods need to be developed that provide skills for prevention within cultural constraints.
Method: Phase I of a 3-year prevention project with the Federation of Uganda Employers included hiring and training staff, + marketing of a new project, as well as identifying the initial companies or factories to participate. Individual workplace educators were identified, trained and provided education materials and condoms. Program was evaluated during Phase I in order to ensure objectives in AIDS prevention were being met, and strategies developed were culturally appropriate.
Results: Using pre-existing organizations such as the Federation of Uganda Employers proves to be a successful strategy in providing information on HIV infection to employees and their families. A cooperative effort with a national organization, local companies, and an International Donor allow Ugandans access to information and prevention services in their place of employment.
Conclusion: This "AIDS in the Workplace" project has successfully completed its Phase I implementation and may provide a model for AIDS prevention in other countries.

W.E.O.18

NEUROPSYCHOLOGICAL IMPAIRMENT OF HIV-INFECTED PERSONS: LEGAL IMPLICATIONS FOR THE WORKPLACE

Barnes, Mark, John, I. and Berti, C.
AIDS Law Clinic, Columbia University School of Law, New York, New York, USA

Recent studies have found that the neuropsychological test performance of HIV-infected persons may be lower thanthat of seronegative controls. These studies have concluded that central nervous system involvement may begin early in HIV infection and cause mild cogntive deficits in otherwise asymptomatic persons. As a result of these reports, some employers, including the United States Armed Services, have removed HIV-infected personsfrom jobs requiring the operation of mechanical equipment, in the fear that these employees could pose an unacceptable safety risk. However, under applicable employment law, at least in the United States, use of HIV infection as a proxy for functional impairment is illegal, unless it can be shown that each person with HIV infection is so impaired and that tests measuring this impairment have been validated to predict actual workplace performance. Further, accepted principles of employment law dictate that discriminationmay also not be legally based on predictions of an employee's future functional impairment,if that employee is currently ableto perform the duties of a position. This paper will describe the applicable employment and discrimination law principles, evaluate the evidence for this alleged impairment, and will conclude that at this time, exclusion of HIV-infected employees from postions based on suspicions of functional impairment cannotbe legally justified.

W.E.O.19

REGIONAL AND TIME DIFFERENCES IN THE EFFECTS OF AIDS-HIV (A-H) EDUCATION ON CHANGES IN KNOWLEDGE AND FEARS AMONG WORKSITE EMPLOYEES

[illegible], Harvey S.*#, Versini,D.** and Roth, D.#
*University of California, San Francisco School of Medicine; ** California School of Professional Psychology, San Francisco;# AIDS Virus Education and Research Institute (AVERI), San Francisco, USA

Objective: To describe the temporal, regional and demographic variables associated with a self-reported decrease in worksite AIDS fears (WAF) and documented increase in A-H knowledge after a specified 2 hour A-H education intervention. Methods: Two-hour A-H education seminars were presented to 1,437 white-collar worksite employees (< 30 per seminar) in U.S. AIDS-endemic areas and Vancouver, British Columbia, during 1987-1989 by AVERI. The seminar consisted of a 20-minute videotape of a person(s) with AIDS, a one-hour slide presentation by a physician with AIDS expertise, and a question-answer session. Standardized pre- and post-knowledge and attitude questionnaires and evaluations were completed by attendees using Likert scales. Results: Mean A-H knowledge scores increased significantly from 68.2% at time 1 (S.D. 13.2) to 88.2% at time 2. (S.D. 5.1)(p<.001). Significantly lower time 1 A-H knowledge scores were associated with female gender, lower educational status and not knowing someone with AIDS or a positive HIV blood test. Worksite fear of "working with someone who has AIDS or is at higher risk" decreased from 48.8% of attendees at time 1 to 21.0% at time 2 (p<.001). Of those with persistent fear, 17.7% had less fear than at time 1. At time 2, 62.2% of attendees reported no WAF or less fear than at time 1. A decrease in WAF was associated with female gender, married or committed relationship status, knowing someone with AIDS or a positive HIV blood test, white race (all p<.01) and a higher educational status (p=.03). 94.2% of attendees agreed or strongly agreed (AOSA) with "It was important to have a physician expert on AIDS present to answer questions." 5.8% AOSA that an AIDS videotape alone would have been sufficient; 47.2% felt the videotape and slide presentation were complementary. Time 1 knowledge scores did not differ significantly by year of presentation; there was a trend towards increased WAF at time 1 comparing successive years. First quarter 1989 data will be reported. Geographic differences in A-H knowledge and WAF exist and are associated with knowing someone with AIDS or positive HIV blood test. Demographic data: Gender: 31% men, 69% women. Race/ethnicity: 71% white, 13% Asian, 9% Black, 6% Latino. 53% knew someone with AIDS or ARC; 30% knew someone with a positive HIV blood test. Conclusions: Our data indicate that white collar worksite employees will admit to WAF when asked anonymously and that their A-H knowledge may be quite variable. A specified 2 hour A-H educational intervention can lead to increased A-H knowledge and decreased WAF. Credible health professionals with A-H expertise may be very important in such interventions and to effect appropriate knowledge and attitude change. Recognizing demographic associations will be useful in targeting specific worksite subpopulations more resistant to knowledge acquisition and fear reduction. AIDS videotapes alone may not be sufficient to effect A-H knowledge and/or WAF. This model of A-H worksite education may be applied to other worksites to increase A-H knowledge, decrease WAF, increase worksite productivity, decrease the spread of HIV in the non-worksite environment, and limit employer and non-employer related A-H health care costs.

Le SIDA dans les médias
AIDS in the Media

W.E.O.20

MEDIA AIDS EDUCATION: THE BOOMERANG EFFECT

BAGGALEY, Jon; Department of Education,
Concordia University, Montreal, Quebec, Canada.

Public resistance to AIDS prevention is becoming increasingly apparent, especially among young people. Objective. The study seeks to identify media campaigning strategies capable of overcoming this psychological resistance.

Methods. A three-year comparative study of TV and film materials from Africa, Australia, N. America and Europe is reported, using traditional programme evaluation techniques and electronic audience research methods recently developed in the media advertising industry.

Results. The most successful campaigns are those which give hard facts about AIDS in a simple and straightforward manner. Advertising campaigns featuring elaborate, symbolic or melodramatic imagery, or dramatization, are perceived defensively by those at high risk of HIV infection and can have 'boomerang effects', polarizing public opinion on the urgency of AIDS and the civil rights of HIV-infected persons.

Electronic analyses of moment-by-moment audience reactions to materials are reported, attributing the adverse effects of media AIDS prevention to lapses in production accuracy or sensitivity of, in some cases, a few seconds only. Moments at which materials become verbally or visually redundant/ambiguous are found to increase psychological resistance by high-risk individuals, while generating unnecessary fears in those at lesser risk.

Conclusions. International AIDS campaigns are favouring media techniques which can do more damage to public attitudes than good. Adverse effects of AIDS information on public fears and discrimination may be directly due to mass campaigning approaches. The conventional techniques of TV advertising are not appropriate in AIDS prevention and should be replaced by the more straightforward techiques urged by health educators for 70 years.

W.E.O.22

CORRELATION BETWEEN LARGE SCALE MASS MEDIA CAMPAIGNS ON AIDS PREVENTION, AND HOMOSEXUAL AND IVDUs GIVING-UP RISK PRACTICES IN MADRID

Martinez, Agustin*, P. Estébanez**, C. Manzano*, R.Estebánez*; * Journalist, Universidad Complutense, Madrid; ** Doctor, Madrid City Council, SPAIN

Objective: To know the influence of mass media information campaigns on the HIV risk practices in Madrid.
Methods: Descriptive study of the information on AIDS given by 4 Madrid newspapers, 6 radio stations and 2 TV channels during 1986 and 1987. Study of HIV risk practices among 578 IVDUs and 488 homosexuals who were treated at a Health Promotion Center of Madrid City Council.
Results: Press information study shows the information was given in different stages, appearing at the beginning of '87 a greater number of articles (500% increase) with a much more preventive content compared to those at the beginning of '86, much more alarmist and scientific. By the end of '87 it drops to 40%. Risk practices among the groups considered slightly decrease during 1987 among homosexuals; but the use of sterile syringes by IVDUs increased 75% during the first semester (March and April) and decreased during the last period of 1987. Information on the moment in which the change of habit took place is 80% coincidental during the first months 1987. The reaction of this group to general mass media information has been 60-80%.
Conclusions: Our research shows a correlation between the quantity and quality of the information and the abandon of risk practices, thus confirming the great importance of mass media informations on AIDS preventive methods.

W.E.O.24

FLAGRANT BIAS AND LACK OF REPRESENTATION OF WOMEN'S GROUPS AND EXPERTS IN MEDIA COVERAGE OF MAJOR AIDS ISSUES

Norwood,Chris, Women and Aids Studies, 710 West End Ave., NY,NY 10025 USA

Objective: To assess the lack of representation of women's groups and experts in the media coverage of Aids, NYC press reports on two issues that particularly effect women—partner notification and enrollment in treatment trials—were reviewed. National press examples of the exclusion of women's groups as sources were also reviewed.
Methods: In NY in 1988, negotiations over passage of a law "permitting" limited partner notification received constant press coverage. Collected clippings from 4 NYC newspapers show constant representation of the opinions of gay groups as this legislation evolved; but, even though partner in NYC would primarily be employed for prevention efforts directed at black and Hispanic women, the same clippings do not show that any women's or black or Hispanic groups were asked to comment on the adequacy of the legislation. Similarly, in stories covering the general lack of enrollment of women in treatment trials, papers as diverse as the NY Times and Village Voice presented the various opinions of white, male physicians that poor, minority women are unreachable and lacking "motivation and understanding." Having evidently sought no women's experts as sources, these papers missed the story that the three major NY treatment trials administered by women have had no problem recruiting women patients. A People magazine cover story on women and Aids in which the 6 experts quoted were all white (and 5 male) and the major 1988 Washington Post story on partner notification which, again, treated this as solely a gay male issue are among national examples of the exclusion of women's groups and experts as sources. Conclusions: Aids coverage which depends almost exclusively on white males as sources results in a failure to properly examine issues and in factual error.
In some instances, press bias has been so severe it has blocked the thorough public discussion needed for policy formation.

W.E.O.21

LES MEDIAS A L'EPREUVE DU SIDA : ANALYSE THEMATIQUE ET COMPARAISON DE LA PRESSE FRANCAISE ET AMERICAINE.

Gilles PIAL*
*MD/ Journaliste. 11 rue Béranger . 75003 Paris. FRANCE

Objectif et méthodes : Depuis le Mal de Naples, la presse occidentale a vu resurgir une thématique que d'aucuns croyaient oubliée, celle d'une maladie épidémique, mortelle, transmissible par le sang et par le sexe.
Le but de la présente étude est d'analyser au travers des études disponibles
- une analyse thématique de 4 quotidiens français entre le 1/01/1986 et le 1/06/1986; une comparaison du nombre d'apparition du thème-SIDA dans 6 quotidiens français entre juillet 1981 et Juin 1986; un recensement du nombre d'occurences du SIDA dans 3 quotidiens et 3 hebdomadaires entre 1982 et 1985.
- la spécificité du " phénomène médiatique SIDA ".
Résultats : Quatres périodes peuvent se détacher depuis la déscription princeps de la maladie : 81-82 : le mystère; 83-84 : le " parler science " et la grande leçon d'immunologie comparée; 85 : l'explosion médiatique et les premiers pas vers une écriture " sociale " du SIDA; 86-87-88 : les années de gestion de la séropositivité comme de la maladie. Sur quelques 290 articles collectés ainsi dans 4 quotidiens nationaux : 70 (24%) sont exclusivement consacrés au SIDA, relèguant le cancer (9,3%), les procréations médicalement assistées (9,3%) ou le tabagisme (1%) au deuxieme rang.
Une comparaison avec les données américaines (W.A Check : Rev.Inf.Dis. 1987 5 : 987-1000) permet d'établir une constance dans les liens unissant presse et SIDA.
Conclusion : Cette revue de presse comparative permet de mesurer le chemin parcouru.

W.E.O.23

THE UK NATIONAL AIDS HEALTH PROMOTION PROGRAMME - RECENT DEVELOPMENTS

Kapila, Mukesh; Wellings, K; Perl, S; Hagard, S.
Health Education Authority, London.

Objective. To describe recent developments and critically review the evolution of the National AIDS Health Promotion Programme in the UK.
Methods. Since 1986, public education efforts have been monitored through consumer research and other public response indicators.
Results. The 1986-87 mass media campaign created high levels of public awareness. But a survey in November 1987 showed significant levels of public anxiety about AIDS, increasing public complacency and no heterosexual behaviour change. A new 1988 campaign was directed at young people and suggested, for the first time, some heterosexual behaviour shift with claimed reductions in casual sex and increased condom usage. The 1989 campaign is aimed at improving the quality of public knowledge, and creating a continuous presence for AIDS issues in the public mind.
Conclusion. The UK Programme has evolved substantially over 1986-89, with each stage informed by specific evaluations. New community and interpersonal approaches have been designed. Target audience specific activities have been developed addressing, for example, homosexuals, ethnic minorities, prisoners, people in the workplace, youth and women. To maximise programme outreach, priority is placed on interagency collaboration across the national/local interface. Programme development is a dynamic process responding to changing epidemiology and altering socio-cultural perceptions of HIV/AIDS.

W.E.O.25

EVALUATION OF THE NATIONAL AIDS MULTI-MEDIA PUBLIC INFORMATION CAMPAIGN

Williams, Kenneth R.*; Dawson, D.D.**; and Murdock, P.***.
*Centers for Disease Control, Atlanta, Georgia, U.S.A., ** National Center for Health Statistics, Hyattsville, Maryland, U.S.A., *** Ogilvy & Mather Advertising, Atlanta, Georgia, U.S.A.

Objective. To discuss the impact of the U.S. Government's national AIDS public information campaign to inform and educate the American public about AIDS and HIV infection in terms of knowledge, attitudes and beliefs.
Methods. The vast amount and types of HIV/AIDS activities occurring throughout the U.S. makes assessment of a national information campaign very difficult. Methodologies used to assess the impact (i.e., household interviews, telephone surveys, analyses of television and radio data) will be presented.
Results. Evidence from the National Centers for Health Statistics' monthly Health Interview Survey (approximately 3000 households per month), number of calls to the National AIDS Hotline, distribution of educational materials by the National AIDS Clearinghouse, along with other State data will be described. Time correlation between campaign activities such as airing of Campaign PSA's, mailing of the brochure "Understanding AIDS" to all U.S. households, and telephone calls to the National AIDS Hotline will be explored and their implications discussed.
Conclusion. There appears to be a correlation between the campaign activities and public knowledge, attitudes and beliefs regarding AIDS. Further studies are required to assess whether the campaign efforts are directly related to these changes.

Services de pastorale
Pastoral Care

W.E.O.26

PASTORAL CARE IN AIDS MANAGEMENT
Rader, Alison; Malama,M.; Campbell,I.D.; Chaava,T.
The Salvation Army Chikankata Hospital, Masabuka, Zambia.

Objective. To describe pastoral care as part of integrated AIDS management in the context of home based care and prevention.
Methods. The management of AIDS at Chikankata Hospital has followed a pattern of home based care with hospital intervention where required. Management is described as an integrated approach to the disciplines of clinical care, education, counselling, administration and pastoral care. Implementation of this concept at Chikankata has been expressed through the formation of a multidisciplinary team. The dynamics of the team are discussed with reference to integrated management and then with specific reference to pastoral care.
Results. Pastoral care is presented as a valid and necessary component of care for patients, families and communities affected by AIDS, particularly in the context of African spiritual tradition. After defining pastoral care, its application is described in terms of patient responses, behaviour change, death, and quality of life.
Conclusion. It is proposed that without provision for pastoral care management is incomplete, and that pastoral care can be appropriately implemented through an integrated, multidisciplinary team approach to care and prevention for patients, families and communities.

W.E.O.27

AN EVANGELICAL DENOMINATION RESPONDS TO AIDS
Finger, Reginald, MD, MPH*; Malloy, Michael, ACSW**.
*Nazarene Health Care Fellowship, Kansas City, Missouri, USA
**Christian Counseling Services, Nashville, Tennessee, USA & Association of Nazarenes in Social Work, Kansas City, Missouri, USA

Objective. To utilize the material, human, and spiritual resources of a religious denomination to deliver compassionate care to those with HIV infection and their families; to educate pastors and laypersons in the church in order to facilitate a scientifically sound and compassionate response to HIV.
Methods. The evangelical community has often been perceived as holding a judgmental and unsympathetic attitude toward those with HIV, because of the risk behaviors in which many of them have participated. In July 1988, over one hundred local and national leaders of the Church of the Nazarene met in New York state to explore HIV-related issues and to plan for educational outreach to the denomination and for a coordinated compassionate response. This conference is believed to be the first of its kind for an evangelical denomination. Since the conference, an informal network of leaders has been formed to continue the efforts.
Results. As a result of these efforts, the established urban ministries of the Church of the Nazarene in New York, Washington DC, and San Francisco are more effectively serving people with AIDS. Pastors and laypersons across the church are increasingly willing to minister to PWAs in the local churches.
Conclusion. The evangelical community represents a potentially powerful resource for education and human services. The combination of valid medical and epidemiologic information about HIV with a sound theological basis for relating to those with risk behaviors, results in effective compassion.

W.E.O.28

JEWISH LAW, VALUES AND THE SOCIAL ISSUES ARISING FROM HIV DISEASE
Freedman, Benjamin; McGill University and the Jewish General Hospital, Montreal, Canada

Jewish law (halakha) and associated literature comprises one of the oldest and most developed systems for the analysis of bioethical issues. The method employed proceeds by means of analogical reasoning from concretized values and ethical schemata. The schemata relevant to HIV include the extent and particulars of the duty to guard against infection as relevant to, e.g., blood and body fluid precautions; the commandment of "caring for/visiting the sick" (bikkur cholim) as related to AIDS care and hospices; social and medical confidentiality (prohibitions on 'talebearing,' r'khilut and lashon hara); and, the adjudication of conflicts between a duty to aid another and the duty to preserve one's own health. Details of these halakhic schemata as applied to current difficult social issues raised by HIV disease are of interest in their own right, and provide a useful contrasting perspective on values and their prioritization.

W.E.O.29

RELIGIOUS LEARDES IN SÃO PAULO BRAZIL JOIN THE AIDS PREVENTION AND CONTROL.
Inglesi E.: Fernandes M.E.:
Centro de Referência e Treinamento em Aids , São Paulo, Brazil.

Objective: To decrease the global impact of HIV infection in the general population through the religious leaders.
Methods: a. Mobilization b. Sensibilization c. Conscientization d. 20 hours training in human sexuality, clinical, epidemiologic ethical, legal, psicosocial .
Aspects on Aids:
Evaluation: A questionaire was apllied before and after the training course.
Results: The religious leaders of 14 different religious groups decided: A. To promote information and prevention on Aids to their communities.
B. Give spiritual support to HIV pacients and families.
C. To open houses to take care of HIV patients.
D. Organization of ecumenic events ever 2 months for solidariety and non discrimination.

W.E.O.30

BAHA'I CONCEPTS TOWARD AIDS PATIENTS AND SOCIETY
*Davachi, Farzin, **Davachi, N., °Wingi, M., **Sefu, L. and **Mbanga, M.
*Department of Pediatrics, Mama Yemo Hospital, **National Spiritual Assembly of the Baha'is of Zaire and °University of Kinshasa, Kinshasa, Zaire

Objective: To describe the Baha'i teachings in relation to the AIDS patient and society.
Methods: The AIDS epidemic has caused worldwide concern from religious and secular organizations. In the absence of a unified stance, we reviewed the Baha'i writings to elucidate the Baha'i recommendations.
Results: The Baha'i Faith is an independant religion which believes in the harmony between science and religion - that these two potent forces must go hand-in-hand for the benefit of mankind. It believes in the fundamental unity and solidarity of the human race. It rejects all forms of prejudice and therefore believes that AIDS'victims should receive support and compassion without trace of discrimination. It regards marriage as a "fortress of well-being" and encourages the practice of chastity before marriage and fidelity afterwards as a protection to the individual and the society. It requires total abstinence from habit-forming drugs except for medicinal purposes prescribed by a physician.
Conclusion: As a strong supporter of human solidarity, the Baha'i Faith rejects all forms of prejudice against AIDS' victims. It offers clear teachings which can serve as a protection to the individual and the society. The practice of these principals has the potential to control this epidemic.

Th.E.O.1

INNOVATIVE AIDS EDUCATION FOR ADOLESCENTS: STRATEGIES FOR BEHAVIOR CHANGE

Conant Sloane, Beverly; Dyer Chamberlain, M.; Berry, K. and Van Treuren, R.
Dartmouth College, Department of Health Education, Hanover, NH, U.S.A.

Objective. Although adolescents and young adults have long been identified as a population at risk for contracting the human immunodeficiency virus (HIV), few educational programs have targeted this group. Dartmouth College has developed a comprehensive AIDS education program designed to change young people's behavior and develop their skills in decision making, problem solving and communication.
Methods. There are three main components to Dartmouth's AIDS education program: a peer education program consisting primarily of a live student presentation or "Roadshow" on AIDS, a program of distributing free condoms on campus, and a program of distributing "safer sex" kits on campus. To determine which of these educational strategies appeared to be the most effective, the Department of Health Education conducted a pilot study. 200 students (100 male, 100 female) were randomly selected and asked to complete an anonymous questionnaire. There was a response rate of 73%.
Results. The study found the peer education "Roadshow" to have the most significant impact on behavior. 93% of students who had seen the show said they practiced safer sex at least some of the time, as compared to 72% who had not seen the presentation. The availability of free condoms and safer sex kits had no significant behavioral impact, although they were helpful in bringing the AIDS issue to student's attention. Subjects perceived the average Dartmouth student to be at less risk than almost every population group suggested. Males perceived less risk than females [F (1,134) = 17.62, p < .001], despite the fact that males reported more sexual partners (M=2.25) than females (M=1.19).
Conclusions. Based on this study, peer education techniques appear to bear promise for effective AIDS education programming. Many researchers have noted the value of role modeling and peer counseling in areas such as smoking cessation, contraceptive education, and alcohol and drug abuse. Other strategies (free condoms, safer sex kits, media announcements) may not be significant in and of themselves, but can serve as useful reinforcers of the peer education message. Dartmouth College has successfully performed and evaluated the peer education "Roadshow" program at colleges and high schools across the United States. The College has also developed a videotape and training manual for purposes of instructing others in this innovative approach. Challenges for the future will include making young people more aware that they are at risk for HIV transmission, and devising more effective programs of AIDS education for adolescent populations.

Th.E.O.3

EQUIPPING KINSHASA PUBLIC BUSES WITH A CASSETTE PLAYBACK SYSTEM IS EFFECTIVE IN AN AIDS PREVENTION CAMPAIGN

N'Galy, B.*; Kalombo,Kitoto*; France, B.**; Eke, T.***; Eiger, R.**; Nzuzi, N.****; *Coordination Bureau, National AIDS Programme, Kinshasa, Zaire; **Population Services International, Washington, D.C., USA; ***Human Sciences Research Center, Kinshasa, ****SAPPS Agency, Kinshasa.

Objective. To determine the effectiveness of using the Kinshasa City Bus System as a means of disseminating AIDS prevention messages to the general population.
Methods. Thirty public buses were equipped with a looped cassette playback system (LCPS) which provided a specially designed fifteen minute vocal recording of music intercut with selected AIDS messages. The message was continuously played during a four week period in September, 1988. In the fourth week, random interviews were conducted among departing passengers.
Results. Of the estimated 234,240 passengers who rode these buses during the test period, 240 were interviewed (140 males, 100 females). Among the respondants 153 (64%) spontaneously recalled hearing both music and health education messages. Of these, 123 (80%) were able to recount specific AIDS messages contained in the cassette. After further prompting, 19 of the 87 passengers who could not initially identify the message, recalled hearing some of the AIDS messages. In total, 142 (59%) of the 240 interviewed passengers retained at least one of the specific AIDS messages.
Conclusion. The use of the LCPS in Kinshasa public buses appeared to be an effective method of disseminating AIDS prevention messages. There are an estimated 600,000 daily bus passengers in Kinshasa. If the system can be effectively maintained, a significant percentage of the urban population of Kinshasa could be reached through this medium.

Th.E.O.5

The Futures Workshop as a method for mobilization and coordination in Aids prevention.

Urwitz V, Ohgren M, Juvall T, Stockholm, SWEDEN

Background: The Stockholm Youth Prevention Project aims at making people who meet youth in their daily work part of preventive action. Stockholm county has 1.7 miljon people organized in 42 districts.

Objectives: Mobilization and coordination of local people and resources for youth prevention in Stockholm County. Development of local action plans.

Method: The Futures Workshop (FW) is a method developed to make grassroots-people and field workers use and share their experience in solving problems and planning specific local activities in reaching out to young people. The FW is unpretentious, creative and fun. It takes one day and 15-25 people from different organisations can take part.

Present experiences and results: During one year the FW has been used in 14 districts. Out of this has developed for instance: locally adapted plans and activities to reach parents. Social group work with girls at risk. Local overall plans for work with sex and relationships through the different stages of school. In all 14 districts there are local coordination groups.

Th.E.O.2

DEVELOPMENTS OF THE NATIONAL AIDS TELEPHONE HELP LINE IN THE NETHERLANDS, 1985 - 1988.

Middelhoff, Monique ACM and Roosjen, JL.
Dutch Committee on AIDS Control, Amsterdam, Holland

Objective. To describe the developments of the Dutch helpline.
Methods. The Dutch National Committee on AIDS has established a fully professionalized AIDS hotline. From the start (1985) data have been collected and computerized: age, gender, area, sex.orientation, HIV-status, problems, items discussed and referral. Monitoring of trends and anual reports are made.
Results.70 calls are answered daily.Mostly heterosexuals(85%) and age 20-40 (70%).There are more calls from cities (Amsterdam 53/10.000), then from rural areas (12/10.000). Nr.1 issue is transmission (50%) followed by prevention(increasing) and questions about testing. In more than 25% referral to testfacilities, g.p.'s etc. has been adviced. Homosexuals are also reached, but not (yet) ethnic minorities and i.v.-drugusers.
Conclusion. 20.000 people yearly use this easily accessible opportunity to talk anonymously about AIDS related problems and fears. For many this is sufficient. A substantial % is referred to more personal guidance. The hotline has been instrumental in detecting trends in HIV related concerns in the general population.

Th.E.O.4

HIV TESTING 'ON THE STREET'

Rekart, Michael L.; Chan, S.; James, E.; Barnet, J., STD Control, Ministry of Health, Vancouver, British Columbia, Canada
Objective To report the results of 199 HIV antibody tests performed on street-involved persons in Vancouver by the AIDS Street Nurse Program.
Methods HIV testing and counselling was performed at the request of 199 street-involved persons in two distinct areas of Vancouver where street-involved persons congregate. The tests were performed from August through December 1988.
Results Sixty-nine percent (69%) of those tested were male and 65% were 14-29 years of age. Fifty-five percent (55%) were active prostitutes, 51% were intravenous drug users, and 40% professed to be bisexual. A total of 10 persons were HIV positive out of 199 tested (5.0%). Most persons had multiple risk behaviors but the activities of highest risk were bisexual prostitution in males and intravenous drug use (IVDU). Of 33 tests in bisexual male prostitutes using intravenous drugs, 4 were reactive (12.1%). An additional 3 of 29 (10.3%) bisexual male prostitutes not using intravenous drugs tested positive. The remaining positive tests occured in 1 of 4 tests in bisexual males not engaged in prostitution or IVDU, 1 of 6 female heterosexual IVDUs, and 1 of 7 female heterosexual prostitutes not injecting drugs. Of note, there were no reactive tests in 49 heterosexuals without additional risk nor in 28 female IVDU heterosexual prostitutes.
Conclusion Amongst street-involved persons in Vancouver, intravenous drug use, prostitution and bisexuality are common. HIV sero-positivity is at a critical stage for interventions (5%) and strategies should be focussed on bisexual male prostitutes.

Th.E.O.6

INCORPORATING AIDS EDUCATION INTO FAMILY PLANNING

Varela, Luis,* Lópes-Juáres, A.**, Rodrigues, G.**
* The Population Council. México, D.F.
** MEXFAM, A.C. México, D.F.

Objectives. To incorporate AIDS prevention activities into ongoing family planning programs. To determine the effect of AIDS involvement in the promotion of family planning.
Methods. AIDS educational activities were included into two family planning programs, one aimed at youths (4 communities) and one aimed at urban marginal population (5 communities). Project activities were preceded by training of staff and development of educational materials. A range of activities were carried out (community and school talks, waiting-room talks, counseling), and most participating centers designated one day a week for AIDS education.
Results. Attendance to activities and demand for talks and lectures exceeded the project goals. Survey shows increased AIDS knowledge among those attending events. However, no changes were detected in the demand for condoms distributed as part of the family planning program. Likewise, no changes were found in the number and type of clients, and no negative consequences of associating AIDS to family planning were detected.
Conclusions. Family planning programs can be effective educating their clients about AIDS without detriment to the promotion of family planning.

Th.E.0.7

UNE STRATEGIE D'INFORMATION PAR RAPPORT A L'ACTION DES POUVOIRS PUBLICS FRANCAIS

Frédéric EDELMANN*, Jean-Florian METTETAL**, Franck FONTENAY*
*ARCAT-SIDA, CNIS, **Hôpital Necker, ARCAT-SIDA, CNIS, FRANCE

Objectif: Etablir les conditions d'une information indépendante en France sur la question du SIDA
Méthode: Analyse sur une période de cinq ans des choix politiques en matière de lutte contre le sida, du comportement des gouvernements successifs par rapport aux organismes institutionnels ou non institutionnels stables; des réponses apportées aux organismes non institutionnels. Suivi de la presse non médicale.
Résultats: La juxtaposition, d'une part des décisions administratives, d'autre part des déclarations d'intention, enfin du calendrier des échéances politiques, indique clairement que les pouvoirs publics français n'ont commencé à prendre conscience de l'enjeu - sans en tirer toutes les conséquences - qu'à partir de l'été 88
Les gouvernements n'ont pas pas trouvé, dans les organismes institutionnels gérant la santé publique, les mécanismes d'alarme leur auraient permis d'y voir plus clair - à l'exception des personnes en charge du SIDA mais qui n'étaient pas à même d'être écoutées. Ils se sont fiés à l'image que leur renvoyaient les média, c'est-à-dire à un un discours portant surtout sur les aspects scientifiques, imprégné par l'autosatisfaction de la découverte du LAV, peu conscient de la complexité des problèmes de santé publique, et donc non critique à l'égard des pouvoirs publics. Enfin, ils ont toujours donné le pas aux organismes institutionnels, même lorsque leur incompétence était établie, de préférence aux organismes non institutionnels. Ces derniers n'ont obtenu de soutien qu'à la condition d'un clientélisme qui les a *de facto* institutionnalisés.
Conclusions: L'action des pouvoirs publics en France est freinée par les traditions politiques, par les pesanteurs institutionnelles, par mauvaise circulation de l'information sur ces mécanismes et l'occultation involontaire des questions de santé publique par les media traditionnels. Les auteurs ont tiré les conséquences de leurs conclusions en créant un mensuel d'information dont le contenu rédactionnel est protégé par une triple condition d'indépendance (financière, politique, associative), condition d'un système d'information critique non passionnel

Th.E.0.9

REPORT OF THE CHILD WELFARE LEAGUE OF AMERICA TASK FORCE ON CHILDREN AND HIV INFECTION

Pressma, Donna; Anderson, V.M., MD.; Horowitz. R.M. Esq.; Emery, L.J.*; Annin, J. Burt, JD*; et. al. *CWLA, U.S.A.

Objective: To establish guidelines and suggest public policy based on what is currently known medically, legally, and in social work practice about the care of children infected with HIV, how it will affect their care at home, in child welfare agencies and how it will affect agency personnel issues.
Methods: The Child Welfare League of America, a membership association of 500 public and voluntary child welfare agencies and 1000 affiliates in the US and Canada, formed a Task Force on Children and HIV Infection immediately after convening an international roundtable: Attention to AIDS: Responding to the Growing Number of Children and Youth with AIDS. The Task Force, representing 57 member agencies, experts from medicine, law and agencies serving HIV infected individuals met periodically to produce a tool for providers of services to children.
Results: The Report of the Task Force, "The Initial Guidelines" has been distributed to five hundred member agencies and approximately 2000 other child serving agencies. A training institute was delivered to representatives of 125 agencies.
Conclusion: If HIV infected children are to be willingly served within existing services wherever possible, the preparation process must include sustained education of all staff and substantial negotiation regarding the application of principles established by serving adults.

Th.E.0.10

AIDS AS A CHALLENGE AND AN INNOVATION IN HEALTH CARE AND HEALTH POLICY

Josephsen, Knud, HIV-positive (ARC), member of the Danish Positive Group, gay, social worker, Copenhagen, Denmark

Objective. Demonstrate the Danish experience of an active participation and dialogue between PWA/HIV and the health care delivery system.
Methods. The barriers between the physicians' professional culture and in the organization of health care towards an open, multidisciplinary strategy of treatment need to be broken down. The experience and the needs of people with AIDS and HIV-positives are best understood, when PWA/HIV are actively involved. It is important to look upon illness, HIV and AIDS as a "proces of learning" for both the patient and the health care provider. There is a need for psycho-social support, which includes "quality of life" as part of medical care. It is paramount, that open communication and constructive dialogue between people with AIDS and HIV and the health care system takes place. This can be done individually and in a group structure. The dialogue is a necessity in order to innovate and develop the health care system. The Danish experiences with such a dialogue are few, but positive.
Conclusion. People with HIV/AIDS are pioneers. They should be utilized in a more consumer-conscious organization of patients, which can contribute to innovate the health care system and health policy.

Th.E.0.11

AIDS AND SOCIAL POLITICS

Arne Grønningsæter, Vice-president, Norwegian Association of Social Workers, Oslo, Norway

Objective: To present an integrated approch with regard to preventing the spreading of AIDS. The social workers must cooperate with the risk-groups and the HIV-infected in the struggle against AIDS - and in caring for people with AIDS.
Methodes: The point of departure is that AIDS is as much a social and cultural problem as a medical one. To face the consequences of this diseas we must strive to change people's behavior. We would therefore present a paper on a social policy-based work against the spreading of HIV and care for the infected.
Important elements in the Norwegian anti-AIDS-work are:
1) voluntary means, 2) protection of the human rights of the risk-groups and the HIV infected, 3) open and direct information on sexuality, including homosexuality, 4) information directed to individuals and communities, and less use of big campaignes directed to the population as awhole, 5) information directed to the risk-groups mediated in cooperation with their organisations, as well as to the general public, 6) cooperation between the authorities, the risk-groups and the HIV-positives, 7) cooperation between the different risk-groups.
Conclusion: We believe that the use of this means has led to a more tolerant society and a decreasing number of HIV-infected. HIV/AIDS is putting the humanistic and democratic way of thinking to a test, and makes it important to underline this values.

Th.E.0.12

STATE AIDS LEGISLATION AND POLICY TRENDS: 1983-1988

Ryan, Caitlin, George Washington University, Washington, D.C., U.S.A.

Dimensions sociales du SIDA
Social Dimensions of AIDS

Th.E.0.13 PSYCHOSOCIAL SEQUELE OF AIDS -- AN INDIAN PROFILE.

Dr SWAMINATHAN SUNDARARAMAN* Dr SOLOMON S.* Dr TARA R.* Dr RAJKUMAR S.*; Ms SUBHA*.
* Madras Medical College, Madras, India.

OBJECTIVE : To describe the psychosocial sequele of AIDS in India. METHODS : This is a descriptive report on 5 families of HIV seropositive individuals of low socio-economic class, living in Tamilnadu, a southern state in India, where an exceptionally large number of cases of HIV infection has been detected. The various psychosocial stressors these families have been exposed to, after the detection of infection, the subsequent communal, social and sensory ostracization, deprivation of homes, victimisation, unique to the Indian setting is highlighted. The families were subjected to an open ended interview and evaluated. The reaction of the infected individuals, the reaction of the family itself, the psychosocial impact, and the societal reaction are studied. Attempt to detect psychiatric and psychological morbidity was made.
RESULTS : Though this situation has not produced severe psychiatric morbidity as yet in the study group, some of them did reveal minor psychological problems viz. depression, agitation, insecurity with respect to illness itself, ambiguity about societal acceptance, uncertainity about their means of living and their future as independant citizens.
CONCLUSION : This should not be treated as an isolated problem affecting just a few families since it is a reflection of the community attitude to HIV infected individuals. The implication of this psychosocial phenomenon in the light of India's socio-cultural conditions and increasing prevalance of AIDS must be borne in mind.

Th.E.0.15 SOCIAL ORGANIZATION AS A DETERMINANT IN HIV TRANSMISSION

Kreniske, John.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, New York, U.S.A.

Objectives: To determine the interaction between social organization and the transmission of HIV infection in the Dominican Republic.
Methods: Field work, structured interviews and participant observation.
Results: The economic plight of groups within the population as well as traditional mores and patterns of behavior of selected sub-populations places these groups and individuals at elevated risk of infection. Sexual workers, young boys who become sexual workers, sexually active adolescents and young people, migrant workers to the United States and seasonal workers to the Dominican Republic from Haiti stand at variable but elevated risk.
Conclusion: Increasing poverty allied with ongoing movement of the population may create a setting conducive to the spread of HIV infection. In this setting, prevention of HIV infection requires the formulation of interventions which are sensitive and appropriate to those sub-populations which may suffer the greatest risk. Among those groups which it seems must be considered are tourists, Dominican workers returning from the United States and Haitian workers entering the Republic to cut sugar cane. Work by Dominicans along these lines will be reviewed and some possible areas where collaborative research and development of interventions might be attempted will be suggested.

Th.E.0.17 RISK-PERCEPTION, RISK-TAKING AND RISK MANAGEMENT AMONG INTRAVENOUS DRUG USERS: IMPLICATIONS FOR AIDS PREVENTION

Margaret M. Connors, Spectrum House, Inc., 155 Oak Street, Westboro, MA 01581 USA

Objective. To describe "perception of risk" within IVDU subculture and its relevance in developing interventions to reduce the risk of HIV infection among IVDUs and their social network.
Methods. Formal ethnographic methods were employed in developing rapport and establishing identity with the community. Data was collected through techniques including directed conversation and observation, "on the street" and in shooting galleries. In addition, standardized questionnaires were given to 120 IVDUs in a drug treatment program.
Results. Results show risk taking to be an integral part of IVDU subculture. Daily, IVDUs risk arrest, overdose, becoming victims of theft, violence and illnesses related to drug use. 90% found that the longer they remained active in the subculture, the more risks they took. Five times as many found "taking a risk successfully" more satisfying than "successfully avoiding a risk." While needle sharing was considered pre-AIDS to be no or low risk by 80%, 77% now consider it a major risk. 70% mentioned AIDS as the catalyst for this change in risk perception.
Conclusions. Efforts to prevent transmission of HIV by advocating that IVDUs reduce high-risk activities will need to consider the role of and attraction to risk-taking. Interventions (information and education) appealing only to the rational judgement of the individual may not be the most effective "means for changing behavior. Providing a concrete "means for change" (bleach for cleaning, new needles) in combination with the "ideas for change" may have a greater impact. Indigenous risk management strategies (running partnerships, etc) may be used as a model for AIDS risk-reduction techniques.

Th.E.0.14 APPROCHE SOCIO-DEMOGRAPHIQUE D'UNE POPULATION DE MALADES DU SIDA HEBERGES DANS DES APPARTEMENTS THERAPEUTIQUES A PARIS ET SA BANLIEUE.

Cordonnier, J.P.*; Javanni, J.**; Maurel, H.***; Michel, A.**** et Sobel, A.*****.
*Psychiatre, Délégué Médical d'APARTS, ****Délégué Social d'APARTS, *****Professeur d'Immunologie Clinique, Vice-Président (APARTS), ***Secrétaire Général (APARTS), **Président (APARTS), Paris France

De mars 1987 à février 1988, 38 malades du Sida ont été hébergés dans la Région Ile-de-France, dans des appartements de relais thérapeutique et social (APARTS), en vue de leur réinsertion sociale et/ou professionnelle.
Les auteurs proposent une analyse sociodémographique descriptive de la population accueillie et précisent certaines données relatives aux modalités de contamination.
Les malades accueillis représentent 8,4% des patients hospitalisés ou en traitement dans les hopitaux relevant de l'Assistance Publique à Paris (Centres Hospitalo-Universitaires).
Les premiers résultats indiquent que la population correspond à la distribution épidémiologique des cas de Sida enregistrés à la Direction Générale de la Santé (Paris). La surmarginalisation sociale serait un facteur indépendant de la contamination et de l'appartenance à des groupes à risque identifiés par les autorités sanitaires françaises. Les données descriptives et analytiques permettent d'identifier différents types de modalités de marginalisation qu'entraîne l'infection au VIH.

Th.E.0.16 SOCIOLOGICAL ANALYSIS OF AIDS PREVENTION AMONG HOMOSEXUAL MEN.

Tielman, Robert A.P. *
* Gay and Lesbian Studies Department of the University of Utrecht, The Netherlands.

Objective. To assess AIDS prevention activities among men with homosexual contacts in The Netherlands, United States, United Kingdom, France, Sweden, Switzerland, and Germany in order to develop better conditions for successful prevention campaigns among other risk groups and the general population.
Methods. With the support of the Global Programme on AIDS of the World Health Organization in Geneva and national researchers an inventory and analysis was made of 1) the most important prevention activities among men with homosexual contacts in the various countries, and of 2) the factors involved in explaining the prevention effects in the target groups.
Results. In all countries investigated, impressive behavioral changes took place among men with homosexual contacts in the direction of safer sex and diminishing chances of HIV-seroconversion. Important factors related to success of those prevention activities are: 1) the community based and explicit character, 2) the non-moralistic, facts and human rights oriented approach; 3) the emphasize on personal freedom and responsibility combined with the introduction of sexually attractive safer sex alternatives for behavior at risk; 4) the avoidance of scapegoating processes and of tendencies to separate HIV infected from non-infected people, 5) the support of HIV positives and PWA's by counseling and anti-discrimination activities, 6) the development of prevention feed back oriented psychosocial research, 7) the use of community based media trusted by the target group, 8) the use of political strategies to develop target group based and general AIDS organisations.

Th.E.0.18 DE CAMPAGNES GENERALES A DES APPROCHES COMMUNAUTAIRES

Perreault, Michel Ph.D. C.E.R.M.E.S. Paris, France.

Même si le développement du sida comme épidémie n'a pas encore engendré les effets sociaux destructeurs de l'ordre social constatés par les recherches historiques sur les épidémies passées, des recherches récentes (Pollak 1988) montrent que les personnes qui n'ont pas de connaissance personnelle des victimes et qui ne se sentent pas elles-mêmes exposées, sont celles qui ont les positions les plus favorables à la mise à l'écart des malades et séropositifs au dépistage obligatoire des étrangers ou de membres de groupes identifiés comme plus à risque. Il y a nécessité de développer et d'évaluer des approches communautaires qui permettent à ces personnes d'avoir une connaissance personnelle des malades et porteurs et de construire une solidarité effective. Actuellement la prévention passe surtout par des campagnes générales de sensibilisation qui ne font appel qu'à la responsabilisation individuelle: ces campagnes ne contribuent-elles pas à accroître le sentiment de sécurité personnelle face à une peur qu'elles contribuent à augmenter ainsi qu'à maintenir l'absence de solidarité, deux conditions susceptibles d'aboutir à l'exclusion des victimes réelles et potentielles, exclusion qui peut être génératrice de graves désordres sociaux.

M.E.P.1 A STRUCTURED EDUCATIONAL SUPPORT GROUP FOR HIV INFECTED INDIVIDUALS

Nancy L. VanDevanter, Catherine Tendler, Ruth Shipton-Levy, Melanie Steilen, Ann Stuart

Columbia University School of Public Health - Box 1814 Madison Sq. Station, New York, NY 10159 - USA

A six session structured group model for HIV seropositive individuals was developed as part of a randomized control study of newly identified HIV seropositive individuals. 95 individuals have participated with average of 8-9 per group. Most groups have been heterogenous with regard to risk factors, age and sex. This psychosocial intervention consists of professionally lead groups with educational as well as psychological and social components. Educational content includes information about transmission of the virus as it relates to daily living and sexual practices; medical aspects of HIV infection, health promotion, disease prevention strategies are reviewed. Skills in stress reduction and communication are taught, individuals share feelings, experiences, and coping strategies.

Groups have decreased the social isolation of HIV postive individuals. Many have developed sufficient cohesiveness to continue as peer support groups. Peer groups seek consultation of professional group leaders as new issues emerge such as changing medical information, illness and death of group members.

M.E.P.2 REPORT FROM A PUBLIC HEALTH PSYCHOSOCIAL CLINIC FOR GAY AND BISEXUAL MEN WITH HIV-RELATED PROBLEMS

Zeipel, Claes*; Westman, Bo**.
*Medical director and ** clinical psychologist, Landstingets Psykhälsa, Wollmar Yxkullsgatan 25, 116 50 Stockholm, Sweden.

Objective. Critical discussion of team formation and team function. Discussion of the need for a clinic aimed especially at gay men. Preliminary analysis of the problems presented by the clients. Tentative evaluation of the therapies and services offered.
Methods. Statistical description of the more than 325 clients. Critical essay on the delicacies and vicissitudes in building a team, forming an agreed philosophy on client work and maintaining efficiency and cohesion.
Results. The clinic has almost equally served both seropositive and seronegative clients. Recurrent themes in both groups similar and centre often on problems around sexuality and low self esteem. The more secretive a person is about homosexuality the more liable does he seem to be prone to anxiety. Low esteem is a risk factor for developing (alcohol) abuse which in turn increases the tendency towards risk sexual behaviour. There seem to be a strong need for addiction recovery facilities directed towards gay men.
Conclusion. Building a team aimed at a gay clientele with HIV-related problems means encountering problems on many levels - yet there are strong motives for specialized clinics with this commission. "Gay competence" and tolerant compassion required.

M.E.P.3 AIDS-STIGMA AND ANTI-GAY PREJUDICE: PUBLIC REACTIONS TO AIDS-RELATED POLICIES AND TO GAY MEN IN THE U.S.A.

Herek, Gregory M. and Glunt, E.K.
Graduate Center, City University of New York, NY, U.S.A.

Objective. To examine the relationship between attitudes held by the U.S. public toward AIDS-related policies and gay men.
Methods. Two samples were used: 1) 133 adults from 5 U.S. cities who completed written questionnaires; and 2) 859 adults from a subsequent national telephone survey. Responses to a battery of AIDS-policy items were factor analyzed, scales were constructed, and regression analyses conducted to determine the best predictors of AIDS-related policy attitudes.
Results: Two factors consistently emerged for AIDS-policy attitudes. Factor #1 items proposed punitive measures to be taken toward persons with AIDS (e.g., quarantine); this factor includes a strong component of blaming people with AIDS for their condition. Factor #2 consisted of items generally endorsed by public health authorities (e.g., education about safer sex). The factors were uncorrelated in the small sample; in the national sample, they were negatively correlated among Whites, but not correlated among Blacks. Attitudes toward gay men were predictive of scores on both factors, with some analyses suggesting that they exert a particularly strong influence on attitudes toward punitive policies.
Conclusion. Attitudes toward AIDS-related policies are multidimensional; ambivalence about AIDS may appear in the form of agreement with punitive as well as constructive public health policies. Influencing U.S. public opinion may require concurrent attempts to reduce anti-gay prejudice.

M.E.P.4 COMMUNICATING AIDS INFORMATION TO HISPANICS: THE IMPORTANCE OF LANGUAGE AND MEDIA PREFERENCE

Hu, Dale J. *; Keller, R.**; Fleming, D.***
*Johns Hopkins University School of Hygiene and Public Health, Baltimore, Maryland,
**Salud Medical Center, Woodburn, Oregon,
*** Oregon State Health Division, Portland, Oregon. U.S.A.

Ojective. To design an effective AIDS education program for Hispanics in Oregon based on language (Spanish/English) and media preference as well as to increase information on AIDS knowledge and attitutes for Hispanics, the fastest growing minority group in the U.S.
Methods. The first part of the program began in January of 1988 with a survey study of 216 Hispanics from three clinics in Oregon to examine beliefs about AIDS and to determine the principal sources of information access for this population.
Results. Major findings from this study showed that respondents whose primary language was Spanish tended to have fewer information sources and relied relatively more on broadcast media than printed media. Despite recent nationwide AIDS education efforts, almost one-half of Spanish-speaking only respondents denied having received AIDS information before. In addition, almost one-half of the sample did not believe or were unsure whether condoms could prevent the transmission of AIDS. Compared to primarily English speakers, respondents whose primary language was Spanish were more likely to believe that AIDS could be casually transmitted and less likely to believe that condoms could prevent transmission.
Conclusion. Based on the results of this study, a culturally and linguistically appropriate media campaign targeted at Hispanics in Oregon was developed and implemented.

M.E.P.5 ' AIDS - A PROACTIVE APPROACH TO MENTAL HANDICAP '

GILLIAN JAMES , Royal College of Nursing, 20, Cavendish Square, London, England.

This paper aims to outline the proactive approach required to meet the educational needs to provide the necessary information to those closely involved in the care and training of people with a Mental Handicap both in the community and in residential settings and for the parents and their children , so developing a positive attitude in relation to the many aspects of education and social change required.

There is already a subculture within this field which has developed many stigmatizing effects which delay hamper and hinder progress for and colour attitudes to our fellow citizens and to have any further additional labels which may further handicap their chances of being accepted as a full member of society can only disenfranchise them further.
The aim of the Society of Mental Handicap Nursing within the Royal College is to provide a format which will help those reading our booklet to promote a positive attitude to the changing needs of those with a Mental Handicap in any setting.

M.E.P.6 EVALUATION OF AIDS EDUCATION PROGRAMS FOR OFFENDERS

Jan R. Godes*, KJ Bell*, VM Thelen*, RD Miller**, RE Sherman**, JL Craig**
*Hennepin County Community Health Department and **Hennepin County Office of Planning & Development, Minneapolis, Minnesota, U.S.A.

Objective. 1) To determine AIDS risk and baseline levels of knowledge, attitudes and behaviors for adult and juvenile offenders. 2) To compare offender knowledge, attitude and behavior outcomes after participation in different methods of AIDS education.
Methods. Random assignment of 204 offenders to 1 of 4 methods of AIDS education: printed material only, video only, video and discussion with a nurse educator (RN), and discussion with RN only. Pre and post-tests (knowledge, attitudes and behaviors) and a risk assessment were administered.
Results. The self-reported behavioral assessment showed the target population to be one with considerable risks. A small, but significant increase in knowledge and attitude mean scores occurred from pre to post-test for 3 methods (t-test, $p < .05$). No significant difference was found between these 3 interventions (ANOVA). Findings from a 3 month follow-up study of changes in behavior after training will be presented.
Conclusion. Although the baseline levels of knowledge about AIDS were higher than expected, adult and juvenile offenders did benefit from receiving AIDS education while in the Corrections system. Shifting to a curriculum that focuses on specific techniques for achieving behavior change may have greater potential for success with this special-needs populations.

M.E.P.7

AN APPLICATION OF SOCIAL MARKETING TO THE DEVELOPMENT OF AIDS EDUCATIONAL MATERIALS.

MAGAÑA,J.R.*; BURRELL, PETER,*; GREENWOOD,J.R.*; PRENDERGAST,T.J.*; MONTOYA ,R.**.
*COUNTY OF ORANGE HEALTH CARE AGENCY, CA. U.S.A.
**MONTOYA, RASCHE, ORANGE, CA. U.S.A.

OBJECTIVE: TO DEVELOP WRITTEN MATERIALS ABOUT AIDS EDUCATION FOR PERSONS WITH LIMITED EXPOSURE TO FORMAL EDUCATION AND WHOSE PRIMARY LANGUAGE IS SPANISH.
METHODS: THE HEALTH CARE AGENCY UTILIZED THE PRINCIPLES AND TOOLS OF SOCIAL MARKETING TO DEVELOP A SPANISH LANGUAGE AIDS EDUCATION BOOKLET TARGETED AT THE LATINO MONOLINGUAL SPANISH SPEAKING POPULATION WITH LITTLE EXPOSURE TO FORMAL EDUCATION. THE FORMAT IS THAT OF A "FOTO-NOVELA" (SOAP-OPERA COMIC BOOK). THIS FORMAT WAS CHOSEN BECAUSE IT IS CONSISTENT WITH A POPULAR GENRE OF ENTERTAINMENT IN LATIN AMERICA. ALTHOUGH THE MESSAGE WAS DEVELOPED WITH MAXIMUM RELIANCE ON VISUAL CUES AND A MINIMUM RELIANCE ON TEXT, THE WRITTEN CONTENT IS ESSENTIAL IN CONVEYING IMPORTANT AIDS EDUCATION. THEREFORE, IT WAS WAS DEVELOPED IN A FORMAT WHICH CAN BE UNDERSTOOD BY INDIVIDUALS WITH NO GREATER THAN A PRIMARY LEVEL OF EDUCATION. THE BOOKLET WAS EVALUATED BY FOCUS GROUPS AND A SEPARATE ASSESSMENT OF THE LEVEL OF READING DIFFICULTY WAS CONDUCTED. THE ASSESSMENT OF READING DIFFICULTY WAS FOR DIALOGUE, CAPTIONS AND INSTRUCTIONS.
RESULTS: FOCUS GROUP RESULTS REVEALED THAT THE BOOKLET HAS A HIGH DEGREE OF CONCORDANCE AND ACCEPTABILITY IN THE TARGET POPULATION. THE DIALOGUE WAS JUDGED TO BE AT THE THIRD GRADE LEVEL; THE CAPTIONS AT THE FOURTH GRADE LEVEL; AND THE INSTRUCTIONS AT THE SIXTH GRADE LEVEL.
CONCLUSIONS: IT IS SUGGESTED THAT THIS IS A USEFUL METHOD FOR DEVELOPING AIDS EDUCATION MATERIALS THAT ARE APPROPIATE FOR THE LANGUAGE, EDUCATIONAL AND CULTURAL CHARACTERISTICS OF PARTICULAR TARGET GROUPS. THE FOTO-NOVELA IS CURRENTLY BEING USED WITH GREAT SUCCESS IN OUR CLINICS AND AIDS COMMUNITY EDUCATION OUTREACH EFFORTS.

M.E.P.9

AIDS IN THE INNER CITY: A BLACK COMMUNITY ORGANIZATION'S RESPONSE TO THE AIDS EPIDEMIC.

Meryle ~~Weinstein~~, Mindy Fullilove, MD, Multicultural Inquiry and Research on AIDS, Center for AIDS Prevention Studies, University of California, San Francisco, U.S.A.

Objective: To assess the factors which encourage minority community organizations to become involved in AIDS prevention.
Method: A local organization, noted for its involvement in community affairs, including AIDS education and drug abuse services, was asked to participate in the study. The anthropological field methods of participant-observation and in-depth interviewing were used in a study conducted over a period of six months. The researcher worked as a volunteer with the AIDS education unit and developed contacts within the organization and the community.
Findings: The organization's entry into AIDS prevention was aided by three important factors: 1) the organization had a strong central leader who was commited to the community and to AIDS education; 2) the flexible structure of the organization enabled it to respond to problems within the community; and 3) AIDS education could be conducted through existing services provided to drug-using clients.
Conclusion: The initial response to AIDS prevention activities by this organization was facilitated by strong local leadership and concern for community welfare. Secure funding sources were critical in developing and building programs. Leadership and funding each affect an organization's response, but may be of critical importance at different times.

M.E.P.11

AIDS EDUCATION IN COMMUNITIES OF COLOR: A PRIVATE-PUBLIC PARTNERSHIP MODEL

Fullwood, P. Catlin*; and Hartfield, K**
*People of Color Against AIDS Network**Sea/King Cty. Hlth Dept., Seattle, WA, U.S.A.

Objective. To describe a model for AIDS education in communities of color.
Methods. People of Color Against AIDS Network (POCAAN) developed a four level strategy to engage communities of color in AIDS education. Level One is to identify issues in terms that are relevant to, and in the idiom of the community. Level Two is to organize community support from both private and public sectors. Level Three is to mobilize the community to confront AIDS through coalition building. Level Four is to motivate individuals to change behavior via direct education, and advocacy on behalf of these individuals.
Results. The strategy was successfully implemented in communities of color statewide. Issue identification occurred via discussions with community leaders and focus groups. Community support was secured through POCAAN's participation in community events, development of culturally specific materials including a nationally acclaimed comic book for youth of color, and the Famous Last Words media campaign, engagement of local and state health departments, and organization of AIDS events including a regional conference attended by 350 people. Mobilization of communities was achieved by providing leadership for collaborative education projects taken on by 10 community agencies. Motivation of individuals is currently being addressed by POCAAN and collaborating agencies, who now have credibility in the communities.
Conclusion. AIDS education within communities of color can be achieved by organizing that culminates in the provision of education by indigenous community organizations, with the leadership and oversight of a central agency.

M.E.P.8

USING NATIONAL AND REGIONAL MINORITY ORGANIZATIONS TO PROVIDE CULTURALLY RELEVANT HIV INFORMATION AND EDUCATION IN THE UNITED STATES.

Fernandez, M. Isabel; Duncan, W.; Lindsey, B. and Kwarmogi, A.
Centers for Disease Control, Atlanta, Georgia, U.S.A.

Objective. To describe a program for developing and strengthening the participation, of national and regional minority organizations in educational efforts to prevent the spread of HIV infection in the U.S.
Method. In 1988, the Centers for Disease Control funded 33 national and regional minority organizations to develop culturally relevant information and education projects targeting minorities at risk. Description of programs and preliminary data on their impact and reach, obtained from quarterly reports, will be provided and includes such variables as number of persons reached, changes in knowledge, attitudes and beliefs. Strategies for coordinating activities, coalition building and networking efforts will be discussed.
Results. To date over 900 persons participated in 30 national and local workshops. Preliminary data indicates significant change in knowledge, attitudes and beliefs. Twelve public service announcements using celebrities were developed for TV and theatre audiences. Preliminary figures suggest 87% day after recall, 78% 2-week recall, and 78% 4-week recall for theatre viewers. Other significant findings and evidence of networking and coalition building among grantees will be presented.
Conclusion. National and regional minority organizations are effective vehicles for providing unique and culturally relevant information and education to minorities in the United States.

M.E.P.10

AIDS EDUCATION PROGRAM FOR HAITIAN IMMIGRANTS IN MONTREAL

Adrien, Alix; Merveille, J.; Alcindor, A.; Ambroise, M-L.; Duperval, R.; Dreyfuss, J.; Bayardelle, P.; Noël, G.
Groupe Haitien pour la Prévention du SIDA (GHP-SIDA), Montréal, Canada.

As of January 1989, 108 (15%) of the 713 adult cases diagnosed in Québec since 1979 were born in Haiti and 20 of the 30 pediatric AIDS cases in this province were born to Haitian mothers.
Objective: To improve AIDS awareness among the 40 000 Haitian immigrants in Montréal.
Methods: Because this community was stigmatized in the early years of the AIDS epidemic, our first goal was to enlist community leaders to support the planning of an AIDS educational program and then to help increase the credibility of the messages. Focus groups were used to formulate French and Creole messages in the fall of 1987. Educational tools included: pamphlets, posters, video, public service announcements in community radio, TV shows and newspapers. A phone response center was also made available.
Results: A 6 week multi media campaign was organised in the spring of 1988. Four weekly radio shows on AIDS prevention were aired on 2 community radio stations and ads were put in two community newspapers. Educative materials distributed included: 3095 pamphlets, 439 buttons, 138 posters displaying the GHP-SIDA's slogan: "Ak Sida, Atansyon pa kapon!". Between July and December 1988, 22 (8%) of 269 randomly selected adult Haitians in Montréal reported having participated in an activity organised by GHP-SIDA.
Conclusion: An AIDS education outreach program is now available for a community that until recently was stigmatized. Continued involvement of all community leaders is essential to the success of the program.

M.E.P.12

IMPLEMENTING A CULTURALLY SENSITIVE AIDS PREVENTION PROGRAM FOR HAITIAN IMMIGRANTS IN NEW YORK CITY

Bastien, A.; Freedman, P.; Norat, Y.; DeHovitz, J.
AIDS Prevention Center, SUNY-HSC @ Brooklyn, USA.

Objective. To describe the rationale and development of an AIDS Prevention Program for Haitian Immigrants in NYC.
Methods. Studies in NYC have shown a high prevalence (6%) of HIV infection in recent Haitian immigrants. The Haitian community presents many barriers to AIDS prevention programs including: 1. A history of stigmatization regarding AIDS;2. Nonwritten language impeding the development of printed education materials; 3. Inadequate access and utilization of medical resources both here and in Haiti; 4. Lack of understanding of concept of prevention of disease; 5. General mistrust of authorities because of both immigration status, and relationships with authority in Haiti.
Results. Components of an effective AIDS Prevention Program should include: 1. HIV counseling and education offered in Creole as a routine part of medical visits when indicated. 2. Active participation by Haitian physicians and community press in educating the population. 3. Unique outreach activities including: videos, skits, and comic books. 4. Public service announcements by prominent members of the community on radio & TV.
Conclusion. In this population the patient's perception of both risk and prevention may be impeded because of multiple barriers. An organized approach must be utilized in order to overcome suspicions and increase utilization of appropriate services.

M.E.P.13 AIDS KNOWLEDGE, LANGUAGE USE AND RESPONSE TO SPANISH AND ENGLISH RADIO MESSAGES OF LOW-INCOME MEXICAN-AMERICAN WOMEN IN SOUTH TEXAS.

Mainer, Marc; Martinez, C.; Prihoda, T.; Rogan, A.; Reyes, M.
University of Texas Health Science Center, San Antonio TX USA

Objective. To determine the educational relationship between AIDS knowledge, language preference and response to AIDS public radio messages for Hispanic women in South Texas.
Methods. We surveyed 212 women in two predominantly Mexican-American housing projects, employing language of preference for each. Scales were constructed to measure Spanish Language Use (SLU), correct/incorrect knowledge of HIV issues (AK+/AK-), risks for HIV (R), recent awareness of AIDS (Qact), sharing HIV information with children (CKO), reported messages from PSAs (RTOT), and enthusiasm for media messages (OPIN).
Results. We found positive correlations between SLU and AK- ($p \leq .0001$), AK+ and CKO (p=.0002), and Qact and AK+ ($p \leq .0001$); and a negative correlation between SLU and AK+ ($p \leq .0001$). In analysis of media, there was no significant association of RTOT and SLU (p=.47), CKO, R, AK+, or Qact. Of note were correlations between AK+ and OPIN (r=-.33, p=.0006); and OPIN and SLU (r=.31, p=.003).
Conclusion. Spanish language preference in these Hispanic women was associated with less net AIDS knowledge and greater enthusiasm for specific messages on HIV risks, precautions and testing. The data suggest that Spanish language media is effective in outreach to Hispanic women with less AK+.

Médias
Media

M.E.P.14 AIDS: THE LANGUAGE, MEDIA, AND PUBLIC RESPONSE

Duffhues, Josee C.; Waterloo Regional Health Unit, Kitchener Ontario, Canada.

Objective: To examine the impact of media coverage of AIDS in community papers and magazines, and to ascertain differences in public and media response to AIDS following the Ontario Ministry of Health $7 million dollar "Let's Talk" media education campaign.

Methods: An examination of local print media coverage of AIDS related articles both before and after the Ministry of Health "Let's Talk" campaign. Additional examination of pre-test instruments distributed at AIDS education presentations. A critical examination of the language used by the media in coverage of (a) medical reports, (b) lifestyle articles, and (c) public and private response stories.

Conclusion: The Ministry of Health advertising campaign has had some impact on the general public. However, while many people now believe AIDS cannot be contracted by casual contact, great confusion still exists around transmission and risk categories. Continued education is required, but such education must be targetted at specific audiences if it is to be successful.

M.E.P.15 UTILIZING THE MASS MEDIA TO PROVIDE CULTURALLY RELEVANT HIV EDUCATION TO HISPANIC AMERICANS

Fernandez, M. Isabel*; Lepicier, R.**; & Montealegre, L.***,
*Centers for Disease Control, Atlanta, Georgia, U.S.A.,
**KCET TV/Hispanic Health, Los Angeles, California, U.S.A.,
***Sosa and Associates, San Antonio, Texas, U.S.A.

Objective. To present a working model for developing effective, culturally relevant mass media HIV education programs for Hispanics.
Methods. Essential components of the model will be illustrated and its practical application described by tracing the development of three video instruments (SIDA is AIDS, ALICIA and AMERICA RESPONDS TO AIDS FOR HISPANICS) from initial concept development to production and utilization. Effectiveness of the model was assessed via field tests on stratified samples from the target population, viewer ratings, press coverage, ratings from national experts, number and types of calls to national and local hotlines, and number of requests for the products. A set of principles for developing effective, culturally relevant mass media interventions for minority populations will be provided.
Results. Preliminary analyses of SIDA is AIDS data suggest: over 16% increase in volume of calls to the national hotline; press coverage in all major newspapers in the market areas; and overwhelmingly positive ratings from national experts. Viewership ratings were either good or extremely good in 80% of the major markets.
Conclusion. Utilization of this model will increase the effectiveness and reach of mass media efforts targeting Hispanic Americans.

M.E.P.16 DEVELOPING A LARGE SCALE AIDS MEDIA CAMPAIGN BY COMBINING PUBLIC AND PRIVATE SECTOR RESOURCES

Webster, Claudia L.*; Fleming,D.*; McAlister,R.*; Tycer,G.**; Schmidt,R.***. *Oregon Health Division, **Turtledove Clemens, Inc. ***Pihas Schmidt Westerdahl, Portland, Oregon, U.S.A.

Objective. To educate the public about AIDS through a statewide media campaign.
Methods. The Oregon Health Division collaborated with two private advertising agencies to produce an AIDS education media campaign. The Division contributed seed money and public health expertise and obtained input and endorsements from political leaders, health care providers, AIDS activists and religious leaders. The private sector donated all creative and production talent and advertising time and space. All material was produced at cost. The campaign's effect was measured by two statewide random digit dialing surveys of 600-800 people each conducted at the beginning and end of the four month campaign.
Results. The campaign was launched in 10/87 by the governor. During the following four months, six T.V. spots were aired 1,932 times; four radio spots were played 3,916 times; 34 newspapers ran at least one of six print ads; 120 billboards, 275 interior and 75 exterior transit ads were placed; and 20,000 bumper stickers and 5,000 copies of 4 posters were distributed. After the campaign, 68% of those polled had seen or heard parts of the campaign. Recognition of specific campaign slogans varied between 66% and 83%. Persons polled after the campaign were more likely to believe that HIV could be transmitted from mother to fetus (78% vs 85%, p=.001), less likely to believe it safe to have sex with someone who tested negative for AIDS (44% vs. 39%, p=.05) and, among 18-39 year olds, more likely to accept the use of condoms (56% vs. 65%, p=.03). The campaign cost Oregon taxpayers $70,000. The value of donated private-sector time and services was estimated at one million dollars. Eight national and international awards have been received for the campaign.
Conclusion. Combining public-sector seed money and public health expertise with private-sector media talent and resources that are largely donated is an effective way to mount a large AIDS public information campaign.

M.E.P.17 THE IMPACT OF MEDIA EVENTS ON PUBLIC INTEREST IN AIDS

Hartfield, K*; Ray-Keil, L*; and Wood, Robert*
* Seattle-King County Department of Public Health, Seattle WA, U.S.A.

Objective. To assess the impact of major media events on general public concern about AIDS, as indicated by calls to the AIDS hotline, King County, Wash.
Methods. The Seattle-King County Health Department's AIDS Prevention Project staffs an information and referral hotline 50 hours per week. Data are routinely collected on the number of incoming calls, gender of callers and risk level with regard to infection with HIV. We analyzed trends in numbers and types of calls with respect to major print and electronic media events.
Results. Calls to the hotline increased immediately following major media events. In the 3 days following the National Mailout, the number of calls doubled compared with the average number of calls during a comparable time period. We noted increases in requests for antibody testing in low risk sites, and similar peaks after other media events including the release of CDC data on the risk of HIV infection from blood transfusions (May 1987), and national network coverage of the International AIDS Conferences, 1987 and 1988. The percentage of calls from females and no risk or low risk individuals also increased following these events.
Conclusion. Major media events have a strong influence on the general public's interest in AIDS, and provide an opportunity for local hotlines to dispel myths and continue educating populations who might not be reached by other campaigns. The impact of the National Mailout was similar to that of a major print or electronic media event, indicating a need for further study of the relative effectiveness of a costly, labor intensive education strategy like the National Mailout.

M.E.P.18 PERCEIVED RISK OF HIV TRANSMISSION FROM A PROMISCUOUS BISEXCIAL PATIENT WITH AIDS AMONG LAY PEOPLE AND PUBLIC HEALTH SPECIALISTS

Gen Ohi, Dept.Environ.Commun.Med., Teikyo University School of Medicine, Tokyo, Japan.

Objective. To see 1)The Magnitude of HIV transmission risk perceived by lay people and public health professionals immediately after mass media reported that a man with AIDS had had contacts with 150 prostitues and homosexcial males prior to the development of the diseas and 2)attitude towards preventive policies with restrictive measures of varying degrees in comparison with the size of perceived risk.
Methods. Study I: Questionnaire study was conducted within a week after the news was released on 893 lay people (students, office workers) and 38 public health specialists Study II: Questionnaire study on 570 university students regarding the above described risk estimation juxtaposed with their attitudes toward preventive programs
Results. Study I: Number of transmission perceived by the lay people was much greater than that by the specialists (mode, 100-999 vs. 0-9)
Study II: No attitudinal difference between the group with higher estimation and the one with lower estimation
Conclusion. 1)Lay people tend to overestimate the risk of HIV transmission and may be more vuluevable to the influence of mass media. 2)Attitudinal change may be associated with fear and anxiety but not with the professed magnitude of transmission risk per se.

M.E.P.19 THE METAPHORS OF AIDS: REPORTING AN EPIDEMIC IN PUERTO RICO

Cunningham, Ineke and Cunningham, E.L.
University of Puerto Rico, Río Piedras, Puerto Rico.

Objective. To analyze quantitatively and qualitatively the reporting of AIDS in the daily press of Puerto Rico (PR).
Methods. All articles from 1981-1988 in the five daily newspapers of PR which mentioned the word "AIDS" (2511) were classified by type (news article, feature, etc.) and source (from PR or elsewhere), and analyzed.
Results. There was a stepwise several-fold increase in number of articles in each of four periods beginning June 1981 (when first medical article on AIDS was published), May 1983 (when JAMA article concluded that there could be household spread), July 1985 (when Rock Hudson announced he had AIDS), and September 1987 (when the U.S. government refused money to PR for AIDS because of political bickering). Content of articles also changed for each period, but not percentage of articles from PR. Emphasis in the first period was on scattered items of information; in the second, the risk to those with non-risk behavior (undertakers, etc); in the third, political arguments on incidence, condom advertising. etc.; in the fourth, nonspecific information rather than political pronouncements. However, metaphors have tended to be political rather than sexual or racial.
Conclusions. The PR press has responded to AIDS like its U.S. counterparts by increasing both the amount and nature of information in response to incidents which changed public perception of the disease, but the metaphors in PR have been different.

M.E.P.20 AIDS INFORMATION CENTER IN LIMA, PERU

Luján, Manuel*; Goicochea, Pedro**; Varela, Luis***; Coleman, Patrick****.
*Peruvian Health Ministry, Lima, Perú, **Proyecto SIDA, Lima, Perú, ***Population Council, México, ****The Johns Hopkins University/Population Communication Services, Baltimore, Maryland, USA.

Objective. To improve press coverage of AIDS in Lima, Perú, through the implementation of an AIDS Information Center.
Method. The following activities have been carried out to design and operate an AIDS Information center:
1. A content analysis of AIDS press coverage.
2. Development of an information strategy based on the distribution of press releases relevant to AIDS prevention.
3. Organization of educational activities for journalists and other mass media professionals.

Results. The content analysis showed that AIDS news are abundant in the local Lima press, however, they are permeated with innacuracies, contradictions, distortions and sensationalism. Additionally, the scientific/technological discourse is often used to advance moral positions toward AIDS, and very little space is devoted to prevention issues. Press releases emphasizing prevention have been sent to newspapers and magazines; one third have been published in 8 different periodicals. Nevertheless, no releases promoting condom use have been accepted for publication. Journalists participating in the center's AIDS seminar felt AIDS reporting should be improved. To this effect, 30% felt they needed to increase their knowledge and 20% felt they needed up-dated information.
Conclusions. The AIDS Information Center has had an initial impact on the quality and quantity of AIDS reporting in Lima by slightly shifting the emphasis to prevention issues. Additionally, it has enlisted the cooperation of mass media professionals who are increasingly using the center's services.

M.E.P.21 AIDS MEDIA & ANTI-DISCRIMINATION: A CRITICAL PRESENTATION

Saalfield, Catherine; Navarro, Ray
Whitney Museum Independent Study Program, New York, U.S.A.

Objective: To provide a critical analysis of U.S. mass media representations of the AIDS pandemic, and to offer an alternative to these.
Methods: Critical analysis will include references to semiotic, psycoanalytic, feminist and anti-racist analyses of U.S. mass media production. Video clips of mass media and alternative productions will be available for viewing and discussion purposes.
Results: By examining some of the images of PWAs available in the mass media in the U.S. we are more able to fully understand the nature of discrimination against this community. The proliferation of these images does not imply a growing sensitivity to the PWA community. We intend to prepare a screening of videotapes (or clips from several tapes) that place this discrimination in a historical context. This will include a brief analysis of past representations of IVDUs and homosexuals and how these stereotypes complicate the media's attempts to report on the pandemic. We will also present material that seeks to explode these stereotypes. Much AIDS-related video work is being made by alternative producers such as video collectives comprised of women, PWAs, etc. We intend to provide a forum in which to discuss some of the implications of this work and how it is significant at this stage, especially in relation to concepts such as the CRI. We also intend to make a list of available alternative productions along with infomation re: distribution, rental/purchase fees, etc.
Conclusion: Alternative video productions offer more coherent, anti-discriminatory representations of the AIDS crisis and are therefore more appropriate as educational tools than mass media productions.

M.E.P.22 AIDS MAKES NEWSPAPERS SELL.

Arredondo, C.; Conde, F. , Coronado, A.*, Gil, E.*.
Ministery of Health.-Spain.

Objective. Collective social groups related with AIDS (health personnel, anti-AIDS organizations, social workers, trade unions...) that have been analyzed through qualitative means, demonstrate a negative attitude towards the usual form and content used by the media to present information about the disease.

The diffusion of information that is uncontested or even false creates uneasiness and uncertainty in all social groups (mosquito bites, syringes left behind in park and beaches, tourists...). All of these increase fear in the population and produce misinformation by creating confusion in the information issued. To a great extent the media themselves are responsible for negative attitudes and fear of the disease because this misinformation encourages something very difficult to fight against; rumours doubt...
Conclusion. The report demonstrates the need for the media to receive an adequate training that will permit them to approach AIDS with objective criteria and effective information.

Milieu de travail
Workplace

M.E.P.23 EMPLOYMENT AND THE SOCIAL CHALLENGES OF AIDS

Laubenstein, Linda J., MD.*; Greene, J. B., MD.*; Campbell, J. R., SPHR**; Weisberg, H. S.**
*New York University Medical Center, 530 First Ave., NY, NY 10016 USA
**Multitasking Systems of New York, NY, NY, USA

Objective. Psychological problems caused by job discrimination among people with AIDS can be reduced through re-employment in a supportive workplace.
Methods. Multitasking Systems of New York (MTS), a specially created "quick-print" company, employs people with AIDS. MTS provides job counseling, placement and vocational rehabilitation, including training.
Results. As of Feb. 1, 1989, MTS registered 120 applicants, hired 10 unemployed people with AIDS and referred 15% of applicants to other employers. Linkages have been made with community-based agencies and government to provide support services, as well as with New York University Graduate School of Business to conduct applied research into relationships between AIDS and work. An MTS-initiated review led New York State to change policy to begin including people with AIDS in job training and vocational rehabilitation programs.
Conclusion. Providing jobs is an innovative, effective way to meet the social challenges of the AIDS crisis. Employment addresses the emotional, economic, legal and ethical needs of the individual with AIDS and society.

M.E.P.24 HEALTH CARE WORKERS AND AIDS: RISK PREVENTION AND EDUCATION

Clavreul, Genevieve, **World Immunological Network Project Foundation**, Los Angeles, CA, USA

OBJECTIVE To outline and describe the need for a consistent educational program in hospitals and clinics geared toward preventing the spread of AIDS between patients and healthcare workers
METHODS Interviews and observations were conducted at private and public hospitals and clinics throughout the United States to determine what institutional efforts were being made to educate staff about taking protective measures against AIDS infection. Physicians, nurses and health aides were interviewed and observations
RESULTS In nearly all of the hospitals and clinical settings investigated, no adequate formal program related to the risk of staff to AIDS infection was in place. Procedures for using masks, gloves and gowns were poorly defined. For the most part, staff took precautionary measures when caring for an identified AIDS patient. However, in cases where the risk is present but less evident, such as in pediatrics,obstetrics, gynecology or intensive care units, staff members were considerably more cavalier about gloves, gowns, masks, using extra precaution in handling syringes and contact with body fluids
CONCLUSION There is a clear need for a consistent and concentrated effort on the part of hospital and clinic administrations to institute formal lectures, classes, and seminars on AIDS risk prevention for staff. Formal procedures need to be implemented, with supervisory staff held accountable for overseeing and insuring that they are followed. Brochures, video presentations and posters should be used to underscore in-house policy

M.E.P.25

THE METRO TORONTO AIDS EDUCATION PROGRAM: A MODEL FOR LOW-BUDGET MUNICIPAL TRAINING

Riley, Diane*, Davey, M.*; Varley,V.*;and Sloggett S.
*Municipality of Metropolitan Toronto, Toronto, Ontario, Canada.

Objective: 1. To provide all Metro employees with the knowledge and skills necessary: to prevent transmission of AIDS; to abide by Metro AIDS Policy, Human Rights, Health and Safety and other legislation: to practice Universal Precautions for infection control; to cope with the psychological, social, and ethical issues raised by AIDS and similar disorders.2. To provide all persons serviced by Metro with the knowledge and skills listed above and to ensure a consistently high level of service to Metro residents regardless of their status with respect to the AIDS virus.

Methods: The program has a low budget with minimal staff and resources,but Metro has more than 12,000 regular employees alone (including health-care, child-care, land-fill, and sewage treatment workers), many with low English or mother-tongue literacy levels. Because information alone is not enough to bring about behaviour change, the program uses a small-group (25 or less), interactive lecture/workshop (2-3 hours depending on needs of audience)approach. Although it may sound costly, this approach ensures high cost-effectiveness by allowing trainees to break through denial, to confront the reality of AIDS in their own lives, and to discuss concerns. It also allows demonstration of infection control techniques, discussion of issues specific to each workplace and to each individual, and ensures that each trainee has met a person who they can contact with future questions in a confidential manner.

Results and Conclusions: Program is cost-effective in that many people in very different occupations and with very different literacy levels can be trained so that both knowledge and behaviour change occurs.

M.E.P.26

EFFECTING BEHAVIOR CHANGE THROUGH POLICY AND TRAINING

Gerberding, Julie Louise , M.D., San Francisco General Hospital, San Francisco, California, USA

Objective: How a hospital's interdepartmental approach to the implementation of Universal Blood and Body Substance Precautions effected staff behavior change.

Methods:
- Questions most commonly asked during initial training sessions indicated areas of greatest concern
- Infection Control Committees observations through hospital rounds and problem-solving consultations
- Major problem areas identified are then targeted as "the Question of the Week" in week-long mini-educational campaigns for staff
- Knowledge is measured through pre/post tests in the second training program

Results:
- Ascertain whether supplies and equipment are available
- Immediate feedback passed to affected departments
- Ascertain cost increases or decreases due to implementation
- Knowledge gain from the training will be demonstrated in employee practice

Conclusion:
- Universal Blood and Body Substance Training transcends the formal program and becomes an on-going, on-site process which is evaluated by changes in staff performance

M.E.P.27

AN EMPLOYER-BASED APPROACH TO AIDS PREVENTION, EDUCATION AND MANAGEMENT

Berry, William L., Vance, R.D., Sofian, N.S.; Anderson, E.S.
Washington (state) Employers' AIDS Prevention Alliance, Seattle, WA, U.S.A.

Many employers lack comprehensive, current and reliable AIDS-related information to use in the workplace. AIDS prevention and education for the general public was cited as an unmet need by the (Washington) State Governor's Task Force on AIDS. The Seattle-based Washington Employers' AIDS Prevention Alliance (WEAPA) is a *participatory* private sector response to the need for AIDS/HIV infection preventive education and AIDS-related information in the work environment.

WEAPA has two main goals: 1) the promotion of AIDS/HIV infection preventive education at the worksite, and; 2) the provision of AIDS/HIV infection management tools to employers.

WEAPA provides educational materials, presentations in AIDS prevention, and technical assistance on legal, benefits, cost, and communication issues related to AIDS. WEAPA is co-sponsored by private and public sector organizations. Participation in WEAPA is through membership (nominal annual fees based on work force size) and includes all services. After one year of operation, WEAPA has 154 employer members, representing an almost equal cross-section of large (>501 employees), medium (51-500 employees) and small (2-50 employees) employers. WEAPA's first annual conference, an introduction to AIDS/HIV infection prevention and management for employers, was attended by all members. 31% (47) of the members received technical assistance in developing human resources policy and procedures, managing insurance and benefits programs, and keeping current on legal issues related to AIDS. 20% (30) of members report having employees who self identify as having AIDS or being HIV positive. WEAPA is an innovative private sector prevention and education model applicable for any metropolitan/geographical area. WEAPA has begun to work with other communities interested in worksite AIDS education.

M.E.P.28

AN AIDS EDUCATION INTERVENTION IN A MULTINATIONAL HOTEL INDUSTRY

Christie, Grania; Zazayokwe, M.; Sher, R.; Metz, J.
AIDS Training and Information Centre, South African Institute for Medical Research, Johannesburg, South Africa.

OBJECTIVE. To formulate, implement and evaluate an AIDS education intervention in a multinational hotel industry.

METHODS. A three-phase intervention was adopted to create an awareness of AIDS amongst all hotel employees. Firstly, executive management attended an AIDS seminar. Secondly, a multidisciplinary team of professionals visited the different hotel regions to address senior, middle and supervisory management about AIDS, and to plan for preventive education. In the final stage, 30 hotel employees were selected on specific criteria for training. Of these, 20 were black, 10 white, with an even ratio of male to female. Two successive groups of 15 people participated in a five-day training course. The objective of the course was to certify them as AIDS educators so that they could disseminate information to all hotel employees. A follow up to monitor progress is carried out at monthly intervals.

RESULTS. In a period of four months 3337 (33%) out of a staff compliment of 10319 were informed about AIDS. Surveys and questionnaires reflect increased AIDS knowledge and awareness. Additional research is necessary to evaluate attitude and behaviour change.

CONCLUSION. The success of the intervention to-date results from a cadre of educators who can provide continued in-house information, and also from management committment to promoting AIDS awareness to all hotel employees,eg. condom vending machines were installed in all hotels.

M.E.P.29

RESPONDING TO AIDS: TEN PRINCIPLES FOR THE WORKPLACE

Levine, Carol
Citizens Commission on AIDS for New York City
and Northern New Jersey, New York, NY, USA

In response to concern among employers and employees about appropriate policies and programs concerning AIDS, the Citizens Commission on AIDS for New York City and Northern New Jersey has developed ten principles to guide businesses, unions, and other organizations. These principles are:

1. People with AIDS or HIV (Human Immunodeficiency Virus) infection are entitled to the same rights and opportunities as people with other serious or life-threatening illnesses. 2. Employment policies must, at a minimum, comply with federal, state, and local laws and regulations. 3. Employment policies should be based on the scientific and epidemiological evidence that people with AIDS or HIV infection do not pose a risk of transmission of the virus to coworkers through ordinary workplace contact. 4. The highest levels of management and union leadership should unequivocally endorse nondiscriminatory employment policies and educational programs about AIDS. 5. Employers and unions should communicate their support of these policies to workers in simple, clear, and unambiguous terms. 6. Employers should provide employees with sensitive, accurate, and up-to-date education about risk reduction in their personal lives. 7. Employers have a duty to protect the confidentiality of employees' medical information. 8. To prevent work disruption and rejection by coworkers of an employee with AIDS or HIV infection, employers and unions should undertake education for all employees before such an incident occurs and as needed thereafter.
9. Employers should not require HIV screening as part of general pre-employment or workplace physical examinations. 10. In those special occupational settings where there may be a potential risk of exposure to HIV (for example, in health care, where workers may be exposed to blood or blood products), employers should provide specific, ongoing education and training, as well as the necessary equipment, to reinforce appropriate infection control procedures and ensure that they are implemented.

As of February 1, 1989, over 300 corporate and non-profit organizations in the United States have publicly endorsed these principles. They serve as a model to other groups concerned with these issues.

M.E.P.30

Workplace AIDS Education: An Evaluation of CDC Employees

Deborah Rugg, S. Kidd, D. Brownell, D. Schnell
Centers for Disease Control (CDC), Atlanta, Georgia USA

Objectives: To examine the impact of an educational intervention on employees' AIDS knowledge, attitudes, beliefs, risk perceptions, HIV test-seeking and level of comfort working with a person with AIDS or HIV.

Methods: A questionnaire designed to measure these factors was self-administered in a pre-post test design by 383 (93%) of the CDC employees attending a one-hour AIDS education seminar.

Results: Survey respondents were generally white (81%), married (64.8%), female (60.3%), and college educated (70.2%). Mean age was 41.6 years. Overall, participants' awareness and attitudes about AIDS improved significantly ($z = 8.3$, $p < .001$). However, many participants reported only modest comfort in working with someone infected with HIV (70%). Accurate AIDS knowledge was modestly predictive of how comfortable people would feel working with someone who is infected. Most of the participants who had already been tested (25.2%), had been tested at blood banks. Although CTSs had not been used in the past, CTSs were reported as a major potential site to visit for testing. Additionally, people remain confused about the safety of the nation's blood supply (60% were incorrect) and what the HIV antibody test shows (50% were incorrect). Respondents rated themselves at low or no risk (90.4%). Nevertheless, over one-third were single adults and 11% felt that they were at risk or were unsure of their risk.

Conclusion: Continued AIDS education targeting these issues and intensive evaluations of such workplace programs are warranted.

M.E.P.31 EDUCATIONAL STRATEGY ON AIDS AT WORKPLACES.

Grandi,J.L.;Fernandes,M.E.;Abbud,N.K.;Adão,V.K.; Kakihara,R.
Centro de Referencia e Treinamento-Aids, Sao Paulo, Brazil

Objective.The State of Sao Paulo, Brazil, is the most industrialized region in South America with aproximately 100,000 big Companies, and because so many people can be reached at the workplace,one of the primary targets for Aids Education considered by the Department of Education and Training from the Secretary of Health was the workplace.
Methods.Once a month we realized a trainning course with 20 hs. for human resources and Health care providers from big companies with the folåwing classes. Epidemiology, Clinical, athical, legal social and educational aspects on Aids. Evaluation of the trainning is done with pre and pos-test with basic questions due to HIV patient in the workplace.
Results.409 human resources and Health care workers were trained from 149 big companies. 70% of them developed massive campagnies and helped with their own material other smaller companies
Conclusion. The response of the trainning course was considered very effective decreasing discrimination and misunderstood.

M.E.P.32 RULES FOR ADEQUATE CARE AFTER ACCIDENTAL SKIN LESIONS WITH RISK OF EXPOSURE FOR BLOOD BORNEINFECTION

Hambraeus,Lars, BA,MD,DTM&H,MPH; Greitz,Yvonne, R.N.T.
Department of Epidemiology, National Bacteriological Laboratory, Stockholm, Sweden

Accidental skin lesions in staff handling possibly HIV-infected material often provoke strong feelings of anxiety for an infection. Thus, there is a need for firm rules how to act in order to prevent overacting and to ensure adequate measures. After several incidents we have formed rules how to advise people in different positions. These rules are divided into four parts each applicable to persons in different roles, summarized as follows.
1. On the spot any blood should be washed away and if bleeding occurs one should try to squeeze out the blood. The exposed person should be brougt to the occupational health service together with full details on the suspected material.
2. The local safety delegate has to help the person in question to make a report of the accident.
3. The local foreman has to ensure that the exposed person is adequately treated, gets good support, and is taken to the health service, that a comprehensive report is duly written, and that the exposed person's family gets support and advice.
4. The health service concerned must elucidate the circumstances, take all indicated tests, give prophylactic medication, and organize proper follow-up.

M.E.P.33 RESULTS ON THE EFFECTIVENESS OF AN AIDS IN THE WORKPLACE EDUCATION PILOT PROGRAM

Blake, S.*, Najjar, D., George, A., and Makinodan, R.
*American Red Cross, Washington, D.C., U.S.A.

Objective: To assess the short-term impact of an AIDS curriculum in the workplace, and to explore factors associated with knowledge, attitude, and behavior change.

Methods: Pre-post survey results from N=131 employees in six companies were analyzed using paired t-test comparisons and McNemar test statistics to determine the significance of change. Kruskal-Wallis and Chi-square test statistics were used to assess the relationship between change and participant or employer demographic characteristics.

Results: Statistically significant changes ($p <.01$) in knowledge of the mode of transmission, risk perceptions, workplace attitudes toward PWAs, prosocial and risk reduction behavioral intentions were found. Participant gains following participation were greatest for persons who were less knowledgeable, less confident, less tolerant of PWAs, and less likely to engage in prosocial behavior, to communicate about AIDS, or to have done anything previously to reduce their risk for exposure ($p < .01$). Relatively few individual or corporate predictors of change were observed.

Conclusion: Short-term effects of an AIDS education program in the workplace can be demonstrated, particularly for those individuals at greatest need of basic information. Future research and curriculum needs are discussed.

Famille
Family

M.E.P.34 FAMILY TREATMENT APPROACH FOR HIV INFECTED CHILDREN

Septimus, Anita and Rubinstein, A.
Albert Einstein College of Medicine, Bronx, N.Y., U.S.A.

Objective. The index patient with HIV infection identifies a whole family at risk where the mother is infected, possibly the father and at times one or more siblings. The experience of chronic illness paralleled by the escalation of multiple losses places a heavy emotional burden on AIDS families. Prior to their HIV infection, these families, present a formidable challenge by the mere fact of their poverty, stigma, rejection, unresolved grief, and poor coping skills.
Method. Clinical observations from case analyses and therapeutic intervention with 45 families at our institution revealed the following. 1) Trauma and fears experienced by young adults losing their children. 2) Isolation and rejection from family members and friends causing the deterioration of couple and family relationships. 3) Full spectrum of uncontrolled emotions due to fatal illness - hopelessness, depression, and suicidal ideation. 4) Guilt in infecting loved ones and fear of infecting further, pervasive anxiety related to future pregnancies in young women. 5) Anxiety related to lack of financial support, sexual involvement, medical outcome. 6) Need to plan for bereavement and the future of the survivors.
Results. Mobilizing as many family members and friends as possible and eliciting their support creates an effective support network. Better coping skills and more functional family intervention ensue. Treating cases outside the family context is ineffective and often detrimental.
Conclusion. In order to diminish family chaos, sustain family equilibrium, improve compliance and provide families with renewed energy and quality of life, timely and targeted family interventions are crucial to the comprehensive management of HIV infected families.

M.E.P.35 MULTI-FAMILY SUPPORT GROUP FOR TRANSFUSION RELATED HIV INFECTION

Stuart, A.*; Steilen, M.* and Campbell, S.**
*Columbia University, New York, NY, **Memorial Sloan Kettering Cancer Ctr., New York, NY

Objective: To decrease the isolation of the recipients from their families, to educate patients and their families about HIV infection and to provide a safe environment in which the patients and their families can express their feelings.

Methods: Group was composed of recipients and any of their family members that could/would attend. The contract was for 6 consecutive weekly evening sessions which lasted 90 minutes. Content included fear of isolation, anger, frustration, issues of loss of control, shame and grief. Education was very important in this population as they were psychologically unsophisticated and grew up in an era in which exposure to infection could result in death.

Results: Group provided a safe environment in which members (age range: 26-76) could share their feelings. These feelings had been denied at home, resulting in family disequilibrium. An ongoing support network was begun.

Conclusion: Important strides were made within this group to restore the homeostatis of the family units. This group model could help others who, because of their beliefs about infectiousness, reinforced by society's fears, are not getting adequate support or medical care.

M.E.P.36 BISEXUAL MEN AND THEIR PARTNERS WORKSHOP SESSION

Palmer, William, Research Officer
Gay and Married Men's Association, Melbourne, Victoria, Australia.

Objective. This workshop is designed to explore the issues related to bisexual behaviours in men which may subsequently lead to H.I.V. transmission within the general community. To discuss the research data on which the rationale of the workshop is based.
Methods. By examining case histories, to identify a range of sexual and emotional behaviour patterns which may, for a variety of reasons result in H.I.V. infection of men in a primary heterosexual relationship. Such factors as non-cognitive homosexual behaviour, denial of risk behaviour, adolescent type sexual behaviour patterns and unpremeditated homosexual experiences will be considered. Emotional barriers to behaviour change and methods to overcome these barriers will be discussed. Factors which rien force positive changes will be presented with the background research information on which they are based.
Results. It is expected that an evolution of emotions and attitudes within the workshop framework will lead to a better understanding of the dilemas routinely faced by men with a bisexual orientation.
Conclusion. By promoting a better understanding of the issues involved in dealing with bisexual behaviour and orientation it is possible to provided more appropriate snesitised services to this group of men. The end result at a community level is the protection of the men themselves, their female sexual partners and the children conceived.

M.E.P.37

AIDS AND HEMOPHILIA: A COORDINATED EDUCATION, SUPPORT AND PERSONAL CARE PROGRAM. EVALUATIVE REPORT FROM A TWO-YEAR PILOT PROJECT

McDonald, John R.*; Dowdle, Ginny**
*University of Calgary, Calgary, Alberta, Canada, **AIDS Calgary, Calgary, Alberta, Canada.

Objective: To describe results of a two-year, Health and Welfare, Canada funded pilot project in education, support and personal care for persons and families having or at-risk for HIV and AIDS in the Southern Alberta Hemophilia Program.
Methods: The project purpose was to strengther the education, support and personal care network for people with hemophilia and their families in Southern Alberta. This purpose was addressed through four objectives: (1) an education, support and personal care network, (2) cooperation with Regional Hemophilia Society and the Comprehensive Hemophilia Clinic in establishing resource and information services, (3) scheduling regular update and specific topic meetings conferences, social and information sessions, (4) conducting hospital staff and public education sessions, and (5) providing limited financial assistance in unmet need areas.
Results: In all fifteen program events held, information base established, support and financial assistance provided. A visible strengthening of the hemophilia community resulted, as well as a regular mechanism for education, support, and networking occurred.
Conculsion: Evaluation indicates program with modifications is viable and important. First year provincial funding granted for program continuance.

M.E.P.38

THE HIV-ENDANGERED/INFECTED CHILD IN THE FOSTER-FAMILY

Schwarz,Gabriele; Hemme,A.
Arbeitskreis zur Förderung von Pflegekindern e.V. ,Berlin, Federal Republic of Germany.

Beside medical specifics of HIV-infection with children as there are - problems in diagnosis of HIV-infection, - course of desease, - mortality rate, - infection of mother in case of pre-/perinatal endangered/infected children, there are also a large number of expectional psychological and judical problems.

Psychological aspects of HIV-infection with children resulting for example from : - HIV-infection of members of the family, - preliminary uncertanity about HIV-status of the child, - death of the mother, - sickness of the mother, resulting in temporary or permanent living of the child outside mother's home, - change in the person who is in charge of the child, - difficulties between own- and foster-family, - problems with social neighbourhood, - problems with institutions.

Judical aspects to be considered are: Liability of the foster-family, - law regarding electronic data processing figures, - HIV-testing of applicants for foster and adoption of the child, - duty of revelation for example, when the child is attending the kindergarten. The poster shows the subjects concerned as well as their combined effects on each another.

M.E.P.39

WHO SPEAKS FOR THE ABANDONED CHILD BORN WITH HIV? A FOSTER PARENT AND ADOPTIVE PARENT RESPOND.

Chamness, Barbara A.*; McCarroll, Tolbert**.
*Childkind, Inc., Atlanta, Georgia, USA, **Starcross, Annapolis, Calif., USA.

Objective: To provide for and address the needs of homeless children born with HIV, from the perspective of the child.
Method: Childkind and Starcross Community are actively involved in the placement and protection of HIV children. Our position is that each child should have maximum human continuity. We have adopted or are in the process of adopting 7 homeless children with HIV. We offer nationwide support and educational services for prospective foster and adoptive parents. The health and dignity of these children are the primary focus in all our lobbying and advocacy efforts.
Results: By cooperating with existing religious outreach programs as well as governmental and social service agencies foster and adoptive parents have been recruited. Foster care homes have been purchased with private monies and parents provided with the appropriate support to care for infants and children born with HIV. These agencies and parents support spiritually, economically and mentally the day-to-day stable home environment so desperately needed by these children.
Conclusion: Children with HIV should be mainstreamed and given the opportunity for early bonding with an individual or family. Our responsibility as caring human beings is to do everything possible to give these children the opportunity to equip themselves with the mental and emotional resources to fight off this disease. Personal involvement with our adoptive and foster children are proving the validity of this approach.

M.E.P.40

AIDS ORPHANS IN NEW YORK CITY: PROJECTED NUMBERS AND POLICY DEMANDS

Norwood, Chris, Women and Aids Studies, 710 West End Ave., NY,NY 10025 USA

Objective. In the focus on Aids and pregnancy, it has been widely overlooked that HIV positive women have many more non-HIV-infected (HIV-) than HIV-infected (HIV+) children. Nearly all HIV- children will be orphaned at a mother's death. Estimates of orphans to be expected in NYC are projected and implications for social policy and prevention discussed.
Methods. Assessment was made of the relative numbers of HIV- and HIV+ children under age 18 residing with HIV+ mothers in 3 NYC boroughs with high levels of women's infection:

Mothers	#	Total HIV-Children	HIV+Children	Ratio-to+Children	Avg.#HIV-Chil.
Heterosexually-infected	30	59	8	7.3:1	2
IV Drug-Infected	34	71	23	3:1	2

Results. Mothers infected by drug abuse had more HIV+ children than those infected heterosexually but, on average, there were 2 HIV- children per mother in both groups. The NYC Dept. of Health estimates there are between 33,000 and 50,000 total infected women in the city, with large numbers approaching illness. Reducing the women's estimates by 10% to allow for older women unlikely to have dependent children, if even 80% of the remaining women develop Aids, it is estimated they will leave behind between 52,272 and 72,000 living, orphaned children, given an average of two HIV- children per woman.
Discussion. While these results are necessarily based on estimates, they have important implications: 1.) In New York and many U.S. localities, efforts to directly counsel women about prevention are focused on women in prenatal care. However, with many women clearly having had their children by the time they become infected, much more preventive effort, including partner notification, must be focused on women who are already mothers. 2.) National policy and attention to care for orphans is urgent in nations with high levels of female infection. Aids-impacted areas simply will not have the resources to care for orphans by themselves.

M.E.P.41

EXPERIENCE QUEBECOISE D'INTERVENTION AUPRES DE FAMILLES A L'OCCASION DE L'HOSPITALISATION DE LEUR PROCHE HOMOSEXUEL ATTEINT DE SIDA

Berthelot, Pierre*; Poirier, G.**.
*Centre de services sociaux de Québec, Services sociaux hospitaliers, Equipe de prévention et de dépistage SIDA, Québec, Québec, Canada; ** Centre de services sociaux de Québec, Services sociaux hospitaliers, Hôtel-Dieu de Québec, Québec, Québec, Canada.

Objectif. Présentation d'une expérience québécoise d'intervention auprès de familles à l'occasion de l'hospitalisation de leur proche homosexuel atteint de SIDA.
Méthodes. Présentation:

- du processus d'intervention: utiliser la crise vécue au moment de l'hospitalisation comme moment stratégique d'intervention auprès de la famille; accompagner et normaliser le vécu des membres impliqués de la famille; précéder le non-dit pour rendre explicite l'indicible, pour le normaliser et pour supporter la famille.
- des difficultés rencontrées dont, entre autres: crainte par la famille du jugement de l'intervenant; difficulté de communication de la famille avec la personne atteinte; lourdeur du secret, ...
- les questions qui se posent: le deuil pour la famille et chacun de ses membres? l'utilité de l'accompagnement à cette étape?...

M.E.P.42

PROVIDING COMPREHENSIVE SERVICES FOR DEVELOPMENTALLY DISABLED CHILDREN WITH AIDS: SERVICES AND ISSUES

Authors: Phyllis Susser & Anthony Trunfio
THE CHILDRENS' CENTER - 594 East 53rd Street, Brooklyn, New York 11203, U.S.A.

The Herbert G. Birch Services, with NYS Office of Mental Retardation and Developmental Disabilities and the State University Medical Center in Brooklyn, New York operates the first community residence providing comprehensive residential, educational, habilitative and medical services for ten developmentally disabled "boarder babies" with AIDS, aged birth to six years.

One out of sixty babies in NYC are born with the virus. On any day, there are 20-30 boarder babies left abandoned in City hospitals.

Over 95% of children with AIDS incur measurable Central Nervous System dysfunction such as: impaired motor skills, severe language disorders, significant cognitive deficits and loss of acquired developmental milestones. A variety of residential alternatives and specialized diagnostic and therapeutic interventions must be established to address the special needs of infected children. These services are offered:1) community residence and respite care, 2) special education day care, 3) daily medical surveillance 4) foster care placement offering case management, training and supervision of families.

The following significant issues will be discussed: foster care vs. congregate care for children with AIDS, (Is it possible for children to bond to more than 2 people, or, good care vs. bad care whether congregate or foster?) discrimination toward children with AIDS and their caretakers (what should staff do when they are refused entry into a local supermarket with one of the children?); Helping staff cope with the inevitable loss of children with whom they have established loving ties.

La communauté (partie 1)
Community (Part 1)

M.E.P.43

ACCESSING, EDUCATING AND RESEARCHING MARRIED HOMOSEXUAL AND BISEXUAL MEN

Palmer, William, Research Officer
Gay and Married Men's Association, Melbourne, Victoria, Australia

Objective. To establish a model method to contact, educate and research married homosexual and bisexual men in the general community.
Methods. Contact was established, and where possible maintained, using a telephone counselling service in combination with an established peer support group. A wide range of additional services were incorporated into this structure to provide suitable medical and legal assistance as well as additional counselling services to the group. Research information was recorded for all participants in anonymous format.
Results. Over one thousand calls have been processed to date and a number of these callers have been followed up as case studies. A wide range of sexual and social behaviour patterns have been noted and an assessment of safe sex knowledge levels have been noted and an assessment of safe sex knowledge levels made within this group. Knowledge levels for safe sex and general information on AIDS were at significantly lower levels than those generally found within the gay community. Data on factors which influence behaviour modification for this group of men was collected. Factors which contribute towards safe sex behaviour for this group of men were also noted.
Conclusion. Married homosexual and bisexual men are difficult to access in the general community, as a result, little is known about their general sexual behaviour patterns. This method of achieving and maintaining contact has been successful. Research results obtained indicate the need for comprehensive campaigns aimed toward educating this particular target group and their female partners.

M.E.P.44

THE GENESIS AND RAPID DEVELOPMENT OF THE AIDS ACTIVIST MOVVEMENT

The Dwight Foundation, New York, U.S.A.

Objective: To describe the rise of AIDS activism, including civil disobedience and direct confrontation as a response to the perceived indifference on the part of medical and government officials resulting in a laggard response to the pandemic.
Methods: The presentation will use video clips, still photos, and excerpts from the popular press to trace the history of the AIDS activist movement from its inception in the fall-winter of 1986-87 through June 4, 1989.
Results: The confluence of 3 separate currents: the visual arts community of artists and graphic designers, e.g. the Silence = Death Project; advocates of civil disobedience and direct confrontation, e.g. the Lavender Hill Mob; and documentarians and educators, e.g. the Testing the Limits Collective, resulted in the founding of ACT UP (the AIDS Coalition To Unleash Power) and similar organizations. These groups not only produce highly successful demonstrations and confrontations, but museum exhibits, speakers bureaus, community outreach, and participation at conferences and conventions at which the medical, economic, or social aspects of the AIDS pandemic are discussed.
Conclusion: A new, medical/social phenomenon has arisen. An afflicted community refusing to accept a passive role in its treatment is challenging medical and governmental authority to demand an equal voice in deciding its fate.

M.E.P.45

DES PROFESSIONNELS DE LA SANTÉ ET LA CRÉATION D'UN GROUPE D'ENTRAIDE À QUÉBEC: réalisation probante de la complémentarité des ressources.

LACHANCE Colette, agente de recherche, Département de Santé Communautaire de l'Hôpital Saint-Sacrement, Ville de Québec. Canada.
RAYMOND René, président du Conseil d'administration de MIELS-Québec.
OBJECTIF: Présenter un modèle de collaboration entre des bénévoles et des professionnels de la santé dans la formation d'un mouvement d'information et d'entraide dans la lutte contre le SIDA à Québec (MIELS-Québec).
MÉTHODE: Présentation du processus d'implantation, de définition et d'ajustement des mandats et des actions qui en découlent. Quelques données sur les résultats d'évaluation après 2 ans de fonctionnement seront également transmises et discutées.
RÉSULTATS: Dès juin 1986, spontanément, des personnes se regroupent dans un contexte d'urgence pour échanger sur les problèmes vécus par les personnes atteintes de la maladie et les difficultés rencontrées par les professionnels de la santé, par exemple, pour avoir accès à certaines clientèles particulièrement touchées. Après quelques rencontres, le comité convient de la nécessité de former un groupe d'entraide bénévole. Les objectifs visent l'information, l'éducation à la prévention et le support aux personnes confrontées au SIDA.
CONCLUSION: La collaboration entre bénévoles et professionnels de la santé est possible, sinon essentielle et MIELS-Québec en fait la démonstration tout en insistant sur la spécificité des rôles de chacun.

M.E.P.46

A COMPARATIVE STUDY OF LOCAL AIDS PROGRAMMES IN THE UNITED KINGDOM

Pye, M*; Kapila, Mukesh*; Buckley, G**; Cunningham, D***
*Health Education Authority, London; **Royal College of General Practitioners, London; ***Faculty of Community Medicine, London,UNITED KINGDOM

Objective. To critically appraise the diversity of responses made by locally based AIDS programmes to supplement the National UK AIDS Prevention Programme.
Methods. Nine areas (urban/rural, high/low HIV prevalence) were selected. In workshop discussion, guidelines were developed for the construction of case studies and their critical analysis.
Results. Nine case studies illustrating good practice and diverse responses were analysed with respect, to various dimensions including:

a) organisational arrangements for local AIDS programmes;
b) general and specific preventive initiatives (eg. needle exchange schemes for drug users);
c) models of care in the community (eg. multi-disciplinary specialist teams);
d) training and education (eg. schools programmes).

Conclusion. In tackling similar issues, local initiatives have used varied, but successful approaches, dependent on prevailing socio-political contexts and opportunities. In many instances, AIDS initiatives have provided the opportunity to tackle other health concerns. Dissemination of the study's findings is aimed at influencing the development of good AIDS related practices nationwide in the UK.

M.E.P.47

THE ESTABLISHMENT AND ADMINISTRATION OF CASEY HOUSE HOSPICE, TORONTO

MIRIAM MAYHEW, Executive Director, Casey House Hospice. Canada.
DOROTHY LEY, Board Member, Casey House Hospice.

Objective:	To describe the process of the establishment of Casey House Hospice, and the administrative challenge of AIDS hospice management in the health service environment of Ontario, and the political environment surrounding AIDS, and the psychosocial issues of AIDS.
Method:	Oral presentation with slides and overheads.
Results:	Overview of success and challenge of a free-standing AIDS hospice.
Conclusion:	The need for standards and funding mechanisms tailored to the model of the free-standing hospice within the context of the Canadian health care system.

M.E.P.48

HOMELESSNESS AND AIDS

Blakeney, Barbara, McMahon, Joan.
Long Island Shelter, Boston,Massachusetts, U.S.A.

Objective: to identify and present in an educational format, the dual issues of AIDS and Homelessness from the perspectives of the Homeless individual with the diagnosis of HIV infection and the clinicians involved in providing care.

Method: A video, produced by the Nurse's clinic at Long Island Shelter. This video focuses specifically on the special problems associated with being homeless and having HIV infection.

Results: At the present time the majority of homeless people with HIV infection at the shelter share the primary risk factor of intravenous drug abuse. Many of these individuals have been homeless prior to their diagnosis. The video explores the experiences, feelings and responses of four homeless men in various stages of their illness, as well as a series of short discussions from the clinicians involved in their care.
Approx length is 30 minutes

M.E.P.49 COMMUNITY COALITION BUILDING AS A MEANS OF IMPROVING SERVICE SYSTEMS FOR PEOPLE WITH HIV INFECTION

Hostetter, C.; Matheny S., McMenamin D., Health Resources and Services Administration, Public Health Service, Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective AIDS Service Demonstration Projects have been funded to demonstrate the impact of a collaborative coalition of service organizations, coordinated through a case management system, on the continuum of care, comprehensiveness of services, and cost.
Method To demonstrate that community coalitions of service organizations and the elimination of unnecessary redundancy can improve patient care for PWAs, 21 high AIDS prevalence communities received funds to establish and maintain such coalitions. The cities vary significantly in the demographics of the epidemic, the political control and organization of their health care delivery systems, and the entity receiving funding. After nearly 2 years in operation, data and experience are available on the relative degrees of success of these coalition building efforts.
Results Factors contributing to the success of coalition efforts include: organizational location of health care and drug abuse services, cohesiveness of groups targeted for services, definition of the historical patterns of health care, cohesiveness of the community, the need for funding resources outside the local community, and the organization formed to receive funding.
Conclusion While community coalitions can have a positive impact on the quality and cost of services, and innovative stategies can be replicated in other areas, an effective health care delivery system must be tailored to the unioue characteristics of a communitv to insure optimal success.

M.E.P.50 A COMMUNITY-BASED AIDS EDUCATION,COUNSELLING AND INFORMATION SERVICE IN ZIMBABWE - A MODEL FOR AFRICA ?

Foster,Geoff. Mutare Provincial Hospital,Mutare,Zimbabwe

Objective. To establish the Family AIDS Care Trust (FACT),a non-governmental organisation with activities carried out by volunteers.
Method. FACT's 100-strong membership was recruited in late 1987 from Mutare churches. Most volunteers were non-medical. In 1988, 40 people completed one of the six 10-hour training courses in AIDS education or counselling which included role-plays and community assignments. Funding of $6000 was raised from many individuals in the community. FACT activities were co-ordinated by a paid secretary.
Results. An information centre,telephone service and window display were set up. Volunteers produced literature,posters and visual aids. Local doctors were consulted.Many patients were referred to FACT for counselling but only 15 attended. Educators used story-telling with appropriate illustrations on flash cards; 70 educational meetings in schools,factories etc. were conducted by 25 members with 8000 people. FACT gave support to official agencies responsible for AIDS activities.
Conclusion. Culture and traditional beliefs influence the effectiveness of AIDS programs.Psychosocial counselling may be inapprpriate in African settings. Preventive education using committed individuals may be more acceptable and persuasive than mass media campaigns. AIDS support and prevention programs are inadequate in third world countries. FACT's model includes the involvement and training of non-medical volunteers committed to counselling and education,production of appropriate materials and the involvement of other agencies in FACT-led activities. The program was implemented rapidly with a limited budget and is being extended to other centres. It may be an appropriate model for other African settings.

M.E.P.51 AN ASSESSMENT OF THE PSYCHOSOCIAL NEEDS OF THE HIV ANTIBODY POSITIVE POPULATION USING THE MONTREAL HEALTH AND SOCIAL SERVICE NETWORK.

Clark, Elisabeth*; Atkinson, V.**; Grayson, N.***.
*Comité sida aide Montréal, Montreal, Quebec,Canada; **Royal Victoria Hospital, Montreal, Quebec, Canada; ***McGill University, Montreal, Quebec, Canada.

Objective: To describe a research project designed to assess the psychosocial support needs of the HIV antibody positive population of Montreal. Since it is evident to professionals within the health and social service network that the demand for psychosocial services far outstrips the available resources, there is a need for concrete data as to the psychosocial service needs of the HIV antibody positive population. There is presently no concrete data available from the point of view of the affected group. It is hoped that results of the data collection and analysis will enable us to make recommendation to the government with respect to the adequacy or inadequacy of services provided in Montreal.
Method: A questionnaire will be administered to a sample of 300 HIV positive persons attending hospitals and community clinics. The questionnaire will be presented by the physician and trained personnel will be available to answer questions should the patient wish assistance.
Results: Some preliminary results of data collected will be presented and discussed.

M.E.P.52 HOSPITALIZED AIDS/ARC PATIENTS PRESENTING DISPOSITION PROBLEMS: NO SIMPLE SOLUTIONS

Pousson, Rachel: King's County Hospital AIDS Team, Brooklyn, New York, USA.

Objective. To identify demographic/social factors predictive of disposition problems (ALOC) in a large urban hospital serving a poor minority community.
Methods. Reviewed social work charts for 131 AIDS/ARC patients to identify which demographic/social factors correlated with becoming ALOC. Data for the total group regarding sex, ethnicity, age, risk factor, and degree of family involvement were compared with data for the 24 ALOC patients.
Results.

Demographic Factor	Total Group N = 131	%	ALOC Group N = 24	%
Male	97	74	12	50
Female	34	26	12	50
Black	106	81	22	93
Hispanic	22	17	2	7
Other	3	2	-	-

Of greatest interest is that fully 12 of 31 black females became ALOC. IV-drug-using and heterosexually-infected patients, but not gay males, often became ALOC as well. Age and degree of family involvement had no significant bearing on ALOC status.
Conclusion. The social milieu in which black females acquire HIV disease is a principal factor in their inability to secure proper post-hospital placement. Solutions cannot be simply hospital-based, but must also address broader environmental factors (poverty, racial discrimination, drug abuse, educational parity, and reproductive rights/child placement).

M.E.P.53 DEVELOPING THE SKILLS OF HOME CARE STAFF IN CARING FOR PEOPLE LIVING WITH AIDS

Cotton Terry, Platt D., London Borough of Hammersmith and Fulham, London W6, U.K.

Objective To provide a comprehensive package of training and support for staff in order to respond to increased demand for services and to overcome staff reluctance to work in this area.
Method After consultation with service managers and Trade Unions to identify key objectives and principal concerns, 1, 2 and 3 day workshops were established employing a range of teaching techniques. Practical issues have been explored alongside and experimental focus on counselling approaches and personal attitudes. People living with AIDS have provided a major part of the teaching input into the courses.
Results Course evaluations have shown considerable change in attitudes towards HIV and AIDS. The proportion of staff refusing to work in this area has dropped and staff confidence has improved.
Conclusions Staff training embodying a broad approach to both practical and emotional issues, addressing a broad approach to both practical and emotional issues, addressing locally identified staff concerns and incorporating the experiences of people living with AIDS can be beneficial in overcoming staff fears and encouraging empathy with service recipients.

M.E.P.54 ESTIMATING NUMBERS OF PEOPLE LIVING WITH AIDS/HIV INFECTION IN A SMALL URBAN AREA FOR SOCIAL SERVICES PLANNING PURPOSES

Manning, Nicholas
Social Services Department, London Borough of Hammersmith and Fulham, W6,U.K.

Objectives To develop some planning assumptions about the numbers of people who may be requiring services in a densely populated urban area (population 150,000) with a perceived high incidence of HIV infection. UK National Health Service figures are not available at this level.
Methods Research was undertaken to ascertain an estimate of the numbers of people living with AIDS, and the numbers unwell with HIV infection, based on the current knowledge of all relevant health and social services agencies operating within the local administrative area. Networking within the voluntary and statutory agencies produced a comprehensive list of all relevant formal and informal agencies and their services. The numbers of people in receipt of each of those services during a three month period was determined. Through extensive liaison, the degree of overlap between groups of services was determined and total estimates of the numbers of residents living with AIDS, and of those unwell with HIV infection, were calculated.
Results The method produced very considerable co-operation from all participating agencies, and reasonable quantitative estimates were calculated.
Conclusion A survey of local agencies can produce valuable information about the numbers of people living with AIDS which reflects both the perspective of the larger agencies and the detailed local knowledge of informal groups and organisations, within a clearly delineated urban area.

M.E.P.55 ESTABLISHING QUALITY CONTROL TARGETS FOR THE PROVISION OF PERSONAL SOCIAL SERVICES TO PEOPLE LIVING WITH AIDS AND HIV INFECTION

Manning, Nicholas
Social Services Department, London Borough of Hammersmith and Fulham, London W6, UK

Objective To develop measures of the outcome of an agency's increasing range of personal social service provision as perceived by key groups of service users.

Methods A consensus approach was employed within a group of practioners, managers, local agencies, and local residents to identify a series of realistic targets for service delivery by systematically considering the key groups of consumers for whom the agency was providing a service, and the key services which the agency could be expected to provide for them. By employing broad definitions of the terms consumers and services the Group was able to identify dimensions of the Agency's activities ranging from the provision of information about the agency's services in relation to HIV to Black and Asian residents of its catchment area, to the provision of a casework service to people living with HIV infection.

Results Steps have been taken towards developing a series of realistic targets for the Agency's services along a series of intersecting dimensions. The targets will be publicised, along with details of its services, by the Agency in order that monitoring of the enhanced services can be made public.

Conclusions Establishing service targets at a time of increasing demand from people living with HIV infection is a feasible exercise, and can successfully incorporate the perspectives of a range of disadvantaged and other interested groups.

M.E.P.57 POLITICAL ATTACK, MEDICAL COMFORT, PSYCHOSOCIAL DEFICIENCIES: FACETS AND EFFECTS OF AIDS POLICIES IN BAVARIA, WEST GERMANY

Setzinger Walter*; Jäger, H.**; Hammel, G.**; Weber, U.*
*Institute for Medical Informatics and Health Services Research/GSF, Munich-Neuherberg, FRG
** AIDS Study Group, Schwabinger Krankenhaus, Munich, FRG

Background. For PWA in Bavaria, the government's tough position in relation to AIDS is contrasted by the high standards of a number of medical institutions providing AIDS care.

Objective. Description of the psychosocial situation and behavioral patterns of persons with AIDS under Bavarian conditions.

Methods. Survey of out-patients assessing medical care and psychosocial support systems; multi-stage empirical evaluation of AIDS-counselling agencies.

Results. 197 HIV-infected patients (66% homo/bisexual men, 28% IVDA; 14% female; 31% in stage 6 of the WR classification) were asked about their attitudes towards AIDS-related care. 30% of them used more than one medical institution parallel. Contrary to their needs expressed, a majority of the respondents tended to underutilize psychosocial support services. Homosexual men and severely ill patients described the care system in a rather positive way whereas IVDA, younger patients and those in earlier stages of disease were more critical of it. - Community-based organizations are increasingly forced to perform a tightrope act between the concerns of their (potential) clients and the demands of authorities, between voluntary self-help work and the need to professionalize.

Conclusion. The ambivalence of the Bavarian AIDS situation (politically deterrent, medically attractive) puts psychosocial support for PWA into an important as well as ambiguous position. Fear of political discrimination increases the need for psychological assistance but also acts as a barrier against using the relevant facilities.

M.E.P.59 "WE HAVEN'T DEALT WITH MUCH OF THAT HERE": HELPING MENTAL HEALTH PROVIDERS PREPARE TO WORK WITH HIV RELATED CLIENTS

Deitch, D.*; Quackenbush, Marcia*; Martin, R.*; Schuyler, M.**

*University of California AIDS Health Project, San Francisco; **California Department of Health Services, Office of AIDS

Objective. To address the problems in low HIV incidence areas when mental health and social service providers (MH/SSP) are not prepared to work with clients with HIV related concerns.

Methods. In many regional areas of California, MH/SSP have not seen HIV related clients so far, are not familiar with the relevant issues, and may be apprehensive about providing services (or unwilling to do so). Individuals in these areas receiving positive HIV antibody results or dealing with other HIV related issues often have few resources for counseling support. A train-the-trainers program will be described which offers in-depth training to selected providers in regional areas; these providers then go on to train their colleagues on issues related to HIV and mental health.

Results. By May 30, 1989, four three-day trainings will have been provided throughout the state of California; and participants in those trainings will have gone on to train an additional 900 individuals by June 30. Preliminary evaluation of the program's success will be presented. The complete training manual will be available for review.

Conclusions. A program of this type can expand expertise and comfort among MH/SSP, thereby improving the quality of resources for the client with HIV concerns.

Supported in part by a grant from the California State Office of AIDS, contract # 88-94560.

M.E.P.56 LOCAL GOVERNMENT PROVISION OF SOCIAL CARE TO PEOPLE LIVING WITH AIDS/HIV INFECTION

Denise Platt, Cotton T., London Borough of Hammersmith and Fulham, London W6, U.K.

Objective To develop a consultative model of social care provision for residents of an urban local government area with a disproportionately large number of residents living with AIDS.

Methods Detailed planning systems involving staff at all levels have been employed within an urban Borough to develop a wide range of both practical and emotionally supportive domiciliary and day care services, in co-operation with all other relevant formal and informal organisations. A comprehensive training programme has been established to support the service initiatives.

results The London Borough of Hammersmith and Fulham has been able to provide services to over 200 people living with AIDS or otherwise unwell with HIV infection. It has gained extensive co-operation from staff and from other agencies working in the field and is recognised as having pioneered many service developments. In particular it is gaining the confidence of many people living with HIV infection from groups with a traditional antipathy towards statutory welfare services.

Conclusion An openly participative approach to the planning and development of services enhances co-operation in a sensitive area of provision, and can facilitate access to services for a wide range of individuals and groups.

M.E.P.58 HIV INFECTION, AIDS AND MENTAL HEALTH: THE CANADIAN NATIONAL WORKING GROUP'S EXPERIENCE

Woo, Stephen* (in English); deMontigny, Johanne** (in French) and Members of The National Working Group on HIV Infection, AIDS and Mental Health, Federal Centre for AIDS, Ottawa.
*Mount Sinai Hospital/University of Toronto, Toronto, Ontario, Canada.
**Psychologist, Private Practice, Montreal, Quebec, Canada

Objectives. (1) To provide an evaluation of the state of mental health service delivery in Canada, as it responds to those affected by HIV; (2) to make program recommendations.

The National Working Group on HIV Infection, AIDS and Mental Health convened in December 1988. The 14 members include representatives from across Canada. They encompass social work, nursing, theology, behavioral science, research, psychology, psychiatry. The group identified 4 main areas of concern: (1) need for a clear definition of mental health as it applies to persons affected by HIV; (2) identification of "special" groups and the implications for services, education and research; (3) the mental health of health care providers serving people affected by HIV; (4) need for a suitable model of care. The group recommends: a needs assessment be done to determine existing mental health services, models and gaps; mental health care needs of health care providers be determined and programs/services developed; centres of excellence to which mental health care workers can go to train be developed; current or proposed legislation regarding HIV infection, that affects the mental health of Canadians be addressed by this working group; methods to encourage research and education into the mental health aspects of HIV infection be developed.

M.E.P.60 SOURCES OF DELAYED HOSPITAL DISCHARGE FOR AIDS PATIENTS

Widman, Mindy;* Light, D.W.;* Platt, J.J.*
University of Medicine and Dentistry of New Jersey-School of Osteopathic Medicine, Department of Psychiatry, Camden, New Jersey, U.S.A.

Objective: Determine the social/environmental factors contributing to delays in hospital discharge for AIDS patients, rank them in order of importance, and determine if differences exist based on mode of transmission or location.

Methods: Interviews were conducted at 13 agencies in 5 cities (Baltimore, Boston, New York, San Francisco, Washington, D.C.). Respondents (N=17) were asked to list factors delaying discharge. The Delphi technique, in which respondents individually and without consultation rank the listed barriers, was used to gain consensus over 3 consequent Delphi rounds. Deviation scores were used to rank all items after each round.

Results: An absence of supportive housing and all levels of nursing home beds exacerbated by inappropriate/inadequate insurance were ranked highest overall. There was, however, variability for IV drug users (IVDUs) where the lack of caretakers or caretaker skills was found most important. Great variations in barriers to discharge were also found among the cities.

Conclusion: As treatments for AIDS improve and patients live longer, more attention will have to be paid to their chronic care needs. Understanding the services required by different populations or in specific regions is necessary for effective allocation of resources. For example, hospital discharges for IVDUs appear to be blocked after less serious episodes of illness by the absence of a skilled support network, whereas nonusers are more likely to remain hospitalized later in the syndrome's progression due to an absence of supportive housing or nursing home beds. Each of these requires that different financial and personnel commitments be made.

M.E.P.61 POST-DISCHARGE HOUSING OF HIV INFECTED PATIENTS IN ROME

Ippolito, Giuseppe; Armignacco,O.;Antonucci,G.;Bove,G.
"L.Spallanzani" Hospital for Infectious Diseases, Rome,Italy.

Objective.To determine if homelessness in HIV infected patients is determinant for pressure on infectious diseases wards and to assess social needs for such patients in term of suitable post-discharge housing.
Methods.In Italy, departments of infectious diseases manage more than 85% of AIDS patients.It has been suggested that the lack of suitable post-discharge housing is a major factor in determining the long stay in hospital after acute care. Presently chronic long term facilities are limited in Rome and extensive home health care is not available. Epidemiological, demographic and social data of 101 AIDS patients and 345 HIV symptomatic subjects hospitalised from 1984 to 1988 were reviewed.
Results. The distribution by risk group of the 446 HIV infected patients (348 males and 98 females) was: intravenous drug addicts (IVDA) 72.4%, homosexual males 14.1 %, heterosexual contacts 5.4%, IVDA + prostitute 3.4%, homosexual males + IVDA 3.1 %, transfused 1.6%.
Out of 101 AIDS cases, 3 patients were forsaken by the family and died in hospital because the lack of social support, 1 went to hospice,3 were accepted home by parents. Out of 345 subjects with HIV symptomatic infection, 25 were accepted in therapeutic communities for resocialisation program, 9 went to hospice without medical assistance and 8 were accepted by parents.
Conclusion. System of comprehensive services for people with AIDS and HIV infection must be encouraged through public sector and non professional caregivers. Presented data are relevent for planning size of services and allocate resources.

M.E.P.62 DEVELOPING COMPREHENSIVE SERVICES FOR HIV INFECTED INTRAVENOUS DRUG USERS: A GUIDE FOR CASE MANAGERS

Diane Pincus Strom, C.S.W.
Bronx-Lebanon Hospital, Bronx, New York,U.S.A.

Objective. To develop a system of comprehensive case management that addresses the multiple needs of HIV infected drug users.
Methods. I.V. drug users have numerous problems that complicate medical treatment. These include personality disorders and social problems that lead to noncompliance, failed appointments and physical/emotional suffering. Comprehensive case management requires addressing of concrete needs, system negotiation, counseling, drug treatment, etc. Most important is the development of resources for individuals at all points of the HIV continuum (asymptomatic, ARC, AIDS) via networking, outreach and informal contacts.
Results. Needs of the IV drug user are identified and discussed in terms of treatment implications, solutions and impact on the patient, significant others, professionals and society. A framework for developing an individualized, comprehensive case management system, including resource development, is offered.
Conclusion. Case management that considers all aspects of the patient's treatment while developing additional resources is crucial for the care of HIV infected drug users. A systematic approach insures inclusion of all factors while simplifying this formidable task for the case manager.

M.E.P.63 NEEDS ASSESSMENT OF PERSONS WITH AIDS AND HIV ILLNESS: IMPLICATIONS FOR COMMUNITY-BASED SERVICE PLANNING IN A LOW INCIDENCE COMMUNITY

Carrick, Richard*; Coleman, D.,**; Zelinski, D.***.
*United Way of Franklin County, **Columbus Health Department, ***Metropolitan Human Services Commission; Columbus, Ohio, USA

Objective: To measure the perceptions of local PWA's and HIV positive individuals regarding unmet needs, awareness of existing community services, and the importance of these services to plan community response.
Method: A written survey instrument was designed to collect this information as part of a comprehensive, community AIDS-planning effort. The survey was developed with the input and support of local PWA's and AIDS service agencies. The instrument was 25 pages, over 125 questions and took 45 minutes to complete. Over 600 surveys were distributed through physicians and direct service agencies; 110 were returned and analyzed. While not a random sample, the results closely resembled the current known incidence of AIDS, ARC, and HIV seropositivity. Responses were both anonymous and confidential. Survey results were compared with a similar survey of service providers.
Results: Respite care, mental health care, income subsidy, dental care, legal assistance, and patient information were ranked as the greatest unmet needs. Responders were generally uninformed about the availability of existing human services. Most needs (50-75%) were being met by friends and family.
Conclusions: Community planning efforts need to focus on 1) strengthening PWA's existing networks of informal support systems; 2) ensuring that PWA's can access existing human services.

M.E.P.64 COMPREHENSIVE VOLUNTEER PROGRAM FOR PEOPLE WITH AIDS

Jacobs, Jonathan; Miller,S.; Streeter, N.
Center for Special Studies, New York Hospital-Cornell Medical Center, New York, N. Y., USA

Objective. To provide emotional support, practical assistance and an ongoing link with professional staff for hospitalized and ambulatory people with AIDS. Through bi-weekly phone contact, to reduce the numbers of unnecessary emergency room visits and to increase staff awareness of patient's home situation. To provide formalized support to volunteers to maximize their effectiveness.
Methods. Recruitment and training program which provides volunteers with an intensive, interdisciplinary program taught by professional staff. A volunteer in-patient visiting program in which 25 patients are visited per week by 10 volunteer visitors. An on-going monthly support group led by social worker to assist volunteers with their own coping. A telephone reassurance program in which 184 calls were made on a bi-weekly basis over a three month period to 30 patients by 5 volunteers. Volunteers provided practical and emotional support to 77 outpatients and their families during clinic hours. Supervision of the program provided by two clinical social workers. Results. Study of 15 hospitalized patients reported they felt less isolated, fearful and anxious after visits from volunteers as compared to 15 patients not seen by volunteers. Percentage of discharged patients who knew volunteers from their in-patient stay kept their first appointments at a higher rate than those who didn't know volunteers. Their behavior on first visits was more relaxed and patients were able to more effectively negotiate hospital system. Less frequent visits to the clinic and emergency room by those patients called on a regular basis for non-medical concerns. Conclusion. This program has contributed to the enhancement of self-esteem of patients with AIDS. It has provided patients and families with a consistent group of experienced and caring individuals linking them to the professional team. It provides the staff with ongoing reports on vital information on ambulatory patients between visits. The mutual respect and support between volunteers and staff has contributed to the success of this program.

M.E.P.65 HOSPITAL LIAISON AND VISITATION PROGRAMS PROVIDE EMOTIONAL SUPPORT, ADVOCACY AND LINKAGE TO COMMUNITY BASED ORGANIZATIONS FOR HOSPITALIZED PWA/PWARCs.

Jue, S.; Bergman, D.; Stroup, S.; Hedderman, Michael
AIDS Project Los Angeles, CA, U.S.A.

Objective. To provide emotional support, advocacy and information regarding community services to PWA/ARCs hospitalized in Los Angeles County. To provide greater linkage among hospitals serving these clients.
Methods. APLA recruited 87 full time employees from 60 hospitals who, by virtue of their position, have access to and are supportive of PWA/ARCs. Once the liaisons were identified, APLA recruited and trained 42 volunteers for 13 hospitals to visit inpatients with AIDS/ARC. Volunteer training includes active listening, hospital protocol and AIDS specific medical and psychosocial information. The hospital liaisons act as resource persons for the volunteers. Hospital liaisons meet quarterly as a group for networking and support. Visitation volunteers meet as a group for supervision and support monthly.
Results. Volunteers provide emotional support, advocacy and information about community and APLA services. Hospital staff report the volunteers to be an asset to patients and staff, particularly in that they are able to spend more time with needier patients. Information regarding CBO's leads to more timely linkage to these services. Also, the liaison and visitation programs provide opportunities for networking and mutual support for the staff from participating hospitals.
Conclusion. These programs are a cost effective model for providing emotional support, advocacy and information regarding community resources to AIDS/ARC patients when they are very vulnerable, i.e., during hospitalization. These programs help these participants alleviate stress/burnout and enable them to maximize scarce resources.

M.E.P.66 THE IMPORTANCE OF THE SOCIAL SERVICE EXPERIENCE AT A UNIVERSITY HOSPITAL IN RIO DE JANEIRO, BRAZIL.

Hanan, Janete Luzia Leite; Moura, E.M.M.; Oliveira, E.R. and Morais de Sá, C.A., U.S.A.
Gaffrée & Guinle University Hospital, University of Rio de Janeiro (UNI-RIO) - Brazil.

Objectives:
1) To identify "the meaning of AIDS" to HIV infected patients, their family members,friends and health care workers.
2) To assess the reasons for discrimination of HIV infected individuals.
Methods: The study comprised 170 infected individuals, 73 family members and friends of these patients and 35 health care workers, from February to December 1988. They were assessed and interviewed by two social workers who used a phenomenological approach and follow-up.
Results: The meaning of "AIDS" and the reasons for discrimination were related to:

	PATIENTS		FAMILY		HEALTH CARE WORKERS	
	N	%	N	%	N	%
Lack of information	150	88	50	68	-	-
Insuficient information	133	78	21	28	-	-
Lack of confidence on information obtained	150	88	34	46	28	80
Difficulty related to sexuallity/ homosexuallity	96	56	47	64	29	82
Difficulty to face death	170	100	73	100	35	100
Lack of material and human resources	-	-	44	60	32	91
Lack of technical training	-	-	-	-	8	22
Lack of emotional support	170	100	73	100	35	100
Press notes causing panic	142	83	61	83	15	42
Social Stigma	142	83	61	83	15	42

Conclusions: Whenever the personal meaning of AIDS is grasped, people start changing their discrimination attitude toward the patient and the disease. We believe in the need of implementation/systematization of this work, in order to, reduce the discrimination and promote multipliers of the process.

M.E.P.67 NORTHERN MANHATTAN WOMEN AND CHILDREN HIV DEMONSTRATION PROJECT: SOCIAL SERVICE ISSUES

Esther Chachkes*, R. Andrew*, C. Healton**, V. Walter***, Joanne Johnson****, *Presbyterian Hospital, N.Y., N.Y.,**Columbia University, N.Y., N.Y.,***Mount Sinai Hospital, N.Y., N.Y.,****Saint Lukes Hospital,N.Y., N.Y.,U.S.A.

Objectives. To increase regional communication and coordination of resources for HIV infected or at risk women and children, and to augment the provision of health education, social services and clinical care in an area where service delivery and health education efforts are fragmented and there is a documented rise in HIV infection. To identify the service needs experienced and the ethical questions faced by participating members.
Methods.The establishment of a consortium model, funded by Health Resources and Services Administration, Bureau of Maternal and Child Health, includes five voluntary and public hospitals, three branches of city government, a school of public health, a community based task force of providers and a major clinical research center. The consortium incorporates a social services committee which captures the collective experience of providers with similar populations in varied settings.
Results.Participating institutions have developed a shared set of goals and objectives, a uniform evaluation instrument and a forum in which problem-solving is enhanced.
Conclusion.The model effectively strengthens the group's ability to advocate for increased and augmented services for women and children and to identify helpful approaches to ethical decision-making.

M.E.P.68 GROUP RESIDENCE AND SCATTERED SITE APARTMENTS AS HOUSING FOR HOMELESS PERSONS WITH AIDS

Dornan, Douglas M.; Wempler, K. and Hough, G.*
*Bailey House, New York, NY, USA.

Objective. To provide supportive housing for homeless persons with AIDS.
Methods. A 44 persons group residence was established in N.Y.C., supported by government funds and private donations. In addition, 20 scattered site apartments were leased by the sponsoring agency. The 2 programs were separately staffed but compared needs and problems.
Results. Staffing included social services, nursing, pastoral care and support services; medical care was provided by referral to hospitals and clinics. In the group residence, 160 persons were served in two years; in the apartment 90 persons were served in three years. Average length of stay in the group residence was seven months, and eight months in the apartments. About one-third of residents in the group residence passes away in their rooms;the others died in hospital following admission for acute medical problems. In the group residence, residents found the frequency of their neighbors' death very difficult, and 13 persons left the residence as a consequence. The community supported the group residence from the inception. Problems of discrimination arose in connection with obtaining building services. Both programs encountered difficulties in providing appropriate support and structure for residents with pre-AIDS psychiatric and/or behavioral problems and for residents who suffered from HIV neurological problems. A combination of homecare and individual service plans was effective in most cases, but residents who were physically destructive or who threatened the safety of others were referred to various other settings.
Conclusion. Scattered site apartments and group residences both provide appropriate housing for persons with AIDs who do not need medically oriented care.

M.E.P.69 SOCIAL SERVICE NEEDS OF PEOPLE WITH AIDS: PERCEPTIONS OF NEED AND UNMET NEED

Fleishman, John*; Piette, J.*; Mor, V.*
*Brown University, Providence, Rhode Island, U.S.A.

Objective. To describe needs for social services as reported by people with AIDS.
Methods. In-person interviews were conducted with 257 clients of the Robert Wood Johnson Foundation's AIDS Health Services Program. Clients were interviewed at nine site across the US. For each of 12 social service needs (e.g., medicaid, home nursing, support groups, transportation, housing placement, dental care), respondents were asked (1) if they needed that service, (2) how much they needed it, (3) if they received it, and (4) whether services received met their needs.
Results. The highest proportion of respondents (49%) expressed a need for dental care, followed by needs for support groups (44%), counseling (41%), and legal advice (40%). Lowest reported needs were for homemakers (15%), meals at home (13%), housing placement (13%), and drug rehabilitation (11%). The most intensely felt needs were for housing placement, medicaid, and drug rehabilitation. Only 21% of those who needed it received dental care; only 38% who needed it got housing placement. Of those receiving services, at least 70% said that their needs were met for each service, with the exception of money for housing (50%). Those who were employed had fewer needs. Compared to gay men, drug users perceived greater need for home nursing and for medicaid.
Conclusion. Dental care is an often overlooked and unmet need. Needs for housing, although not prevalent, are intense and hard to meet.

M.E.P.70 STEP DOWN CARE ACCEPTABILITY IN HOSPITALIZED AIDS PATIENTS

McCormick,Wayne C*;Inui,TS*,Deyo,RA*,deGroff,C*and Wood,R.**
*University of Washington, Seattle VA Medical Center,
**AIDS Prevention Project, Seattle, Washington, USA.

Objective.To determine the acceptability of special AIDS residences with skilled nursing ("step down care") among hospitalised persons with AIDS.
Methods.We obtained demographic, medical, and social profiles of 100 persons with AIDS during their hospitalisations, and interviewed them regarding the acceptability of step down care as an alternative to a lengthier hospital stay or to home care. We also interviewed their doctors, nurses, and social workers regarding appropriateness of such a care setting for each patient.
Results.Of the 100 AIDS patients(all males, mean age 35 yrs), 56 found step down care to be acceptable in concept during their hospital stays (although 21 of these felt home care would be equally as acceptable). Of these 56, 20 were felt to be appropriate for step down care by their doctor and nurse or social worker(or all 3); 9 were discharged to such settings (nursing homes and hospices), 6 expired in the hospital,and 5 went home(3 with home care). Of the 44 patients who felt step down care was an unacceptable option, the majority(42 or 95%) wished to receive their care at home(2 wished to stay in the hospital). Of these 44, 11 were considered appropriate for step down care by their caregivers; 9 went home(5 with home care), 1 went to a hospice and 1 expired. Of the patients who found step down care acceptable, more went to such settings at discharge or expired in the hospital(15 of 56) than those who did not find step down care acceptable(2 of 44)(27% vs 5%, p<.01).
Conclusion. Hospitalised persons with AIDS willingly express their desires for various care settings following hospitalization. A majority feel step down care would be acceptable, but many patients prefer home care.

M.E.P.71 A MULTI-DISCIPLINARY MODEL FOR DECISION-MAKING AND CASE PLANNING FOR HIV-INFECTED CHILDREN & YOUTH IN CHILD WELFARE AND CHILD PROTECTIVE SERVICES SYSTEMS.

Annin, J. Burt*; Emery, L.J*; Ponte, K.** *Child Welfare League of America **Massachusetts Department of Social Services, MA, U.S.A.

Objective: To provide service providers in the public and volunteer sectors with an expert review panel model to approve or recommend case decisions in order to establish a standard of practice and support the willingness of agencies to serve HIV-infected children in the face of myriad fears, e.g. liability.
Methods: CWLA convened administrators from 17 public child welfare agencies to identify problems in mobilizing their bureaucracies to serve HIV-infected children and youth. They identified supporting decisions made as a significant barrier. The Massachusetts Department of Social Services and CWLA proposed and described a multi-disciplinary review team model; CWLA received 289 responses from 250 agencies surveyed re: challenges faced; decisions made; methods used; and conclusions reached; Massachusetts DSS tested and operationalised the model.
Results: Among obstacles agencies face making case planning decisions for infected children are: 1) resistance to serve without assurances on managing contagion; 2) conflicting confidentiality and testing policies and beliefs; and 3) liability and risk management concerns.
Conclusion: A multi-disciplinary review team's validation of case-planning decisions speeds agencies' response.

M.E.P.72 COMMUNITY-BASED CARE FOR PEOPLE WITH HIV DISEASE

Rubin,Howard and Sacks,H. Mount Sinai Medical Center, New York, New York, USA.

Objective. To develop models for comprehensive community-based care for people with HIV disease (PWH).
Methods. We interviewed representatives from AIDS service organizations (ASOs) in New York, San Francisco and Chicago and observed their operation. We culled promotional material from ASOs across the USA and examined how they incorporate the needs of their local communities and of their clientele into viable systems of care.
Results.We describe basic elements of care which may be necessary for ASOs to develop adequate services for PWH: 1.The existence of community clinics which can provide primary health care to PWH and which offer anonymous HIV antibody testing and counseling. 2. A mechanism for recruiting and training volunteers to serve the emotional and practical needs of PWH, their friends and families. 3. Advice for PWH concerning their legal rights, appropriate medical care, access to government aid, and experimental protocols. 4.Assistance with housing and food. 5.An AIDS hotline and other educational services. 6.Outreach for intravenous drug users. 7.Coordination of services with local hospitals.
Conclusion. An appreciation of the basic services that ASOs provide may help local communities develop services which offer competent, humane, and comprehensive care for PWH.

M.E.P.73 THE CHALLENGE OF AIDS IN AN AREA OF SCATTERED POPULATION AND LOW PREVALENCE

Tyson, Pat

Regional Joint AIDS Community Support Centre, 52 Clifton Road, Newcastle upon Tyne NE4 8DQ England.

Our AIDS and HIV figures are "normal" for the U.K. and very much lower than London - 28 AIDS cases and 254 diagnosed as HIV positive. We have encountered serious obstacles in pursuing our aim of developing non-hospital based care. Among the issues I would like to discuss are:

1. Medicalisation of care of people with AIDS.
2. Protectiveness/possessiveness of established carers - largely medical.
3. Lack of confidence of people with AIDS and medical providers in social workers.
4. Non-reality of AIDS as an issue in areas of normal (low) prevalence.
5. Social workers' perception of being de-skilled by HIV and its implications - is this an appropriate or inappropriate response?
6. Training - who and how to target training to social workers when AIDS is seen only in theory as a priority area, and in practice is seen not to be relevant to most social workers in a local authority.
7. Non-availability of substantial, vocal and cohesive groups of people with AIDS.

M.E.P.74 COMPREHENSIVE SOCIAL SERVICE HIV RETROVIRUS PROGRAM AT WALTER REED ARMY MEDICAL CENTER, WASHINGTON, D.C.

Gemmill, Robert H., Social Work Service and the Walter Reed Retrovirus Research Group, Washington, D.C., United States of America.

Objective. To identify and describe 20 clinical psychosocial treatment and health care management components utilized in the development and implementation of a comprehensive social service program for HIV infected individuals, family members and health care service providers.
Methods. Twenty psychosocial treatment/intervention procedures and health care management components were developed based upon policy review, problem identification, needs assessment, literature review, patient surveys and research findings. The resulting components were utilised in developing, implementation and providing a comprehensive social service program for HIV infected individuals, family members and a supportive program for the staff.
Results. The table below summarises the 20 components:

Twenty HIV Psychosocial and Management Program Components

1.	Pride and prejudice	8.	State-process	15.	Substance-style
2.	Services and treatment	9.	Self-determination	16.	Model development
3.	Process and content	10.	Cognition-affect	17.	Management formula
4.	Rehabilitation	11.	Technology-compassion	18.	Integration
5.	Practice and research	12.	Content-context	19.	Uneasy truce: LB/RB
6.	Treatment and cure	13.	Evolutionary process	20.	Predictions
7.	Multidisciplinary	14.	Threshold level		

Conclusion. A comprehensive HIV retrovirus social service program was developed and implemented based upon 20 psychosocial and management components.

M.E.P.75 CRÉER UN MILIEU DE VIE: UNE APPROCHE ARCHITECTURALE NOVATRICE

Germain, Céline*; Morisset, R.**; Coulombe, J.***;.
* Corporation Félix-Hubert-D'Hérelle, Montréal, Québec, Canada; ** Hôtel-Dieu de Montréal, Montréal, Québec, Canada; *** Atelier Habitation Montréal, Montréal, Québec, Canada.

La maison D'Hérelle se veut une alternative aux longs séjours en milieu hospitalier.
OBJECTIF: créer un milieu de vie pour les personnes atteintes qui soit adapté à leurs besoins.
MÉTHODE: le projet a été élaboré par une équipe multidisciplinaire composée de médecins, travailleurs sociaux, architectes, administrateurs, personnes atteintes. Le projet a fait l'objet de consultations auprès d'autres groupes ou individus impliqués dans l'intervention auprès des personnes atteintes ou ayant développé un projet similaire en fonction de d'autres pathologies. Les différentes étapes de la maladie et les besoins spécifiques y étant reliés ont été cernés. Le type et la qualité de l'intervention ainsi que les besoins des intervenants ont été clairement établis.
RÉSULTAT: le choix du site et le concept architectural qui réunit une rénovation sur un bâtiment ancien à une construction neuve témoignent d'une préoccupation majeure de créer un milieu de vie répondant aux différents besoins des personnes atteintes:

> cadre de vie familial; enracinement dans la communauté; vie communautaire en même temps qu'intimité; autonomie - semi-autonomie - convalescence; besoin de sécurité et besoin de liberté; silence - recueillement et communication - expression; présence continuelle; soins et support à la vie quotidienne; encadrement médical léger; activités récréatives et artistiques.

CONCLUSION: Un concept architectural polyvalent pour recevoir 11 personnes atteintes. L'espace organisé par modules en fonction des besoins et des activités permet de répondre à une mixité de clientèle à différentes étapes de la maladie.

M.E.P.76 DESCRIPTION ET ÉVALUATION DU SERVICE TÉLÉPHONIQUE INTÉGRÉ DE LA PROVINCE DE QUÉBEC POUR LE SIDA ET LES AUTRES MTS.

Duval, Bernard*; Bédard, N.*; Fortin, C.*. *Unité de recherche clinique sur le traitement du SIDA, Centre hospitalier de l'Université Laval, Québec, Canada; *Centre régional de la Santé et des Services sociaux (CRSSS 03), Québec, Canada.

Objectif. Analyser le fonctionnement d'un système téléphonique provincial pour les MTS-SIDA intégré à un service général d'informations sur la santé.

On a mis sur pied en septembre 1987, un service téléphonique de renseignements sur les maladies transmissibles sexuellement (MTS) qui fonctionne 24 heures par jour et 7 jours par semaine. Le service est bilingue et accessible gratuitement pour les 6 millions d'habitants de la province. Appelé INFO-MTS, il est greffé à un système d'information générale sur la santé, INFO-SANTÉ, qui est basé au CRSSS 03 et sert la région immédiate de Québec.

Un échantillon aléatoire de 1153 appels a été analysé à partir des fiches remplies par les infirmières pour chaque appel. Le SIDA a fait l'objet de 31,8% des appels. Par comparaison avec les autres MTS, ceux qui appelaient pour parler du SIDA étaient plus souvent des hommes (44,5% contre 36,7%) et moins fréquemment des jeunes de moins de 20 ans (20,8% contre 26,8%).

Parmi les appels concernant le SIDA, 87,5% demandaient de l'information, 18,3% des conseils thérapeutiques et 28,6% une référence à un service clinique. Pour les autres MTS, on observe respectivement 70,7%, 26,2% et 35,4%.
Conclusion. On constate la pertinence d'un service téléphonique de renseignements sur le SIDA. Le jumelage avec un service d'informations sur la santé permet d'améliorer beaucoup l'accessibilité car le volume d'appels autorise une permanence continuelle qui serait trop onéreuse autrement.

Éducation (partie 1)
Education (Part 1)

T.E.P.1

REPORTED LIKELIHOOD OF SEXUAL ACTIVITIES WITH A NEW PARTNER IN A SURVEY OF BAR PATRONS IN A LOCAL GAY COMMUNITY.

Martin, David J.*, Edwards, C.W.**, and Geiger, W.**
*UCLA School of Medicine, Harbor-UCLA Medical Center, Torrance, California,
**AIDS Intervention Project, Long Beach, California, USA.

Objective. To survey current sexual activities to determine current and future risk-reduction education needs of the local gay community.
Methods. An exit survey was administered to local gay bar patrons, requesting demographic information, information on participation in local AIDS-education programs, whether or not respondents had been tested for HIV antibodies, test results (if applicable), changes in sexual behavior, number of partners, location(s) where respondents meet new partners, and likelihood of various sexual behaviors with and without condoms with a new partner.
Results. Most respondents reported meeting new sexual partners at bars. The following behaviors were rated relatively unlikely with condoms and likely without condoms: mutual masturbation, receptive oral sex, and insertive oral sex. The following behaviors were rated relatively likely with condoms and unlikely without condoms: insertive anal sex, receptive anal sex, ejaculation inside partner, and receptive anal sex with ejaculation. HIV antibody testing exerted no effect on reported likelihood of any behavior, but seropositive men reported that they were less likely to engage in receptive or insertive anal sex than seronegative respondents (regardless of condom use).
Conclusion. Gay men report significant changes in their sexual behavior that appear to substantially reduce the risk for HIV transmission. The relative likelihood of unprotected oral sex in the absence of definitive information regarding its risk suggests that research on the associated reasons for and the risks of this behavior is needed

T.E.P.2

AIDS-PREVENTION ACTIVITIES TARGETING HOMO-AND BISEXUAL MEN

Michael von Bröckel, Deutsche AIDS-Hilfe e.V., Nestorstr.8-9
1000 Berlin 31, West-Germany

Objective: The main objective is the fight against the spread of HIV-infections. Methods: Homo- and bisexual men are extensively informed. Their collective and individual identity is strenghtened. Lifestyles and sexual behaviour are accepted and as there is little intervention a considerable prevention effect is achieved. The Safer Sex message is transmitted through existing structures within the gay sub-culture. One-way media as well as interpersonal communication are offered. Apart from an employed staff volunteers and even bartenders are prepared for counselling services. Impulses are given by give-aways. There are no prohibitions neither in words nor in pictures. We confine ourselves to give advice in regard to lifestyles and sexual behaviour. Special problems and personal fears are individually treated and anonymously discussed in public. The work is supported by public relations. Results: The study "CHANGES IN SEXUAL BEHAVIOUR OF GAY MEN UNDER THE IMPACT OF AIDS" (1987), a follow-up study made in 1988 as well as further observations (such as the decrease of rectal gonorrhoea) show that low-risk sex has proved to be accepted by an important majority of gay men in West-Germany. Conclusion: By this prevention strategy the rate of infection has been reduced considerably. It has not been proved that similar results can be achieved by means of offical measures.

T.E.P.3

ADAPTATION OF SAFER-SEX WORKSHOPS FOR GAY AND BISEXUAL MEN IN BARCELONA, SPAIN.

Wohlfeiler, Daniel A.*; Frutchey, C.**; de Blai, R.***; Procupet, A****.(*University of California, Berkeley, USA; **San Francisco AIDS Foundation;***Gais per la Salut, Barcelona;****AIDS Program, Generalitat de Catalunya, Barcelona, Spain.)

Objective: To adapt, conduct and evaluate workshops, originally designed to promote behavior and norm change in U.S. gay and bisexual men, for use in Barcelona, Spain.
Methods: Gays for Health, a Barcelona community-based organization, began these workshops in December, 1988, with U.S. and Barcelona facilitators. Publicity was distributed to gay bars, bath houses, bookstores, and through the media.
Results: 31 men attended the two pilot workshops. 89% agreed that the workshop helped them feel more comfortable talking about safer-sex; 79% agreed the workshop helped them believe safer sex could be fun; 79% that the workshop helped them feel more capable of controlling AIDS. At the end of the workshop, participants were asked to list at least three safer-sex activities. 94% of the responses were correct; 26% referred to tactile (non-penetrative) sex; 26% referred to condoms; 17% referred to avoidance of unsafe behaviors. A process evaluation revealed that participants perceived role-plays (i.e., negotiating safer sex with a partner) to be less useful than brainstorming (i.e., discussing AIDS and safer sex in large groups).
Conclusion: 1) Interventions targeting gay populations in one culture may be adaptable for use in another; 2) Recording participants' responses provides an excellent source of information on knowledge, attitudes and behavior of the target population.

T.E.P.4

SOURCES OF INFORMATION ON AIDS IN ZAIRE AND IMPLICATIONS FOR PROGRAM PLANNING

Lusakulira H *, Moore, Melinda, *,**, Hassig SE *,**, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire
** Tulane University, New Orleans, USA

Objective. To determine sources of information on AIDS in Zaire and desired sources of communication for the future.
Methods. Two populations were surveyed during 1987-1988: 3500 health workers (HW) of all levels throughout Zaire and 2500 employees and spouses (ES) at a commercial bank in Kinshasa.
Results. HW have learned about AIDS from radio (59%), written materials (29-36%), television (TV, 28%), courses (13%) and discussions (10%). For ES, sources were radio (51%), TV (43%), written materials (11-25%) and discussions or songs (29%). For HW, mass media and written materials are preferred in urban areas, courses and discussions in rural areas. Among ES, mass media and written materials are preferred by male employees, while their female spouses prefer face to face communication. The preferred language for HW is overwhelmingly French; among ES, male employees prefer French, and female spouses prefer Lingala, the local language in Kinshasa.
Conclusions. AIDS education programs should specifically consider the setting (urban/rural) and the audience (HW, lay population), including different strategies according to sex, educational level, profession and language preference.

T.E.P.5

AIDS EDUCATION: USING COMMUNITY TELEVISION TO REACH GAY MEN AND BISEXUALS

Sobota, Michael, AIDS Committee of Thunder Bay, Thunder Bay, Ontario, Canada

Objective: To deliver education about AIDS, particularly about safer sex practices, to gay men and bisexuals.
Methods: Utilizing public, community television which included negotiations with television station management, training of volunteer technicians and support staff, designing individual programs [content, format, guests] taping and airing programs including live, on-air phone in sessions.
Results: AIDS education programs aired on public community television from October 1988 through April, 1989. Written feedback [correspondence] and direct contact from phone-in programs indicate viewer interest and positive response. Some controversy concerning language and content with resulting intervention of public officials. Conflict resolved in favour of programs continuing to be aired.
Conclusions: Community television is an important media to access difficult to reach targeted populations. Community television can be utilized at little financial cost if there is a volunteer pool available. Community television rallies volunteers from within the gay and lesbian community if they see the project to have real and specific benefit to their borthers and sisters.

T.E.P.6

LES EFFETS D'UNE CAMPAGNE GRAND PUBLIC SUR LES HOMOSEXUELS FRANÇAIS

Michael Pollak*, Pierre Boisson**, *CNRS, GSPM; **Gai Pied Hebdo, Paris, France.

Objectif. Évaluer les effets de la campagne télévisée "Le SIDA, il ne passera pas par moi" (1987) sur les attitudes et comportement des homosexuels français.

Méthode. Sondage par questionnaire (n=1 550) inséré dans une revue homosexuelle.

Résultats. Bien qu'elle ait réussi à capter l'attention des gais (78% se souviennent du slogan), cette campagne est jugée peu claire, floue, peu explicite et "utile pour les autres" plutôt que pour les gais. Les moins de 25 ans sont les seuls qui, grâce à la campagne, ont accéléré leur adaptation sexuelle au risque. Les moins motivés par la campagne sont les classes populaires.

Conclusion. Pour avoir un effet incitateur important sur les homosexuels, la campagne télévisée est arrivée trop tard, avec un message trop timide. Les campagnes grand public, efficaces parmi les homosexuels dans le groupe d'âge des moins de 25 ans, n'arrivent pas à toucher les homosexuels des classes populaires. La prévention devra tenir compte de ce phénomène dans des actions de proximité spécifiques.

T.E.P.7

TRACKING SURVEY OF AIDS KNOWLEDGE, ATTITUDES AND BEHAVIORS IN SAN FRANCISCO'S BLACK COMMUNITIES

J.J.Day, *A.Houston-Hamilton DMH,* D.Taylor MPH,* G.Lemp PhD,** G.Rutherford MD,**
(*Polaris R&D, **Department of Public Health, San Francisco, CA USA)

Objective To obtain data on AIDS knowledge, attitudes, and risk behaviors in an urban Black population and to compare it to baseline data obtained in 1987
Methods A door-to-door survey was conducted with a randomly selected population based sample of 350 adult Black residents
Results The percentage of respondents with sexual partners who had been diagnosed with AIDS or ARC increased from less than 0.5% to 4.9%. The percentage reporting sexual partners who were IVDUs increased from 5.2% in the baseline survey to 7.6% and those reporting partners who had had STDs increased from 7.1% to 10.9%. The percentage of IVDU needle sharers remained stable, 4.3% in 1987 and 4.9% in late 1988. The tracking survey confirmed the baseline findingd that bisexuals have a higher number of sexual partners than homosexuals. Heterosexuals reported the lowest number of partners. Homosexual men reporting recent participation in both protected and unprotected anal intercourse (15%) was disproportionately larger than their representation in the sample (3.5%). However, 11% of male and 10% of female heterosexuals also had unprotected anal sex during the prior month. Bisexuals were more likely than heterosexuals to engage in unprotected vaginal intercourse.
Conclusions AIDS and ARC may be increasingly visible in the Black community. Risk levels remain high with bisexuals a potentially potent vector for dissemination of HIV as a result of their high number of partners, use of crack and other drugs during sex, and extensive participation in risky sexual behaviors

T.E.P.8

Effective Safe Sex Discussion Groups

Bill Rowe, D.S.W. — *Department of Social Work, King's College, U.W.O.*
Clarence Crossman, M.A. — *Aids Committee of London, Ontario*
William Fisher, Ph.D — *Department of Psychology, University of Western Ontario*
CANADA

Objective: To develop a safe sex discussion group for gay men that increases their skill in negotiating safe sex encounters and exiting unsafe situations.

Method: Participants were pre and post tested in videotaped role plays where they were presented with the task of negotiating a safe sex encounter and exiting an unsafe sex situation. The excerpts were rated for evidence of skill.

Results: The results along with other measures indicated that the participants level of skill increased after the group intervention. The group format and program are described in detail.

T.E.P.9

T.E.P.10

COMMUNITY BASED AIDS PREVENTION AND EDUCATION: LINKING RESEARCH, RESOURCES AND COMMUNITY *

Indyk, Debbie, Lefkowitz, P., Rose, D., Barrett, E., and Belville, R. Mount Sinai School of Medicine, NYC, NY, USA.

Objective: This paper presents the results of an assessment of the state of community based AIDS prevention programs. A blueprint is drawn for the development of an infrastructure to link these grass-roots programs to a strategically located center.
Methods: The assessment focused on the local community which Mount Sinai serves and the broader cosmopolitan research community to which it is strongly linked. The data gathered were drawn from extensive interviews, literature reviews, and the identification and annotation of key programs, resources and networks.
Results: Multitudes of diffuse grass-roots programs and agencies have developed around AIDS prevention. Most have done so in isolation, and without building into the program a meaningful evaluation component. Most lack the flexibility required to allow for the assessment and incorporation of new prevention knowledge into existing programs.
Conclusion: Each of these anecdotal programs provides discrete population-based case experiences whose results must be aggregated and assessed. This blueprint acknowledges the crucial role of the gatekeeper and builds it into the structure. The organizational apparatus developed would additionally facilitate local network building, a forum for case reviews, consensus formation and goal sharing. This model replicates, in miniature, the strategy suggested by the AIDS Network which led to the formation of the National AIDS Information Clearinghouse. Participation in this effort would be encouraged by the reduction of duplicative efforts and the expanded pooled resources this collaboration would yield. It is strongly urged as a necessary next step in the development of a meaningful approach to AIDS prevention.

*Funded by the Aaron Diamond Foundation.

T.E.P.11

DEVELOPMENT OF A UNIQUE AIDS CONSORTIUM CENTER TO ADDRESS HIV/AIDS IN THE MINORITY COMMUNITY IN THE U.S.

Jackson, Rudolph E.*; Haynes, A.**; Griffith, P.* et al.
*Morehouse School of Medicine, Atlanta, Georgia, **Charles R. Drew University of Medicine and Science, Los Angeles, California, U.S.A.

Minorities constitute 42% of the total 82,764 cumulative AIDS cases reported by the U.S. Centers for Disease Control in early January 1989. This disproportionate involvement of HIV/AIDS in minorities has resulted in the need for more culturally appropriate and unique approaches in AIDS prevention, research and patient care. Because of lack of adequate resources and research infrastructure, no single minority institution is presently equipped to properly address all of these needs.
Objective. To develop an AIDS Consortium Center consisting of a group of minority schools which will together form an AIDS Center to especially address and coordinate intensive prevention and research activities aimed at reducing the incidence, morbidity and mortality of HIV/AIDS in Blacks and other minorities.
Methods. A consortium of seven (7) predominantly black schools including schools of medicine, pharmacy and veterinary medicine joined to plan and pool expertise necessary for an AIDS center.
Results. Each school brought to the consortium its expertise in the areas of prevention, basic and clinical research, and case management. An agreed upon structure and plan were developed to carry out these activities.
Conclusion. An AIDS Consortium Center has been planned with a program developed to address four AIDS areas: 1) Prevention research, 2) Drug development, 3) Clinical trials, and 4) Animal modeling. Support for this unique AIDS Center has been requested from the National Institutes of Health, thereby providing the Public Health Service with a vehicle which will allow for increased participation in and acceptance by the minority community.

T.E.P.12

Title: Local Action & Research

Madsen, Poul*; Bentsen, Ingeo**;
* AIDS-INFO, Odense, Denmark; ** The County of Funen, Denmark

The effort of this poster, is to show examples on how the wellknown Danish National Strategy, can be converted, father developed, planned and evaluated into action in a small Island, with 500.000 inhabitans. How a Non Govermental Organisation and the Island County, can work together in order to change sex habbits and increase the populations accept of the problems with AIDS and how it can be prevented.

In august of 1985, the formation of AIDS-INFO Funen was started by a small group of volunteers from the local chapter of the National Organization for Gays and Lesbians. The first project was to organize a twentyfour hour open hotline. Later this was supported by a special equipped bus which drives to all places where people, special young people meet in great numbers: Marketplaces, open air concerts, festivals etc. A unique shop, is opened, where face to face councelling is taking place, where you can get supervision, information and buy campaimaterial, such as posters, T-shirts, joggingsuits and of course condoms. Pamphlets and brochures are given out free in large numbers.

Two research studies will be shown, one called "Even safer sex", where in a period of 12 month app. 1/2 mill. condoms were given out free, followed by promoting the use of condoms with an intensive use of PR-material, to se if there was any change in the condomhabbits among riskgroups.
The other study, "Condomcomfort" is about the technical standards of condoms, and the users experience, showing the most detailed knowledge about condoms in the world so far.

The County of Funen has established an AIDS-secretariat, who has implemented an educational programme of AIDS instructors. The responsibility of these instructors is to educate young people, in the age group of 14 - 25 years. Within the county, the willingness to supply free syringes to drug addicts, and taxidrives willingness to hand out condoms to anybody wanting them.

The conclusion is that the project must be an ongoing one, which only will succeed if the NGO's and the county continues collaborating; - remains updated; - uses humor and suprise, in the process of getting knowledge trough to people and change their behaviour.

T.E.P.13

FIGHTING AIDS - AN EDUCATIONAL MODULE FOR ARMY UNITS

Schenker Inon. School of Public Health and Community Medicine,Hebrew University-Hadassah Medical Faculty, Jerusalem,Israel

Young men and women who serve in the armed forces of their countries are an important target group for AIDS prevention campaigns. Data collected by WHO and the CDC demonstrates clearly that prevalence and incidence of HIV infection are higher in the young adults populations. This data shows,as well,that AIDS cases in their late 20s or in their 30s, have contracted HIV 5 or 8 years befor- while in university,highschool or the army.

In some cultures army life is a catalizator for sexual and drug adventures that coincide with sexual development and maturity at that age.

As a totalitarian institute (sociology) every army is in the position to control HIV infection by obligatory education campaigns in its units.In collaboration with the Israeli Defence Forces Medical Corps, a special educational program for AIDS prevention was developed. It was named "Fighting AIDS".

The module is a 100 minutes session whichis based on direct communication between a medical officer stationed in an army unit and the soldiers of that unit. Fighting AIDS comes in a kit which includes:manual for the army doctor 2 sets of cartoon slides,stories,a leaflet for each army personnel.

Since July 1987 this module, officially accepted as the unified program for the IDF,is implemented in all commands. Special training workshops were developed and conducted for army phycisions in the various units.

The module was pre-tested in a sample of units among which were the army jail for women and for men.Barriers of implementation will be discussed as well.

T.E.P.14

AN ASSESSMENT OF KNOWLEDGE, PERCEIVED RISK AND BELIEFS ABOUT PREVENTION STATEGIES AMONG NEW YORK STATE RESIDENTS

Beeker, Carolyn *; Zielinski, M.*; and Holmes, J.*

Objective. To assess knowledge, attitudes and beliefs about AIDS in the general population of New York State, U.S.A.

Methods. As part of a CDC-sponsored AIDS prevention project, a random digit dial telephone survey of New York State adults (N=1117) was conducted between May and September 1988. Survey items were adopted from the 1987 National Survey, from Ostrow (1987) or developed by the authors.

Results. The representative sample included 10% Hispanics and 14% blacks and was evenly divided between males and females, single and married, with a mean age of 43. At least 90% of the sample correctly responded to "basic" questions on AIDS, e.g., major modes of transmission; and over 85% discounted the possibility of HIV transmission through very casual contact, such as shaking hands. A larger proportion of the sample, however, still believe that HIV transmission is possible through donating or receiving blood, insects, public toilets and being coughed on. While condom use is correctly regarded by 90% of the sample as an effective risk reduction strategy, more than one-third are uninformed or misinformed about diaphragms and spermicides. Educational attainment, race/ethnicity and age are consistently related to accuracy of knowledge on a number of casual transmission and risk reduction effectiveness items. Knowledge of casual transmission and risk reduction effectiveness also appears to be related to the perceived risk of personal exposure and reported behavior change.

Conclusion. Educational campaigns in New York State must address misinformation about casual contact transmission and provide clear messages about the ineffectiveness of diaphragms and spermicides without condoms as barriers to HIV.

T.E.P.15

EFFECTIVENESS OF FEAR APPEALS IN AIDS-EDUCATION POSTERS: COMPARISON BY RACE/ETHNICITY, AGE, AND GENDER IN THREE POPULATIONS

Rhodes, Fen; Wolitski, R. J. and Arguelles, L.
AIDS Research & Education Project, California State University, Long Beach, CA, USA

Objective. To investigate the effectiveness of fear appeals in AIDS-education posters.

Methods. Twenty experimental posters with high-fear pictures portraying severe consequences of AIDS and 20 posters having pictures that were neutral with respect to disease severity were evaluated in terms of their attention value and their perceived effectiveness in motivating people to use condoms. Poster messages were also manipulated experimentally to achieve high and low levels of communicated personal vulnerability and behavioral response efficacy. Subjects were 310 Black, White, Hispanic, and Asian community residents, college students, and intravenous-drug users (IVDUs).

Results. Fear level of experimental posters was positively related to their perceived effectiveness in motivating people to use condoms and to their value in attracting attention (p = .0001). This effect was consistent across the three populations studied, i.e., general community residents, college students, and IVDUs. Response efficacy and personal vulnerability of poster messages, and their interactions with fear, were also significant ($p < .05$) but accounted for relatively little treatment variance in comparison with the fear main effect. Age, gender, race/ethnicity, and population membership were found to mediate reactions to high- versus low-fear posters to only a small degree.

Conclusion. Findings confirm previous research supporting the effectiveness of fear appeals in persuasive health communications and suggest that fear-oriented posters may be more effective than positive, non-threatening appeals in motivating a broad range of individuals to adopt AIDS risk-reduction practices.

T.E.P.16

COMPUTER-ASSISTED HIV EDUCATION FOR IVDUs

Lewis Benjamin F*; Ahlgren D J**; Grace A G**
* Spectrum House Inc., Westboro MA 01581; ** Trinity College, Hartford, CT 06106, U.S.A.

Objectives: To develop and evaluate a modular pilot program for IVDUs using computer-aided-instruction (CAI) techniques. Course modules are built using TSSS (Teacher Student Support System), a Macintosh/Hypercard-based software system developed at Trinity College. TSSS facilitates development and use of mixed-media courseware without requiring special computing expertise.

Methods: An experimental bi-lingual CAI program was developed and introduced to a sample of methadone maintenance patients in an urban clinic. Program modules include 1) a simple instructional module; 2) a module describing HIV, HIV transmission, and IVDUs; 3) a module describing protective behaviors (needle cleaning and safe sex). TSSS provides quantitative utilization information for evaluation purposes.

Results: A Macintosh computer has been dedicated to this CAI application. Staff have been trained in using the modules. Modules on protective behaviors have been completed, piloted, and evaluated by 57 IVDUs. As reported in client satisfaction surveys, interest in HIV education employing this technology is substantially higher than in HIV education based on forced compliance.

Conclusions: This interdisciplinary merger of computing technology with HIV education objectives shows great promise. For the first time it is possible to develop multi-media computer-based instructional approaches which place control of learning in the hands of the learner.

T.E.P.17

PROMOTION OF HIV PREVENTION OUTREACH ACTIVITIES TARGETING INTRAVENOUS DRUG USERS IN THE UNITED STATES

P. Imani Thompson, Jones, T.S., O'Reilly, K.
Centers for Disease Control, Atlanta, GA, U.S.A.

Objective: To implement outreach activities targeting intravenous drug users (IVDU) to curtail the spread of HIV infection through contaminated injection paraphernalia and sexual transmission to partners.

Methods: IVDUs are among the hardest to reach persons at risk for HIV infection due to their lifestyle, and environmental and societal factors. One method of educating IVDUs and their partners is the use of former IVDUs who conduct street outreach in their neighborhoods. While no empirical data exists concerning the effectiveness of outreach programs to IVDUs, as measured by documented changes in risk behaviors, these programs are considered by many communities to be essential in reaching this hard-to-reach population.

Results: CDC has awarded approximately $17.5 million to States and municipalities for prevention programs targeting IVDUS. These programs include activities within drug treatment centers and by community-based organizations (CBO), such as counseling, testing and partner notification, and outreach programs. Other outreach activities funded by CDC include community demonstration projects and the U.S. Conference of Mayors' funding of CBOs. In addition, in FY 1989 the CDC will provide direct funding to minority and other CBOs to conduct health education and risk reduction activities. CDC has systematically reviewed outreach activities to IVDUs in order to design an outreach prototype that can be used by other programs to enhance overall effectiveness. The authors will present the prototype and findings from the review.

Conclusion: Through funding and provision of technical assistance, CDC - in collaboration with State and local health departments, national and community-based organizations - has promoted the implementation of HIV prevention outreach activities targeting IVDUs and their sexual partners. The results of CDC's efforts have been an increase in the number of outreach programs targeting IVDUs and an increase therefore in the numbers of IVDUs receiving HIV prevention education.

T.E.P.18

MARRIED HOMOSEXUAL AND BISEXUAL MEN - THE DEVELOPMENT OF AIDS EDUCATION STRATEGIES AND RESOURCES FOR HEALTHCARE PROFESSIONALS.

Molenaar, John W. Education and Liaison Officer
Gay and Married Men's Association, Melbourne, Victoria, Australia. Curriculum Consultant, Ministry of Education, Victoria, Australia.

Objective. To present the range of strategies employed and resources developed to assist Healthcare Professionals and Workers to make contact with and educate married homosexual and bisexual men.

Methods. Over one thousand married have counselled and their needs, concerns and information levels documented. Specific counselling and education strategies have been developed as a result of this information and has been presented in a number of formats to assist Healthcare Professionals and Workers.

Results. The development of a resource kits entitled - Married Homosexual and Bisexual Men and their Partners:'Resource Kit for Healthcare Workers','Workshop Kit for Facilitators,' a poster - 'AIDS Special Information for Married Couples and Bisexual Men,' and pamphlets - 'AIDS Special Information for Married Couples' and 'AIDS Special Information for Bisexual Men'. These materials are distributed on request.

Discussion. These materials have trialled and reviewed by Healthcare Professionals. Requests for the materials come form all over Australia including the Australian College of Nursing and District Nursing Society.

Conclusion. Application of current research assists in the development of relevant resources for specific target groups and their support providers.

T.E.P.19

DIRECT APPROACH WITH INFORMATION TO BLOOD DONORS AT RISK OF AIDS INCREASES THE SAFETY OF THE BLOOD SUPPLY

Van Der Poel, Cees*; Reesink,H*.
*Red Cross Blood Bank, Amsterdam, The Netherlands.

Objective. To study the effects of more direct approach with information to high-risk blood donors, in order to increase the safety of the blood supply.
Methods. In January 1988 the risk groups of AIDS in the national information leaflet for blood donors, were defined more strictly. Since July 1988 informed consent, indicating non-involvement in high-risk activities, was required. Rates of withdrawal of high-risk blood donors, related to donation history, risk factors and gender were compared, before and after introduction of the new approaches in information.
Results.

period	# donors tested n	withdrawals for HIV risk n	(%)	p value	proportion repeat donors n	(%)	p value
1987	80,498	161	(0.2)		83	(52)	
Introduction new information leaflet							
1988 (Jan,Feb,Mar)	19,663	96	(0.5)	<0.001	54	(56)	
1988 (Apr,May,Jun)	19,811	30	(0.2)		11	(37)	
Introduction informed consent							
1988 (Jul-Dec)	27,310	102	(0.4)	<0.001	85	(83)	<0.001

Conclusions. After the new approaches, a significant increase of withdrawal of high-risk donors was observed, the relative proportion of repeat donors being significantly higher after implemetation of informed consent.

T.E.P.20

EVALUATION OF THE AIDS EDUCATION PROGRAMME IN N.S.W. PRISONS, AUSTRALIA.

Lisa Conolly; Potter, F. N.S.W. Department of Corrective Services, Sydney, Australia.

Objective. To evaluate the AIDS education programme in N.S.W. prisons which aims to disseminate AIDS information, teach prevention strategies and prepare prisoners and staff for the implementation of policy changes (such as the integration of HIV positive inmates).
Methods. Interviews were conducted with random samples of prisoners from six N.S.W. prisons. Their knowledge about AIDS, attitudes to AIDS and drug use and sexual behaviour were assessed using standardised semi-structured interviews. The knowledge and attitudes of custodial staff were also assessed from questionnaire data and from interviews with a random sample of staff from one N.S.W. gaol.
Results. Overall prisoners and staff level of knowledge about AIDS was poor, but educated prisoners had a significantly higher level of knowledge about AIDS. More prisoners were optimistic that the spread of AIDS could be stopped in N.S.W. prisons than staff. Variety of arguments for and against prison AIDS prevention strategies (compulsory testing, segregation or integration of HIV positive inmates, condoms in prison and clean needles in gaol) were put forward by both staff and prisoners. Some prisoners said they had abandoned drug use or sexual behaviour or had adapted their behaviour to reduce the risk of catching AIDS. However, other prisoners said they continued to engage in behaviour that they knew would put them at risk for AIDS.
Conclusion. AIDS education programmes can help prisoners and staff to increase their knowledge about AIDS. To achieve this,AIDS education must involve staff and prisoners in the organisation of AIDS education programmes which provide a variety of materials relevant to the needs of different subpopulations within the prison system. From the results,hypotheses have been generated about the relationship between prisoners' knowledge, attitudes and behaviour which will need testing in future research.

T.E.P.21

KNOWLEDGE, ATTITUDE & PRACTICE (KAP) OF SELECTED POPULATION GROUPS TOWARDS THE DISEASE AIDS

Adam, Zenew E.*, Yemesbat A.°, Fekadu D.°, Yacob E., Melaku A.°, Mulai T.°, et al.°

Dept. of Community Health Faculty of Medicine, Addis Ababa University, Ethiopia

OBJECTIVE: Following a large scale programme of information dissemination on AIDS, a KAP survey was conducted to assess and compare perceptions and attitude formation of different population groups in a road side town in Ethiopia.

METHOD: On the basis of various roles in the community, teachers, students, health workers and prostitutes were randomly selected and interviewed using structured and pre-tested questionnarie.

RESULTS: Information on AIDS reached 94-100% of the population studied. Access to information was from a combination of Radio, Television and Newspapers and there was no one best media identified. Knowledge on modes of transmission and preventive measures was correctly stated in 77.3 and 86.3% of the informed subjects respectively. Attitude towards collaboration and participation in control programmes including voluntary laboratory test was very high and encouraging (95.1%). Behavioral changes (modified sexual acitvity after being informed on AIDS was reported in all groups studied, but high (46.8%) among teachers and low (19.2%) among prostitutes. Minimizing sexual partners was the method of choice (83.7%) by those who claimed behavioral change. Use of Condom was surprisingly indicated in only 3.5% of them, and all condom users were students.

CONCLUSION: Combined usage of available media is superior than anyone alone. Teachers are potential agents of behavioral change no less than health workers. Careful assessment of people's preference on preventive measures should be considered and be emphasized selectively rather than indiscriminate health education. Behavioral change (sexual) among prostitutes is unlikely with health education alone, but may require additional effort to change their way of life.

T.E.P.22

CIS-AIDS ZAGREB: TELEPHONE ENQUIRY SERVICE - TWO YEARS' EXPERIENCE

Gotovac Petar[+], Lang S.[++], Svjetličić M.[+], Štritof M.[+], Baklaić Ž., Vodopija M.[+]

[+]Zagreb Institute of Public Health, Zagreb, Yugoslavia
[++]City Committee for Health and Welfare, Zagreb, Yugoslavia

Objective. Yugoslavia belongs to a group of countries with the lowest cumulative number of AIDS cases (65 AIDS cases as of 23rd Dec. 1988). The AIDS help-line in Zagreb was established with the aim of enabling the general population and health workers to receive information and advice on AIDS on an equal basis. Apart from the telephone line educational activities are also conducted within the CIS-AIDS (Center for Information and Education on AIDS).
Methods. The Center has developed horizontal and vertical communication with related institutions and offers a comprehensive and updated knowledge about AIDS. Public health workers daily answer telephone calls in scheduled time.
Results. Initial frequency of calls, in 1987, was between 50 and 100 per day, gradually decreasing to less than 10 calls/day. An estimated 10% of calls are placed by persons belonging to any of the risk-behaviour groups or otherwise potentially exposed to HIV infection.
Conclusion. Through adequate information and advice HIV infection is losing the connotation of social stigma. The activity of CIS-AIDS represents a new form of health promotion in Zagreb.

T.E.P.23

LA PREVENTION DU SIDA
REALISATION ET EVALUATION DANS L'OCEAN INDIEN

TROUSSIER Thierry * DUFFAUD Bernard, PROVANSAL Patrick
Président de l'Association Réunionnaise Prévention SIDA-Réunion France
B.P. 1232 - 97494 ST DENIS CEDEX (la Réunion)

Ce travail a été effectué dans le cadre associatif de l'A.R.P.S.
Les réunions inter-îles ont mis en évidence l'urgence de la prévention dans cette zone du monde partiellement épargnée. La diffusion de l'information pouvant s'amplifier aussi rapidement que celle d'une M.S.T.

Le but est de former les relais d'information dans différents groupes afin de respecter la pluralité ethnique, socio-culturelle, la présence importante dans les îles de structures associatives de diverses communautés.
Cette formation tiendra compte des différences de moyens humains et économiques propres à chaque île. Elle étudiera la spécificité des paramètres en abordant le savoir déjà acquis, l'éthique, et le recueil de témoignages locaux de sujets séropositifs ou atteints de SIDA maladie. Elle abordera le thème des croyances et des comportements face à l'utilisation du préservatif. Ceci permettra de le promouvoir fonction des résultats obtenus (contraceptif, seul remède efficace, gadget...).

Le problème de réinsertion psycho-sociale de personnes atteintes dans une "petite île" sera soulevé.
Une évaluation de ces différentes formations de relais et de leur impact sur l'individu sera mis en place fonction des possibilités locales.

Mots clefs : Oceani, Association, personnel de Santé, formation, Evaluation.

T.E.P.24

ESSAI D'UN DIDACTICIEL EN PREVENTION DU SIDA/MTS AUPRES D'ADOLESCENTS.

Cloutier, Richard. Département de santé communautaire, Hôpital Général de Montréal; Montréal, Québec, Canada.

Objectif. Développer un logiciel éducatif interactif en prévention du SIDA et des MTS et l'évaluer dans une école auprès d'élèves de 15 à 17 ans.
Méthodes. Un logiciel éducatif: "Les MTS, c'est facile à éviter", a été construit et mis à l'essai auprès de 55 adolescents (29g, 26f). Le programme est composé d'un questionnaire appelé SEXOTEST portant sur les connaissances et les attitudes face aux MTS et au SIDA et évaluant le risque de contracter une MTS. Des informations sous forme de jeux et d'animation sont offertes sur le SIDA, la gonorrhée, la chlamydia et les moyens de s'en protéger. La gestion informatisée des apprentissages est possible et permet à un intervenant de créer des activités pédagogiques de groupe.
Résultats. Avec un questionnaire de type Stapel (1 à 5), il a été démontré que les élèves considéraient le logiciel très valable (4,6/5), très intéressant (4,7), très utile (4,5), assez stimulant (4,1) et assez plaisant (4,2). On voit aussi que les étudiants actifs sexuellement apprécient davantage le logiciel que ceux qui ne le sont pas. Les commentaires recueillis soulignent l'intérêt pour la facilité d'utilisation, l'aspect interactif du logiciel, l'individualisation de l'enseignement et le respect de l'anonymat.
Conclusion. La détermination d'une cote personnelle du risque de contracter une MTS et la possibilité d'analyser les données des élèves ayant utilisé le programme sont des aspects particulièrement intéressants. Ce logiciel est un outil novateur et utile pour la réalisation d'activités éducatives sur le SIDA et les MTS auprès des adolescents.

T.E.P.25

LIVE BEYOND YOUR LIMITS

Nassaney, Louie* Kolb, Glenn*
*Louise L. Hay Educational Institute
Santa Monica, Ca. U.S.A.

Objective. To describe how Louie Nassaney has combined medical, holistic, and attitudinal techniques to survive AIDS for over six years.
Methods. In addition to medical therapies which have included AZT and Interferon, Mr. Nassaney has also employed alternative techniqes such as vitamins, nuitrition, meditation, visualization, posative affirmation, and self-love to survive during this time.
Results. Mr. Nassaney has not been ill during this period due to an HIV-related cause. The quality of life has vastly improved since diagnosis.
Conclusion. Medical and alternative techniques combined with loving the self have affected well-being and survival.

T.E.P.26

EVALUATION OF THE ITALIAN NATIONAL AIDS INFORMATION CAMPAIGN.

Marasca Giuseppe*, Bonvini V.**, Greco D.*, Piazzoli M.***, Zampieri A.*
Istituto Superiore di Sanità, Rome, Italy, Abacus, Milano, Italy, A. Testa, Roma, Italy.

Objectives. To determine knowledge and beliefs about HIV transmission and prevention; to determine the impact of the national AIDS information campaign.
Methods. A random sample of the general population of Italy was selected using a multistage sampling procedure. The sample was selected in order to be proportional to the general population for: sex, age groups, population size, and geographical area. The sampling unit was the local authority and within each of it, subjects were randomly selected from telephone directories. Interviews were carried out by phone in the evening, using a structered questionnaire. The key questions were about transmission, prevention, risk categories and information. The inteviews were carried-out in two stages, early in July 1988 before the starting of the campaign and in October just before the ending.
Results. 2,385 numbers were selected in stage I, there was no reply in 1,050 and refusal in 326. A complete interview was obtained in 1,009 (75.6% of attempts) with a response rate of 42.3. The figures for stage II were respectively 2,251 contacts, 1,012 interviews (76.4% of attempts) and 44.9% response rate. 97% ot the subjects in July and 97.8% in October knew at least the word AIDS. However in October 71% considered AIDS a disease everybody could catch, compared to 53% in July. 86% knew about the sexual transmission of HIV in October compared to 56% in July. Comparable figures for parenteral transmission were 75% and 37%. A more detailed analysis will be presented at the Conference.
Conclusion. Although the low response rate limits the value of the results it seems that in Italy there is a good general knowledge about AIDS even though more efforts should be made in the area of actual prevention of the spread of the disease.

T.E.P.27

THOSE AFFECTED BY AIDS TREATED AS OUTSIDERS; CONSEQUENCE OF MISINFORMATION.

Coronado, A.; Conde, F., Arredondo, C.*, Gil, E.*,
Ministery of Health.-Spain.

Objective. The strategy of information based on the relationship of AIDS= Death, the difusion of the concept of groups at risk... has led to the creation of a stereotype of AIDS whose extremely negative social consequences lead to social segregation of the collective social groups susceptible to becoming affected, and to the nihilism and fatalism of those who suffer it.
Conclusion. It is absolutely necessary to change this one way communication code that encourages uncertainty and fear, for a double communication code that simultaneously defines the healthy stages of the syndrome on one hand, and on the other hand the individual and collective behaviour that the individual carrier as well as the non-carrier should adopt at each stage of the illness.

T.E.P.28

NEEDS OF FAMILY CAREGIVERS OF PERSONS WITH AIDS

Corby, Nancy H.* and Wilson, G.**
*Long Beach Health Dept.; **Families Who Care, Long Beach, CA, USA

Objective. To determine the social and educational needs of family members of adult male persons with AIDS (PWAs).
Methods. A detailed needs-assessment questionnaire was designed, pre-tested, and administered to 50 family members. In addition, a focus group of bereaved family members was conducted to identify needs associated with terminal stages of AIDS. Family members surveyed included mothers, fathers, sisters, brothers, and wives of adult male PWAs.
Results. Specific needs of the family were related to duration and severity of the PWA's condition. Early in the course of the disease, families wanted information on AIDS transmission and prevention, their own risk, treatments, who to tell, and homosexuality. In the middle period they were more concerned about communicating with their PWA and health-care providers, how to nurture an adult without increasing dependency, what the future held, behaviors of their PWA such as moodiness or forgetfulness, depression (theirs and their PWAs), and care resources and skills. Some bereaved caregivers wanted more concrete information about legal issues, preparing for death, funerals, management of religious issues and conflicts, emotional changes to expect, survivor guilt, managing grief, and determining how much information to disclose to whom. After death, a major concern of a significant portion of families was how to most effectively fight AIDS; others wished to retreat from involvement in AIDS. Need for family and social support occurred throughout the process.
Conclusions. In order to most effectively serve their needs, programs targeting family caregivers should be tailored to the stage of HIV infection in which their relative with AIDS currently finds himself.

T.E.P.29

THE MALE COUPLE: A CASE STUDY

Krueckl, Judy Social Work Department, St. Paul's Hospital
Vancouver, British Columbia, Canada

Reliable social science research indicates that over 50% of gay men maintain committed, intimate relationships for one to five years. Other studies and clinical reports document relationships between gay male partners lasting from five through fifty years. What is surprising is the number of male couple relationships that manage to survive and endure in the face of institutionalized, social, and internalized homophobia. Gay male relationships lack legal and religious sanctions and are often unsupported by the partners' families.

This presentation will discuss the impact of a diagnosis of HIV infection/AIDS on one male couple and the stresses this created on their relationship. Some of these stressors included: addiction to prescription drugs, disclosure of the illness to others, resurgence of internalized homophobia, concern with sexual and physical intimacy, depression, financial problems, dementia and a suicide attempt.

Conflict between the couple and the PWA's mother accelerated. Excerpts from an audio tape sent by the PWA's mother graphically depicted her anger, hostility, and homophobia towards her dying son and his lover.

This case study illustrated the multi-dimensional challenges endured by the couple, and how they managed to maintain their relationship when faced with a diagnosis of AIDS.

T.E.P.30

AIDS PREVENTION AS COMMUNITY INTERVENTION

Urwitz, V.; Juvall, T; Sennerfeldt, P. and Öhgren, M.
The Stockholm Youth Prevention Project, Stockholm, Sweden

Background: Behavioral change requiers not only information but possibilities to integrate the information through discussion with trusted peers and adults. Stockholm county has around 250.000 teenagers.

Objectives: To make adults who meet teenagers in their everyday life as professionals, privately or as volunteers prepared to discuss and give information on sex and relationships, STD and AIDS.

Method: Through using the existing infrastructure, massive outreach was possible in short time. Partnerships were formed with local authorities and organisations. The project offered training, service, support and follow up. During 2 years 3.500 people were trained: teachers, schoolnurses, youth leaders, priests, social workers, PTA-members e t c.

Results: 98% of all schools for 13-20 year olds have sex-education including info on STD and AIDS. Numerous youth clubs have developped discussiongroups on sex and relationships. New youth clinics are established. Local plans are being developped.

T.E.P.31

The hiv-epidemic: Attitudes towards public preventive measures in the Norwegian population. J. Rise & P. Kraft, National Institute of Public Health, Oslo, Norway

Several public preventive measures have been debated in Norway in order to combat the hiv-epidemic: Coercion against the so-called risk-groups and hiv-infected persons, different hiv-antibody testing designs, revelation of the identity of hiv-infected persons, and regulation of sexual behavior. Eleven statements were constructed in order to tap the attitude structure of these issues in a nationwide interview survey in March 1988 in 1100 Norwegians aged 15 and above. A factor analysis produced three attitudinal dimensions which may be denoted: "Prohibition", "Coercion", and "Testing". The "Prohibition" dimension was strongest and explained 24.6% of the variance, the "Coercion" and the "Testing" dimensions explained each 5.1% of the variance. Norwegians were most negative against use of coercive measures and most positive towards testing measures. The three dimensions subsequently served as dependent variables (Alpha=.60)in a multivariate model. Age, knowledge, political preferences, and worry about infection were the strongest predictors (R^2=.15-.22). In conclusion, the results indicate that in addition to being associated with factors related to hiv-aids and psychological factors, attitudes towards public preventive hiv-measures is a controversial issue impinging upon the religious-moralistic axis as empirically observed in Norwegian politics.

T.E.P.32

AIDS in Barbados

Prof. E. R. Walrond, Chairman, National Advisory Committee on AIDS, Barbados

Barbados is a small independent island country in the Southern Caribbean with a population of 250,000. The population is well educated and has good internal and external communications. The island has 400,000 tourist visitors a year, and this is one of the mainstays of its economy.

The first indigenous case of AIDS was reported in late 1984, and the local medical association and the Ministry of Health moved early in 1985 to establish general and health professionals education and the screening of donated blood. The epidemic has been similar in pattern to that in the Western world with predominantly male homosexuals affected at first, with increasing heterosexual transmission thereafter. The prevalence of the disease is similar to that of the United States.

Aspects of the education programme to send simple direct messages without an overwhelming message of death are described. Evidence is presented that the messages are being remembered, they may have however led high risk individuals to use the blood donation service to obtain testing free and without counselling. The limited evidence obtained is used to direct specific changes in education and practise related to AIDS education, prevention and cogtrol.

COMMUNITY PARTICIPATION IN THE DEVELOPMENT OF A FIVE YEAR PLAN ON AIDS;NEW YORK STATE'S PROCESS AND SIGNIFICANT FINDINGS

Anarella,Joseph*;Bergmann,C.,M.P.H.*.*AIDS Institute,New York State Department of Health,Albany,New York, U.S.A.

Objective.To describe the process that allowed New York State to incorporate community analysis of AIDS related problems in the Governor's Five Year Plan on AIDS and to summarize significant recommendations.
Methods.A series of nine Roundtable discussions were held with health and human service providers,advocacy groups,community based organizations,and persons with HIV infection.Roundtables were charged with identifying AIDS related issues,prioritizing those issues and then developing recommendations.
Results.A total of eighty recommendations emerged from the Roundtable process.A significant outcome was that separate roundtables often developed similar recommendations,thereby strengthening these proposals.Included among these common recommendations were:to increase access to a wider variety of services(drug treatment,social services,etc)in primary care settings,provide ongoing training to professionals so they may be sensitive to the needs of different populations,provide services to families,develop and refine educational materials with the targeted community's assistance,increase access to information and clinical trials and identify sources of alternate levels of care.
Conclusion.The roundtable discussions were a useful means of identifying important issues and proposing specific recommendations,State agency planners gained valuable insight into "frontline" needs,and community representatives expressed satisfaction with the dialogue that was established.

T.E.P.35

A FEMINIST VIEW OF AIDS: POLICY IMPLICATIONS OF THE SOCIAL CONSTRUCTION OF A DISEASE

Herbert, Barbara, MD, Working Group on Women and AIDS and The Moore Clinic, Johns Hopkins Hospital Baltimore, MD, USA

Many policy decisions affecting HIV positive women in the US are informed by inexplicit principles and covert perceptions which obtain to women specifically and differently from men, but may not be consciously available to policy makers. These decisions result in prevention strategies with limited likelihood of success: i.e. approaches which mirror previously unsuccessful campaigns like many current efforts to decrease the rate of teen pregnancy. These policies may have widespread implications for gender definition, sexual autonomy and reproductive choice among women at risk for infection as well as women, who because of class and race (categories frequently used as proxy for risk in the absence of known behavior) disproportionately experience their impact. North American feminist analysis provides a framework to understand these underlying principles and evaluate their policy implications. Feminist experience utilizing concepts like empowerment may provide new directions in policy and prevention.

T.E.P.34

PATIENTS' PREFERENCES FOR LOCUS OF CARE AND FOR ACTIVE TREATMENT: PRELIMINARY RESULTS OF A MULTI-SITE STUDY

Mor, Vincent*; Fleishman, J.*; Piette, J.*
*Brown University, Providence, Rhode Island, USA.

Objective. To describe preferences of people with AIDS for care at home and for continuing active treatment in the face of severe symptoms.
Methods. Personal interviews were conducted with 257 clients of the Robert Wood Johnson Foundation's AIDS Health Services Program in 9 cities in the US. We assessed patients' preferences for home treatment (e.g., dying at home, being treated at home, being home with unreliable medical care access) and for active treatment in the face of severe symptoms (e.g., constant nausea, incontinence, disfigurement, life support dependence). We compared responses by risk group and by whether the patient had recently been hospitalized.
Results. Nearly 90% want to die at home; 75% prefer living at home even if dirty to living in group quarters; and 63% prefer being home even if access to medical care is more complicated than getting therapy in a hospital. Patients' willingness to endure complications of aggressive treatment had 3 clusters: common symptoms, which 55-65% would endure; functional dependence and disfigurement, which 31-41% would take; and life support dependence, which only 8-12% would put up with. Only small differences by risk group were observed, and recent hospitalization was unrelated to preferences.
Conclusion. Patients' preferences for home-based care are consistent with social norms and should be considered in program planning. Preference for aggressive treatment varies as a function of the anticipated consequences.

T.E.P.36

The Social Correlates of AIDS Bigotry, Causes for Concern

Webb, Farrell*
*New York University, New York City, NY, USA

Objective. To explore the social correlates of AIDS bigotry (negative attitudes toward persons with AIDS) among American citizens and to investigate the implications it has for the rights of persons with AIDS and policies directed at persons with AIDS.
Method. Data from the General Social Survey were examined using multiple regression analysis in an effort to determine what were types of people were most likely to display AIDS bigotry.
Results. AIDS bigotry was not easily explained by the variables traditionally used in social science research. Among the strongest indicators was the overall level of education, but this too was minimized when personal contact issues, such as whether or not AIDS testing should occur before marriage, were introduced.
Conclusion. This investigation has implication for policy makers because it demonstrates that general programs (those designed to reach the most people such as mass mailings or television shows) may not be the best method to use. It is clear that programs must be designed to address issues that are of concern to the public, but that program designers and policy makers are well advised to study just what they mean by "public."

T.E.P.37 L'INFECTION PAR LE V.I.H : ANALYSE DES AXES DE LA POLITIQUE DE SANTE DES POUVOIRS PUBLICS (PP) EN FRANCE.

Serfaty, Annie *; Brodin, M.*; Alfaro, C.*; Pissarro, B.**.
*Departement de Sante Publique, Faculte Xavier Bichat, PARIS, **Service de Medecine Sociale, Hopital Saint-Antoine, PARIS, FRANCE

Objectif : Identifier les axes de la politique de sante des Pouvoirs Publics (PP) et en reperer ses forces et ses lacunes par une demarche systematique et quantifiee.
Methodes : Tous les textes (2 lois, 5 decrets, 7 arretes, 37 circulaires) elabores entre le 2o juin 83 et septembre 88 en reponse a l'epidemie, ont ete examines par une methode d'analyse de contenu, basee sur le schema de communication de Lasswell. Les donnees informationnelles contenues dans les textes sont analysees selon une grille de lecture, support de la classification thematique de ces informations.
Resultats : La production par les PP, des actions de sante en reponse a l'epidemie evoluent selon un modele epidemique (3eme epidemie, J.Mann) : les interventions emises par les PP ont augmente d'un facteur 10,7 entre 83 et 88, avec deux pics un en 85 en relation avec la mise sur le marche des tests de depistage des anticorps anti-VIH et un en 88 en relation avec les services mis en place pour promouvoir l'acces au test (T) et a l'information (I).
L'analyse des tendances des programmes de lutte contre le VIH en unites d'information (UI), montre que : depuis le debut de l'epidemie, 23,3% des UI (soit 220UI/944) sont consacrees aux mesures preventives(MP), 20,7% (195UI) a l'acces au T, 16,9% a l'information, 7% a la Formation des professionnels. Entre 83 & 85, les actions sont dominees par les MP sur dons de sang, en 86 par la Surveillance Epidémiologique et en 87 par l'acces au T.
Les services administratifs ayant participe a la gestion du sida appartiennent au ministere de la sante pour 84,4% et de la justice pour 5,2%.
Conclusion : Une analyse de ce type permet d'objectiver les grands axes des interventions des Pouvoirs Publics Francais, dans la lutte contre l'infection par le VIH et d'en evaluer les objectifs de sante publique. Elle reste a comparer les politiques des autres pays europeens, afin d'en reperer les manques et agir en consequence.

T.E.P.38 SEXUAL AND INJECTING RISK BEHAVIOUR AMONGST DRUG USERS IN BIRMINGHAM, ENGLAND

Kinnell, Hilary; Griffiths, R K
Community Medicine Department, Central Birmingham Health Authority, UNITED KINGDOM

Background: Birmingham is Britain's second largest city, but no authorized source of free sterile injecting equipment is yet open for drug users. Drug treatment agencies claim low levels of injecting amongst users in the city.
Project: Outreach workers initially investigated the extent of injecting amongst female prostitutes, finding 25% who had either themselves injected or had a boyfriend who injected. 190 injecting drug users (male and female, prostitute and non-prostitute) were then interviewed using the same informal networks as were used to contact prostitutes.
Results: In the month prior to interview 80% had injected and 50% had shared injecting equipment. 85% had shared in their lifetime. 32% of males had shared in prison. 75% claimed to clean their injecting equipment, but cleaning methods varied greatly. 8% had shared in Scotland since 1983 when HIV is known to have been present in Edinburgh. 34% of females and 6% of males had prostituted. 16% of males and 11% of females recorded homosexual contact. Condoms were never used with 70% of recorded partners. 45% of partners were current or previous injectors. 31% had been HIV tested, but only 8% were tested in Birmingham. Most avoided local drug services.
Conclusions: i) both sexual and injecting risk behaviour is common amongst injectors in Birmingham; ii) local testing and treatment centres have inadequate information relating to HIV and injecting because injectors do not contact local agencies.

T.E.P.39 AIDS-RELATED KNOWLEDGE, ATTITUDES AND BEHAVIOR OF HOSPITAL ADMINISTRATORS AND PHYSICIANS: A COMPARATIVE ANALYSIS

Campbell, Scott*; Willenbring, K.* and Henry, K.*†.
*Department of Medicine, St. Paul-Ramsey Medical Center, †University of Minnesota Medical School, St. Paul, Minnesota, U.S.A.

Objective. To describe differences and similarities of AIDS-related knowledge, attitudes, and behaviors between physicians and hospital administrators located at one hospital.
Methods. In September 1987 an anonymous survey was delivered to all physicians and administrators at a 455-bed acute care teaching hospital. Included in the survey were scales measuring AIDS-related knowledge, attitudes, behaviors, homophobia, and homosexual bias.
Results. Responses were obtained from 167 of 270 MDs and 77 self-described administrators. The two groups did not differ significantly in age (mean = 38.4 yrs); race (96% caucasian); and sexual preference (97% self-described heterosexual). MDs were more often male (121/166; 73%) than administrators (24/77; 31%; p<.0001). A comparison of MDs vs. administrators revealed that MDs possessed higher AIDS-knowledge scores (p <.001) and tended to report more favorable behaviors related to AIDS patients (p = .075). The 98 males from the two groups combined possessed higher AIDS-knowledge scores (p < .001), less desirable attitudes towards AIDS patients (p = .066), were more homophobic (p < .001), and more biased against homosexuals (p = .083) than the 145 females.
Conclusion. Administrators in this study demonstrate lower AIDS transmission knowledge than MDs, as might be expected, as well as less desirable behaviors in relation to AIDS patients. The higher knowledge scores among males is likely due in part to the high percentage of MDs being male. In spite of a higher AIDS-knowledge level, men were more homophobic and possessed less desirable attitudes towards AIDS patients. Those who deliver AIDS education in health care setting should consider these findings. Since health care administrators play a key role in policy and financial decisions, they should be considered when AIDS inservice education programs are developed.

T.E.P.40 HIV COUNSELING FOR WOMEN POLICIES AND PROGRAMS

Rodriguez-Trias, Helen*;Dumois, Ana**;Alexander, Vicki**; Chavkin, Wendy**.
*N.Y.S. Dept. of Health, AIDS INSTITUTE, N.Y., N.Y., **Community Family Planning Council, N.Y., U.S.A.

Objective. To describe the New York State Department of Health Policies, Programs, and procedures on HIV counseling for women and the response of two types of programs providing family planning and prenatal care services.
Methods. A review of documents, protocols, suggested guidelines and policy statements emmanating from the NYS DOH planning and prenatal care services. Interviews of the Directors and selected staff members of two major providers of Community based services obtained information as to constraints and incentives to introducing HIV Counseling and testing in the programs.
Results. Constraints: staff time and attitudes, financial, concerns about confidentiality, negative impact on clientele and lack of knowledge and skills. Incentives were: realization of risk for clientele served, staff training and reimbursement for Counseling activities. A perception that state policies emerge without adequate consultation with program people was common among providers. As a result a more interactive model is being developed.
Conclusion. Interactive models incorporating providers into policy and program development processes spur greater program activity.

T.E.P.41 DEVELOPING LONG-RANGE AIDS PLANS IN NEW YORK CITY AND SAN FRANCISCO

Udall, Linda M.*; Reutenberg, E.L.**; Rutherford, G.W.*; Baker, M.**; Amory, J.W.*
*Department of Public Health, San Francisco, CA; **Department of Health, New York City, NY, USA

Objective: To compare approaches to and problems with AIDS planning in New York City (NYC) and San Francisco (SF).
Methods: We reviewed long-range AIDS plans developed in the two cities in 1987-88 and analyzed problems encountered and common approaches.
Results: NYC has developed two plans, one from an intragovernmental committee which focused on public sector service development and one from a public-private task force which emphasized service development across sectors. SF developed a single plan involving community-based organisations which combined epidemiologic projections and fiscal aspects and public and private sector service development. Common problems were projecting future health care costs, accounting for potential improvements in treatment technology, and estimating utilisation of proposed services not currently available, such as care for patients with earlier stages of disease, supported housing, and adult day health care.
Conclusion: Both cities are experiencing increased pressure on their AIDS health care delivery systems creating competition with other services. Long-range AIDS planning requires careful epidemiologic analysis, thorough community participation and review, and detailed service utilization and cost data.

T.E.P.42 FACTORS ASSOCIATED WITH WILLINGNESS TO ENTER DRUG TREATMENT

Kleyn, Jeanne; Fiser, R. and Lake, E. University of Washington, Seattle, Washington, USA.

Objective. To identify factors associated with Seattle-area intravenous drug users' willingness to enter treatment.
Methods. A street sample of 78 out-of-treatment intravenous drug users was selected from Seattle's Central Area using modified chain referral techniques. Respondents were interviewed using a revised version of a structured survey instrument that had been used previously in San Francisco, California. Preliminary analysis was conducted using cross-tabs. A multivariate analysis will be conducted using logistic regression.
Results. More than half (57%) of those sampled indicated that they would be willing to enter treatment if a place were available. An additional 9% said they would be willing to enter treatment if certain conditions were met (for example, if the form of treatment provided were methadone treatment or if childcare were made available). In a preliminary analysis, demographic characteristics, socioeconomic characteristics, and attitudes about and experience with treatment were all associated with willingness to enter a treatment program.
Conclusion. The preliminary analysis suggests that community health outreach workers can effectively target certain kinds of intravenous drug users to encourage entry into available treatment slots. Recruitment of others may require changes in the kinds of treatment and other services offered. In Seattle-King County, changes to be made may include simplification and centralization of the current treatment intake system, offering of on-site child care, and integration of vocational programs with treatment offerings.

T.E.P.43

Current Utilization of Inpatient Alcohol and Drug Treatment Services in a Cohort of IV Drug Users.

Solomon, Lisa, Frank, R., Vlahov, D., Celentano, D., Cohn, S.
The ALIVE Study. The Johns Hopkins University, Baltimore MD. USA.

Objective. To determine the current utilization of inpatient drug and alcohol treatment services in a cohort of high risk IV drug users (IVDUs) and to correlate current utilization with serostatus.
Methods. A cohort of IVDUs, recruited by community outreach, were enrolled in a longitudinal study of HIV infection. Participants were queried concerning their utilization of inpatient drug or alcohol treatment services within the prior six months. Utilization of services was correlated with HIV serostatus.
Results. Among the group of 305 respondents, 21% were HIV seropositive (ELISA and WB confirmed). Forty-four (15%) had been an inpatient in a drug or alcohol detoxification program within the previous six months.
Four (9%) of those in drug or alcohol treatment, versus 59 (23%) not in treatment were seropositive ($p <.08$).
Conclusion. Although based on a self-selected cohort, these data indicate that the majority of individuals currently in inpatient detoxification are seronegative and suggests that prevalence estimates derived from inpatient samples may have underestimated true prevalence. Also, of additional concern, HIV positive IVDUs may not be receiving needed drug treatment.

T.E.P.44

THE SOFT UNDERBELLY OF RESEARCH: ADMINISTRATIVE AND COST CHALLENGES IN A STUDY OF HETEROSEXUAL HIV TRANSMISSION

Laufer, D.; Zierler, S.; Feingold, L.; and Mayer, Kenneth.
New England Behavioral Health Study (NEBHS), Brown University, Providence and Memorial Hospital, Pawtucket, RI, U.S.A.

Objective. To enroll up to 3000 heterosexual adult volunteers in a cross-sectional seroprevalence study of HIV transmission, and up to 1000 high risk heterosexuals in a prospective cohort study.
Methods. Recruitment, beginning in early 1988, has involved establishing multiple outreach and referral sites at hospital-based HIV clinics, community service agencies, drug and STD treatment facilities, and other agencies serving HIV+ high risk populations. Publicity efforts have included public service announcements for TV and radio, newspaper ads, brochures, bookmarks and matchbooks. Participants are offered free physicals, counseling, HIV testing which includes p24 antigen and T-helper lymphocyte screening for HIV+ persons, and medical and social service referrals, but are not paid.
Results. In the first 10 months, 215 people (109 women and 106 men) have enrolled. The effort required to reach and inform a variety of intended high risk audiences, some of whom do not speak English and many of whom are not motivated to be tested, is labor-and cost-intensive. Developing public relations has been expensive, requiring creative, low-budget approaches and reliance on limited broadcast community service initiatives.
Conclusion. Research and voluntary testing programs need extensive resources in order to reach, inform, and motivate populations at risk for HIV infection. Creative strategies are needed in order to maximize limited resources, overcome cultural barriers to research in general, and to deal with the anxieties that people have about HIV testing and research.

T.E.P.45

NEW JERSEY'S EMERGENCY RETROVIR REIMBURSEMENT PROGRAM - EVALUATION OF ITS AFFECT ON SURVIVAL TIME

Conviser, R.; Young, S.; Hummel, R.; Bishburg, E.; Costa, S.
New Jersey State Department of Health, Trenton, New Jersey, USA

Objective: New Jersey received $1.5 million and subsequently $996,000 from Congress to provide antiviral drugs for low-income people with HIV infection lacking public assistance, enough to provide for about 175 person years of AZT (Retrovir). This study's objective is to determine the characteristics of persons receiving the drug through this program, to compare then with persons receiving the drug through other programs and to determine the effect of AZT on length of life of recipients.
Methods. Confidential records from the entitlement programs was compared to information from the State AIDS Registry. Demographic and diagnostic variables were matched between two samples: those receiving the drug through the various entitlement programs and those on the Registry who were not receiving the drug. On the basis of the Registry, length of life was studied. 544 persons receiving AZT through entitlement programs was compared to 5153 persons on the State AIDS Registry.
Conclusions. The demographic profiles of the two sample groups were fairly well-matched. However, analysis identified a need for further outreach to black males, who were under-represented in the AZT population as compared to the State AIDS Registry. This study also presents an analysis from a broad public policy perspective that complements existing medical literature.
Results. Analysis suggests an effect of AZT on persons on the various entitlement programs in terms of increased length of life, when compared to survival time of a comparable sample of individuals from the State AIDS Registry. 71% of AZT recipients were alive at the end of the study period, compared to 36% from the State AIDS Registry sample not receiving AZT through these programs.

T.E.P.46

POLITIQUE D'INTERVENTION MUNICIPALE DE LA VILLE DE MONTRÉAL RELATIVE À LA PROBLÉMATIQUE DU SIDA.

COUSINEAU, Léa* DORÉ, Luc* BLAIN, Raymond**Ville de Montréal CANADA

Objectif: Présenter la politique municipale de la Ville de Montréal relative à la problématique du SIDA.

Contenu: La Ville de Montréal a décidé d'intervenir à l'intérieur des quatre rôles qui lui sont dévolus en ses qualités d'employeur, d'entreprise de services, de gouvernement municipal et d'agent de concertation afin de: 1) freiner la progression de l'épidémie; 2) réduire les conséquences sociales infligées aux personnes atteintes; 3) favoriser l'implantation des ressources susceptibles de répondre aux besoins engendrés par la maladie.

Outre l'adoption d'une politique qui identifie clairement les intentions de la Ville par rapport à ces quatre rôles, la Ville entend mettre en oeuvre les six mesures concrètes suivantes:
1- préparation et diffusion d'un programme d'information pour ses employés;
2- préparation et diffusion de programmes de formation adaptés à l'usage des employés de première ligne afin qu'ils puissent effectuer leur travail de façon sécuritaire et respectueuse des droits de la clientèle sidéenne;
3- mettre à la disposition de la population la documentation relative au SIDA et à sa prévention;
4- affichage obligatoire dans certains établissements publics de mesures de prévention contre le SIDA;
5- l'élimination des obstacles à l'établissement des ressources aptes à répondre aux besoins spécifiques issus du SIDA;
6- la participation à la concertation des différentes actions entreprises sur le territoire de la Ville en vue de contrer le SIDA.

T.E.P.47

RECENT CHANGES IN SEXUAL BEHAVIOR AMONG MEN IN LOS ANGELES

Freeman, H.,* Lewis, C.,* Montgomery, K.,* Corey, C.*
University of California at Los Angeles, Los Angeles, California, U.S.A.

Objective: To assess the changes in sexual behavior among homosexual and heterosexual men in Los Angeles over a 2-year period.

Methods: Random-digit dialing telephone calls were placed to residences; men ages 18-60 were eligible to be interviewed. Households in census tracts with higher than average rates of reported cases of AIDS were oversampled. Results are weighted to reflect oversampling.

Information on sexual orientation numbers of sexual partners, and other risk-related behaviors, were gathered for 2 time frames: the past 2 years and the past 3 months.

Results: Significant differences are found between homosexual and heterosexual men in terms of numbers of partners and presence of other risk-related behaviors (over half the homosexual men in the study reported having 4 or more sexual partners in the past 2 years (1986-1988), as compared with less than one quarter of heterosexual men.

Sexual activity and increased risk behavior was significantly reduced for both groups over the past 3 months (March-June 1988), although a higher percentage of homosexual men remained highly sexually active.

T.E.P.48

SCIENCE AS A POLITICAL FORCE: THE CASE OF THE AIDS EPIDEMIC

Smith, Stephen C., Human Rights Campaign Fund, Washington, D.C., USA

Objective. To draw the lessons of the AIDS crisis for the role of science and scientists in political life.
Methods. The author -- who has devised political arguments and strategies for AIDS policies based on scientific advice -- will review relevant literature in the history of science.
Results. Most modern political-economic systems claim to be "scientific," and science has greatly reduced the forces that most excite human fears -- poverty, violence, and disease -- but public understanding of science has not progressed at the same rate. Scientists are not well represented among policymakers nor in the general public. Thus, the average person, even in "developed" countries today, often responds to their basic fears from superstition or pseudoscience, not scientific thinking.
The public and political response to the AIDS crisis demonstrates the results: many people are reluctant or unwilling to accept the advice of science on scientific questions -- e.g., modes of transmission. Policies may thus be based on an unscientific response to fear, and may be counterproductive -- not only in addressing the problem at hand, but in developing a scientific outlook on the common challenges of human society.
Conclusion. Scientists must become more actively involved in political life and the formulation of policy.

T.E.P.49 THE REFERENCE AND TRAINING CENTER ON AIDS,SÃO PAULO BRAZIL.

Fernandes, M. E. L. ; Teixeira P.R.; Del Bianco,Rosana, Pinto V., Ueda M.
Centro de Referência e Treinamento em Aids, São Paulo, Brazil.

Objective: In February 1988 the secretariat of Health, of São Paulo, Brazil created a reference and Training Center in an 8 floor building to bring together the state Aids Prevention and Control Plans. The Center is composed of: The surveillance UNIT, the educational and Training UNIT, a day care hospital, an out pacient clinic, a laboratory UNIT, a Central for hospitals beds vacancy and a multiprofessional home care unit.
Methods: A multiprofessional TEAM with experience on Aids Since 1983 established the policy of Aids Prevention and Control in the state of São Paulo and descentralized the information on Surveillance, Education, Pacient care to the 62 health regions. Consultant is being done to all 62 health regions.
Results: 3.000 patients are followed in average/per month in the out patient clinic.
. HIV patients from all state are being followed in 75 different health care units after training.
. 2110 health care providers and community leaders were trained in 1988.
Conclusion: The reference and Training Unit Permitted the implementation of the policy Aids Prevention and Control in the State of São Paulo.

T.E.P.50 A STUDY OF NATIONAL AIDS/HIV POLICIES AND PROGRAMMES IN THE 32 COUNTRIES FOR THE EUROPEAN REGION

Gredler Brigitte* and Wayling, S.*
*World Health Organisation, Regional Programme on AIDS, Copenhagen, Denmark

Objective. To describe and evaluate national AIDS/HIV policies and programmes in the European Region and identify strategic lessons for national AIDS/HIV prevention, control and care policies.
Methods. An analytical review, using guidelines of good practice developed by the Global Programme on AIDS, of material from representatives of national governments. Preliminary results substantiated through formal and informal contacts with persons in and outside of government.
Results. National AIDS Committees and other national coordinating mechanisms that are multi-disciplinary and include participation of Non-Governmental Organizations initiate AIDS/HIV policies that appear to achieve a greater degree of effectiveness in HIV prevention and ensuring a continuum of care.
Conclusion. The presence or absence of explicit policy is not necessarily the measure of the effectiveness national AIDS/HIV programmes. Effective policy and programmes appear to be strongly influenced by the mechanism by which they are formulated and implemented. As such, and lacking comprehensive measures of HIV-seroprevalence, the policy process and application in practice must be evaluated to estimate impact.

T.E.P.51 PROVIDING ACCESS TO PROMISING INVESTIGATIONAL DRUGS FOR AIDS: A MANAGEMENT MODEL FOR "TREATMENT INDS"

Katz, Deborah; Feinberg J.; Myers, M.; Gubish, E.; Hoth, D.; AIDS Program, National Institute of Allergy and Infectious Diseases (NIAID), Bethesda, Maryland, USA

One of the primary goals of the AIDS Program, NIAID, is the rapid transfer of new therapeutic advances from the clinical research setting to the community of treating physicians. New federal regulations (6/22/87) defined a mechanism for access by any licensed U.S. physician to promising investigational new drugs (INDs) that have evidence of safety and provisional evidence of efficacy in serious of and life-threatening diseases. These "treatment IND" protocols provide access by any licensed U.S. physician to such therapies.

We have employed "treatment INDs" as part of our overall strategy for rational drug development, and have created a successful management model for their design and implementation. The key components of this model, to be discussed in detail, are: (1) establishment of a telephone information capability (hotline), (2) protocol design, (3) physician education, (4) triage and enrollment process, (5) drug distribution system, (6) data capture and retrieval, and (7) analysis of results.

The AIDS Program has sponsored the only 2 such "treatment INDs" for AIDS indications. While each novel therapy for AIDS patients presents unique medical and logistical problems, we have successfully developed a strategy for "treatment INDs" which allow access to new agents and collects data on their use while meeting U.S. regulatory requirements.

T.E.P.52 DISCRIMINATION AGAINST HIV POSITIVE WOMEN BY ABORTION CLINICS IN NEW YORK CITY.

Franke, Katherine M. New York City Commision on Human Rights, AIDS Discrimination Division, New York, N.Y. USA.

Objective. To document discrimination against HIV positive women in access to abortions in New York City.
Methods. Test calls were placed to 25 abortion clinics. After an appointment was made for an abortion, the caller revealed that she was HIV positive.
Result. Of 25 clinics surveyed, 16 (64%) would not schedule an abortion for a woman who reveals she is HIV positive.
Conclusion. Many health care professionals who perform abortions in New York City manifest open hostility toward HIV positive female patients and remain poorly educated on the need to use universal infection control precautions, thereby violating various public health and anti-discrimination laws.

T.E.P.53 PSYCHOSOCIAL ADAPTATION AND ECONOMIC CIRCUMSTANCES OF PERSONS WITH AIDS OR ARC

Crystal, Stephen*; Jackson, Marguerite**
*Rutgers University, New Brunswick, NJ, USA
**School of Medicine, University of California, San Diego, CA, USA

Objective: To evaluate how persons with AIDS (PWA) and persons with ARC (PWARC) meet their economic, social and medical needs
Methods: 50 PWA and 54 PWARC were surveyed in San Diego County, California, between October 1986 and February 1987.
Results: Social and economic impacts of the disease had been profound for both groups. PWARC reported more unmet needs than did PWA. Both groups reported their greatest unmet needs as financial. A majority were no longer employed; 84% of nonemployed PWA but only 41% of nonemployed PWARC were receiving Social Security disability or SSI, and many nonemployed PWARC had little or no income. Most PWARC lacked Medicaid or other health insurance coverage.
Conclusion: Health care and social services systems will be increasingly challenged not only by needs of PWA but by severe unmet economic and medical needs of an even larger population of PWARC.

Rôle des organismes non-gouvernementaux
The Role of Non-Governmental Organizations

T.E.P.54 CANADIAN HEMOPHILIA SOCIETY: A PLANNED RESPONSE TO HIV AND AIDS

Robert O'Niell, Nena Nera, M.Sc.S.W., C.S.W., Canadian Hemophilia Society; Social Services Advisor, Federal Centre for AIDS, Health and Welfare Canada, Ottawa, Canada

This presentation will describe how a consultative planning process model used by the Canadian Hemophilia Society (CHS) to deal with HIV and AIDS has resulted in an effective response to the crisis.

CHS created a "Task Force on HIV and AIDS" in 1987, comprising of a non-medical and medical group. The four-step planning process followed by these two groups to develop a comprehensive response to the HIV/AIDS catastrophe will be presented and discussed.

The numerous positive effects and substantial results of this well coordinated planning process will be shared at this conference.

T.E.P.55 CANADIAN HEMOPHILIA SOCIETY: A COLLABORATIVE MODEL APPROACH WITH A NON-GOVERNMENTAL ORGANIZATION (NGO)

Nera, Nena M., Shearer, R. J. Federal Centre for AIDS, Health and Welfare Canada, Ottawa, ON, Canada

The devastating impact of HIV/AIDS did not make its mark only to the consumer group but had as much if not stronger impact on the Canadian Hemophilia Society as an organization.

In early 1986, shortly after the Minister of Health and Welfare, Canada, announced its five-year national program, the then National AIDS Centre met with the Canadian Hemophilia Society to analyse the impact of HIV/AIDS on the hemophilia community. The effects of blood products, HIV testing and psycho-social needs of individuals/families with hemophilia became of paramount concern.

With the establishment of the Federal Centre for AIDS in July, 1987 both the Canadian Hemophilia Society and the Federal Centre for AIDS looked at various approaches to meet identified needs of the hemophilia community.

This presentation will not only describe the step-by-step process which evolved in this collaboration with a non-governmental organization, but will also present the achievements derived from such a partnership. The benefits derived by the Society as an organization; the community members as individuals, families and support groups, as well as a general community; and the benefits derived by a governmental agency in the response to the AIDS crisis will be described.

T.E.P.56 ROLE OF THE UNIVERSITY: EDUCATION, RESEARCH, POLICY AND SERVICE

Berman, Caryn*; Cooksey, J.A.*
*University of Illinois at Chicago, Chicago, Illinois, U.S.A.

Objective: To describe a role for an urban university in AIDS education, research, policy and service.
Methods: The University of Illinois at Chicago appointed an AIDS Advisory Council in 1987 with the charge: encourage AIDS-related instruction and prevention programs; promote research; advise on policy; and develop community outreach. Faculty, students, employees and administrative members developed an organizational plan, identified priorities and carried out the charge through several working groups.
Results: Education - highest priority; distribution of printed AIDS awareness materials; peer education programs for students. Research - information and interest sharing; quarterly research forums combine biologic and social scientists; newsletter listing all AIDS grant programs. Policy - campus level policy; addressing nondiscrimination, no mandatory testing, educational programs, and currency with legislation and scientific guidelines. Service - community outreach and empowerment; forum on AIDS awareness and resources for community groups in the neighboring area.
Conclusion: A university has many technical, leadership and service resources to utilize in developing an institutional response to the AIDS epidemic. These resources may be productively shared with the community.

T.E.P.57 PRIMARY CARE AT A RESIDENCE FOR PERSONS WITH AIDS (PWAs): BAILEY HOUSE, NEW YORK CITY, NEW YORK

Ramon A. Torres*, Staats J**.
*St. Vincent's Hospital (SVH) and Medical Center, New York, NY, USA.
**Bailey House (BH), New York, NY, USA.

Objective: To describe a pilot program of onsite primary care at Bailey House (BH), a 44 room residence for homeless persons with AIDS in NYC, that emphasized assessment, advocacy, and timely referrals that led to appropriate interventions.
Methods: A 6 month pilot program was instituted at Bailey House in 7/88 to provide onsite medical consultation to supplement the existing team of nurse practitioner, social workers, substance abuse counsellor, and personal care workers. Close association with a local community hospital, SVH, facilitated referrals for diagnostic procedures, hospitalization and/or specialty clinics.
Results: During the six month period 337 resident contacts by the medical/nursing team led to referrals for outpatient therapy for opportunistic infections, including oral candidiasis, PCP, bronchitis/pneumonia, and soft tissue infections. Many were seen in the SVH clinic of the BH medical consultant. Familiarity with the physician appeared to encourage compliance with clinic visits and treatment plan. Other referrals were to emergency rooms, psychiatric clinics, specialty clinics, private MDs, or for transfusions, diagnostic tests, direct admission, or experimental protocols. Inclusion of a physician in the BH team also allowed for administration of intravenous hydration and infusion therapies (in conjunction with and supervised by the Visiting Nurse Service of New York), administration of aerosol Pentamidine, laboratory monitoring, supportive care to terminally ill patients, counselling, and crisis intervention.
Conclusion: Onsite primary care in a residential setting, utilizing the team approach, provides for more comprehensive outpatient management of PWAs.

T.E.P.58 AIDS COALITION FOR EDUCATION (ACE): A BROAD-BASED ORGANIZATION FOR THE COORDINATION OF AIDS EDUCATION, INFORMATION AND PREVENTION EFFORTS.

Balin, Peter L*; Holbrook, D**; Peterson, M***. *Denver Disease Control Service, **Colorado Department of Health, ***Mile High Chapter, American Red Cross, Denver, Colorado, USA.

Objective. To coordinate and avoid the duplication of efforts by agencies in the state of Colorado involved in AIDS education, information and prevention.
Methods. Beginning in July 1986 with 6 members, ACE had grown to 42 members by December 1988. Members include individuals and organizations, public and private, involved or concerned with AIDS educational activities. They include state and local health departments, community-based service organizations, hospices, insurance carriers, state and local school districts, blood banks, minority organizations, and family planning groups. ACE collectively sponsors educational events and maintains a coordinated speaker's bureau data base. In July 1988, ACE incorporated as a nonprofit educational organization.
Results. Members meet once a month to share resources and present work completed and planned. ACE has a 13-member working Board of Directors. ACE has coordinated three annual statewide education campaigns. In 1987, ACE received national recognition for its print media for the theme "EXPLORE THE FACTS". The coordinated speaker's bureau has documented 2078 presentations to a cumulative audience of 110,000 people from October 1986 to November 1988. The data base collects information in 18 fields including topic, type of audience, and educational media used. Smaller, local coalitions have developed as a result of ACE's example, allowing for ongoing regional cooperation and statewide referral.
Conclusions. Given the limited resources available, and the current proliferation of entities involved in AIDS education, ACE has insured the effective utilization of resources, communication among participants, and an effective method for coordination of regional and state activities.

T.E.P.59 UN EXEMPLE DE COLLABORATION ENTRE UNE ONG ET LE PROGRAMME MONDIAL DE LUTTE CONTRE LE SIDA DE L'OMS : LA FORMATION CLINIQUE DANS LES PAYS AFRICAINS.

Malkin Jean E.*; Lebas J.**; Tarantola D.*; Landi A.*.
* Organisation Mondiale de la Santé (OMS), Programme mondial de lutte contre le SIDA (GPA), Genève, Suisse; ** Médecins du Monde (MDM), Paris, France.

Objectif : dans le cadre d'une action spécifique de formation, développer une collaboration entre une ONG et l'OMS s'inscrivant dans les plans nationaux de lutte contre le SIDA dans les pays africains.
Méthodes : à la suite de la signature d'un protocole d'accord entre l'OMS/GPA et Médecins du Monde, six séminaires d'une semaine ont eu lieu,de décembre 87 à novembre 88, dans les pays suivants : Guinée, Bénin, Togo, Cameroun, Gabon, Côte d'Ivoire. Organisés par Médecins du Monde, ces séminaires avaient pour but d'assurer une formation clinique de haut niveau sur le SIDA pour environ 30 à 40 praticiens dans chaque pays, de sensibiliser le corps médical de ces pays aux stratégies élaborées par l'OMS et les Comités nationaux de lutte contre le SIDA (CNLS), d'initier ces praticiens à la prise en charge des malades et des séropositifs.
Résultats : a. Dans les six pays un total de 235 praticiens à haut niveau de responsabilité ont reçu une formation sur le SIDA. b. La collaboration triangulaire entre l'OMS Genève, Médecins du Monde Paris, et les CNLS dans les pays a parfaitement fonctionné. c. Les séminaires ont permis aux intervenants de Médecins du Monde d'établir des contacts étroits avec d'une part les responsables du GPA et d'autre part les responsables de la lutte contre le SIDA dans les pays concernés.
Conclusions : - les ONG peuvent et doivent s'intégrer dans les programmes de lutte contre le SIDA élaborés par l'OMS et les CNLS.
- Cette collaboration dans le domaine de la formation doit continuer et s'étendre à d'autres aspects de la lutte contre le SIDA.

T.E.P.60 A PROPOSAL FOR A PERMANENT INTERNATIONAL FORUM OF NGOs WORKING WITH AIDS

Almeida, Walter*; Braune, F.W.*; Cardoso Jr, H*; Daniel, H*.
* Brazilian Interdisciplinary AIDS Association (ABIA), BRAZIL

Objective. To propose the creation of a permanent international forum (PIF) of NGOs related to the AIDS epidemic in order to exchange experiences, articulate activities and programs and increase the effectiveness of each organization.
Method. A list of all NGOs related to the AIDS issue was drawn up and approx. 300 circular letters were sent out by ABIA explaining this proposal to NGOs in Latin America, Central America, Caribe, Europe and USA. It was also suggested that the initial site for this encounter be at the V AIDS CONF. contacts with key persons in various countries were made to compose a steering group to link the proposed forum with Programme Committee and secretariat of the Conference, so that a date and place be set during the event for a first session.
Results. The response to the letters was highly positive, and suggestions were made for a round-table rap session during the Conference.
Conclusions. Many NGOs face insurmountable difficulties establishing network exchange programs within their respective countries as well as across national boundaries. Although they touch the reality of AIDS at grassroot level and can directly mobilize available resources and community support, little has been done to tap this potential in fight against AIDS, mostly in the Third World context. The V International AIDS Conference on AIDS offers a unique opportunity in this direction.

T.E.P.61

SOCIAL MARKETING OF CONDOMS AND SPERMICIDES IN KINSHASA, ZAIRE

van der Does, Tibo*; Kakera, K**; Mivumbi, N**
*Population Services International, Kinshasa, Zaire, **Projet De Marketing Social, Kinshasa, Zaire

OBJECTIVE: To increase the availability and awareness of condoms and spermicides. Until 1987 condoms and spermicides were expensive and marginally available in pharmacies, and underutilized in clinics. They were not promoted. Creation of customer demand, affordable pricing, and efficient distribution to wholesale depots, pharmacies and clinics was thought crucial to better utilization.
METHODS: Cooperating with the PSND, Dept of Health, Govt. of Zaire; and USAID, PSI, a not-for-profit organization, set up the Projet De Marketing Social to promote and sell condoms and spermicides at subsidized prices using the commercial infrastructure. The condom,"Prudence", was named, packaging designed; and auto decals and point of sale adverts distributed.
RESULTS:

MKT SURVEY	No. Zones	No. Pharmacies	% CDM,	Sperm on Sale
BEFOR SALES	3	110	54.5	31.8
AFTER 11 MOS	3	110	94.8	100.0

Condom sales increased dramatically from 19,000 1st month to 300,000 units 10th month. Spermicides experienced slower growth.
CONCLUSION: By rapidly increasing sales growth in the private sector social marketing may cause the adoption of more condom use, and consequently have a positive impact on prevention.

T.E.P.62

OBTAINING MULTI-SECTORAL COMMITMENTS TO AIDS PREVENTION THROUGH LEADERSHIP WORKSHOPS IN DEVELOPING COUNTRIES

JD DUPREE*, ML LIOT**, B NIBIGAGA***
*AIDSCOM, Washington DC; **Academy for Educational Development, Washington DC ***National AIDS Committee, Bujumbura, Burundi

Objective. To demonstrate the use of an information and planning workshop for obtaining multi-sectoral commitments to implement Medium-Term Plans for AIDS prevention in developing countries.

Methods. The authors describe developing the idea for engaging all sectors of society in the AIDS prevention effort through a week-long leadership workshop conducted in Bujumbura, Burundi. Representatives of 16 governmental and non-governmental organizations met to discuss and make commitments to the implementation of Burundi's Medium-Term Plan for AIDS Prevention. The participants represented Ministries of Health, Education, Labor, Social Services, Women and Family, Youth/Sport/Culture, Information, three religious denominations, and labor unions.

Results. Pre- and post-tests were administered in conjunction with the workshop, as well as participant evaluations and subsequent follow-up evaluations. Short-term results indicate that mobilizing many sectors of society as possible helps ease some of the burden of Ministry of Health personnel. In addition, it contributes to a coordinated effort and sense of purpose if more people are part of the planning process.
Conclusion. Conducting a joint workshop for leaders from public and private sectors can be one effective way of mobilizing multi-sectoral commitment in a country's AIDS prevention efforts.

T.E.P.63

TITLE. ROLE OF VOLUNTARY ORGANIZATIONS IN DEVELOPING COUNTRIES IN THE BATTLE AGAINST AIDS.

Courtneay, Audrey V. Belize Red Cross, Belize

Objective. i) *Effective dissemination of Facts about AIDS targetting sexually active sector of Community.*
Constraints - a) Restricted human and financial resources
b) Scattered, isolated communities
ii) *Alteration of lifestyles, sexual attitudes, practices and behaviour.*
iii) *Prevention of Public hysteria from Fear of AIDS.*
Method. Involvement of Voluntary Organizations e.g. Red Cross Society/Child Alive Volunteers. Already structured and mobilized to reach target sector quickly and effectively. Familiar with community - enjoys confidence of people.
Results. In (8) eight months, whilst National AIDS Committees deliberated with inevitable bureaucratic restraints the Red Cross trained, promoted messages, and/or distributed leaflets to:

90 - Red Cross Volunteers
37 - Traditional Birth Attendants
964 - Primary and Secondary Students
60 - Members of Community groups also
Distributed 500 Manuals.

Conclusion. Belize's experience proves that without direct involvement of Voluntary Organizations, Governments of developing Countries will not successfully achieve their stated objectives.

T.E.P.64

ABIA: A BRAZILIAN STRATEGY FOR AIDS PREVENTION BASED ON ACTION AND SOLIDARITY

Guimaraẽs, Carmen Dora*; Almeida, W.*; Cardoso Jr., R.*; Daniel, H.* and Ramos, S.*.
*The Brazilian Interdisciplinary Aids Association-ABIA, Rio de Janeiro, Brazil.

Objective. To describe the characteristics of ABIA and discuss its strategy and methods in response to Aids prevention and control in Rio de Janeiro.
Method. This report presents an anthropological perspective of ABIA's organization, activities and methods since 1986. Emphasis will be given to the ways in which services are provided, and to the projects designed in antecipation of the future social consequences of the epidemic.
Results. ABIA is a multidisciplinary, non-governmental organization created in response to the problems Aids imposes on the population. Funded by national and international agencies, its approach is action-oriented and carried out by a small professional staff and 60 voluntary members. The basic programs, developed in collaboration with specific groups, provide accurate information in culturally appropriate language to elicit discussion, awareness and action. Emphasis is given to solidarity and community support so as to humanize Aids and reduce irrational fears.
Conclusion. ABIA stands as a effective low-cost model for Aids prevention largely due to its innovative, humanistic and sociocultural approach. Follow-up data will be needed to assess retention of knowledge and behavioral changes over time.

T.E.P.65

OUT PATIENT CLINIC FOR SOCIAL OUTCASTS IN RIO DE JANEIRO, BRAZIL.

Mª Inez Carvalho*; J.M.TAME**; CASTELLO-BRANCO,L.R.*;NEY FEIJÓ**
* BANCO DA PROVIDÊNCIA, **BANCO DO BRASIL STAFF, RIO DE JANEIRO.

Objective: In Brazil, male and female prostitutes, beggars, transvestites, drug addicts and street kids are often illiterate and not reached by government AIDS prevention campaigns. Only 40% of them receive any medical care. They are very important vectors for spreading AIDS. Prostitutes and transvestites average 600 different sexual partners per year. A free out-patient clinic located in a "red light" district and specializing in these social outcasts was started in 1985, by the Catholic Church. Routine medical care was dispensed, weekly AIDS prevention lectures were given and all volunteers had their blood tested for AIDS and other diseases, providing data for a study HIV antibody occurrence in these patients. Patients are counselled, with proper follow-up of those who are HIV infected. Current data suggest a gradual decline in number of partners per year and increasing use of condoms.
Conclusion: Other out-patient clinics specializing in care of social outcasts should be started. Besides medical care, social help of multiple aspects should be dispensed by a multidisciplinary staff. Not only the infected but also their relatives should be looked for, in an effort to re-socialize the group. Only through this type of clinic has it been possible to reach and counsel the outcasts who are instrumental in spreading AIDS.

T.E.P.66

PRISE EN CHARGE DES PATIENTS INFECTES PAR LE V.I.H. AU SEIN D'UNE CONSULTATION HOSPITALIERE SPECIALISEE : ROLE DES ASSOCIATIONS DE VOLONTAIRES.

LEBAS Jacques* ; BAUDRY O** ; MEYOHAS M.C* ; GONZALEZ G* . PICARD O* ; IMBERT J.C*.
* Hôpital Saint Antoine. PARIS. FRANCE
** Association AIDES. PARIS. FRANCE

Objectif. Favoriser l'insertion des patients infectés par le V.I.H. dans les structures hospitalières et promouvoir, à ce niveau, le counselling et une prise en charge globale.
Méthodes. Au sein de la consultation pluridisciplinaire de l'hôpital Saint Antoine spécialisée dans l'infection à V.I.H., une permanence est assurée par des volontaires d'une association d'aide aux patients (AIDES). Un réseau intra et extra hospitalier comprend des services : d'aide sociale, de conseil juridique, d'appui psychologique et d'information sur l'épidémie. Les volontaires peuvent être contactés par le patient lui même ou par l'équipe soignante. Ils peuvent suivre le malade en hospitalisation ou à domicile. Une évaluation régulière du suivi des patients est assurée avec des services psycho-sociaux de l'hôpital.
Résultats. En 18 mois, 101 patients ont été pris en charge à la permanence d'accueil : 78 hommes dont 14 toxicomanes. 17 femmes dont 9 toxicomanes. La moyenne d'âge est de 30 ans. 67 patients vivent en situation de précarité. Les services suivants ont été assurés : aide économique : 37 cas ; conseil juridique : 17 ; démarches sociales et administratives : 43 ; counselling : 97.
Conclusion. Ces permanences assurées par des volontaires associatifs permettent un véritable accompagnement des patients dans et hors de l'hôpital.

T.E.P.67

SURVEY OF THE CLIENT STRUCTURE OF THE AUSTRIAN AIDS FOUNDATION'S COUNSELLING CENTRE IN VIENNA, JULY 1987-DECEMBER 1988

Mutterer, Judith; Brandstätter, R.; Vogt, G.; Piribauer, F.; Blaas, P.
Österreichische AIDS-Hilfe (Austrian AIDS Foundation) - ÖAH, Vienna, Austria.

Objective: To give a survey of the composition of the clientele of Austria's most frequented HIV/AIDS counselling centre.
Methods: Evaluation of the 3,600 clients who frequented the Vienna counselling centre of the Österreichische AIDS-Hilfe (ÖAH) between 1 July 1987 and 31 December 1988. This centre is one of seven in a nation-wide network of anonymous and free HIV/AIDS counselling centres operated by the Austrian AIDS Foundation in which teams of psychologists, physicians and social workers offer information and educational work, anonymous personal and telephone counselling, psychosocial help, care and support, and anonymous and free HIV antibody testing.
Results: 64% of these 3,600 clients were men, 36% women; 80% stated that they were heterosexual, 14% homosexual or bisexual; the sexual orientation of 6% was not stated; 87% of the clients decided to have an HIV antibody test, 94% of them tested negative, 6% tested positive. A more detailed presentation concerning factors such as risk behaviour, frequency of visits to the counselling centre, age, etc., will be given at the poster session.
Conclusion: The information and counselling offered by the ÖAH are, to a large extent, accepted both by the general population and by the so-called risk-groups. The ÖAH, however, focusses on the care and support of HIV positive people and PWAs.

T.E.P.68

RECHERCHE D'UNE STRATEGIE DE COMMUNICATION EFFICACE CONTRE LE SIDA

Dagenais Bernard, Université Laval, Québec, Canada.

Objectif. Déterminer pourquoi les reportages et les campagnes de communication n'ont pas réussi à changer les comportements des individus dans les pays occidentaux.
Méthode. Comparaison des études sur la mémorisation des messages et les changements de comportement des individus.
Resultats. Un sondage gallup mondial de janvier 1988 estime que 80% de la population des 40 pays interrogés sont au courant du SIDA. Le taux de mémorisation des campagnes anti-sida en 1988 s'élève à plus de 80%. Mais la crainte d'être contaminée par le virus est de 10% en moyenne. Pourquoi?
1. Le SIDA est la maladie des autres. Les campagnes sont faites pour nous dire comment nous prémunir contre le SIDA mais ne nous disent pas que le SIDA est dangereux pour nous.
2. Les campagnes anti-sida sont confrontees aux valeurs religieuses et sociales de chaque société.
3. Toutes les campagnes qui ont été orientees vers les changements de comportement ont mis de nombreuses années à se réaliser (la cigarette).
4. La résistance des pouvoirs publics à parler de sexe.
Conclusion. Les stratégies média contre le SIDA ne sont pas efficaces car on a sauté l'étape de l'information sur le SIDA pour parler des moyens de s'en prévenir.

T.E.P.69

A 40-HOUR TRAINING PROGRAM ON AIDS FOR PUBLIC HIGH SCHOOL TEACHERS

Fernandes, Maria Eugenia*, Pinel, A.*, Nardi, M.A.,* Abud, N.*, Isaler, A.C.*, Inglese, E.*
*Centro de Referencia e Treinamento-AIDS, São Paulo, Brazil

Objectives. To train teachers from the public school network on AIDS.
Methods. A 40-hour training program on human sexuality and AIDS was developed by the Education and Training Unit of the Center of Reference and Training in AIDS as a complement to a booklet that would be distributed by the Secretariat of Education of the State of Sao Paulo to public high schools. The program consisted in 16 hours of human sexuality (gender identity, gender role behavior, sexual orientation, childhood sexuality, adolescent sexuality, anatomy and physiology, condom use), 16 hours of AIDS (biological, psychological and social aspects), and 8 hours of teaching methodology and AIDS. The format included lectures, discussion and A-V presentations. A pre and post-test was applied and a subjective evaluation was required from each participant.
Results. 150 teachers were trained in 2 groups. Despite the fact that there was a significant increase in the knowledge about AIDS as seen in the post-test, the majority of the participants did not feel ready to pass the information to colleagues and students.
Coclusion. Training must be followed by a support program.

T.E.P.70

AIDS - NEW TYPES OF PUBLIC HEALTH PROGRAMS IN WEST-BERLIN

Hachmann, Monika*, Bergstedt,P.*, Messing,K.*, Kohlhoff,A.*, Klapps,P.**
*Working Group AIDS of the Senat Department for Health and Social Affairs at the Berlin Institute for Tropical Diseases, Berlin, F.R.G., **German Red Cross, Berlin, F.R.G.

Objective. Most experts agree that in the combat of AIDS only those measures can be effective which consider and accept individual needs and conditions of the different target groups. Public health institutions therefore have to develop new types of programs based on this principle.
Methods. In West-Berlin 3 programs have been implemented in this sense by support of the Working Group AIDS of the Department for Health and Social Affairs at the Institute for Tropical Diseases:
1. Since May 1987 an AIDS Education Program for Schools, carried out by especially trained external doctors and teachers ('schoolworkers'),
2. since May 1987 a 'Prostitution Abandonment Program' for prostitutes in danger of infection from clients; it has been realized in close cooperation with a self-help group for prostitutes,
3. since Oct. 1987 a Mobile Information and Counselling Team (1 doctor, 1 psychologist, 1 nurse and 1 social worker) for the staff of local outpatient services.

Results until Dec. 31, 1988: 1.)About 60 000 students aged from 13 to 22 were given instructions on sexuality and AIDS during normal lessons. Their level of information has considerably increased. 2.)About 100 women could be offered employments which enabled them to refrain from prostitution voluntarily. The drop-out rate amounts to only 7%. 3.)About 1700 staff members of local outpatient services could be motivated and encouraged to incorporate patients with HIV and AIDS into their routine of daily practice.
Conclusion. The obvious success of these new types of measures - all of them are accompanied by scientific evaluation studies - indicates the possibility of developing similar target group-linked programs in other big city areas with large numbers of people with HIV and AIDS. Such programs can possibly serve as prototypes for further public health strategies.

T.E.P.71

AIDS SERVICE ORGANIZATION: LESSONS FOR STRATEGIC PLANNING AND ORGANIZATIONAL DESIGN

Rector, Richard* Wayling, S** Grose R***
Health Consultant - AIDS, **World Health Organization, Regional Programme on AIDS, Copenhagen, Denmark ***World Health Organization, Geneva

Objective. To identify strategies to deal with the evolving organizational and management issues identified by AIDS Service Organizations as priorities.
Methods. Outcome of a global meeting of AIDS service organization in Vienna, Austria, 28 February - 3 March 1989. Forty organizations from 25 countries were represented.
Results. The capacity of AIDS service organizations to initiate, fund and manage programmes is being reached. Strategic planning and organization design are prerequisites to overcome organizational and management challenges.
Conclusions. AIDS Service Organizations have the.. technical expertise to provide client services. However, their organizational objectives must be clarified, administrative frameworks delimeated and resources better allocated.

T.E.P.72

PLACING EDUCATIONAL INTERVENTIONS WITHIN THE CONTEXT OF COMPREHENSIVE SOCIAL POLICIES TO REDUCE THE SPREAD OF HIV INFECTION.

Ronny A. Shtarkshall.
Dept. of Social Medicine, The Hebrew University & Hadassah Faculty of Medicine, Jerusalem, Israel.

Although there are no bio-medical means to either prevent HIV infection or cure AIDS, it is a mistake to assume that the only, or even dominant means available to reduce the risk of HIV infection are educational. Other means which could form the basis for a comprehensive social policy are available. These are both of a "Health Promotion" and a "Health Protection" nature, sometimes combining elements of both in one measure. I propose to consider the following measures as examples of the elemets that can compose such a policy and to consider their implications and ramifications: 1. the direct and indirect use of medico-economic and socio-economic incentives, among vulnareable groups, to promote early testing and recruitment into preventive programs; 2. lowering economic and social barriers to the use of risk-reducing measures; 3. Redeining drug addiction socially as a disease and addicts as ill people, rather than criminals, while keeping un-authorized drug productionn and distribution illegal; and,
4. considering and studying different strategies fo free or at-cost distribution of injectable drugs under medical supervision, within comprehensive programs, as part of the effort to stem the spread of HIV infection among IV drug users.
Among the implications which I intend to discuss are: possible objections from established societal power and professional groups; reactions of organized crime; influence onn drug addiction and on drug-related crimes; and, the influence on disadvantaged groups.

T.E.P.73

AIDS AND THE ROLE OF CIVIC MOVEMENTS. - A COMMUNICATION BRIDGE IN BOTH DIRECTIONS.

Anabitarte,Héctor*;Torres,J.*;Usieto,R.*;Mompradé,B.*
* Comité Ciudadano Anti-SIDA,Madrid,Spain.

Objective. To the uncertainty which was provoked by the appearance of AIDS,we have to add the prejudging attitude faced with the same,preoccupying more the AIDS-infected than the retrovirus.The affected people were blamed,insisting that they were victims of a "dammned"plague due to their habits.The appearance of AIDS encouraged a serie of already existing prejudices which have been weakened some decades ago,specially in the democratic and pluralistic societies.Methods. AIDS arrived to show us that including in the most liberal and democratic countries,there still were existing population groups who were living marginated and a significant part of their daily existence passes in secrecy.This fact implants the urgent necessity to avoid the spreading of the virus and at the same time we have to integrate socially important human groups in a plan of equality in relation to the whole population,thinking from new estimates about the individual rights and the social obligations.Results. From there we think we should potenciate the civic anti-AIDS movement,because they play an important role as a communicating bridge between the diverse state administrations,the affected and the persons with practices of risk,and this communication.as we understand it,must be fluent,not schematic and the less hierarchic possible,and in both directions.Conclusions. The administrations have to know how to talk to the groups with practices of risk with efficacy in order to infiltrate solidly healthy habits through the information and education.At the same time,AIDS-infected or possibly inf.,need to canalise proposals and claims and this is practical,accesible if one could count on an organizing and independent instrument.

T.E.P.74

SUCCESSFUL COMMUNITY-BASED HIV/AIDS EDUCATION AND INFORMATION PROGRAMS TARGETING RACIAL AND ETHNIC MINORITY COMMUNITIES IN THE UNITED STATES

~~Schindler, Stephen~~*, Murguia, M.**, Gambrell, A.E.**, Nowicki, C.*, Johnson, E.D.**, Bowen, G.S.*, et al. *Centers for Disease Control, Atlanta, GA, U.S.A. ** United States Conference of Mayors, United States Conference of Local Health Officers, District of Columbia, U.S.A.

Objective: To elicit behavior change in people who are at risk of HIV infection by providing financial, programmatic, and technical assistance to community-based organizations (CBO) to enable them to provide HIV/AIDS education/information targeting racial and ethnic minority communities in the U.S.

Methods: Since 1985, The U.S. Conference of Mayors/U.S. Conference of Local Health Officers (USCM/USCLHO), using funds from the Centers for Disease Control, has been providing assistance to CBOs. Since 1987, this assistance has focused on organizations that target racial and ethnic minority communities for HIV education and information. With this assistance, CBOs provide information to targeted groups of individuals (e.g. blacks, hispanics, intravenous drug users, gays, and others at risk of HIV infection), conduct outreach, and perform evaluation of methods and outcomes.

Results: Since 1985, USCM has provided funding and technical assistance to 86 CBOs. Many of these organizations have now become leaders in providing HIV/AIDS education/information at the local level. These organizations serve as models for other organizations in program and materials development, information on methods used in targeting specific populations, information on how to conduct specific activities, and information on collaboration with other CBOs and governmental agencies.

Conclusions: The authors will provide information on programs of specific organizations that developed and implemented "model" programs for HIV/AIDS education/information at the community level, and will describe how these programs were designed and implemented, and how the programs are being evaluated.

T.E.P.75

T.E.P.76

THE STOCKHOLM MODEL- COMMUNITY INTERVENION AS A MEANS TO REACH 1.6 MILLION PEOPLE WITH AIDS PREVENTION

Asp, Anna-Karin, Gustafsson, B., Abascal, L., Urwitz, V.
Stockholm County Council Aids Prevention Project, Sweden.

Objectives: To reach inhabitants of the Stockholm County with health education on HIV/AIDS and support them to change behavior.

Method: To get a quick start we chosed four target groups which we mainly work with; young people, health and medical staff, immigrants/refugees and homo- and bisexual men. We use the existing infrastructure and educate and support people who daily come into contact with our target groups. We work to promote a positive attitude towards sexuality and personal relationships and our aim is to get people to talk to each other on sexuality and feelings. Our method combines community intervention with information strategies and production. We have an information centre to support the about 5.000 people that we have educated within the project e.g. teachers, youth leaders, social workers, school nurses, representatives from the immigrant organisations, home-language teachers, interpreters, health and medical staff, voluntary organisations. We provide them with all kind of information material, seminars, further training, video sessions etc just to keep their interest on top.

Results: We have reached about 5.000 people who work with our target groups. They have started activities among the target groups. For example among the young people 98 per cent of all schoolsfor 13-20 year olds have sex education including information on STD and aids. Our education and information support has started great activitis on the local plan among our target groups. There is also a great interest in getting more help and support from the project and the information centre.

W.E.P.1

STRUCTURE OF AMERICANS' KNOWLEDGE REGARDING TRANSMISSION OF HIV INFECTION: IMPLICATIONS FOR TARGETED EDUCATION

Soskolne, Varda, Schnell, DJ., Aral, SO., and Bowen, GS.
Centers for Disease Control, Atlanta, GA USA

Objective: To identify racial and ethnic differences in underlying basic conceptual components of knowledge regarding modes of HIV transmission.
Method: We analyzed responses of 17,696 adults to the AIDS Knowledge and Attitudes Supplement of the 1987 National Health Interview Survey, drawn from a nationally representative sample of households. Underlying components of knowledge about HIV transmission were identified separately for Blacks, Hispanics, and Whites, using principal components analysis.
Results: a) The proportion of correct responses was significantly higher for Whites than Hispanics and Blacks on some items, such as working near someone with AIDS (61%, 55%, 50%, respectively, $p<0.05$), and transmission via mosquitoes (36%, 26%, 24%, respectively, $p<0.05$) b) Despite differences in level of knowledge, similar underlying components, which accounted for the same proportion of total variability, were identified in all three groups. They were: general misconceptions of HIV transmission (explaining 31% of the variability), followed by very risky behaviors (13%), transmission via body fluids (9%), transmission via pets and mosquitoes (7%), and transmission without physical contact with a person with AIDS (7%).
Conclusions: 1) Areas in which Blacks and Hispanics have less knowledge than Whites should be addressed through content specific educational interventions targeted to these groups. 2) Future educational messages should be prepared in accordance with the basic conceptual structure underlying cognition of transmission.

W.E.P.2

AIDS ACTIVISM: A MEANS FOR PRODUCTIVE CHANGE TO PROMOTE CLINICAL RESEARCH AND DRUG DEVELOPMENT

William R. Bahlman, Veteran Gay and AIDS Activist, a founding member of the Lavender Hill Mob, the Lavender Hill Education Project and the AIDS Coalition To Unleash Power (ACT UP), U.S.A.

Objective. To explain the positive role individuals can play in defining issues and setting national research agendas to promote a speedier and more humane process to develop drug for the marketplace.
Methods. Through practical experience the presenter will explain the importance of careful development of positions, organizational teach-ins, informative leaflets and the carrying out of sensitive and creative actions. Sample copies of leaflets and press clippings will be made available to those attending this session.
Results. A number of specific victories and failures of AIDS Activists efforts will be discussed.

W.E.P.3

SIDA, SEXOLOGIE ET CULTURE EN AFRIQUE CENTRALE

Schoepf, Brooke G*, Rukarangira wN**, Payanzo N*** Walu E*.
* Projet CONNAISSIDA, Kinshasa, Zaire; ** Harvard School of Public Health, Boston, USA; *** Institut Pédagogique National, Kinshasa, Zaire.

Objectifs. Comprendre la construction culturelle du SIDA et ses rapports avec les pratiques sexuelles, la procréation, le mariage et croyances connexes afin de faire face aux contraintes de la prévention.
Méthodes. Observation-participante, entrevues en profondeur, histoires de vie, lectures bibliographiques, analyse de documents, recherche-action psychosociale.
Résultats. Des valeurs anciennes telle le désir de produire beaucoup d'enfants, des croyances telles les liens entre la sexualité, la santé et la procréation et le caractère des relations sociales entre hommes et femmes, rendent difficile l'emploi du condom parmi les couples stables dont une proportion significative est déjà séropositive.
Conclusion. L'ethnographie et la recherche-action qui associent les interessés à la résolution pratique des problèmes sont indispensables pour comprendre la portée du SIDA et limiter son extension dans la région. Elles démontrent la limitation des méthodes de prévention actuellement préconisées et suggèrent de nouvelles approches.
Mots clefs: sexologie, couples stables, prévention, méthodologie

W.E.P.4

LA SOCIETE SENEGALAISE FACE AU SIDA.

Barry, Martial*; Sy, A*; Sarr, I*; Fall, L*; Touré, O*; Ba, M*
*Unité de recherches épidémiologiques et statistiques. DAST/ Ministère du Plan et de la Coopération. Sénégal.

Objectif. Evaluer la compréhension du SIDA pour une prévention efficiente.
Méthodes. Enquête à Dakar et sa proche banlieue auprès d'un échantillon de 5000 US(15ans et plus)**. Les méthodes statistiques de traitement(SPSS) et d'analyse factorielle des correspondances ont été utilisées.
Extraits des résultats. *** 12,6 % de la population ont une bonne connaissance de la transmission du virus. Les mieux informés l'ont été par les journaux(32,2 % contre 7,2 % par la rumeur publique). Une bonne connaissance semble induire des comportements d'évitement du risque. Dans le groupe bien informé, 62,2 % ne s'exposent pas au danger contre 37,8 %, alors que pour les mal informés, les proportions sont de 56,3 % contre 43,7 %. Ces personnes, mal informés, sont peu disponibles au préservatif(84,9 %) et aux mesures préventives générales(51,7 %). Une bonne connaissance de la transmission est corrélée avec les catégories socio-professionnelles : 76,5 % des cadres moyens sont bien ou assez bien informés contre 32,5 % des sans profession.
Conclusion. L'enquête réalisée avant le lancement de la campagne nationale d'information montre que la population de la capitale est globalement mal informée. Les résultats de cette étude devraient permettre la mise en oeuvre d'une politique de prévention plus adaptée tenant compte des contraintes identifiées dans cette étude.
** erreur type réelle inférieure à 1 %. *** Niveau de signification = 5 %

W.E.P.5

TITRE : L'INFORMATION ET LA PREVENTION DU SIDA : ANALYSE COMPARATIVE DE DEUX PROGRAMMES NATIONAUX D'EDUCATION POUR LA SANTE EN AFRIQUE CENTRALE ET DE L'OUEST.

AUTEURS : Dr PETITGIRARD Anne* ; Mme CHAZE Simone* Dr DIOUF Ousmane** Dr SOMSE Pierre***
* HPS/ - OMS - GENEVE
** Directeur de l'Education Pour la Santé - SENGAL
*** Coordinateur Programme SIDA République Centrafricaine.

OBJECTIF. Comparer les programmes nationaux en identifiant les similitudes et différentes d'approche éducative et les résultats obtenus à la phase initiale, afin de proposer les principes directeurs méthodologiques par une action de mobilisation sociale en vue d'un changement de comportement.
METHODE. Analyse des choix de politique éducative en fonction des contextes socio-culturels, économiques et organisationnels de ces pays. Analyse des moyens globaux (par 1000 habitants adultes) et distribution par groupe cible et par structure organisatrice.
RESULTATS Avec des objectifs généraux similaires, on constate une grande différence d'approche entre les programmes d'information. La participation de tous les secteurs de planification explique ces différences et facilite la mise en oeuvre des programmes. L'information médiatique est toujours limitée par des résistances culturelles religieuses et institutionnelles. Elle ne permet la conscientisation et l'intégration, que renforcée par une stratégie de promotion de santé.
CONCLUSION C'est à partir de la mobilisation participative que, progressivement les activités I.E.C. s'intègrent dans les réseaux et services existants dans le secteur santé et, au delà dans les secteurs de développement et les réseaux actifs de la société

W.E.P.6

Computer Simulation as an Aid to Rational Problem Awareness.

Gonzalez, Jose J.*; Myrtveit, M.**; Vavik, L.**.
*ASA, Arendal, **Teachers College Stord, Rommetveit, Norway.

AIDS has given rise to unfamiliar problems. Knowledge of epidemiological facts and interrelations had become less important, for epidemics were supposed to have become a thing of the past, and have lost any importance they may once have had for modern society. The appearance of a sexually transmissible disease for which it is hardly likely there will be a cure or a vaccine in the near future came unexpectedly.

Using novel methods we address the crucial problem of educating the public in order to reduce the spread of HIV through behavior change and appropiated measures. It is now possible for any school to have a personal computer (PC). One has in this way access to data processing equipment which only 15 years ago would have served a whole university. The advantage of such computers is that they can rapidly process huge amounts of data and, if the user so decides, carry out simulations of complex situations. Our program, AIDS Information, Modification and Simulation (AIMS), is a user-friendly program for schools and (in an advanced version) for doctors and medical personnel. It offers geographical, demographic and epidemiological facts; the freedom to focus these facts in any way the user chooses; the means of representing them in plastic form; the chance to understand and explain to others their interrelations, and to represent concretely their abstract significance for individual behavior.

W.E.P.7 AIDS PREVENTION THROUGH OUTREACH EDUCATION IN PUBLIC SEX ENVIRONMENTS

Backstein, David M.F.C.C.; Dunn-Mota, R. M.P.H,
Santa Cruz AIDS Project, Santa Cruz, California, U.S.A

Objective. To prevent the spread of HIV infection among gay and bisexual men who engage in high risk sexual activity in public sex environments through a program of face-to-face education and condom distribution.

Methods. Volunteer field educators are recruited from the the cultural and social peer groups most at risk for HIV infection: previously married or nonidentified gay or bisexual men, gay men in alcoholic or other substance abuse recovery, ethnic minority gay men such as Latinos and blacks and college students familiar with bisexual communities. Trained extensively in AIDS prevention, outreach communication skills, and the sociological culture of clandestine male sex activity; these peer educators visit public sex environments on a regular basis and engage in individual education and distribute condoms. They gradually became accepted in this social milieu and serve both as resource people and role models. Educators document the number of contacts and evaluate effectiveness through self report of prevention techniques.

Results. Eight active peer educators have demonstrated a high degree of effectiveness by making 215 contacts during a six month period with high risk men, 93 % agreed to use condoms.

Table of Outreach Contacts	July- December, 1988
Total Contacts	215
Anglo	188
Black	8
Latino	24
Asian	5
Accepted Condoms	155
Named Safe Sex Methods	201
Percentage Demonstated Competency	0.93

Conclusion. Direct and face-to-face education among high risk groups in public sex environments proved to be an effective method for influencing behavioral change.

W.E.P.8 A MULTIDIMENSIONAL APPROACH TO PROMOTE AWARENESS OF AIDS IN THE GAMBIA.

Dibba Sekou , Ceesay Saihou of Medical and Health department, Cole Amie of Radio Gambia, George Theophilus of Book Production Unit, etl all of Banjul, The Gambia.

Objective : To promote individual and popular awareness of AIDS and the national AIDS situation as a prerequisite for the development of positive attitudes and responsible lifestyle. Also to create and enhance a climate favourable to enabling individuals and groups to gain access to factual information about the disease.

Method : The national health services programme, in collaboration with other organizations, undertakes arrangements to achieve the objectives reiterated above. A multidimensional approach has been employed. Some 40,000 leaflets have been printed and distributed to the public. About 200 health and extension agents have been orientated for specific tasks in the area of information and education. Radio programmes have been produced and transmitted in local languages. Other media and approaches developed and utilized include group contacts, films, schools, billboards, voluntary organizations, community leaders, nongovernmental organizations, and the local government system.

Since the information and education process was set in motion in 1986 public awareness of and interest in the AIDS situation has been gaining momentum. Uptake of condoms has increased, dialogue on the disease has bocome more noticeable at family level, work places, and other social settings.

W.E.P.9 TAKIN' IT TO THE STREETS: THE DYNAMICS OF COMMUNITY OUTREACH TO COMBAT AIDS

Biernacki,Patrick*; Broadhead, R.S.**
*Youth Environment Study, Inc., San Francisco, CA, USA,
**University of Connecticut, CT, USA.

Objectives. The central methodological problems are analyzed that street-based outreach workers face in accessing and working with IV drug users, their sexual partners, and prostitutes in combating the spread of AIDS. Outreach workers personally enter communities to work with persons on their own terms. To do so, outreach workers must come to recognize and understand what those terms are; they must be skilled in the methodology of ethnography. Central methodological problems include: (1) analyzing and mapping targeted client communities; (2) establishing a credible identity in situations that exhibit extreme distrust and suspicion of outsiders; (3) developing skills in directly approaching IV drug users and others; (4) learning to work in a nonjudgmental manner; (5) controlling the spread of information that can stigmatize clients and put them at great personal risk.

Methods. The analysis is based on one year's participant observation of several outreach teams as they interacted with clients, plus indepth interviews with outreach workers and their supervisors.

Results/Conclusions. Accumulating data strongly indicate that outreach workers are having tremendous success in contacting and working with clients in the community; they are exploding the pervasive myth that IV drug users per se are an extremely unreachable and uncooperative population. Data are also indicating that the most uncooperative and unreachable groups to work with in combating the epidemic are the competing professional and social/health agencies that make up the city's health care "system."

W.E.P.10 AIDS EDUCATION AND OUTREACH IN TORONTO BATH HOUSES

Bob Tivey - Community Health Officer, Department of Health, City of Toronto, ON, Canada

Objective: Many men at the Baths are considered hard to reach because they do not patronize Gay Bars and have no links to the Gay Community. This project involves educating these men who are Homosexual and Bisexual. Workshops include information on HIV, 'Safer Sex' practices, testing and counselling and assisting persons already infected with HIV to maintain a healthy lifestyle.

Method: A team consisting of staff from the Department of Public Health and Community Based Agencies enter each Bath House in the City and facilitate workshops for patrons. Presentation is followed by discussion and counselling. A questionnaire was filled out by patrons to assess their risk, sexual practices, knowledge level and seminar evaluation.

Results: Facilitators found that although 100% of participants were considered by facilitators at high risk for HIV infection, many were not well informed about AIDS and HIV transmission. A sizable portion of these men consider themselves bisexual and some are married and still living with their wives. Patrons said they felt more comfortable about talking about AIDS and negotiating 'Safer Sex' after sessions.

Conclusions: This type of program is very much needed on an ongoing basis. People need to hear messages repeatedly before they will consider to change behaviour. Men are more likely to change behaviour if they feel that 'Low Risk' sex is the norm. Being part of a discussion group helps with this process. There is no other way to reach this group of men. Although some of the men responded well to having a nurse (female) participate in these discussions, other men did not and avoided the presentation.

AUTEURS: *LAGUË, J., *THOMAS, R., *BASTIEN, R.,**DENIS, J.L.

" MTS BUSTERS" Réactions et pénétration de la population-cible à une intervention novatrice dans les bars.

*DSC Charles LeMoyne - **Université McGill, CANADA

DESCRIPTION DE L'INTERVENTION

Dans le cadre d'une campagne provinciale de sensibilisation sur les M.T.S. en novembre 1988, le DSC Charles LeMoyne a contacté 10 bars de son territoire pour leur proposer une intervention visant à sensibiliser leur clientèle au problème des M.T.S. et du SIDA. De courte durée, l'intervention avait comme caractéristique: 1. Analogie avec le film " Ghost Buster", 2. Intervention directe de 2 comédiens costumés, 3. Dramatique de 5 - 8 minutes, 4. Distribution d'information et d'un auto-test.

OBJECTIFS

Dans un but d'appréciation formative de l'intervention, nous voulons:
- apprécier l'impact médiatique de l'intervention,
- déterminer les canaux de diffusion de l'intervention (bars, médias, réseau social),
- apprécier le degré de rétention du message en fonction des différents canaux de diffusion,
- identifier les réactions de la population-cible à l'intervention.

MÉTHODE

Une échantillon représentatif de 300 répondants agés de 18 à 30 ans, résidant sur le territoire du DSC Charles LeMoyne, est sélectionné et les données sont obtenues par sondage téléphonique.

RÉSULTATS

Les résultats seront disponibles en avril 1989.

CONCLUSION

L'intérêt de cette démarche est d'évaluer jusqu'à quel point une intervention peu conventionnelle permet de rejoindre, de part son impact médiatique, une proportion importante de la population cible.

AUTEURS: LAGUË, J., THOMAS, R., BASTIEN, R., DENIS, J.L.

W.E.P.12 INTEGRATING AIDS EDUCATION RESEARCH INTO A DRUG TREATMENT PROGRAM

Phalen, Judith*, Lewis, B.*, McCusker, J.**, Morrison, C.**, Cameron, G.*
*Spectrum , Inc., Westboro, MA 01581, ** University of Massachusetts, Amherst, MA, U.S.A.

Objective: To assess the impact of implementing an HIV education research project in a drug treatment setting.

Methods: Clients entering inpatient detoxification are assigned to one of three randomly rotating educational interventions: 1) a two hour informational format while on Methadone, 2) a two hour informational format after withdrawal from Methadone, or 3)a 6 hour enhanced/skill building format. Data regarding AIDS knowledge, beliefs, attitudes and preventive behaviors are collected during treatment and at 3 and 6 month follow-up.

Results: Of eligibles, 62% enrolled in the study, 11% refused to participate; 85% report high-risk drug use practices and 90% report unprotected sexual practices. To date, 51% of participants completed the inpatient research protocol, 64% report using bleach in the previous 3 months, 70% report previous drug treatment. Issues related to implementation and coordination of research and clinical activities are: health educator/clinician dichotomy, hands-on-needle cleaning, focus on HIV antibody testing and informed consent and differing priorities of research and clinical teams.

Conclusion: The resolution of staff attitudes towards these issues has a major impact upon effective data collection and creating an enviornment which positively influences client attitudes about research with minimal disruption to the existing treatment program.

W.E.P.13

THE USE OF INDIGENOUS WORKERS FOR AIDS OUTREACH EDUCATION/PREVENTION

Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

Objective. To present issues and solutions for hiring and training indigenous outreach workers.
Methods. By anecdotal information gathered by informal survey with 58 sites around the USA in NIDA funded programs who have hired ex-addict indigenous outreach workers.
Results. The foundation of 58 NIDA funded outreach research demonstration projects rests on indigenous (ex-addicts) outreach workers to educate and motivate addicts who are not in treatment and their sexual partners to change at-risk AIDS behaviors. Because of their ex-addict backgrounds, these outreach workers present a unique challenge to program management in terms of (1) hiring; (2) supervision; and (3) training. In addition, program management must confront ethical issues because of exposure to workers of dangerous street situations, exposure to an atmosphere where the workers are vulnerable to relapse, and helping workers who contract AIDS because of past risky behaviors.
Conclusion. All programs hiring outreach workers need to be aware of these issues and develop policies and strategies which are specific to this population of employees. Suggestions include special attention to job descriptions, the interview and hiring process, time management, development of career ladders and management of staff confrontation and anger. Management should also be prepared to help staff develop writing and communication skills.

W.E.P.14

AN INFORMATION, EDUCATION WORKSHOP TO INCREASE CONDOM USE AMONG MALE BAR WORKERS IN BANGKOK

WERASIT SITTITRAI, RODDY RE*. Center for AIDS Research and Education, Bangkok, Thailand, *Family Health International, North Carolina, USA.

Objective- To evaluate a workshop for increasing condom use among men who work in bars and who are at risk for HIV infection.
Method- We conducted workshops in 3 bars and 2 bars served as controls. The workshop consisted of a play, a video of an interview with a Thai person with AIDS and an informal question and answer period. Free condoms and lubricants were provided in all study bars during the study. We compared knowledge about HIV infection, attitudes about condom use, reported condom use and sexual practices.
Results-

	Pre-workshop Survey		Post-workshop Survey	
	Exper.	Control	Exper.	Control
Knowledge Score, Mean(Range)	8.9(3-14)	8.6(3-14)	9.6(5-14)*	8.6(3-12)
Attitude Score, Mean(Range)	4.6(1-6)	4.1(0-6)	4.6(1-6)	4.4(1-6)
Customer used condoms	31%	37%	46%	57%
Bar worker asked customer to use a condom	55%	44%	67%	58%
Bar worker used condom	42%	37%	47%	62%**

*p=.03 pre- vs post-workshop in exper. group,p=.01 exper. vs control group post-workshop. **p=.02 pre- vs post- survey in control group.
Conclusion- The workshop was able to increase the knowledge about HIV infection but changed attitudes about condom use little. Unexpectedly, condom use increased more in the control than in the experimental group.

W.E.P.15

EDUCATION STRATEGIES FOR HEALTH CARE WORKERS AND PRISONERS IN WALES.

GEORGE, A M, WELSH OFFICE, CARDIFF, WALES AND GRIFFITHS C, WEST GLAMORGAN HEALTH AUTHORITY, SWANSEA, WALES UNITED KINGDOM

OBJECTIVE: To describe methods of providing regular updates of information on AIDS to two specifically targeted groups.

METHODS: (i) Health Professionals: a core team with expertise in epidemiology research, health promotion and nursing was established by professional organisations and a Government Department. The team visits each Health Authority on a regular basis at approximately six monthly intervals as a "road show". Health care workers from many disciplines attend.

(ii) The programme for prisoners is targeted at short-stay young offenders and long-stay adult prisoners. Issues covered are drug abuse, other sexually transmitted diseases and AIDS. The approach has recently been changed to target prisoners just prior to release so as to maximise the impact. This programme is run by a health promotion officer not a multi-disciplinary team.

RESULTS: Several thousand Health care workers have participated and demand continues to increase. This programme has run for 2 years, as has that for prisoners.

CONCLUSIONS: A small multi-disciplinary core team is an effective way of regularly updating health care workers. Prisoners require a more intimate approach and the use of a dedicated health promotion officer has been found effective.

W.E.P.16

LES SERVICES À DOMICILE: LA PERSONNE D'ABORD.

Bureau.Céline: Duranceau.A: Fortier.R:Gagnon.C:Lachance.J.
CLSC Métro (Centre local de services communautaires) Montréal. Québec. Canada

Les services à domicile. Le CLSC Métro est un organisme para-public qui offre des services de santé et des services sociaux courants à sa population. Le CLSC dispense un programme de services à domicile dans lequel les membres d'une équipe multidisciplinaire (auxiliaires familiales.ergothérapeute.infirmières.médecins.physiothérapeute et travailleurs sociaux) visitent des personnes ayant besoin d'aide dans leur milieu de vie. Actuellement. une vingtaine de sidéens requièrent ces services. Cette situation représente un défi à la fois personnel. professionnel et organisationnel.
Problèmes identifiés. Les personnes atteintes du SIDA font face à des problèmes d'ordre physique et psychosocial tandis que les intervenants pour leur part. vivent des situations nouvelles. parfois difficiles et stressantes. Cet état de fait demande des ajustements et réorganisations fonctionnels pour les équipes d'intervenants habitués à travailler à domicile avec une clientèle âgée ou handicapée.
Eléments du modèle d'intervention. Le modèle préconisé fait appel à divers éléments et ressources qui ensemble. contribuent à l'amélioration des conditions de vie des sidéens à domicile et à la qualité des services. Ces éléments sont:l'approche globale. les liens avec les ressources médicales et communautaires. la concertation de l'équipe. la formation et le financement.
Conclusion. C'est la personne d'abord. en tant qu'individu. qui est considérée dans l'approche et c'est la vie et non seulement la maladie qui détermine les interventions. Les six éléments du modèle d'intervention ne doivent pas être examinés séparément mais faisant partie d'un tout. Ils sont indispensables afin de relever le défi de façon optimale et afin de s'assurer d'une plus grande qualité de services auprès de la clientèle sidéenne.

W.E.P.17

EVALUATION OF AN EDUCATIONAL PROGRAM. KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR ABOUT AIDS IN THE 14TO20 AGE GROUP.

Böhm W.*, Heckmann W.**, Michel Sigrid***, Seyrer Y.****
Sen.f.Schulw.Berlin*,**BGA-AIDS-Zentrum , FEDERAL REPUBLIC OF GERMANY
spi.*WHO- Centre Paris, FRANCE

Objective:To assess the KNOWLEDGE, BELIEFS, ATTITUDES AND BEHAVIOUR of N=770 Students from a vocational schoolcenter in Berlin-W. They are involved in a special schoolprogram to inform on AIDS by special trained physicians or biology teachers.
Methods: Knowledge about transmission, risk factors, use of condoms, attitudes, beliefs and former sexual education were collected by a questionaire with standardised and open questions before(n=770), four weeks(n=572) and six month(Sept.88) after(n=431) the lessons.
Results: After six month there was a higher acceptance of using condoms, and still very high level of information about ways of transmission and risk factors. Coping with fear, confidence, stable partnership, communication and the competence of using condoms are most important factors to prevent HIV-Infection. Only 11% proposed instead of enlightenment, measures of repressive control. Although >90% of the students had sexual education <2% had learned to speak about feelings and emotions related to sexuality. Students would not isolate HIV+persons.
Conclusions: Six months after the AIDS information lesson students still have a high level of AIDS related information and competence. They are interested in more lessons about sexuality and partnership, and about AIDS as a social problem. The approach of 'personal prevention' is a necessary measure, which is closing the gap between the preventive information given by the mass media('medial prevention') and the necessary preventive acting of adolescents.

W.E.P.18

SCHOOL AND COMMUNITY PARTNERSHIP IN AIDS EDUCATION

MARK J. ASKEW, Chairman, AIDS Education Task Force, Sydney Catholic Education Office, Sydney, Australia.

OBJECTIVE: To develop and implement a comprehensive education program, teaching knowledge, skills and values about AIDS for students aged 5 to 18 years in a large school system, and through teacher education and school-based parent meetings, to reach out to the wider community with AIDS education.
METHODS: During 1987 a comprehensive teaching kit consisting of print and audio visual materials was produced to teach,both about HIV infection, and love and care for people with AIDS.It is an across-the-curriculum approach which not only provides knowledge about AIDS, but also teaches skills (eg communication, decision-making, assertiveness) and values (eg love, respect for human dignity, compassion,hope) in response to the AIDS crisis. In early 1988 implementation of the program began,after a series of intensive 4 hour teacher education sessions ensured that every school had at least one member of staff trained to use the kit to educate other staff, parents, community members and students.
RESULTS: Over 90% of the 200 Sydney Catholic schools began AIDS education using the kit in 1988 for activities including teacher education, community meetings and intergrating AIDS education for students into all relevent areas of the curriculum. The success of elementary schools was particularly impressive. There is continuing widespread interest from other school systems and health educators in the teaching kit.
CONCLUSION: Successful knowledge, skills and values education programs about AIDS are essential.Schools can provide AIDS education for the community.

W.E.P.19 KNOWLEDGE AND ATTITUDES OF ITALIAN YOUTH ABOUT AIDS

Carducci, Annalaura; Frasca, M.; Matteelli, G.; Calamusa, A.; Bendinelli, M.; Avio, C.M.
Dpt of Biomedicine, University of Pisa, Pisa, Italy.

Objective. To evaluate the effects of educational campaigns about AIDS on the awareness and the perception of the problem by the youth.
Methods. A self compiled anonymous questionnaire was administered to 3300 Navy recruits and to 2437 high school students from the city of Pisa.
Results. Fifty percent indicated newspapers and 56% television as major sources of information, only 16% the school. The information provided was judged sufficient and mostly true, useful and clear; nevertheless most people (90%) requested further information mainly from doctors. On the whole, knowledge about the etiological agent, mode of transmission and risk-taking behaviours was satisfactory, while clinical symptoms, vehicles of infection and preventive measures appeared less well known. There were, however, marked differences depending on education level and area of residence: youth from Northern and Central Italy with upper instruction showed a more precise perception of the AIDS problem. Concerning psychological reactions, 40% declared some impact on their social life, but there were again considerable differences among different groups.
Conclusions. The study has pointed out gaps in knowledge about AIDS, mainly in less cultured subjects, as well as some negative psychological reactions. Moreover, it has indicated the need of systematically evaluating the results of educational campaigns in order to correct possible errors in information strategies.

W.E.P.21 PEDIATRIC AIDS SOURCEBOOK

Allbritten, Dorothy J.
National Association of Children's Hospitals and Related Institutions, Alexandria, Virginia, USA

Objective To assist hospital and community-based agencies in planning programs of care for children with AIDS and HIV infections.
Methods Nineteen programs in areas of high incidence of HIV infection providing pediatric care were identified and surveyed. A review of literature and interviews were conducted. Information was then assembled, documented and disseminated.
Results The sourcebook is a compendium of current principles, plans and interdisciplinary programs that may be used as models of comprehensive care for children in primary, secondary and tertiary health care settings.
Conclusion Many programs provide care in a variety of ways to HIV infected children. Common factors found include an interdisciplinary team working in a coordinated effort to provide comprehensive, child-centered, family-focused intervention to meet the complex needs of these special children and their families.

W.E.P.23 AIDS INFORMATION IN FRENCH SCHOOLS : AN EXPERIENCE AND A SOCIOLOGICAL VIEW

Deniaud, François* ; Kalamaridès, M.** ; Crespin, S.** ; Livrozet, C.** ; Moreaux, D.*** ; Delamater, A. et al.
* Unité d'Oncologie Virale, Institut Pasteur, Paris, France.
** Santé scolaire du Rectorat de Paris, France.
*** Santé scolaire du Rectorat de Créteil, France.

Objective. To evaluate an AIDS information model for youth at school.
Methods. During the school year 1987-88, 6500 students from Paris and suburbs, from 13 to 25 years old received a pilot information. This model was personalized, supported visually by video & slides and thematic but non-formal, e.g. suggesting questions and dialogues among the classes. 1707 open questionnaires have been answered : 1512 by students who followed the information [mean age = 18 ; sex ratio M/F = 1/3], 195 by "control" students [mean age = 18 ; sex ratio = 3/5].
Results. 1/ The information model improved the students recognition of risks related to the frequent change of sex partners. 2/ It convinced them that condoms are efficient if of good quality and used correctly. 3/ However, the model did not change their intention (74% in both groups) of using one in a "one-night stand with an unknown partner", as described in the questionnaire. 4/ A new meaning to condom use is evolving : altruism and mutual respect of each partner.
Conclusion. This information model improves the global understanding of AIDS among the students. Without knowing if they will lead to a new behavior, some intentions expressed are encouraging : to refrain from one-night stands ; to use a condom also for contraception and to protect the partner whenever there is a doubt about one's own sexual history.

W.E.P.20 PREPARING TEACHERS FOR ADOLESCENT AIDS PREVENTION EDUCATION: YEAR TWO OF THE MASSACHUSETTS TEAM TRAINING DESIGN

Davoli, Gerald W.*; Cranston, K.* and Rosenfeld, S.**
*Massachusetts Department of Education, United States
** Massachusetts Department of Public Health, United States

Objective: To describe the effectiveness of a split three day teacher training on 1) their knowledge and attitudes related to AIDS, 2) their confidence for doing AIDS education, and 3) the impact of utilizing a Person With AIDS (PWA) in the team training design.
Methods: Fifty-three school districts participated. Changes in knowledge, attitude and confidence levels were measured by pre- post-testing. Subjective feedback forms measured the effectiveness and utility of the training activities. The initial two day training included basic AIDS information, health behavior change strategies, affective education techniques, human sexuality, and interaction with a PWA. The third day, held 6-8 weeks later, covered grades K-12 learning activities, parent education strategies, and an opportunity to report on the process and progress of their AIDS education efforts within their respective schools and districts.
Results: A total of 220 faculty were trained. Statistically significant gains were found regarding teacher comfort levels for working with HIV+ and AIDS diagnosed students and co-workers, answering questions about HIV transmission, and teaching about AIDS. Regarding the training activities, interacting with a PWA received the highest ranking for personal impact.
Conclusions: The split three day training design, and interacting with a PWA, has proven an effective methodology for increasing AIDS related knowledge and confidence levels for teaching about AIDS and preventing HIV infection.

W.E.P.22 KNOWLEDGE AND ATTITUDE TO AIDS SHOWN BY UGANDAN SCHOOLCHILDREN, BASED ON A NATION-WIDE POSTER COMPETITION

Mueller, Olaf**; Lubega, J.*; Senoga, J.*.
**League of Red Cross and Red Crescent Societies, Geneva, Switzerland; *Uganda Red Cross Society, Kampala, Uganda.

Objective. To determine the knowledge and attitudes of youth in Uganda concerning AIDS-prevention and -patient care after one years education campaign in the country.
Methods. On I. I2. I988, World AIDS Day, Uganda Red Cross carried out a nationwide AIDS poster competition on the themes of AIDS-prevention and -patient care. The contents of the posters have been evaluated.
Results. Out of 6 major cities in Uganda, I8 schools contributed 97 posters. The median age of participants was I4 ys. 85% mainly described AIDS-prevention as keeping to one partner, whereas only 3% emphasized the use of condoms. I2% insisted mainly on the use of sterile instruments. I00% of the children promoted the importance of caring for AIDS patients, emphasizing close relation, good food and medical care. The main problem, in 6%, was that the carrierstate of HIV infection was not fully understood.
Conclusion. The poster contents reflect the current state of the AIDS education program in urban Uganda. Schoolchildren have good knowledge and a positive attitude about AIDS.

W.E.P.24 AN HIV/AIDS EDUCATION AND TRAINING PROGRAM FOR LAW ENFORCEMENT OFFICERS

Mindell, William*; Yaffe, B.*; Federico, M.**; Hancock, D.**
*City of Toronto Department of Public Health, Toronto, Ontario, Canada.
**Metropolitan Toronto Police, Toronto, Ontario, Canada.

Objective. To give police officers sufficient understanding of HIV transmission and prevention for them to operate confidently and appropriately.
Methods. A 10-minute training video and 35-minute teaching program were developed by police and public health officials for use in an established decentralized police training format. Each session was conducted jointly by a Police Training Sgt. (PTS) and a public health unit educator (PHUE).
Results. From January to June 1988 all uniformed officers (>5800) of the Metro Toronto Police underwent the HIV/AIDS training module. Each of the six municipal public health units participated in the sessions conducted within their jurisdiction of the metropolitan area covered by the police. New police procedures were developed within the context of a comprehensive Police Dept. Training Precis on Infection Control and the Metro Toronto Corporate Policy on AIDS. Procedures and policies were reviewed by the PTS while the PHUE covered the curriculum on AIDS; both could then respond to questions. Prior to the implementation of this program there were numerous complaints from officers about possible HIV exposures and some community incidents. Following implementation there have been no complaints or criticism inside the Force or from the community, and appropriate records of contact have been maintained when blood-related incidents involving officers have occurred.
Conclusion. A highly organized and cooperative effort between local law enforcement and public health authorities has resulted in a decentralized HIV/AIDS training program that is concise and effective.

W.E.P.25

IMPLEMENTING A MANDATED CURRICULUM

Bacon, Marion, McConnell, Wee, Hyne, L. Craven A, TV Ontario, CANADA

Objective To provide Ontario teachers with strategies and resources to deliver a mandated curriculum in AIDS Education.

Method TVOntario in co-operation with the Ministries of Health and Education applied a trainer of trainers model to address AIDS education. Eight teachers, regionally located were released from their teaching positions and were trained to deliver television-based workshops to persons teaching the curriculum. Nine additional teachers were trained to meet the demand for workshop requests. Video materials were reviewed, acquired and distributed to every school board. Parent information nights provided a link with home. Strategies that focused on attitudes, values and behaviour were piloted, revised and refined. Costs for teaching and distribution of video and print materials were covered by a grant of 1.2 million from the provincial government.

Results In total 331 workshops were delivered from January 1988 to June 1988. 13,083 teachers, public health nurses and parents were trained. A series was produced for parents and elementary and secondary teachers. Four additional videos were acquired and distributed for class use. Three teacher guides were developed and distributed. A survey conducted by the Ministry of Education which measured success of implementation ranked TVOntario's activities first in staff development.

Conclusion The trainer of trainers model was successful in delivering the strategies, video and print support necessary to implement a mandated curriculum. The model could be adjusted to various situations or educational settings with similar results.

W.E.P.27

WORLD AIDS DAY THE LAUNCHING OF AN EXTENDED AIDS PREVENTION PROJECT

F Aeberhard**, D Jayle*, J Lebas **, D Rayon*, C REYNAUD* et al
* APS Association pour la Prevention du SIDA **MDM Medecins du Monde, Paris, FRANCE

Objectives 1) To combine the experiences in AIDS prevention among youth of 2 associations (APS AIDS Prevention Association and MDM Medecins du Monde) in order to asses their impact and the potential for extending such activities throughout the country 2) To evaluate the impact of the World AIDS day activities organized by these associations and the demand for further, similar programs

Methods For the past 2 years APS has created through AIDS education training programs a network of AIDS educators throughout France, the majority of whom are involved with youth (teachers, school nurses or doctors, youth workers) APS has been supported in part by the Mutualite Francaise, a federation of insurance companies which has financed the development of training materials as well as some training programs for AIDS educators nation-wide MDM, a large French organization which carries out worldwide public health and emergency relief actions, has run several free/anonymous HIV testing centers in France.
A partnership between the 2 associations was formed to launch a joint AIDS prevention project which would facilitate an intensification of AIDS prevention efforts for youth throughout the country. The project was designed to start on Dec 1 1988, the first international World AIDS DAY. Prior to this day, members of each association were contacted in order to solicit their interest in participating in World AIDS DAY and in continuing to be active with this coalition by expanding and modifying their AIDS prevention activities in 1989. Over 300 activities ("Points d'infotmation SIDA") were organized nation-wide. Following the activities on World AIDS Day, a questionnaire was distributed to all those participating in the organisation of the different "information points". The evaluation was designed to document 1) the sorts of actions organized, 2) the number, profile, and reactions of those persons reached by the activities, and 3) to measure the level of interest among those participating in continuing and expanding their actions in 1989.

Conclusion Treatment of the questionnaire is in process. The results will be used to assist in designing regional AIDS educator training programs which will be implemented throughout the country, starting in May 1989.

W.E.P.29

READABILITY ANALYSIS OF AIDS BROCHURES AND PAMPHLETS FROM THE UNITED STATES

James A. Wells PhD*, Randall L. Sell MA*, Amy Will BS*, Portia DeFilippes BS*
* Project HOPE Center for Health Affairs, Washington, DC, USA.

Objective: To assess the readability of a representative sample of AIDS educational materials from the United States.

Methods: The researchers selected a random sample of brochures, cards, and inserts (N = 104) and pamphlets, books, and monographs (N = 41) from the AIDS Information Resources Directory (American Foundation for AIDS Research, 1988). Raters sampled 30 sentences, counted the number of polysyllabic words (> 2 syllables), and graded readability using the method of McCaughlin (SMOG Index). Grade equivalent reading level, representing the requisite level for 100% comprehension, is calculated as 3.1291 + 1.0430[SQRT(# polysyllabic words)].

Results: Preliminary results based on 57 brochures show the following grade level distribution:

	Grade Equivalent Readability Level									
	Middle/Jr. High				High School			College		
Grade	6	7	8	9	10	11	12	13	14	15
%	2%	11%	9%	7%	18%	25%	19%	5%	4%	2%
Cum %	2%	12%	21%	28%	46%	70%	90%	95%	98%	100%

They show that 72% of brochures are at a grade equivalent of 10th grade or above and 10% are at a grade equivalent beyond high school. Mean grade levels by target group are: minorities (10.2); adolescents, students (9.0); drug users (10.0); gay, bisexual men (11.7); HIV test takers, HIV positive (13.4); sexually active adults (9.9); and other (11.4). Differences are statistically significant (F = 4.42, df = 6,50, p < .001)).

Conclusion: Reading levels of many brochures are inappropriately high. This is especially true of materials prepared for those taking the HIV antibody test. Steps should be taken to make brochures more comprehensible to a wider audience.

W.E.P.26

AIDS GRADUATE EDUCATION EIGHT SEMESTERS EXPERIENCE IN TEACHING AN ADVANCED, INTERDISCIPLINARY COURSE ON AIDS

Schmidt, Robert M.
Center for Preventive Medicine and Health Research, San Francisco State University and Pacific Presbyterian Medical Center, San Francisco, CA, USA

Objective To integrate HIV/AIDS education into the permanent, regular curriculum of a major university

Methods An interdisciplinary, advanced undergraduate/graduate course on HIV/AIDS was designed and approved as an experimental course in January 1985 at San Francisco State University. Initially, a 700 page book of reprints was developed, since no "text" was available. From the beginning, the course was designed to allow a student, even without a science background, to understand the epidemiology, etiology, pathology, molecular biology, diagnostic tests, laboratory, and clinical manifestations of AIDS-associated diseases vis-a-vis normal immune function. The course also includes treatment, prevention, education (with emphasis on the community), ethical, legal, psychosocial, blood transfusion and public health issues. Students write AIDS research papers.

Results Eight AIDS courses have been taught. The SFSU course is thought to be the first AIDS course in the United States offered for credit (letter grade) in the regular curriculum of a major university. Many course participants have become full- or part-time AIDS educators. Pre-health professions students are educated and sensitized to AIDS issues prior to attending one of the 70 medical schools accepting our students each year. Students also educate their peers.

Conclusion It is recommended that AIDS education be integrated into the regular, "for-credit" curriculum of colleges and universities. Such courses allow students to develop an interdisciplinary approach to the understanding of the AIDS epidemic which can be applied as a paradigm to any disease state.

W.E.P.28

WORLD AIDS DAY - SOUTH AFRICA

Sher, Ruben*; Christie, G*; Lazayokwe,M*; Padayachee,G.N**.
*AIDS Training and Information Centre, South African Institute for Medical Research, Johannesburg, South Africa, **City Health Department, Johannesburg, South Africa.

OBJECTIVE. To design and execute World AIDS Day in a country with varying population groups, cultures and levels of education.

METHOD. Careful consideration was taken of cultural variables, channels of communication, existing awareness of AIDS, political, religious and social ideologies. The following activities formed part of World AIDS Day: 1) Media coverage (television, radio, newspapers, magazines), 2) Posters and pamphlets 3) AIDS slogans on taxis, buses and private vehicles, 4) awareness programmes using audio-visual material were held at corporations and schools, 5) promotion of songs, 6) taped music in black taxis carrying educational messages about AIDS, 7) puppet shows, 8) a symposium, 9) a music concert, and 10) mobile units set up in the streets as a source of information.

RESULTS. The use of multiple and novel means of educating the general public resulted in a greater awareness in the lay public in both urban and rural areas. It also motivated many volunteers to come forward to be trained as educators. Numerous phone calls and requests for more literature and information on AIDS was experienced.

CONCLUSION. The success of the World AIDS Day programme revealed that cross-cultural knowledge and understanding is essential for AIDS education. Although there has been greater demand for condoms it is difficult to assess whether a change in sexual behaviour has occurred.

W.E.P.30

TRENDS IN CONDOM PROMOTION STRATEGIES FOR HIV PREVENTION: PRACTICAL CONCEPTS FOR CONSIDERATION

Saunders, Susan G.*; Smith, W.A.*; Ramah, M.**; Levy, D.***
* AIDSCOM Project: The Academy for Educational Development, Washington, D.C.; ** AIDSCOM: Porter/Novelli; ***SOMARC Project: The Academy for Educational Development, Washington, D.C., U.S.A.

Objective. To explore new venues for condom promotion not used by family planners and health educators. For example, when is being provactive helpful? What is the role of fear in appeals? What are strategies for managing the explicit nature of the subject matter without alienating policy makers, target audiences, and the general public.

Methods. Systematic review of condom promotion concepts and messages media by type of audience and media channel being conducted. Delineation of the basic concepts in condom promotion are highlighted with examples from around the world. Creative strategies to reach audiences and overcome communication obstacles receive special attention.

Results. Condom promotion strategies have changed in the past four years with an increasing number of appeals to more distinct target audiences. Regional variations in socio-cultures contexts and the level of HIV infection have a direct impact on type of promotion strategies used.

Conclusion. Two types of condom campaigns may be called for. The first one will set the stage and the second to communicate the real message.

W.E.P.31

AIDS INFORMATION AT THE NATIONAL CENTER FOR HEALTH STATISTICS

Wilson, R. and Hardy, Ann M., National Center for Health Statistics, Hyattsville, MD, United States.

Objective. To provide information on AIDS data available from the data collection systems of the National Center for Health Statistics (NCHS)
Methods. Data sets were reviewed and summarized.
Results. The following is a preliminary summary of available data:

Data Set/Survey	Type of Data	Time Period
1. Health Interview Survey (HIS)	Knowledge, attitudes	1987-88
2. Health and Nutrition Examination Survey (HANES)	HIV seroprevalence	1988-93
3. Household HIV Serosurvey	HIV seroprevalence	1988-1989
4. Hospital Discharge Survey	Hospital utilization	since 1965
5. Mortality Data	AIDS, HIV-related deaths	HIV ICD-9 codes (1987)
6. Mortality Follow-back Survey	Health care utilization in last year of life	1986
7. Survey of Family Growth	Female sexual behavior	1988
8. Maternal and Infant Health Survey	HIV antibody status during pregnancy	1988

NCHS publications and survey instruments/data forms will be displayed.
Conclusion. Making others aware of AIDS data available from NCHS will prevent duplication of effort and will allow analyses by a variety of researchers and techniques. Sharing data forms will promote consistency in data collection and allow for direct comparisons between studies.

W.E.P.32

DOCAIDS : UN SYSTEME DOCUMENTAIRE VIH-SIDA

Vanderveken, Mark*; Bury, J.A.*; Jayle, D.**; Pluskwa, D.**; Spoiden, A.*; Bertrand, M.A.*
* Université Catholique de Louvain, Bruxelles, Belgique
** Centre Régional d'Information et de Prévention du SIDA, Paris, France

Objectif. Créer des outils documentaires spécialement conçus pour le traitement de l'information couvrant l'ensemble des domaines des infections à VIH.
Méthodes. Pour combler la lacune existante au niveau international, un thésaurus VIH-SIDA, défini par la norme ISO 2788, a été conçu en tenant compte des langages documentaires existants dans les institutions participantes et des expériences développées dans le traitement des informations, l'analyse des questions et le service des réponses aux usagers. Il est complété par un classement thématique afin d'organiser la documentation tant pour le rangement en bibliothèque que pour la publication d'un bulletin signalétique. La traduction anglaise et espagnole est en cours.
Résultats. Le thésaurus d'environ 480 descripteurs et 120 non-descripteurs, associés par des relations d'équivalence, de hiérarchie ou d'association, est destiné aux services de documentation, aux producteurs de base de données documentaires, aux chercheurs, gestionnaires, planificateurs et au public intéressé. Le classement thématique est divisé en 12 grandes rubriques :

00. Ouvrages généraux
01. Géographie et Politique
02. Organismes
03. Réglementations
04. Ethique
05. Economie
06. Psycho-social
07. Santé publique
08. Information
09. Virologie
10. Immunologie
11. Clinique

Conclusion. Le système DOCAIDS permet l'indexation et la recherche des documents VIH-SIDA, en facilite la diffusion locale et internationale et couvre largement les aspects non-médicaux des infections à VIH et du SIDA.

W.E.P.33

EVALUATION OF THE PREVENTION COMPONENTS IN THE MTP'S OF COSTA RICA, PANAMA, TRINIDAD AND TOBAGO AND URUGUAY.

Bond, Lydia, Longshore, D., St. John R., and Zacarias, F., AIDS Program, Pan American Health Organization, WHO Regional Office for the Americas, Washington, D.C., U.S.A.

Objective. The purpose of this study is to assess the extent to which the prevention strategies outlined in four countries' medium-term programs have been implemented to minimize transmission of the human immunodeficiency virus. These strategies encompass the prevention of sexual transmission, the prevention of transmission through blood, and the prevention of perinatal transmission.
Methodology: The approach selected will be a combined quantitative-qualitative methodology, using the same evaluation indicators for each country studied.
Results: In the study period, preventive educational activities were carried out in health centers, hospitals, STD clinics, maternity clinics, schools, and community organizations. Various AIDS education materials were printed, distributed, and used; blood and blood product supplies were secured, adequate production standards and accessibility of condoms were ensured, and sterile injecting equipment was distributed. In addition, counseling training programs were established and implemented in conjunction with blood testing and several types of personnel were trained in health promotion.
Conclusion: Prevention efforts in the countries studied were implemented with varying degrees of efficiency. Monitoring evaluation was useful because it permitted the improvement of existing prevention programs.

W.E.P.34

EFFECTING ATTITUDE AND BEHAVIOR CHANGES IN REGARD TO HIV INFECTION

Auleb, Ann*; Dundas, E.*
*San Francisco State University, San Francisco, California, United States

Objective. To examine the effectiveness of the use of personal contact with a peer infected by HIV in conjunction with the use of personal history films of HIV infected individuals in effecting attitude and behavior changes in regard to HIV transmission.
Methods: Students in two university level human sexuality classes were introduced to a fellow student as a speaker on sexual orientation. His HIV positive antibody status was not disclosed until two weeks later when a film about him was presented in class and he returned to speak about his experiences. A second film, about a young mother with AIDS was then shown. Three additional lectures were given on AIDS. Students were asked to write reactions to each of 20 films shown during the semester and to write about the one that had the most impact on their lives.
Results: Students voluntarily disclosed the following:
Increase in AIDS knowledge: 5% ; Increase in knowledge about HIV transmission prevention: 18%; Increase in concern for individuals with HIV infection: 71%; Realization that they now know someone with HIV infection: 43%; Increased perception of personal vulnerability: 51%; Current risk reduced behavior reinforced: 6%; Decided to change behavior: 38%; Implementation of risk reduction behavior: 30%
Discussion: Previous research at San Francisco State University showed a high degree of student knowledge about AIDS and HIV transmission, but few felt personally vulnerable or were using condoms consistently. It is believed that behavior change requires a perception of vulnerability, the decision/change and implemetation of change. Use of methods that evoke an empathetic response can be effective in modifying attitudes and behavior.

W.E.P.35

AVOIDING AIDS: PREVENTING AIDS WHILE PRESERVING SEX.

E. Bargai* and Ronny A. Shtarkshall**.
*Unit of Sex Education, Ministy of Education and Culture of the State if Israel, **Dept. of Social Medicine, The Hebrew University and Hdassah, Faculty of Medicine, Jerusalem, Israel.

The principles and implementation of a program to reduce the risk of HIV infection among a general population of adolescents, within sex education (SE) is presented, together with a demonstration of training educators to carry it out. The program is aimed at the adolescent population of a country with a medium prevalence of HIV infection and a "North American" mode of transmissinn.
The integration of HIV risk reduction into SE is based on three assumptions: 1. Adolescents are a vulnerable population; 2. for the large majority of adolescents the relevant issues are those concerning sexual transmission; and, 3. in most cases, the risk of HIV infection is mostly under the control of individuals.
The educational intervention is based on the principles of experiential learning, empowering, and the joining of the rational and the emotional in determining one's lifestyle and behavior.
The objectives of the program are four: 1. To reduce risky behaviors and to promote healthy ones among adolescents; 2. to reduce irrational fears of AIDS that may damage the development of sexual behavior, while not contributing to the reduction of HIV infection; 3. to confront persecutory attitudes toward people who are either seropositive for HIV or people with AIDS; and 4. to help people deal with their emotions when confronted with AIDS in their environmet. The main sections of the program are: 1. Knowledge Is Power: Learning through action the facts about AIDS, 2. The Power of Communication: Talking and deciding instead of doing and regretting; 3. Take Your Life In Your Own Hands: Decisions and their Implications; 4. AIDS in our midst; and, 5. Evaluating instruments.

W.E.P.36

AIDS EDUCATION FOR ADOLESCENTS: WHO RESPONDS?

Brown, Larry, M.D., Barone, V., Ph.D., Fritz, G., M.D.
Rhode Island Hospital/Brown University
Providence, Rhode Island, U.S.A.

Objective. To determine which student variables are most closely associated with intention to behave safely following public school AIDS education.
Methods. A sample of 1800 students were studied before and after AIDS education to determine the level of knowledge, AIDS related attitudes, and prior risk-taking behavior. An ANOVA, a multiple regression analysis, and the Scheffe Test between contrasting subgroups, were used to explore the relationship between these variables and the students' intention towards future safe behaviors.
Results. The variables studied were found to account for 31% of the variance in intention toward future behavior ($F=10.5$, $p<.0001$). A subgroup particularly responsive to the education were junior high school girls with high changes in knowledge and fear of AIDS (Scheffe Test, $p<.001$).
Conclusion. Age, sex, changes is knowledge and attitudes, and prior risk-taking behavior account for much of the differential impact of AIDS education in adolescents.

W.E.P.37

STRATEGIES POUR UN PROGRAMME D EDUCATION POUR MINEURS INTERNES

Camargo Irani*, Cecchini, G.*, Casillas, V.*, Paiva, S.*, Fernandes, M.E.**; Abbud, N.**.
*FEBEM - Fundação Estadual do Bem Estar do Menor, S Paulo, Brésil
**Centro de Referência e Treinamento de AIDS, S Paulo, Brésil

Objectif. Diminuer l'impact global du SIDA entre les mineurs internés. Le but est d'atteindre 30.000 mineurs par an, la majorité desquels venus de familles désagrégés et précocement introduits aux drogues et à la vie sexuelle.
Méthodes Entraînement et capacitation des fonctionaires et d'agents multiplicateurs ayant pour but l'orientation des mineurs. Exposition en salle de classe, vidéos, débats, compétitions.
Résultats. a) le programme a capacité 1280 fonctionaires et 68 agents multiplicateurs, lesquels sont chargés de repasser les renseignements aux mineurs. b) les fonctionaires et les mineurs ont produit des matériaux d'information (pièces de theatres, chansons et affiches). c) les tensions et les préjuges ont diminué. d) émergence de la cooperation et de la solidarité.
Conclusions. a) les méthodes doivent être créatives, pour stimuler la population envisagée. b) dûment stimulée, cette population est capable de créer les matériaux adaptés à ses pairs.

W.E.P.38

PARENTAL VIEWPOINTS ON AIDS EDUCATION IN THE PUBLIC SCHOOLS OF COPENHAGEN

Lindholm, Merete; Hansen, B.
The Municipal School System of Copenhagen, Denmark.

Objective. To acquire knowledge of the parents' points of view concerning the AIDS education given by the teachers in the primary and lower secondary schools in Copenhagen.
Since it is very important to continue the AIDS education in the School System, it is essential for teachers to consider the opinions of parents and to incorporate their viewpoints in the future planning.

Methods. Questionnaire investigation among the parents of 3,000 pupils in the 2nd, 5th and 9th forms.

Results and conclusions. The investigation is ongoing and the summary of results and conclusions will be presented in Montreal in June 1989.

W.E.P.39

RESEARCHING RELEVANT AIDS EDUCATION MATERIAL FOR YOUNG PEOPLE

O'Sullivan, Anna and Gillies, Pamela
University of Nottingham, **UNITED KINGDOM**

Objective. To describe a technique for researching and developing relevant, effective comic material for use with teenagers and young adults.
Method. Volunteer groups of young people from schools, youth clubs and youth training centres were selected. In-depth group interviews about HIV transmission and AIDS were conducted by a researcher and graphic artist. Ideas for content of comic were discussed; real-life stories included; language considered and characters drawn during the course of discussion. A pilot comic was then designed and presented to the groups, who were asked to write comments on the actual copy on an individual basis (N = 75).
Results. Young people involved in producing the comic felt it was interesting, used appropriate language and clarified how HIV could be caught as well as informing about precautions which could be taken. The stories engaged the emotions and the humour was appreciated. Scientific evaluation has shown that the comic has a significant impact upon knowledge.
Conclusion. Young people can be used effectively in the process of the writing and development of AIDS education materials.

W.E.P.40

AIDS EDUCATION FOR YOUTH - A RANDOMISED CONTROLLED TRIAL

Bellingham, Kathy and Gillies, Pamela
University of Nottingham, UNITED KINGDOM

Objective. To evaluate the impact of an AIDS education comic on the knowledge, attitudes, sexual behaviour and intentions of 16-19 year olds.
Methods. Six youth training centres in Nottingham were randomly allocated to experimental and control conditions. 162 trainees were allocated to the experimental group and 161 to the control. Data were collected prior to use of the comic and 2 weeks after use via a self-completed questionnaire.
Results. There were no differences between groups pre-test and no differences by sex. The experimental group had a significantly higher level of knowledge compared with the control post-test.
Mean knowledge scores by group

	PRE-TEST					POST-TEST			
	$\bar{X}$ score (max=33)	SD	t	p	df	$\bar{X}$ score	SD	t	p
Experimental (N = 121)	23.89	5.22	-1.39	Not Sig.	238	27.40	5.11	2.98	<0.01
Control (N = 119)	24.76	4.43				25.53	4.58		

Significantly more experimental than control trainees knew at post-test that you could contract HIV from anal sex ($p<0.001$) and that HIV entered the body through broken skin ($p<0.01$). In addition, twice as many experimental (55%) as control (25%; $p<0.001$) trainees at post-test were aware that a cure for AIDS was unlikely in the near future. The comic had little effect upon attitudes and no effect upon sexual behaviour or intentions.
Conclusion. This comic can significantly improve young adults' knowledge of HIV transmission in the short-term.

W.E.P.41

W.E.P.42

AN INSTRUCTIONAL PROGRAM ON AIDS AWARENESS AND PREVENTION IN THE HIGH SCHOOL.

Murray Newell * and *Françoise Caron* **
Science Department Head, LeMoyne d'Iberville High School, Longueuil, Quebec, Canada.
**Nurse, CLSC Longueuil Ouest, Longueuil, Quebec, Canada*

Objective: *To develop a model educational program on AIDS awareness and prevention.*
Methods: 1. The target population was all secondary 3 students (ages 14-15). The instructional material was integrated into the compulsory curriculum courses of human biology and MRE (moral and religious education).
2. The AIDS education program was organized and coordinated as a co-operative effort with the school health care services and the science department to develop an instructional approach, and to review, adapt and develop educational materials. 3. Four major themes were covered in biology: (A) What AIDS is (B) What causes AIDS (C) How AIDS is transmitted (D) How AIDS can be prevented. 4. MRE classes emphasized the social, psychological, moral and ethical aspects of AIDS and addressed related issues of discrimination, civil rights, and testing.
Results: 1. The integrated curriculum approach focused on the adoption of health conducive behaviors by knowledge (biology), skills (health care services), and attitudes (MRE). 2. Evaluation of knowledge was achieved through pretest and posttest results.
Conclusion: There is a great need for a planned intensive AIDS program integrated into the context of the regular curriculum.

W.E.P.43 IMPLEMENTATION OF A MANDATED HIV/AIDS CURRICULUM IN THE PUBLIC SCHOOLS OF WASHINGTON STATE

Livingston,Gary*; Baldwin,P.** and Downer,A.***
*State of Washington,Office on HIV/AIDS,Olympia, WA.,**Office of the Superintendent of Public Instruction, Olympia, WA.,***University of Washington, Seattle, WA.

In the spring of 1988, the legislature of the State of Washington,USA,enacted the second Substitute Senate Bill No. 6221, the so-called "AIDS Omnibus Bill". A key part of this legislation expressly established a mandate that: 1)AIDS prevention education be taught in the public schools; 2)a model curricula be developed; 3)that an Office on AIDS, established by this legislation be responsible for a) the medical accuracy of the model curricula and b) all other materials intended for classroom use also be approved for medical accuracy.

The processes involved in developing the model curricula, the development of objective criteria against which to judge existing AIDS curricula, approval of materials for classroom use, introduction to and training for the implimentation of the model curriculum, and other aspects of the legislation specific to AIDS education will be discussed.

W.E.P.44 LES APPARTEMENTS DE RELAIS THERAPEUTIQUE ET SOCIAL : ACCUEIL POST-HOSPITALIER ET REINSERTION SOCIALE.

Cordonnier, J.P.*; Javanni,J.**; Maurel,H.***; Michel,A.**** et Sobel,A.*****.
*Psychiatre, Délégué Médical (APARTS); **Président (APARTS); ***Secrétaire Général (APARTS), ****Délégué Social (APARTS); *****Professeur d'Immunologie Clinique, Vice-Président (APARTS), FRANCE

Les appartements de relais thérapeutique et social (APARTS) proposent une solution provisoire d'hébergement destinée aux malades du sida (stade IV) ne nécessitant plus une hospitalisation plein temps, et présentant des difficultés d'ordre social et psychologique.

L'accueil post-hospitalier dans ce type de structure intermédiaire permet d'assurer la prévention tertiaire d'une population socialement marginalisée par l'infection du VIH.
Ce type de structure favorise la réinsertion des malades en traitement. Elle permet aux patients de recouvrir leurs droits sociaux et de retrouver une place dans la cité.
Les appartements thérapeutiques complètent le dispositif français de lutte contre le sida et d'aide aux malades en situation de précarité.

W.E.P.45 HEALTH EDUCATION FOR AIDS PREVENTION AMONG STUDENTS

Perucci, Carlo A.*; Borgia, P.*; Abeni, D.* and Todini, G.**. *Regional Epidemiologic Unit (REU), Rome, Italy, **Local Health Unit RM/3, Rome, Italy.

Objective. To define methods to implement an educational program for HIV infection prevention among school population.
Methods. Target population: students of Junior High Schools (JHS) and High Schools (HS) of the Latium Region, Italy (approx. 525,000 subjects); educators: a minimum of 2 school teachers every 3 (JHS) or 5 (HS) classes. Teachers are appointed by the local School District authorities. A total of about 13,000 teachers will be trained; trainers of educators: approx. 100 medical doctors and biologists, selected by a multiple choice questionnaire on AIDS; training of trainers: 5 day courses organized by the REU, for 25 subjects each, on the prevention of HIV infections. Objectives of the course: at the end of the course health professionals have to be able to: a) define educational objectives for teachers; b) talk correctly on the main issues of AIDS prevention; c) define appropriate techniques of communication to fulfill each educational objective. Methods of the course: J.J. Guilbert's (WHO) method for the education of health professionals is adapted to the objectives of the program. The main steps in the educational process are: a) definition of professional tasks and specific educational objectives; b) identification of the components of a task (practical, communication, and intellectual skills) and planning of an evaluation system; c) use of techniques of active self-learning. Each AIDS issue is introduced by a 45' lecture, and then transformed into educational objectives for teachers by the participants. Work is carried on in groups of 5, and each group illustrates the main features of its product to the others: presentations are then discussed in plenary.
Evaluation: a pre-test questionnaire is administered before the course to define baseline levels of knowledge; after the course, intellectual skills are evaluated with a multiple choice questionnaire (post-test). Observation of individual behavior during group work and presentations, and analysis of individually written material (i.e., prevention guidelines, slides for overhead projections, etc.) allow a global evaluation of practical and communication skills.

W.E.P.46 "DOES AIDS HURT?" EDUCATING YOUNG CHILDREN ABOUT AIDS

Quackenbush, Marcia*; Villarreal, S.**

*University of California AIDS Health Project, San Francisco; **Department of Pediatrics, San Francisco General Hospital

Objective. To outline principles for discussing AIDS with young children (to age ten), particularly as they apply to parents; and to social service, mental health, medical and education professionals working with young children and their families.

Methods. All over the country, and especially in high HIV incidence areas, young children are asking questions about AIDS. Because of the sensitive nature of many AIDS related concerns, care and thought must be taken in providing age-appropriate and culturally-appropriate answers. A series of guidelines, principles and approaches to discussing AIDS/HIV disease with young children will be presented, along with case study material.

Results. These guidelines and principles will increase the comfort and willingness of parents and professionals to offer appropriate AIDS education in school, home and clinical settings, to young children; and to advocate for others to do so.

Conclusions. There is a need for professionals working with young children and their families to prepare to discuss HIV with them, and certain principles and guidelines will make this easier.

W.E.P.47 SCHOOL BASED AIDS EDUCATION IN A NATIONAL PRESPECTIVE: THE IMPLEMENTATION AND PRELIMINARY EVALUATION OF THE ISRAELI MODULE.

Schenker Inon , School of Public Health and Community Medicin Hebrew University-Hadasah Medical Faculty, Jerusalem, Israel

Since September 1987 a national module of AIDS education in schools is implemented in Israel.The implementation was based on 4 stages: 1) preparation of an accepted curriculum 2)Training teachers,school nurses etc. in using the curriculum 3) creating an on-going flow of information to program users 4)widening the available resources.There was no planning stage.
Reacting to media reports and general public anxiety,a special committee was set in education ministry to examine a proposed curriculum on AIDS prevention prepared for teachers working in 6th-12th grades.The curriculum,based on the "Immune system approach",was approved for use in secular and religious schools on a national level. the paper will present universal barriers in the curriculum approval process. Training of health educators,teachers,nurses and councelors in using the curriculum was introduced at in-service training and special workshops. Evaluation re knowledge of teachers,nurses etc. about HIV &AIDS presentwarning signs re the "social AIDS epidemic"(eg descrimination). The special structure of the training workshops will be discussed."AIDS FACT" -a monthly newsletter for programs' users will be presented. The "keep us informed" problem of teachers will be highlighted with examples from a few of the countries which followed the Israeli module,in part.We shall discuss the establishment of "teachers' resource center on AIDS" and the widening of resources of diffrent approaches.
Preliminary evaluation indicates that this module is suitable for others too.

W.E.P.48 SEX EDUCATION MATERIALS TO PREVENT S.T.D. AND AIDS IN ADOLESCENTS.

Tafur de, Matilde*, Martín de, C**, Martínez, R***
Fundación Oriemlc Colombia, Bogotá. Colombia. S.A. * ** ***

Objective. To describe Sex Education materials, to prevent S.T.D. and AIDS in adolescents from low resources communities in Bogotá. Colombia S.A.
Methods. This work describes the process of designing and elaborating the Sex Education materials "Body and the pleasure of Being" with the participation of adolescents. The objective of the sex education materials according to the results of the previous research carried with the adolescents was: To make possible the recognition and worth of the body, as a way to prevent S.T.D. and AIDS. The information was collected through anonimous questionnares and individual and group interviews. The contents were distributed in four units: 1. Encounter with the body. It facilitates the reflection on sexuality and body image. 2. All the bodys part's are important in the expression of sexuality. This unit makes reference to the brain, the sense organs, and the genital organs, in experiencing sexuality. 3. Clarification of miths about sexual organs and the necessity of taking care for all parts of the body. 4. Responsible sexual behavior to prevent S.T.D. The units were proved and evaluated in two Sex Education workshops. the evaluation was conducted through structured questionnaires and, focus groups interviews.
Results. The methodology described in the materials: 1. Increases the information level concerning structure, localization, functions and care of the sexual organs: prevention and treatment of S.T.D. and AIDS. 2. Facilitates the clarification of miths, and beliefs related to sexual organs, S.T.D. and AIDS. 3. Stimulates the recognition of the body image which contribute to adopt responsible sexual behavior.
Conclusions. The theme of S.T.D. and AIDS should be a part of an integral sex education program that includes the bio-psico-social aspects of sexuality. To approach prevention of S.T.D. and AIDS, it is necessary to emphasize the recognition and worth of the body image. It increases self esteem and stimulates body care-taking.

W.E.P.49 A NATIONAL STRATEGY DESIGNED TO REDUCE BARRIERS HINDERING THE IMPLEMENTATION OF EFFECTIVE HIV EDUCATION FOR YOUTH: FIRST YEAR'S ACHIEVEMENTS

Duncan, Carlton*; Jones, J.*; Daily, L.*; Poehler, D.*; Kann, L.*; Kolbe, L.*. *Division of Adolescent & School Health, Center for Chronic Disease Prevention & Health Promotion, Centers for Disease Control, Atlanta, Georgia, USA

Objective. To describe the first year's achievements of a national strategy designed to overcome major barriers hindering implementation of effective HIV education for youth.
Methods. In 1987, the Centers for Disease Control (CDC) sponsored 2 national meetings to identify barriers hindering implementation of effective HIV education for youth. Participants identified as major barriers, the lack of: 1) organized support from national education organizations; 2) educational policies, guidelines, and recommendations; 3) access to educational resources for youth; 4) teacher training programs; 5) parental involvement and support; and, 6) data describing HIV-related knowledge, attitudes, and behaviors among youth and the effectiveness of educational interventions to influence these factors. CDC initiated a national strategy comprised of 6 systems to reduce the barriers. These systems are described and first year achievements are delineated.
Results. A system of organized support from 20 national education organizations was implemented. Seventy State, local, and Territorial education agencies initiated programs to provide effective HIV education for youth. A national computerized database of educational materials was established. Three education agencies provide national training for educators and 13 regional training centers were identified to provide teacher training. Nine States and 6 cities established databases describing knowledge, beliefs, and behaviors among representative samples of youth. Research is underway to evaluate the effectiveness of interventions.
Conclusion. First year's achievements rapidly reduced the first 3 barriers. Continued and expanded efforts are needed to reduce the latter three barriers. This strategy may have applicability in nations that provide national-level support for implementing HIV education for youth.

W.E.P.50 A NATIONAL STRATEGY FOR THE DIFFUSION OF PROGRAMS ON SCHOOL HEALTH EDUCATION TO PREVENT THE SPREAD OF HIV

Daily, Lisa*; Jones, J.*; Jubb, W.**; Martindale, J.***; Sheffield, A.****; Kolbe, L.*;
*Division of Adolescent and School Health, Center for Chronic Disease Prevention and Health Promotion, Centers for Disease Control, Atlanta, Georgia, USA;**Michigan Department of Education, Lansing, Michigan, USA;*** San Francisco Unified School District, San Francisco, California, USA; ****New York State Education Department, Albany, New York, USA.

Objective. To describe a national model for the diffusion of programs on school health education to prevent the spread of HIV.
Methods. In 1987, the Centers for Disease Control (CDC) began providing financial and technical support to 1 local and 2 State education agencies that had the experience and capacity to help others plan, implement, and evaluate HIV education programs for youth. Each agency provides training and demonstration related to the accomplishments and problems encountered in planning, implementing, and assessing HIV education programs within its jurisdiction. Training/Demonstration Programs are offered to teams responsible for implementing HIV education programs in regions throughout the United States. Financial assistance is provided by CDC to support the travel and per diem of participants. Content of the Training/Demonstration Programs is discussed.
Results. Currently, the Training/Demonstration Programs have trained teams from 40 States and 21 cities. Over 300 persons including parents, school board members, and representatives of education and health departments, and agencies that serve out-of-school youth have participated in these programs.
Conclusion. This national model of demonstration, training, and technical assistance supports the rapid diffusion of strategies for planning, implementing, and assessing HIV education programs. This model may have applicability in nations that can provide national-level support for regional training/demonstration programs.

W.E.P.51 COMPARATIVE KAP STUDIES AND STD IN TWO DIFFERENT SOCIO-ECONOMIC GROUPS

Oyewo, Edward, Bamgbose. J., Adetugbo, A., Durosinmi. A., and Soyinka. F.
Obafemi Awolowo University, Ile-Ife, Nigeria

Objectives: To compare the level of awareness, cultural and sexual practices as well as attitude to AIDS and STD in two different Socio-economic groups with a view of formulating appropriate health education messages for HIV prevention.

Methodology: Pretested and modified questionnaires were administered to 410 randomly selected undergraduates and also to 375 (purposefully) selected individuals of lower socio-economic status. Questions were designed to cover awareness, knowledge, practice on AIDS and STD, sexual habits and preferred mode of receiving health education as well as individual assessment of existing health education material on AIDS.

Results: Undergraduates exhibited more knowledge of symptoms and prevention of AIDS than the rural dwellers. Whereas, the former indulge in higher risk practices than the latter, condoms are more acceptable and used by the former than the latter. Undergraduates prefer to learn more about AIDS through electronic media and newspapers while the rural dwellers prefer community health talks.

Conclusion: Health education against AIDS must be targeted to suit needs of different groups. For rural areas with low AIDS prevalence, health education with emphasis on safe is important. Campaign against HIV infection ought to be integrated with Primary Health Services.

W.E.P.52 UN EXEMPLE DE COLLABORATION ENTRE MEDECIN ET JOURNALISTE

Franck FONTENAY*, JF METTETAL**, F. EDELMANN***
*Gai-Pied, CNRS; **Hôpital Necker; *** ARCAT-SIDA, CNRS; Paris, France

Objectifs: améliorer l'information sur le sida dans un hebdomadaire destiné aux homosexuels (Gai Pied Hebdo), notamment par le biais de la page intitulée "Info-Sida" qui paraît dans chaque numéro du journal.
Méthode: une collaboration étroite et régulière a été établie avec une association spécialisée sur l'information et la prévention du sida, l'ARCAT-SIDA, et en particulier avec les médecins de cette association. Sur la base d'études parues dans la presse scientifique internationale ou de faits établis par la pratique médicale, les articles portant sur un sujet précis sont élaborés en commun par un journaliste et un médecin au cours d'entretiens enregistrés. L'article est ensuite rédigé par le journaliste puis relu et corrigé par le médecin. L'un et l'autre signent l'article à sa parution.
Résultat: Une enquête annuelle réalisée par le journal auprès de ses lecteurs montre que ceux-ci considèrent en grande majorité la page "Sida" comme indispensable. Toutefois les lecteurs ne se manifestent pas directement par écrit ou par téléphone pour demander des informations supplémentaires ou pour que soit abordé tel ou tel sujet. En revanche, les articles de l'Info-Sida provoquent des réactions et engendrent le dialogue entre les patients et les médecins de l'association au sein de leur cabinet. D'une façon générale l'Info-Sida est reconnue pour sa qualité par le corps médical, les associations et les institutions. La collaboration entre une association spécialisée et des journalistes permet à ces derniers d'acquérir des connaissances approfondies sur le sida, mais ils sont alors enclins à utiliser une terminologie et un discours de plus en plus médical au détriment de l'accessibilité de l'information par les lecteurs.
Conclusion: l'exigence de la qualité de l'information n'est pas une fin en soi. Une constante évaluation de la perception de l'information doit être établie pour éviter qu'elle ne devienne trop hermétique pour les lecteurs mais au contraire adaptée à leurs connaissances et à leurs besoins. Ce qui présuppose une analyse précise du lectorat du journal.

W.E.P.53 COMPARISON OF AIDS KNOWLEDGE LEVELS AND BEHAVIORS IN SEXUALLY TRANSMITTED DISEASE (STD) CLINIC PATIENTS AND ALTERNATIVE TESTING SITE (ATS) CLIENTS

Day, J.; Dillon, B.; Moye, John; Kunches, L.; Mofenson, L.; et al. MA Dept. Public Health, Boston, MA, USA

Objective: To compare levels of AIDS knowledge and behaviors in persons attending selected urban STD and ATS facilities.
Methods: From 7/88 through 10/88, 1,063 (398 ATS, 665 STD) self-administered surveys of AIDS knowledge, behaviors, and demographics were completed. Knowledge scores and behaviors were compared by clinic setting, sex, and race. Demographics for STD respondents (STD) showed greater proportions of nonwhite (42% vs. 13%), female (38% vs. 29%), and adolescent patients (19% vs. 2%) compared to ATS respondents (ATS).
Results: Heterosexual preference was more common in STD than ATS (93% vs. 66%). The groups were similar with respect to number of sexual partners, history of nongonococcal STD, needle use, needle sharing, and prior antibody testing. Fewer STD indicated a desire for testing than ATS (45% vs. 97%). Based on a 10-point scale, ATS rated self-perceived knowledge levels higher than STD (mean score, 6.8 vs. 5.7), and objective evidence of knowledge was greater in ATS for all questions. Among STD, knowledge levels were higher among whites than nonwhites. ATS reported sexual behavior changes (fewer partners, increased condom use) more often than STD (53% vs. 38%, and 48% vs. 37%). Reductions by ATS in unsafe intravenous drug use (IVDU) were similar to STD (stopped IVDU, 57% vs. 62%; decreased needle sharing, 29% vs. 35%).
Conclusion: Compared to ATS (who are test seekers), STD need greater educational and behavior modification efforts to reduce AIDS risk.

W.E.P.54 WHAT KEEPS PHYSICIANS FROM TALKING ABOUT AIDS: Barriers to AIDS Prevention Education

Allerton, Michael W., MS. Kaiser Health Education, Permanente Medical Group, Oakland California, USA.

The specific aims of this study were:
1) To find out if primary care physicians in a large HMO setting were providing AIDS risk reduction information to their patients, and 2) to identify barriers that might prevent them from providing this information.

An anonymous survey was mailed to 650 physicians in a large Northern California Health Maintenance Organization (HMO). A usable return rate of 65% (423/650) was obtained.

Statistically significant differences in the willingness to discuss AIDS with patients were found to exist depending on the *physician's perception* of the patient's risk for AIDS. Use of Pearson correlation coefficients found that the most often reported barriers of "lack of time", "more important health issues", and "the need for more reliable information" did not correlate as a deterrent to providing health education as much as reported discomfort with initiating discussions of sexual practices or drug use . Chi-square analyses showed differences in providing AIDS prevention education were not statistically significant by age, type of practice, or location (urban or rural) of practice . There were statistically significant differences for sex of the physician, numbers of AIDS patients in their practice, and knowing someone (friend, relative or colleague) with AIDS .

These findings changed the direction and emphasis of physician education programs and were an essential part of the needs assessment used to develop clinic services to enhance AIDS risk reduction efforts.

W.E.P.55 PROPOSED MODEL OF MEDICAL WORKSHOP ON AIDS IN AFRICA

Crocchiolo,Paolo*;Attas,H.A.**;Khatib,O.J.***;Schinaia, N.*;Othman,A.***;Chwaya,H.H.*** et al.
*Global Programme on AIDS,WHO,Geneva;**Infectious Diseases Hospital,Mombasa,Kenya;***National AIDS Prevention & Control Programme,MOH,Zanzibar

Objective.To develop a model of medical workshop(W)as effective as possible in conveying essential messages on all main aspects of AIDS and HIV infection(clinics,epidemiology,prevention,counselling and ethical issues).
Methods.33 MDs(at least 1 from each Hospital in Zanzibar)were invited to participate in a 5-day W on AIDS and HIV infection.A blackboard,50 transparencies on different issues,50 slides,mainly on clinical subjects,an overhead projector and slide projector were used by 7 facilitators (2 clinicians,2 epidemiologists,1 public health expert,1 lab technician and 1 social scientist).To evaluate the W,a 50-items questionnaire on all main subjects was distributed to the participants both before and after the W,and a standardized evaluation form was distributed after the W,designed to register comments on the W by the participants.
Results.An average of 70.75% correct answers to the test were given at the end of the W,while the pre-test figure was 55.69%(with a significant increase of about 15%,p 0.00001).All participants felt they had greatly improved their knowledge on AIDS.
Conclusion.Updating of medical personnel is urgently needed in all developing countries in order to effectively tackle the impending epidemic. This 5-day full-time W has proven useful,as it conveyed basic ideas on all main aspects of HIV infection;active participation by the attendees was also a key element for the success of this training experience.

W.E.P.57 DIRECTIONS FOR THE FUTURE: A REVIEW OF WORLDWIDE AIDS PROGRAMS

K CAROVANO*, GB MACDONALD, M HELQUIST**

*Johns Hopkins University/AIDSCOM, **Academy for Educational Development/AIDSCOM, Washington, D.C., U.S.A.

Objective: To survey education and information programs used to increase knowledge and reduce risk behavior related to HIV/AIDS.

Methods: The authors have identified five categories within which AIDS education programs from around the world are examined. These five categories include: Regional and National Information Campaigns, Community and Institutional Network Responses, AIDS Prevention Counseling and Behavior Support Efforts, Condom Marketing Strategies, and Media Education Programs.

Results: AIDS prevention and education programs have been implemented around the world in response to diverse needs with varying degrees of success. Through a systematic examination of programs in both industrialized and developing countries, critical program components have been identified that can serve as models for the further development of prevention programs.

Conclusion: The opportunity for partnership and exchange between regions is made apparent by the simultaneous diversity and commonality of these initiatives.

W.E.P.59 A COMMUNITY-WIDE SURVEY OF AIDS KNOWLEDGE, ATTITUDES, AND PREFERRED INFORMATION SOURCES

Wolitski, Richard J.*; Rhodes, F.* and Corby, N. H.**
*AIDS Research & Education Project, California State University, Long Beach, CA, USA
**Department of Public Health, Long Beach, CA, USA

Objective. To involve community residents in program planning, assesses preferred sources of AIDS information, and measure knowledge and attitudes about AIDS.
Method. In May 1988 questionnaires were mailed to a randomly selected sample of 5,000 residents in Long Beach, CA; each received one questionnaire to complete personally and another to distribute to a friend or relative. The questionnaire assessed (1) the preferences of adults regarding sources of AIDS information for adults and adolescents and (2) basic AIDS knowledge and attitudes regarding personal risk, disease severity, response efficacy, persons with AIDS, and social norms.

Results. A total of 642 questionnaires were returned—502 from mailing recipients and 140 from those distributed by residents. 85% of respondents were white; 41% were male and 59% female. Age ranged from 18 to 85 (mean = 44). Differential preferences regarding sources of AIDS information for adults and adolescents were expressed. Television (79%), newspapers (75%), and personal physicians (75%) were preferred by information sources for adults while schools (82%), television (75%), and parents (68%) were rated as the most appropriate sources for adolescents. Basic AIDS knowledge of respondents was fairly high (79% correct). Respondents tended to view AIDS a severe health threat that has caused many individuals to modify high-risk behaviors; however, few respondents viewed themselves as being personally at risk. Age and sex, with few exceptions, were not related to preferences, knowledge, or attitudes ($p > .05$).

Conclusion. Community surveys provide valuable information for AIDS program development and provide a mechanism for direct citizen involvement.

W.E.P.56 CROSS-CULTURAL OBSTACLES TO AIDS EDUCATION IN THE SOUTHERN AFRICAN CONTEXT

Christie,Grania; Zazayokwe,M; Sher,R.; Metz,J.
AIDS Training and Information Centre, South African Institute for Medical Research, Johannesburg, South Africa.

OBJECTIVE. To identify and resolve various barriers to educating Africans about HIV/AIDS in Southern Africa.
METHODS. Data pertaining to education barriers was collected over a period of one year, as follows: (1) field experience, (2) interviews, (3) group discussions, and (4) surveys.
RESULTS. Some of the most common barriers to AIDS education include: (1) the traditional belief that disease is caused by ancestors or evil spirits and the ignorance of the germ theory of disease; (2) the absence of terminology for 'virus' and 'immune system' in the vernacular; (3) the fact that sex is not openly discussed between elders and the youth or males and females; (4) the practise of polygamy, urbanisation and migrant labour which has led to (the practice of) multiple sexual partners; (5) the inaccessibility of AIDS information in rural areas; (6) the view that 'witchdoctors' can cure AIDS; (7) the high rate of illiteracy and ignorance; (8) the idea that condoms are a political ploy to control population; (9) the unavailability, expense, fear and stigma associated with the use of condoms; and (10) the notion that AIDS is a 'white mans' disease.
CONCLUSION. Cross-cultural knowledge, awareness and skills must be developed to overcome obstacles to AIDS education. It is imperative to work within the world view of different people in order to educate effectively.

W.E.P.58 REPORTED BEHAVIOR CHANGE IN AIDS RISK GROUPS

Galavotti, Christine*; McAlister, A.**; Shoemaker, P.***; Zbylot, P.**; Vacalis, D.***; and Reed, C.****.

*Centers for Disease Control, Atlanta, Georgia, USA, **The University of Texas Health Science Center, Houston, Texas, USA, ***The University of Texas, Austin Texas, USA, ****Texas Department of Health, Austin, Texas, USA.

Objectives: To examine behavior change in groups at risk for AIDS/HIV.
Methods: A statewide telephone survey of 1,649 randomly selected persons in Texas was completed in 1988. Seventeen percent of the sample reported more than one sex partner, 10% reported another STD, 3% reported sex with a prostitute, and 2% reported sex with an IV drug user.
Results: For those who reported having had more than one sex partner, the following results were found: Since hearing about AIDS, 44.8% reported reducing their number of sex partners, 21.3% used condoms, and 11.3% became monogamous; women in this risk group were significantly more likely than men to become monogamous; men were more likely to report having fewer partners rather than becoming completely monogamous (50.8% of men vs. 28.1% of women), or to use condoms (23.4% of men vs. 15.3% of women, $p<.05$); television was the most frequently cited source of information prompting behavior change among this group (26.1% cited television); and men were more likely than women to cite television; women were more likely than men to say a sex partner influenced them to change. Among minorities, Blacks (19.9% of the sample) and Hispanics (30.5% of the sample), television was the most frequently cited source of information prompting behavior change; television most often prompted condom use (64.3%), monogamy (47.8%), and fewer sex partners (32.8%). Fewer than half of those reporting sex with an IV drug user had made similar changes.
Conclusions: Mediated communications may be successful in prompting behavior change among groups at risk of AIDS/HIV. In order to reach all risk groups, public health campaigns may need to incorporate interpersonal communication and televised AIDS prevention messages.

W.E.P.60 HOW TO EDUCATE 26,000 HEALTH CARE WORKERS IN 6 MONTHS

Lamberto, Barbara RN, BSN, MBA*; Evans, D. RN, BSN**. Kaiser Permanente Medical Centers, *San Francisco, **Vallejo, Ca, U.S.A.

Objective. To provide within 6 months consistent and comprehensive education about Universal Precautions (UP) for 26,000 health care workers (HCW) in a health maintenance organization.
Methods. In response to the Centers for Disease Control's recommendation for HCW to use UP to prevent transmission of blood-borne diseases, a multidisciplinary education task force developed a program integrating expertise of various regional, local and bargaining unit personnel. In 12 weeks this task force created a UP specific Train-The-Trainer package: 8 minute video, master training script, teaching outlines for facility training, transparency masters, pre- and post-tests, visual test for people with English as a second language, resource materials, posters, pocket cards, graphics, buttons. The program was marketed through existing media sources at local and regional levels. Presentations to 26 peer groups enlisted the support of key departmental managers and supervisors.
Results. During a 2 week period 300 people completed master training sessions. In the following 10 weeks, these master trainers educated 26,000 physicians and employees in appropriate regional departments (e.g., laboratory), 14 hospitals, 26 medical office buildings within the Kaiser Permanente Medical Care Program-Northern California Region.
Conclusion. Over 90% of the 26,000 HCW were educated by the deadline. In order to assess the efficacy of the project, ongoing monitoring and evaluation components were integrated into procedures at local medical centers. Key factors in the successful implementation were strong administrative support and commitment.

W.E.P.61 THE JUDICIOUS USE OF HUMOR IN A CONDOM PROMOTION CAMPAIGN

Downer, Ann*; Kelleigh, B.**; Welch, N.**; Purdue, T.**
*University of Washington, Seattle, WA., USA; **Northwest AIDS Foundation, Seattle, WA., USA.

The Northwest AIDS Foundation coordinates social services for people living with HIV/AIDS in the Pacific Northwest United States and sponsors skill-building workshops and mass media campaigns. The Be Well-Equipped media campaign (1987-8) was designed to promote consistent use of lubricants, spermacides and latex condoms. Humor became an integral part of this campaign based upon the belief that taboos about discussing condoms could most easily be abolished through humor. A community-based planning group helped the Foundation to develop guidelines for using humor in AIDS prevention messages. Artist/writer Lynda Barry created a series of condom promotion cartoons with titles such as: Fascinating Condoms of the Future, Can This Love Affair Be Saved?, and a Valentine's Day cartoon called A Dozen Red Condoms. Comment and testimony from the community was positive regarding this attempt to use humor in promoting safer sex. Guidelines for using humor in AIDS education will be discussed and the artwork for Be Well-Equipped will be displayed.

W.E.P.52 SIDAIDS: A COMPUTERIZED TELEPHONE AIDS INFORMATION & COUNSELLING SERVICE (TELEMATIC)

Billon,P.*; Duckett, Margaret**; Champoux,L.*;Baribeau,T.*, and Descout,R.*
* Communications Canada, Montreal, Quebec, Canada;
**McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada.

Objective: To describe a personalized telematics service providing information and advice on AIDS, accessible by the general public through any telephone (residential or public). Although the computer software and structure of the communications are complex, the service to users is highly user-friendly.
Method: A user consults the computer-driven service anonymously using a personal access code. The user can choose to communicate with a counsellor or a computer. The user receives replies and advice that take into account his or her personal situation(age, sex, sexual orientation,etc.).
Results:The equipment, computer programme and data collection are now defined that provide the following service:1) SIDAIDS communicates clear and precise information on AIDS to anyone who consults the system about specific questions. This function is similar to the activity of many hotlines with respect to information on AIDS, but it allows, in addition, for personalization of the replies without overloading counsellors.2) SIDAIDS promotes self assessment by the user of his or her "risk coefficient". In many cases, this assessment involves several stages - each stage covers a specific aspect of the individual case and includes educational elements.3) SIDAIDS establishes and maintains a continuing interactive link of consultation and education, so as to foster changes in individual behaviour and thereby reduce the risks of spreading AIDS. In this regard, clients with "at risk" behaviour have priority access to the counsellors, and, as far as possible, a user in this category will have access, if he or she wishes, to the same counsellor, call after call.4) SIDAIDS permits a counsellor, at the user's discretion, to have access to all information ever entered by the user.5) SIDAIDS facilitates the collection of epidemiological and behavioural information for subsequent data analysis.
Conclusion: Prototypes are confirming the feasibility and utility of the SIDAIDS mechanism.

W.E.P.63 AIDS PREVENTION CAMPAIGN IN HEALTHY CITY PROJECT OF ŁODZ

Tadeusz Górski, H.Kamieniak, E.Korczyński[x]
Sanitary-Epidemiological Station, Wodna str., 40, 90-046 Łódź, Policlinic of Venereology[x], Zakątna str., 90-618 Łódź, Poland

Objective. To describe the AIDS prevention campaign as one of very important tasks undertaken in healthy city project of Łódź- "Health for All by the year 2000".
Methods. WHO /Euro/ approach and principles for undertaking the health promotion of cities have been adopted. For the health surveillance the main AIDS risk group of about 300 nonorganized adult people has been chosen. They have been taught on AIDS, the healthy attitudes and risk behaviours by the questionnaire study.
Results. The blood service intervention and health education have caused the implementation of AIDS precautionary measures among blood donors and drug abusers. AIDS problem is connected with the improvement of the survey on other groups. The questionnaire survey among adult risk group shows that their knowledge is on the sufficient level but their risk behaviours are unrelated to their knowledge as it is shown in the below table.

Condom use gives full security			Do you use condoms?		Are condoms accessible?			Do you examine in a lab?	
Yes	No	Unknown	Yes	No	Yes	No	Unknown	Yes	No
28%	16%	56%	40%	60%	24%	60%	16%	68%	32%

Conclusion. The regular use of condoms should be practised especially by homo/bisexualists. They ought to receive them free.

W.E.P.64 EXTENDING THE ROLE OF AIDS HOTLINES IN AIDS PREVENTION PROGRAMS IN DEVELOPED AND DEVELOPING COUNTRIES

Saunders, Susan G.*; Melquist, M.*; Stein, J.*; Coravano, K.* Dela Vega, E.**; Duke, B.***
* AIDSCOM Project, The Academy for Educational Development, Washington, D.C.; **Brooklyn AIDS Task Force, New York; ***National AIDS Committee, Trinidad and Tobago.

Objective. To assess the role and function of AIDS Hotlines in developed and developing countries.
Method. Literature review and in-depth interviews with key informants and Hotline staff in community-based organizations and AIDS programs in the U.S., Mexico, Trinidad and Tobago, and Peru.
Results. AIDS Hotlines are an integral component of AIDS prevention programs in the United States, with operations at the community, state, and national level. Hotlines in the U.S. provide information dissemination, referral, and listening support to callers. Hotlines also track trends in caller concerns, misperceptions, and service needs; and monitor levels of message awareness and recall provided through national information and education initiatives. Comparable programs which provides listening services and referrals are being established in several Latin American and Caribbean countries.
Conclusion. Hotlines are an important link in the communication chain to inform and support callers concerned about AIDS and HIV infection. Hotlines are frequently the first point of intake into the AIDS service support system in the U.S. In Trinidad and Tobago the hotline serves primarily as a listening support system, and in Peru it is being used to provide information targeted to gay and bisexual men.

W.E.P.65 KNOWLEDGE AND PERCEIVED RISK OF AIDS AMONG THE ADULT POPULATION OF KINSHASA, ZAIRE

Bertrand, J.*; Bakutuvwidi M.**; Kinavwidi L.N.**; Balowa D.**; Hassig, Susan*; and Chirwisa C.**.
*Tulane University, New Orleans, LA, USA, **Projet des Services des Naissances Désirables (PSND), Kinshasa, Zaire.

Objective. To measure knowledge of AIDS, level of perceived risk, and factors which predict knowledge and perceived risk.
Methods. Based on probablistic sampling, 3083 men and 3661 women of reproductive age were selected for this 1988 survey.
Results. In Kinshasa, 99% men and 96% women have heard of AIDS. Among these, nine in 10 men and women know the four main modes of transmission. Knowledge of specific facts about AIDS is higher among men than women, among the more educated, and among the age groups 20-40. Forty-seven percent of men and 63% of women believe they are at no risk of contacting AIDS. Perceived risk was highest among those who had extramarital relations, were more educated, were 20-40, and had seen messages on AIDS through multiple channels. However, knowledge of the specific facts relating to AIDS was not associated with perceived risk.
Conclusions. Education efforts have succeeded in informing the public of AIDS and the modes of transmission. Future campaigns should promote greater use of condoms, stress the absence of a vaccine or cure, and focus special efforts on the young, unmarried population that seemingly deny their risk of AIDS.

W.E.P.66 SECONDARY SCHOOL STUDENTS AS AIDS HEALTH PROMOTERS FOR AN ILLITERATE RURAL WEST AFRICAN VILLAGE POPULATION

Bennett, Diane; Demby, A.; and Kamara, P.
Eastern Province AIDS Committee, Segbwema, Sierra Leone, W. Africa

In rural areas of Africa, where most of the population is illiterate and mass media are not available, AIDS Health Promotion is often difficult. Literate young people make up a small proportion of the population, but they traditionally bring news and information when they return to their villages. We worked with secondary school students, training them to use pretested pamphlets and a photonovella to teach villagers about AIDS. The young people also made posters, and created songs and dramatic presentations. A pilot programme showed that information about AIDS transmission and prevention was successfully conveyed by these means, but that the young people most often shared information with semi-literate people. The materials and training programme were redesigned so that the audience reached would be larger and more varied. Randomly selected villagers were interviewed before the programme, and at one week, six weeks, and six months after it. Interviews included questions about programme exposure, AIDS transmission and prevention, sexual practices, and condom use. STD incidence in sexually active age groups in the villages will also be compared with pre-programme incidence, as will registration at Planned Parenthood centres for condoms. We will discuss the design and implementation of our programme, including pretesting, preliminary evaluation, and redesign of materials as well as results.

W.E.P.67

AIDS EDUCATION IN PRISONS
A MODEL

Loree Violet Rose; Educational Consultant/Private Practice
Vancouver, British Columbia, Canada

Objective. To present people, working in both provincial and federal prisons, with information inmates and youth need to know about AIDS and techniques they might use to teach them.
Methods. * Examples of methods of bonding with an inmate audience will be presented * Using brainstorming we will explore sexual self-definition and examine same-sex contact * Presentation of resources and materials * Preview of the video- AIDS-A BAD WAY TO DIE * Review most frequently asked questions * Using brainstorming and color coding we will outline which body fluids carry HIV * Introducing use of condoms and needle cleaning * Testing informational input using a Safer Sex Continuum * Teaching concrete learners/considerations for information passing
Results. People working with those in confined settings will become familiar with basic AIDS information needed by inmates and youth, their learning styles, and techniques for teaching.
Conclusion. The prison system is a place where there is both drug use and same-sex contact. It is critical that we give incarcerated people health and lifestyling information so they can make choices.

W.E.P.68

RISK REDUCTION AFTER OUTREACH INTERVENTION AMONG INTRAVENOUS DRUG USERS

Meryl Sufian*, SR Friedman*, A Neaigus*, D Goldsmith*, DC Des Jarlais**, F Graves*
* Narcotic and Drug Research, Inc., New York City, NY, USA. **NY State Div. of Substance Abuse Services, New York City, NY, USA

Objectives: To assess risk reduction by intravenous drug users (IVDUs) after ex-addict street outreach.
Methods. Ex-addict outreach workers of the AIDS Outreach and Prevention Project performed street-level educational outreach (including oral and written messages about using bleach or alcohol to decontaminate injection equipment) to IVDUs in NYC starting in early 1987. Bleach was not distributed (through early 1988). HIV antibody testing and counseling were offered. 325 subjects received an interview, which is an educational tool in itself, when they were educated; 295 were tested. 144 (44%) subjects were re-interviewed at a median of 140 days later. Subjects who were and were not followed up were similar in ethnicity, gender, drug injection frequency (total, and by specific drugs), and condom use. Older subjects and those recruited in the Bronx or Queens, rather than Brooklyn, were significantly more likely to be reinterviewed. Results are reported for subjects who were interviewed twice.
Results. Over the median 140 days between interviews, mean monthly drug injections declined from 34 to 10 ($p < .0001$ by paired comparison t-test). 50 (35%) subjects reported no injections in the month prior to the initial interview; fully 74 (51%) did not inject during the several months between interviews. Bleach use to decontaminate injection equipment was stable and low: 16 (11%) subjects initially reported regular bleach use as compared to 19 (13%) in the follow-up interview. Regular users of alcohol as a decontaminant decreased from 65 to 54. Of 128 subjects who had sex during the year before the first interview, 46 (36%) used condoms at least once; this changed to 61 of 116 (53%) during the follow-up period ($p < .05$).
Conclusions. Although AIDS risk behaviors declined after intervention, bleach or alcohol use did not increase. Since bleach use has been widely adopted by IVDUs in cities where it has been distributed by outreach workers, outreach without bleach distribution appears to be less effective in promoting decontamination of injection equipment.

W.E.P.69

NIVEAU DE CONNAISSANCE DU SIDA DANS UNE POPULATION EXPOSEE

Soulimane,A.,Taleb,M.,Sadok S.
Service d'Epidémiologie,CHU de Sidi-Bel-Abbes,Algérie

Il s'agit d'une enquete d'information réalisée auprès d'une population d'étudiants du centre universitaire de Sidi-Bel-Abbes en Algérie.
L'objectif de l'étude est de déterminer le niveau de connaissance des étudiants sur le problème du SIDA.
L'échantillon,obtenu après sondage aléatoire,est composé de 273 sujets qui ont rempli,d'une façon anonyme,un questionnaire à plusieurs items.
L'age moyen des sujets est de 23 ans.Il y a autant de filles que de garçons,issus surtout d'un contexte familial modeste,et résidant en majorité en milieu urbain.Les deux tiers des sujets enquetes ont une connaissance précise de la définition de la maladie et des effets qu'elle provoque.Plus de la moitié d'entre eux(55%) connaissent le nom du virus et ses modalités de détection.
Par contre,près d'un étudiant sur trois ne connait pas ses modalités de transmission,et n'identifie pas correctement les groupes particulièrement exposés à la maladie.
En matière de comportement,si le problème inquiète deux étudiants sur trois,la plupart des sujets considèrent la maladie comme étant un phénomène non important dans le contexte socio-culturel actuel.
L'enquete montre la nécessité d'une action d'éducation pour la santé permanente en direction de cette population.

W.E.P.70

COMMUNITY RESPONSE TO THE AIDS EPIDEMIC IN FOUR U.S. CITIES: NEW YORK, SAN FRANCISCO, LOS ANGELES, AND MIAMI

Howell, Embry M.*, Andrews, R.*, McClung, R.**, Preston, B.*, and Keyes, M.*
* SysteMetrics/McGraw-Hill, Washington, DC, USA
** Health Resources and Services Administration, USPHS, Rockville, MD, USA

Objective. To describe the community response to the AIDS epidemic in four U.S. cities with large concentrations of people with AIDS. The purpose of this project was to provide this information to other cities which are developing a community response to AIDS.
Methods. Extensive case studies were performed in New York, San Francisco, Los Angeles and Miami during the spring and summer of 1988. Public officials, health care providers and representatives of community-based organizations were interviewed. Planning documents, local newspapers, and statistical reports were reviewed.
Results. The four cities differed along several dimensions. Race, income, risk group, and political influence of the community's AIDS population were important in shaping the community response. Larger proportions of uninsured, low income, minority, and/or drug abusing persons with AIDS have led to more difficulty in developing services. Other important influences have been the pre-existing health and social service systems and the availability of volunteers. Most communities have too few appropriate long term care, supportive housing, home health care and personal support services. The geography of the community (e.g. land area and geographic barriers) has also shaped AIDS services. A final determinant has been the cooperation between public agencies, which plan and fund services, and private providers.

W.E.P.71

IMPACT OF PILOT INTERVENTIONS TO REDUCE THE SPREAD OF HIV INFECTION AMONG HIGH RISK WOMEN IN AFRICA

Nichols, DJ*; Mouny-Lobé, M**; Koumaré, B***; Neequaye, A****; DeBuysscher, R*; Jesencky, K*; Weir, S*.
*Family Health International, Res Triangle Park, No. Carolina; **Hôpital Central, Yaoundé, Cameroun; ***Institut National de Recherche en Santé Publique, Bamako, Mali; ****University of Ghana Medical School, Accra,Ghana.

Objective: To develop and test an intervention model that will slow the transmission of HIV infection among urban prostitutes, a population at high risk of contracting and spreading AIDS as well as other sexually transmitted diseases.
Method: Peer health educators (PHEs) are recruited from prostitute groups and trained to provide information to other prostitutes on the risks and consequences of AIDS, to offer condoms and to encourage women to adopt "safer sex" practices.
Results: Preliminary data indicate that prostitutes are highly interested in taking actions to reduce their risk of AIDS, and are accepting and using condoms provided by the PHE. Clients, however, appear to be less willing to adopt risk-reducing behaviors and thus present compliance problems.
Conclusion: Development of appropriate educational materials and training for PHEs, coupled with adequate supplies of condoms, is likely to result in less high risk behavior among urban prostitutes and their clients.

W.E.P.72

SOCIAL AND CULTURAL CONSTRAINTS IN THE CONTROL OF AIDS AND HIV INFECTION IN SUB-SAHARA AFRICA

LEMA; V.M.
DEPARTMENT OF OBSTETRICS AND GYNAECOLOGY
UNIVERSITY OF NAIROBI - NAIROBI, KENYA.

AIDS and HIV infection have over the past few years become a major health, social, political, economic and cultural concern the world over. These are mainly acquired through social behaviours which are to a large extent influenced by society's cultural beliefs and practices. These differ from one Community to another, and may be constraints in the various strategies aimed at controlling the spread of AIDS and HIV infection.

The paper attempts to look at some of the salient social, cultural attributes in sub-sahara Africa namely, marriage customs, the right of women in sexual matters, the single man/woman, the adolescent, the desire for fertility, separation of spouses in search of economic gains, and the traditional/cultural beliefs and practices, which may have an impact on AIDS and HIV infection control programmes.

Their role in the spread of the epidemic and ways of changing or influencing them are discussed.

KEY WORDS: Social, cultural beliefs and practices, control of AIDS and HIV infection, Sub-Sahara Africa.

W.E.P.73

THE AIDS-RELATED KNOWLEDGE, ATTITUDES, AND BEHAVIOR OF INTERNISTS AND SURGEONS: A COMPARATIVE ANALYSIS

Henry, Keith*; Campbell, S.*, Eyer, S.** and Willenbring, K.*
Departments of Medicine* and Surgery**, St. Paul Ramsey Medical Center and University of Minnesota Medical School, St. Paul, Minnesota, U.S.A.

Objective. To identify factors accounting for differences and similarities of AIDS-related knowledge, attitudes, and behaviors between surgeons and internists.

Methods. In September 1987 an anonymous survey was delivered to all physicians at a 455-bed acute-care teaching hospital. Included in the survey were scales measuring AIDS-related knowledge, behaviors, attitudes, homophobia, and homosexual bias.

Results. A total of 68 internists- IM(68/98; 69%) and 34 surgeons- SG(34/69; 49%) responded. Three of the IMs and one SG identified themselves as homosexual. The IMs had a lower mean age (38.1 vs 40.0; p = .062), and were more likely male (84% vs 65%; p = .058). The only gender related difference in the parameters studied was a higher level of homophobia among male MDs (p = .014). The IMs were less biased in their attitudes towards homosexuality (p = .048) but were not significantly less homophobic than SGs. The IMs reported more favorable behaviors in hypothetical situations with AIDS patients (p < .001) and had slightly higher AIDS knowledge scores (p = .088) than SGs. IMs more frequently reported knowing someone with HIV infection (45/67; 15/34; p = .030) and they had more often cared for someone with AIDS (61/67; 22/34; p = .005). SGs were much more concerned about acquiring HIV through work exposure (p < .001) and reported a much greater level of contact with patients (p < .001). A majority (25/34; 73%) of surgeons were in favor of mandatory HIV testing of all hospitalized patients, while a minority (11/66; 17%) of IMs favored this (p < .01). Forty-seven percent (16/34) of the SGs and 28% (19/67) of the IMs desired a secret HIV test for themselves (p=.09).

Conclusions. SGs may exhibit less desirable behaviors towards PWAs compared to IMs due to more homosexual bias and more concern about at-work exposure. Education programs need to innovatively address these issues.

W.E.P.74

AIDS, AND FAMILY PLANNING IN ADOLESCENTS

Hani El Tonsi and Hafez, S*.
El Menia University, Faculty of Medicine, Egypt, *World Federation Reproductive Health Center, Kiawah Island, SC, U.S.A.

HIV has been isolated and/or cultured from endometrial biopsies, cervical mucus and vaginal fluids of seropositive women. These secretions and sloughed off infected endometrial cells adhere to the surface of intrauterine devices (IUD's) and their tails throughout the menstrual cycle. Lymphocyte-like infected cells are detected within cervical crypts. Local infection of susceptible cervical cells from infected semen precede systemic HIV s[illegible]. IUD's also cause dramatic increases in cervical/vaginal atypia, cervicitis and inflammation of HIV-infected women. There is increased risk of HIV infections of the cervix in women with "Pelvic Inflammatory Disease (PID)". In developing countries, most risk groups for AIDS and contraception are similar. AIDS counseling can be conducted in an INTEGRATED Family Planning/maternal-child, Health Center/Drug Treatment Center/STD Clinics. Adolescents should be provided with sex education, AIDS awareness information and adolescent contraceptives services at schools/colleges. To discourage adolescents to undergo unnecessary abortion; childless couples could adopt prospective infants of adolescence before birth. HIV-seropositive women should be counselled to avoid pregnancies since many infected women are asymptomatic. Temporary surgical contraception is recommended for seropositive women to avoid pediatric AIDS.

W.E.P.75

A STUDY OF KNOWLEDGE, ATTITUDES AND BELIEFS ABOUT AIDS AMONG FOURTH YEAR MEDICAL STUDENTS OF TANTA UNIVERSITY, EGYPT

BY

PROF.DR. IBRAHIM M. SHOAIB, MPH,MD.

The present study was conducted on a randomly chosen sample of 100 fourth year medical students of Tanta University who have not been exposed to formal medical education about AIDS. The purpose of the study was to assess their knowledge, attitudes and beliefs about AIDS. A self-administered questionnaire was distributed consisting of 31 questions which sould evaluate students' knowledge including; cause of the disease, modes of transimission, severity, personal susceptibility, and the need for including more detailed education about the disease in their medical courses.

Findings of the study revealed that, such students possess some knowledge about AIDS, although this knowledge is uneven. As regards disease transimission, 95% of students correctly stated that sexual itercourse transmitt AIDS from infected persons, however only 50% were aware that the use of a condom during sexual intercourse protect against the risk of infection. The majority (90%) agreed AIDS is a fatal disease, but only 40% were aware that no vaccine is yet available against AIDS and only 65% reported that AIDS could not be cured. Most students (85%) believe that AIDS is a serious problem and that it is important for them to know more about the disease through formal medical education.

W.E.P.76

ATTITUDES SUR LE SIDA ET COMPORTEMENT SEXUEL ENTRE LE PERSONNEL DE LA SANTÉ A LISBONNE: UNE ÉTUDE EXPLORATOIRE

TELES,Louise*, AMARO, F.**; DANTAS, A*
*Fondation Bom Sucesso,Lisbonne,Portugal;**Université Téchnique de Lisbonne et Fondation Bom Sucesso, Av.Dr.Mario Moutinho - 1600 Lisbonne, PORTUGAL

OBJECTIF: Etudier les attitudes du personnel de la santé face au SIDA en vue à l'etablissement d'un programme de formation et d'organisation des services.

MÉTHODE: La communication se base sur une enquête effectuée auprès de médecins et d'infirmières dans un Centre de Santé et dans un service hospitalier à Lisbonne (n=56). La recherche a utilisé un questionnaire auto-administré.

RÉSULTATS: L'étude a démontré des différences d'attitudes entre les infirmières et les médecins et les aspects suivants sont à noter: le SIDA est considéré comme le plus grand problème de santé par 27% des infirmières et 11% des médecins;parmi les maladies transmissibles par voie sexuelle 92% des infirmières et 75% des médecins considerent le SIDA comme la maladie la plus préoccupante; en ce qui concerne les formes de contagion, les médecins donnent une plus grande importance à l'homosexualité (46%) que les infirmières (19%), les infirmières (42%) donnent une plus grande importance aux relations hétérosexuelles que les médecins (18%), en ce qui concerne le risque de contagion périnatale, il est consideré par certains médecins et infirmières comme nul. Les médecins et les infirmières ont également montré des opinions et des attitudes différentes en ce qui concerne leur connaissance du SIDA.

Quant au dépistage du SIDA, les infirmières se montrent davantage d'accord avec le dépistage obligatoire (77%) que les médecins, (50%), pour les groupes de risque.

Les réponses face aux pratiques sexuelles montrent également des différences entre les médecins et les infirmières, les médecins ayant une plus grande tendance à accepter des pratiques telles que le sexe oral: médecins 71%, infirmières 46%; sexe anal: médecins 36%, infirmières 31%, homosexualité: médecins 29%, infirmières 12%.

Les médecins (57%) et les infirmières (85%) disent avoir peu de connaissance sur le SIDA et ils montrent des attitudes différentes en ce qui concerne la totale approbation de l'usage de préservatifs: médecins (7%) et infirmières (31%).

CONCLUSION: L'etude démontre l'existence de grandes différences d'opinion et d'attitude entre les infirmieres et les médecins, et aussi que les deux groupes considerent avoir peu de connaissance sur le SIDA. Ceci a permis l'élaboration d'un programme de formation qui est actuellement en cours dans le Centre de Santé où la recherche a été effectuée.

Th.E.P.1 CONTRACEPTIVE UTILIZATION IN AND OUT OF THE MARITAL SETTING: IMPLICATIONS FOR THE TRANSMISSION OF HIV IN KINSHASA.

Piripiri L*, Doppagne A***, Hassig SE *,**, Moore M*,**, Bertrand WE*,**, Kashala TD*
* Zaire School of Public Health, Kinshasa, Zaire; ** Tulane SPHTM, New Orleans, USA; *** Banque Comm Zaire, Kinshasa, Zaire

Objective: To determine and compare the level of contraceptive utilization in and out of the marital setting.
Methods: A working population in Kinshasa and their spouses were interviewed to obtain contraceptive and sexual histories.
Results: Overall 32% of 1063 monogamously married men(MMM) and 29% of 1084 monogamously married women(MMW) currently use contraception with their spouse. Condom usage with spouses was 2% in MMW and 3% in MMM, with 12% "regular" usage, primarily for pregnancy prevention. Thirty-five % of MMM and 2% of MMW acknowledged extramarital contacts(EMC) in the past year. Use of condoms in EMC was low (13%) and infrequent (23% regular use). Half knew that condoms were effective against HIV, and this was associated with condom use in marriage (p=0.002) but not in EMC. Use of condoms in marriage was 4 times higher in men and women with a history of EMC than those without EMC (p=0.07).
Conclusions: The potential for HIV transmission in this population is high, given the prevalence of unprotected extramarital relations. Education and counselling efforts for both family planning and prevention of HIV should take this into account.

Th.E.P.2 MODELLING THE SPREAD OF HIV/AIDS AND ITS DEMOGRAPHIC IMPACT: A REVIEW OF APPROACHES

United Nations Population Division Task Force on AIDS* and A. Palloni**
*United Nations Population Division, United Nations, New York 10017;
**University of Wisconsin, Madison, Wisconsin 53706, U.S.A.

Objective. To review models of the demographic impact of AIDS developed by selected authors in light of modelling approaches, data needs, assumptions, algorithms and usefulness for measuring the impact of selected interventions.
Methods. Numerical information is reviewed on the nature of the HIV agent, modes of transmission, duration from infection to AIDS to death, and regional patterns. Current models are reviewed and classified according to their ability to incorporate behavioural, biological and epidemiological elements, and measure the demographic impact of behavioural and other changes.
Results. Models requiring very few parameters are often uninformative from a policy perspective; those requiring many parameters were hampered by insufficient empirical data. Modelling results appear sensitive to assumptions of the shape of the incubation function, time distribution of infectivity, heterogeneity in sexual behaviour, and interaction among population groups.
Conclusions. In spite of shortcomings, models have already helped enhance our understanding of expected short and long-term demographic effects of vaccine development, behaviour changes and blood screening. The extent to which numerical results depend on assumptions of parameter values, distribution functions and model structures is not clear at present. The Population Division Task Force will be further investigating these issues as part of its efforts to synthesize the results of world-wide modelling efforts.

Th.E.P.3 RISK FACTORS FOR HIV-2 INFECTION

De Zalduando, B.*; Kanki, Phyllis*; Siby, T.**; Marlink, R.*; Essex, M.*; M'Boup, S.**; et al. *Harvard School of Public Health, Boston, MA, USA; **University of Dakar, Dakar, Senegal

Objective: To determine the risk factors and historical parameters associated with HIV-2 seropositivity in a cohort of prostitutes in West Africa.
Methods: An analysis of 139 registered female prostitutes was performed on a subset of approximately 1100 prostitutes registered at an STD clinic in Dakar, Senegal. The HIV-2 seropositive females in the subset had been matched by age, nationality and years registered in the clinic with seronegative females, yet still were representative of the entire clinic population in age (+ 2 years), nationality distribution and years in the clinic. The matched historical parameters were analyzed in relation to serostatus to HIV-2.
Results: In the subset of 139 prostitutes, as well as in the clinic population, a slightly higher seropositivity rate to HIV-2 was associated with an original nationality outside of Senegal. Also associated with significantly higher seropositivity was the "workplace" parameter usually seen with the non-Senegalese prostitutes ("Chez elle" or brothel setting), confounding the above observation.

Interestingly, the seronegative prostitutes in the subset were more likely to have been previously hospitalized and to have a history of transfusions. No association was seen with HIV-2 seropositivity and female circumcision, scarification, tattoos or previous vaccinations, such as BCG. In evaluating the historical parameters concerning the prostitutes' children, no difference was noted in seropositives versus seronegatives in the number, health status or infant/childhood mortality of their offspring. There was no difference in the age of first sexual encounter between seropositive and seronegative prostitutes. Estimates of the number of lifetime sexual partners, however, was significantly associated with seropositive status.
Conclusions: HIV-2, as with HIV-1, appears to be a sexually transmitted disease. Follow-up of this cohort will provide insight into the epidemiology of and parameters associated with HIV-2 infection.

Th.E.P.4 DETERMINANTS OF CONTRACEPTIVE PRACTICES AMONG INTRAVENOUS DRUG USERS IN NEW YORK CITY

Anthony Kouzi*, DC Des Jarlais**, SR Friedman*, S Tross*, A Abdul-Quader*
*Narcotic and Drug Research, Inc., New York, NY,USA
**New York State Division of Substance Abuse Services,New York,NY,USA

OBJECTIVE: To identify factors associated with contraceptive use among IV drug users in New York City.
METHODS: Structured interviews with 403 IV drug users recruited through street outreach in New York City produced information about contraception, AIDS risk behavior, and socio-demographic characteristics. Analyses used crosstabular and logistic regression techniques.
RESULTS: Forty-two per cent (167/403) reported current use of contraceptives or other forms of birth control. Thirty-three per cent (135/403) used condoms. Contraception was significantly positively associated with education, plans to have children, employment, number of sex partners, currently being in a sexual relationship, being non-Hispanic, and engaging in drug injection risk reduction practices. Contraception tended (p>.05) to be greater among younger and non-homeless subjects, but was not related to gender, having children, levels of alcohol use, or past psychiatric history. In stepwise logistic regression, the number of sexual partners, current sexual relationship, race, and making drug related behavior changes remain significant. Similarly, for condom use alone, the number of sexual partners, drug injection behavior changes, and involvement in a sexual relationship were significant predictors.
CONCLUSIONS: Among IVDUs, there is considerable contraceptive and condom use but not nearly enough to prevent pregnancy. Almost half of the sample practiced at least one form of contraception or birth control in an average month. These findings associating education, working, and contraception are consistent with the findings from general population surveys. Since contraception consisted mostly of barrier methods such as the use of condoms, this should serve to retard HIV spread through heterosexual and perinatal transmission.

Th.E.P.5 CHARACTERISTICS OF MEN IN THE NATIONAL MORTALITY FOLLOWBACK SURVEY WHO DIED OF AIDS

Powell-Griner, Eve*; Trent,K.**
*National Center for Health Statistics, Hyattsville,Maryland, U.S.A.; **State University of New York, Albany, New York, U.S.A.

Objective: To contrast the social and demographic characteristics, health care access and utilization, and disability prior to death of men dying from AIDS with those of other men.
Methods: Descriptive statistics are presented for data from a nationally representative sample of adults aged 25 or more who died in the USA in 1986. The sample consists of 18,733 decedents, 204 of whom died of AIDS. The data yields the first population level statistics on many characteristics of men dying from AIDS in the USA.
Results: Men dying from AIDS tended to be younger, more highly educated, and hold higher status occupations than other men. They were more likely to suffer disorientation and need help with daily activities. Caretakers of AIDS decedents were less likely to be family members and more likely to be visiting homemakers or nurses. Use of physicians, mental health professionals and hospice care was also greater among men dying from AIDS than others.
Conclusion: The social, demographic and health characteristics of men dying from AIDS are considerably different than those of men dying from other causes. Understanding these differences can help in developing programs to assist those who are infected with HIV. The NMFS data can provide information on many characteristics of AIDS decedents not available from any other source in the USA. As a nationally representative sample, the data can be used for generalizing to the population as a whole.

Th.E.P.7

CENTRE DE DEPISTAGE ANONYME VOLONTAIRE ET GRATUIT DE MEDECINS DU MONDE. PARIS. FRANCE.

AEBERHARD Françoise* ; LEBAS J* ; MASSE B* ; BEDOSSA A** COIGNET M.C**.
* Médecins du Monde. PARIS. FRANCE
** Laboratoires BEDOSSA. PARIS. FRANCE.

Objectif. En juillet 1987, Médecins du Monde entreprend une action contre la pandémie du SIDA, en créant le premier centre de dépistage anonyme et gratuit du V.I.H. en France. Cette démarche qui a permis d'informer et de sensibiliser les personnes face à l'extension de ce fléau, sera reprise par les pouvoirs publics six mois plus tard.
Méthodes. L'équipe est composée de bénévoles : 30 médecins hospitaliers et libéraux ; 5 psychologues ; 15 infirmières ; 1 personne d'accueil ; 1 statisticien. Nos critères sont l'accessibilité au test, le volontariat, l'anonymat, la confidentialité, la gratuité, et l'information personnalisée avec pour but la prévention. L'annonce de la séropositivité apparait un moment primordial et le travail de l'équipe psychologique nous semble important.
Résultats. Nous avons dépisté 4 280 personnes, dont 67% d'hommes, 33% de femmes. Le pourcentage de séropositifs est de 7,5%.
Conclusion. Il nous est apparu important de faire une étude sur le profil des personnes séropositives à partir du questionnaire anonyme et du carton réponse en reprenant certains critères : le sexe, l'âge, la catégorie socio-professionnelle, le comportement sexuel, la toxicomanie.

Th.E.P.8

ESTIMATING THE PERCENTAGES OF HIGH RISK GROUPS WHICH HAVE BEEN TESTED AND COUNSELED FOR HIV BY 1988. Judson, Franklyn; Douglas, J.; Davidson, A. Denver Public Health, Denver, Colorado, USA

Objective. To estimate the percentages of homosexual and bisexual men (GM) and heterosexual intravenous drug users (IVDU) ever tested/counseled for HIV.
Methods. Recent surveys indicate that about 3% of men aged 18-60 consider themselves homosexual or bisexual (GM) and thus are at potential risk of HIV infection. By December, 1988, Denver Public Health (DPH) alone had recorded 5,228 HIV testing/counseling visits by GM, or more tests than the estimated 4,524 GM in Denver's population of 510,000. Because this approach does not correct for multiple testing of individuals, we asked all patients making initial visits to the Denver Metro STD Clinic 1/1/88 - 9/30/88 if they previously had been tested for HIV and recorded the numbers tested during the current visit.
Results.

STD Clinic Patient Group	No. Visits	No. Previously Tested (%)	No. Tested/Retested Current Visit (%)	Total No. Tested (%)
Homosexual Men	833	548 (62.2)	369 (41.8)	708 (80.4)
Male IVDU	532	185 (34.8)	288 (54.1)	397 (74.6)
Female IVDU	275	122 (44.4)	174 (63.3)	233 (81.1)

Conclusion. Based upon a unselected sample of patients attending an STD clinic, we estimate that 60-80% of homosexual men and 40-75% of heterosexual IVDU have undergone HIV T/C. For GM, high rates of T/C acceptance, declining prevalence of HIV in recent T/C volunteers, a 1988 increase in new AIDS cases of only 10% over 1987, and dramatically falling incidence rates for gonorrhea, syphilis, and HIV infection affirm the success of 7 years of efforts toward safer sexual practices and bode well for eventual control of AIDS in this risk group.

Th.E.P.9

Emotional Impact of Voluntary HIV Antibody Testing
Perry, Samuel; Jacobsberg, L.; Fishman, B; Frances, A Novick, A; Rein, R; Cornell Medical Center, New York U.S.A.

Objective: To assess prospectively the psychological effects of HIV testing in conjunction with individualized pre-and post-test counseling.
Methods. Standardized measures of distress were completed 2 weeks before HIV test notification, immediately before and after notification, and 10 weeks later by 214 asymptomatic adults (138 gay/bisexual men, 25 IV drug users, 51 heterosexuals with suspected HIV-infected partners).
Results. For the 174 seronegatives, visual analogue scale (VAS) measures of anxiety and depression fell immediately upon notification compared to scores at entry and immediately before notification (all $p < .001$), even though most seronegatives (76%) had correctly predicted their results. Compared to entry values, their scores on VAS, Beck Depression Inventory (BDI), and State Trait Inventory (SAI) at 10 weeks after notification were all significantly decreased (all $p < .02$). Immediately after notification, the 40 seropositives had a transient increase in reported depression, but did not have significant increases in the VAS measure of anxiety. At 10 weeks, after notification and continuing psychoeducational counseling, VAS depression had returned to its baseline, BDI had decreased significantly ($p < .002$) and VAS anxiety had decreased below its values at entry ($p < .02$).
Conclusion. HIV serological testing when combined with individualized counseling was emotionally helpful for both seronegative and seropositive research subjects at two months following notification.

Th.E.P.10

HIV ANTIBODY TESTING BY CANADIAN GENERAL PRACTITIONERS AND FAMILY PHYSICIANS
Elmslie, Thomas *; Shearman,J. *; Busing N. *.
* University of Ottawa, Ottawa, Ontario, Canada.

Objective. To assess HIV antibody testing by primary care physicians in Canada. Methods. A mailed questionnaire survey was used to obtain information from a proportionate, random sample of Canadian general practitioners and family physicians, stratified by geographic region and size of community. Results. 80.4% of the physicians returned a completed questionnaire. Of the 833 respondents, 75% had ordered at least one HIV Ab test in the last two months. Of these 625 physicians, 66% stated that the test was patient-initiated over three-quarters of the time. 13% of physicians received at least one positive result. 72% of physicians always obtained informed consent, 22% never do; 68% always do pretest counselling; and 37% never do post-test counselling. Factors identified by logistic regression as being associated with those physicians who always pretest counsel and obtain informed consent include feeling at ease when pretest counselling, feeling concerned about HIV infection in their practice, and conduct routine risk assessment. 35% of all respondents stated they would inform the patient's partner of a positive result without the patient's consent, 32% would sometimes. Conclusion. Much of HIV testing is patient initiated. The importance of informed consent, carrying out pretest and post-test counselling needs to be emphasized.

Th.E.P.11

TELEPHONE SCREENING FOR MEN AT RISK OF HIV INFECTION
Lewis, C.E.,* Freeman, H.,* Montgomery, K.* University of California at Los Angeles, Los Angeles, California, U.S.A.

Objectives: To test the feasibility of conducting telephone interviews with a random sample of men in Los Angeles to determine their engagement in activities placing them at increased risk of HIV infection, and to assess the effects of feedback on their degree of risk (low/increased) on their follow up of this information.

Methods: Random digit-dialing telephone calls were placed to residences; men ages 18-60 were asked to participate in a risk-assessment interview. Those determined to be at increased risk were so informed and given a toll-free 800 number to call for further information, counseling, and referral for a free medical evaluation, if indicated.

Results: Seventy-percent of men contacted were interviewed; 1,610 interviews were completed, half in 18 census tracts, with an incidence of 19.2 cases of AIDS per 1,000 men. The rest represented all other areas of Los Angeles. 4.7% of men stated they were homosexual/bisexual. Of heterosexual men, 13.2% had >4 partners in the past 2 years. Rates of HIV testing were associated with degree of risk. Overall, 14.7% (adjusted for oversampling) of men in Los Angeles had been tested for HIV antibodies. Despite facilitating access to counseling/care, only 4% of those at risk took advantage of the assistance offered and called the 800 number.

Th.E.P.12

CAMPAGNE DE PROMOTION POUR LE DEPISTAGE VOLONTAIRE, ANONYME ET GRATUIT A LYON - FRANCE.
DUBESSY Bruno, LOZAT R., LIVROZET J.M. & ESTOURNEL J.L.
Médecins du Monde - Lyon, JUMP, MNEF.

L'association Médecins du Monde a réalisé à Lyon du 11 au 26 avril 1988, une campagne d'affichage publicitaire (sur 300 panneaux municipaux, 50 panneaux commerciaux de 4 m x 3 m, plusieurs centaines d'affichettes en milieu étudiant) pour promouvoir le dépistage volontaire, anonyme et gratuit.
Le slogan retenu était "Moi, je préfère savoir" et le support visuel le portrait d'une chanteuse populaire chez les 15 - 25 ans. Un numéro d'appel téléphonique gratuit était donné par l'affiche pour connaître les différents centres de dépistage anonyme, publics et privés, de la ville.
Cette campagne ciblant les jeunes reposait sur la théorie selon laquelle une personne connaissant sa sérologie (positive comme négative) est plus motivée pour respecter les mesures de prévention, par rapport à une personne en situation de doute.
Dans les six semaines qui ont suivi la campagne d'affichage, 6 800 appels téléphoniques ont été reçus, la fréquentation moyenne de tous les centres a été multipliée par trois. Au cours des consultations de rendus de résultats et d'information, un questionnaire épidémiologique était proposé aux patients. Le pourcentage de séropositifs dépistés pendant cette période a été plus faible que pendant les mois précédents (5%).

Th.E.P.13 ANONYMITY SOUGHT IN HIV ANTIBODY TESTING

Moulton, J.; Havassy, B.; and Dilley, James W.
University of California San Francisco School of Medicine, Dept. of Psychiatry and UCSF AIDS Health Project, San Francisco, California, U.S.A.

Objective. To determine HIV antibody test site client preferences for confidential versus anonymous antibody testing across two data collection points: 1987 and 1988.

Methods. In Study I (1987) and Study II (1988) 417 and 697 consecutive clients (respectively) from the San Francisco HIV Antibody Test Site were surveyed about their preferences for confidential versus anonymous testing prior to receiving their test results.

Results. Study I. Of the 326 respondents comprised of gay men, bisexual men, intravenous drug users (IVDUs), and heterosexual contacts with multiple partners, 46% reported they would not have taken the test if anonymity were not guaranteed. An additional 30% said they were not sure whether they would be tested under confidential procedures. Bisexual, gay, and IVDU respondents were significantly more likely to express doubt about utilization of other than anonymous testing procedures ($p<.0004$). Also prior to notification, seropositives and seronegatives differed in their response to the question ($p<.01$) with the majority of positives (71%) stating they would not be tested without a guarantee of anonymity. Study II. Results will be presented on 1988 preferences for confidential versus anonymous testing. Comparisons across time points, gender, race/ethnicity, and risk group will also be presented.

Conclusions. Based on 1987 data, the guarantee of anonymity in the testing process was an essential factor leading to utilization of the Antibody Test Site in San Francisco.

Th.E.P.14 ASSESSING THE ETHICAL AND POLICY IMPLICATIONS OF TESTING SURGICAL PATIENTS FOR HIV ANTIBODY IN THE USA

Copello, A. Gene*
*Vanderbilt University, Nashville, Tennessee, USA

Objective. To assess the ethical and policy implications of HIV antibody testing of USA surgical patients in the context of preventing occupational transmission of HIV in surgical settings.
Methods. 1) Review of data concerning: a) HIV occupational transmission in surgery, b) current status of HIV testing technology, and c) rationale advanced for antibody testing of surgical patients; 2) analyze the surgical health care worker and patient relationship regarding health promotion and maintenance; and 3) assess the scope of policy benefits and policy problems which may be generated by antibody testing in surgical settings.
Results. Review of data suggests that HIV occupational tranmission is a minimal risk, espcially when U.S. Centers for Disease Control (USCDC) recommended precautions are routinely followed. The current status of HIV antibody testing remains problematic due both to false negative and false positive results. In assessing ethical and policy issues, it appears that antibody testing on a mandatory level in surgical settings would generate more difficulties than benefits at the present time. It could also disrupt the normative ethics of the health care worker and patient relationship.
Conclusion. Mandatory HIV antibody testing for surgical patients in the USA is not recommended at this time. The routine offering of HIV antibody tests especially if clinically indicated, is recommended. Such testing should address counseling needs and patient consent.

Th.E.P.15 PRELIMINARY EVALUATION OF AN ADMISSION, HIV ANTIBODY, VOLUNTARY SCREENING PROGRAM IN A LARGE PRIVATE HOSPITAL

Harris, Richard*; Boisaubin, E.*; Salyer, P*, and Somands, D.*.
*The Methodist Hospital, Baylor College of Medicine, Houston, Texas U.S.A.

Objective: To evaluate an admission, HIV antibody, voluntary screening program in a large (1280 bed), private hospital as to testing compliance, attitudes, positivity rate, cost and confidentiality.

Methods: Data were obtained from The Methodist Hospital (TMH) Information Services, Virology Laboratory, and from individual patients' medical records. One hundred patients (50 who agreed to and 50 who refused testing) were interviewed.

Results: From 12/1/88 to 1/15/89 there were 3987 patients admitted to TMH; 2115 (53%) agreed to testing. There were 9 (.43%) true +, 3 (.15%) false +, and 3 (.15%) indeterminate results. Of the 9 true +, 6 were admitted for proven or probable HIV-related disease; all 9 patients were known to be in a high-risk category on admission. Informed consent for testing was obtained by admitting personnel, ward clerks, or nurses - seldomly by physicians. The most common reasons to agree to testing were "I wanted to know" (50%) and "I thought it was required" (28%). The most common reasons to refuse testing were "I'm not at risk" (48%) and "I was previously tested" (16%). Of the 100 patients interviewed, 85% felt that this screening program was in their best interest and should be continued. Cost of testing was borne by private insurance or by Medicare DRG payments. No problems with confidentiality were documented.

Conclusion: An admission, HIV antibody, voluntary screening program can be implemented in a large private hospital with favorable patient opinion and at least moderate patient compliance. If greater patient testing compliance is desired, better education and physician-patient interaction is suggested. In this low HIV+ -rate population, it is difficult to show that universal admission screening adds to a practical approach to hospital infection control. Although previously unknown HIV+ patients were discovered, the majority could have been predicted by a history of risk factors and this is a significantly more cost-effective method of HIV screening.

Th.E.P.16 EVOLUTION DES MOTIFS DE PRESCRIPTION DE SEROLOGIE VIH EN MEDECINE GENERALE EN AQUITAINE, FRANCE, 1987 - 88

Maurice, S.; Poumerol, G.; Vivares, C.; Debis, F.; Tilly, B.; Salamon, Roger,
Département d'Informatique Médicale, Université de Bordeaux II, Bordeaux, France.

Objectif . Etude de l'évolution de la prescription de sérologie VIH par les médecins généralistes et des facteurs influençant cette prescription.
Méthode . Un réseau télématique de surveillance épidémiologique par des médecins "sentinelles" répartis sur la région Aquitaine -2,720,000 habitants- a été mis en place en 1986. Depuis octobre 1987, 80 médecins généralistes transmettent des données concernant leurs prescriptions de sérologie VIH.
Résultats . En 15 mois, 566 sérologies VIH ont été prescrites, dont 20 (3,5%) ont été positives (confirmation par Western Blot). Le nombre moyen de prescriptions par médecin et par mois a augmenté de 20% (de 0,41 fin 1987 à 0,53 fin 1988). Dans 46% des cas, le test est prescrit à la demande du patient, et dans 54% des cas à l'initiative du médecin. Ces proportions sont restées stables au cours du temps. Les demandes de sérologies concernent aussi bien les hommes (52%) que les femmes (48%). On retrouve dans 40% des prescriptions un comportement à risque pour l'infection par le VIH . Dans 10% des cas il s'agit d'homosexualité/bisexualité, associée ou non à une toxicomanie, dans 5% des cas d'hémophilie ou d'antécédents de tranfusion, et dans 25% des cas d'un contact avec des partenaires hétérosexuels multiples ou à risque. Pour 60% des prescriptions (191 femmes et 147 hommes), aucun comportement à risque n'est identifié à l'origine de la demande. Dans ce contexte, la sérologie est demandée à l'occasion d'un examen prénuptial pour 41% des hommes et 35% des femmes, ainsi qu'à l'occasion d'une grossesse pour 41% des femmes. Lorsqu'aucun comportement à risque n'est identifié, des antécédents de maladies sexuellement transmissibles sont retrouvés dans 12% des cas ; cette proportion est de 18% chez les hommes et de 7% chez les femmes.
Conclusion . La demande de sérologie VIH en pratique généraliste libérale augmente régulièrement en Aquitaine. Plus de la moitié des prescriptions sont effectuées chez des sujets ne présentant aucun comportement à risque . Dans ce cas, le médecin est aussi souvent à l'origine de la demande que le patient . Les bilans prénuptiaux et prénataux sont souvent à l'origine d'une prescription.

Th.E.P.17 CARACTERISTIQUES DES CONSULTANTS D'UN CENTRE DE DEPISTAGE ANONYME ET GRATUIT DE L'INFECTION PAR LE VIH, BORDEAUX, 1988

Jost, Jean-Paul* ; Mamane, G.* ; Chaslerie, A.** ; Frossard, AM.*** ; Géniaux, M.* ; Salamon, R.**
* Service de Dermatologie, Hôpital Pellegrin, Bordeaux, France ; ** Laboratoire d'Epidémiologie, Université Bordeaux II ; *** Direction des Actions Sociales et de Santé de la Gironde, Bordeaux, France.

Objectif. Une enquête a été effectuée pour étudier le profil de la population consultant le centre.
Méthodes. Un questionnaire anonyme est rempli pour chaque sujet, par un médecin, au cours de la consultation. Une prise de sang permet ensuite de pratiquer de manière confidentielle ou anonyme, le sérodiagnostic (dépistage par un test Elisa, et confirmation par un test Western-blot).
Résultats. Du 1er Août au 31 Décembre 1988, sur les 685 tests effectués, 29 étaient positifs (4,2%). Pour 95% des consultants, il s'agissait d'un premier dépistage . Le sexe ratio homme/femme (H/F) est de 1,8:1, mais on trouve plus de femmes chez les moins de 20 ans (H/F=0,8:1) que chez les plus de 20 ans (H/F=2:1) ($p<0{,}002$). La tranche d'âge des 20-29 ans prédomine (51%), suivie de celle des 30-39 ans (25%). Les consultants sont le plus souvent célibataires (77%) et hétérosexuels (78%). Les homosexuels utilisent plus souvent les préservatifs (58%) que les hétérosexuels (27%) ($p<0{,}001$). Les toxicomanes IV représentent 12% des sujets testés. Les principaux motifs de demande de dépistage sont par ordre croissant : appartenance du partenaire actuel à un groupe à risque (7%), appartenance du sujet testé à un groupe à risque (23%), souci personnel lié aux relations sexuelles antérieures (45%) . Dans 55% des cas, l'anonymat est préféré à la confidentialité .
Conclusion. Le consultant type du centre de Bordeaux est un homme, jeune, célibataire, hétérosexuel, ayant en général des rapports sexuels non protégés, ne présentant pas d'autre comportement à risque, et demandant pour la première fois une sérologie par souci personnel. Ce profil correspond à celui des patients consultant habituellement pour des maladies sexuellement transmissibles.

Th.E.P.18 CHARACTERISTICS OF PATIENTS SUBMITTED TO HIV SEROLOGY IN A CLINIC FOR SEXUALLY TRANSMITTED DISEASE OF DOWNTOWN MONTREAL

Alary, Michel*; Castel, J.*; Olivier, C.**; Côté, S.** and Marchand, M.**. *Département de Santé Communautaire, Hôpital du St-Sacrement, Québec, Canada; **Clinique L'Actuel, Montréal, Québec, Canada.

Objective. To describe the evolution in time of sex, age, sexual orientation and prevalence of HIV infection in patients submitted to HIV serology in an STD clinic of downtown Montreal (Clinique L'Actuel).
Methods. All patients' charts with HIV serology reports were anonymously reviewed: serology results, age, sex and sexual orientation were recorded.
Results. 2,709 patients were submitted to 3027 tests for HIV from November 1985 to December 1988. The global prevalence was 15.8% in this population. The mean age was 30.8 years. The following table presents the time trends:

Semester/Year	Prevalence	% of women	% of heterosexual	N
2/85, 1/86	52.9%	2.1%	6.7%	140
2/86	38.0%	2.5%	10.4%	163
1/87	23.2%	13.2%	37.7%	448
2/87	10.2%	23.5%	54.3%	829
1/88	7.0%	25.9%	49.6%	715
2/88	10.4%	24.2%	48.8%	732

Conclusion. As expected, the prevalence of HIV infection in tested individuals decreased at the same time that the proportions of women and of heterosexual individuals increased in that population. However, the increased prevalence noted in semester 2, 1988, might reflect a recent increase of heterosexual transmission in downtown Montreal. This observation has to be confirmed by additionnal data.

Th.E.P.19 ALTERATIONS SOCIO-ECONOMIQUES ET COMPORTAMENTAUX DES PERSONNES INFECTÉES PAR HIV.

Menan, Janete Luzia Leite; Moura, E.M.M. et Morais de Sá, C.A.
Hospital Universitário Gaffrée e Guinle - UNI-RIO - Brésil

OBJECTIF: Identifier les alterations socio-économiques et comportamentaux que sont avec plusieurs fréquens dans les personnes infectées par HIV.

MÉTHODE: L'étude il a developper en train d'analiser les découverts que ont choisi dans les Promptuaires Sociaux de personnes HIV+ dans la période de mars à décembre 1988, totalizant 170 personnes infectées.

RÉSULTATS: Les alterations plus fréquentment observés, ont:

SOCIAUX	N	%	ECONOMIQUES	N	%	COMPORTAMENTAUX	N	%
Rejet familliaire	51	30	Démission	68	40	Engagement en batailles par le meilleurs conditions d'assistance et traitement aux infectés	25	15
Rejet des amies	170	100	Sous-emploi	83	49	Etat morbide	80	47
Rejet des professionels de santé	170	100	Eloigners pour le medicin de l'emprise	100	59	Transformation du comportement sexuel	39	23
Stigmatisation	170	100	Abandonées	20	12	Negation de l'accepter la possibilité d'être infecté par HIV	85	50
Discrimination	170	100						

CONCLUSION: Les alterations qui ont observés montre à la question de le stigmate, de le rejet et de la discrimination comme facteurs que provoquent les autres alterations d'écris. Nous craions que travers d'un ample programme d'orientation et d'education extensif à toute la population, cette chaîne puisse être interrompie.

Th.E.P.20 FUNK AND EPIDEMIOLOGY: VIRAL DIALECTICS IN THE SOUL MUSIC OF PRINCE.

Harrington, Mark; Barr, D.; Vazquez, R.; Deagle, R.
AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To elucidate the hitherto unexamined impact of the HIV epidemic as deployed in motifs of the seminal work of a major 1980's musician. Methods: Analysts listened to, read the lyrics of, danced to and attended concerts containing material from the albums SIGN "O" THE TIMES and LOVESEXY. Discussion: "In France a skinny man died of a big disease with a little name. By chance his girlfriend came across a needle and soon she did the same." "Positivity. Have U had your plus sign 2-day? Positivity. Do we mark U present or do we mark U late? ... Where did it come from? What did U have 2 do? Can U sleep nights? ... Positivity. Have U had your plus sign 2-day?" Conclusion: "Hold on 2 your soul. We've got a long way 2 go." (In concert:) "Cross the Line!"

Th.E.P.21 STUDY OF THE PREVALENCE IN A HIV TESTING CENTER

Defourny, Joëlle; Krings, M.; Mauchard-Marique, D. and Bachelet, J.F.; Sondag-Thull, D.
AIDS Reference Laboratory, Université de Liège, Belgium.

Objective: The AIDS Reference Center of the University of Liège has developed a program to evaluate the HIV seroprevalence in relation with motivations of consultants and actual risks of transmission.

Methods: A preliminary interview with the consultant is held with each team member and a confidential epidemiological survey form is filled. Seroprevalence is determined by classical serological methods (EIA, WB).

Results:

Motivations	*Percentage*	*Evaluation of real risks*	*Seroprevalence*
to be reassured	44%	none	0%
multiple heterosexual relationships	17%	±	0%
homosexual relationships	9%	+	2%
IV drug users	3.5%	+	1%
sexual relationship with seropositive	6%	+	1%
professional risks	4%	-	0%
others	16.5%	-	0%

Conclusion: In Belgium, the seroprevalence rate among blood donors is 2/100,000. In our AIDS Reference Center, this rate is 4/100 among people requiring a HIV test. The rate climbs to 1/9 in the population considered at risk.

Th.E.P.22 PREVALENCE OF ANTI HIV ANTIBODIES IN PHIHISICE - SOROCABA (SÃO PAULO) - BRAZIL

GONCALVES, V.L.C-Dos anjos, R.M.P.-Gomes, M.C.O.-Ramos, T.F.

Prevalence of anti HIV antibodies was investigated in 100 internal patients of CONJUNTO HOSPITALAR DE SOROCABA (CHS) Thisiology Infirmary thourong ELISA recombined test, in a period going from May 12, to August 20, 1987. All patients were of male gender, their age varying from 16 to 86 years (medium age 36 years). 36% of them of white colour and 50% single.
In the epidemiological examination realized later, to select persons with AIDS-risky behaviour, we verified:

a) 14% of the patients were homosexuals or bissexuals.
b) 58% of the patients had antecendents of sexual transmissible diseases.
c) 50% of the patients donated or received blood.
d) 26% of patients
e) 05% of the patients were using injetable drugs.

5 Soropositives (5%) were encountered, being minimum 23 and maximum 33 years old (medium 28 years); four (4) of them where white and single. All presented a risk factor (one or more) for AIDS Virus infection: Being 04 homossexuals or bissexauls (two of them were using injectable drugs) and 1 blood receptor, with a total of 2 tranfusions.
For the five (5) HIV (+) patients, one was blood donor, one has been jailed, and 3 admitted that they had transmissible sexual diseases, and in the medical examination, two of them had signals and symptoms related to AIDS.
After leaving the infirmary, they were sent to health centers, near their house, for attendance. Only one belonged to our district and died after presenting disseminated Sarcoma Iaposi.
M. Tubercolosis encountered in individuals with AIDS has been related with relative frequency, appearing before AIDS, concomitantly after the diagnostic of the infection by HIV.

Th.E.P.23 SOCIAL ACCEPTABILITY OF HIV SCREENING AMONG PREGNANT WOMEN.

Moatti Jean Paul, (1), Le Galès C (1), Pr Henrion R. (2) et Pr Papiernik E. (3)
(1) INSERM Research Unit 240, Paris, France. (2) Obstetrics and Gynecology Port-Royal, Paris, France. (3) Obstetrics and Gynecology Antoine Béclère, Clamart, France.

Since 1987, free HIV screening is systematically proposed, at their first prenatal visit, to all pregnant women attending 9 obstetrical clinics of public hospitals in Paris region. During December 1987 and January 1988, a questionnaire in written form was submitted, just before HIV screening proposal, to all women attending two of these clinics: response rate was 97% and 400 questionnaires were analyzed.
Respondents were significantly older (68% between 25 and 35 years of age) and had a higher level of education than the general population of pregnant women in the region (Civil Census Data).
26.4% declared having already been tested for HIV (43.8% of these tests have been prescribed during ambulatory prenatal care). *93.7% knew, before attending clinics, about the risk of transmission of HIV from mother to fetus.* 92.7% having learned about it through the media. 94.2% believed in such transmission during pregnancy, 29% during delivery, 11.1% through breast feeding, and only 2% by taking care of child after birth.
92% supported systematic HIV screening proposal during pregnancy. 81% thought that female HIV carriers should renounce to pregnancy, and 80% supported abortion proposal for pregnant HIV carriers.
Among women already tested before attending clinic, 9.5% perceive themselves as being "more than average" at risk for HIV; among women not already tested but having previously thought about testing, 15.5% are in this category vs only 2.8% among others (p<0,01). *It suggests an important effect of reassurance of testing. High acceptability of screening is also revealed by the fact that 70% were ready to financially participate in order to get access to testing.*

Th.E.P.24 PSYCHOSOCIAL PREDICTORS OF PEOPLE WHO FAIL TO RETURN FOR THEIR HIV TEST RESULTS

Catania, Joseph; Kegeles, S.; Coates, T.

University of California, San Francisco, Center for AIDS Prevention Studies, U.S.A.

Objective: Although the majority of people who seek HIV antibody testing return for their results, a substantial minority fail to return. An understanding of the barriers to returning for test results is important to HIV prevention efforts that depend on people having knowledge of their HIV antibody status.

Methods: Data were collected from 997 individuals seeking HIV antibody testing at free anonymous test sites in California (96% volunteer rate). Respondents were assessed (self-administered questionnaires) when they came to have their blood drawn and reassessed when they returned for their test results two weeks later.

Results: Twenty-eight percent did not return for results (n=287). Relative to returnees, non-returnees were more likely to be of lower educational level, more anxious about contracting AIDS, less knowledgeable about HIV testing, and more likely to be young transfusees; groups did not differ on sexual orientation, gender, race, age, marital status, reasons for seeking testing or knowledge of HIV transmission routes.

Conclusion: Efforts are needed to motivate young transfusees, and those with less education to obtain their test results; more on site counseling to reduce anxiety and increase knowledge of test results may enhance return rates.

Th.E.P.25 A CONFIDENTIAL PUBLIC HEALTH HIV TESTING CLINIC AS AN ACCEPTABLE ALTERNATIVE TO ANONYMOUS TESTING

Rekart, Michael L.; Cook, D.; Black, W. B.C. Centre for Disease Control, Ministry of Health, Vancouver, British Columbia, Canada

Objective To analyse the results of 5,189 HIV antibody tests done over a 39-month period at a combined AIDS Testing and STD Clinic operated by a provincial government in Canada and to compare this confidential service with anonymous testing by private physicians.

Methods Testing in British Columbia is free-of-charge and available through any physician and through the Vancouver VD Clinic. Patients seen in the clinic are required to provide identifying information but tests done by physicians outside the clinic do not involve the transfer of identifying data to Public Health.

Results Of 5,189 tests performed on clinic patients, 220 (4.2%) were reactive. Over the same time period, 1,944 of 53,116 tests performed by private physicians were reactive (3.7%). The demand for testing through both sources rose significantly over the 39 months and seroprevalence rates dropped from 16-17% to 2-3%. The following seroprevalence rates were recorded at the clinic: 206 of 3,733 tests on males (5.5%); 12 of 1,371 tests on females (0.9%); 194 of 1,268 tests on homosexual/bisexual males (15.3%); 10 of 2,152 tests on sexually-active heterosexuals (0.5%); 2 of 335 IVDUs (0.6%); 1 of 23 homosexual IVDUs (8.7%); 1 of 38 female IVDU prostitutes (2.6%); none of 22 non-IVDU female prostitutes; and 2 of 85 blood transfusion recipients (2.4%).

Conclusion Non-anonymous HIV testing through a public health clinic is an effective and acceptable alternative to anonymous testing through private physicians. Homosexual/bisexual males in Vancouver are heavily infected with HIV but heterosexuals and IVDUs are thus far relatively spared.

Th.E.P.26 FACTORS AFFECTING THE DECISION TO REFUSE HIV TESTING AMONG HAITIAN IMMIGRANTS IN MONTREAL

Adrien, Alix*; Hankins, C.A.*; Tousignant, Y.**; Boivin, J.F.*.
Community Health Department, Montreal General Hospital and *McGill University, **Université de Montréal; Montréal, Québec, Canada.

Objective. To identify factors associated with acceptance or refusal of anti-HIV testing in Montrealers of Haitian origin.

Methods. In an ongoing study of knowledge, attitudes and practices related to AIDS in the Montréal Haitian community, anti-HIV testing and appropriate counselling about the test were offered. Subjects could participate in the study and yet refuse the test component. Acceptance or refusal of the test as well as reason for refusal were noted on each questionnaire. Analyses were conducted to identify differences between the "accept" and "refuse" groups and between the reason-for-refusal sub-groups which numbered four.

Results. Of the 264 study subjects, approximately 40% (107) accepted anti-HIV testing and 60% (157) refused. Few significant ($p<0.05$) and meaningful differences were found. Subjects who accepted the test were proportionally more likely to have had occasional sex partners in the past, to currently be in a steady relationship, to have changed their sexual behavior because of the advent of AIDS, to have ever thought of having the test, to have a higher income, to see condom use more positively, and to be more in favor of mandatory anti-HIV testing for immigrants and everybody else. Within the refusal group, the reason for refusal of the test was not associated with any particular characteristic of the study subjects.

Conclusion. Acceptance of anti-HIV testing among Haitian Montrealers seems to be influenced by positive attitudes towards the test itself and by self-reported behavior change in response to the AIDS crisis.

Th.E.P.27 Anxiety and attitudes to HIV testing in an ante-natal clinic.

L. Sherr, C. Victor, A. Stevens - St. Mary's Hospital London, U.K.

Objective:- Monitor the psychological cost of HIV Screening in Pregnant Women.

METHOD:- 140 women attending routine A/N in the area of highest incidence in the U.K. were questioned about HIV testing, routine testing and anxiety & attitudes surrounding these. Mean age 27.1 years, 52% were primiparous and 48% were multiparous. They were born in 23 countries. 57% were married, 18% coupled and 24% single.

RESULTS:- Although 82% thought women had the right to be offered a test, 39% would refuse if asked personally and 10% were unsure. If anonymous blood was tested 37% would mind. HIV raised more anxiety than other routine tests. (% anxious for B/P = 5%; other blood tests = 11%; scan = 15%; HIV = 50%). On the other hand reassurance from such tests was low (1 in 5 would be reassured by the HIV test compared to 1 in 2 by a scan). AIDS & HIV usually generate a high information demand but here 24% wanted a lot more, 17% a little more, 50% no more and 10% wished they had less! Only 2 women had discussed anything to do with HIV with a doctor. Simply carrying out the survey generated much staff concern.

CONCLUSION:- There is a high emotional cost to HIV testing in pregnancy and routine policies need to proceed with caution.

Th.E.P.28 HIV TESTING AND COUNSELING PRACTICES IN THE UNITED STATES: A DESCRIPTIVE NATIONAL STUDY

Cohen, Felissa L.*
*University of Illinois College of Nursing, Chicago, Illinois, United States

Objective: To describe the HIV testing and counseling practices at various types of sites in the United States.

Methods: A questionnaire was developed for this study and subjected to procedures to establish content validity. The tool was mailed to 400 randomly selected HIV testing sites selected from a combined list derived from information provided by CDC and state health departments. The final sample size was 258, and the response rate was 65.7%. 92 (35.7%) of respondents were located in higher AIDS prevalence states.

Results: 23% of respondents conducted anonymous testing only, 20.2%, confidential only, and 56.8%, both. Fees charged ranged from $0.00 to $100.00 (mean = $4.05, s.d.= 10.67). HIV testing/counseling programs located in general health departments were significantly less expensive, saw fewer clients per month, had a lower percentage of HIV positive test results and were more likely to be conducting testing in lower AIDS prevalence states than were other types of sites (e.g. hospital clinics). In 85.4% of respondents, it was policy for clients to see the same person for pre/post counseling if possible. Nearly half of the respondents (45.8%) indicated that if a person who was well known in the community came to their site for a HIV test it could be known why they were there despite procedures in place. Description of content covered in counseling, waiting time, and cost comparisons for high and low AIDS prevalence states will be presented.

Conclusions: Conclusions derive from the results above.

Th.E.P.29 IMPACT OF EXPERIENCE WITH AIDS ON HIV TESTING PATTERNS: AN ANALYSIS OF MINNESOTA AND U.S. HOSPITALS

Campbell, Scott*; Thurn, J.R.*; Maki, M.**; Willenbring, K.* and Henry, K.*†.
*Department of Medicine and **Infection Control, St. Paul-Ramsey Medical Center, †University of Minnesota Medical School, St. Paul, Minnesota, U.S.A.

Objectives. To obtain data on three issues regarding HIV antibody testing in key U.S. and Minnesota hospitals: how often patient consent is obtained; how often that consent is documented; how often adequate risk-reduction counseling is done in conjuction with HIV antibody testing.

Methods. In February 1988 surveys were sent to infection control departments at the 200 hospitals in the U.S. which conduct infectious disease (I.D.) fellowship training and to all 171 short-term care Minnesota hospitals, as a follow-up to a previous study (JAMA 1988; 259: 1819-1822). The survey included one item related to each of the three issues above. Respondents were asked to circle a response. The response set range for each item was 0%-100%, divided into 10% increments.

Results. Responses rates and results were:

	U.S. I.D. hospitals	Minnesota hospitals
	U.S.: 124/200; 62%	Minnesota: 133/171; 78%
1. Freq. of obtaining consent for testing	mean = 70.1%; S.D.= 33.9%	m = 35.2%; S.D.= 41.6%
2. Freq. of consent documentation	mean = 62.9%; S.D.= 37.1%	m = 33.7%; S.D.= 42.3%
3. Freq. of risk reduction counseling	mean = 52.8%; S.D.= 30.8%	m = 21.8%; S.D.= 31.7%

The U.S. hospitals were separated into 3 groups according to the number of AIDS patients served. ANOVA testing found that hospitals serving a higher number of AIDS patients tended to give higher estimates on each of the items ($p < .05$). A similar trend was found among the Minnesota hospitals.

Conclusion. HIV testing practices vary widely from hospital to hospital in the U.S. and Minnesota. Hospitals serving more HIV+ patients are probably more likely to obtain and document consent for HIV antibody testing and to provide risk-reduction counseling in conjunction with testing. Positive changes in HIV testing practices were not apparent (JAMA 1988; 259: 1819-1822). The need for practice improvement continues, especially in areas of lower incidence of HIV infection.

Th.E.P.30 CHARACTERISTICS AND RESPONSES OF MEN SEEKING HIV ANTIBODY TEST RESULTS

Ostrow, David*; Joseph, J.*; Beltran, E.*; Chmiel, J.** and Phair, J.**
* University of Michigan, Ann Arbor, MI, USA, ** Northwestern University Medical School, Chicago, IL, USA.

Objective: To determine whether there are subgroups of gay/bisexual men who respond differentially to learning their HIV antibody (HIV-ab) status.

Methods: This is a continuation of the collaborative Coping & Change Study (C&CS)/Chicago MACS examination of the behavioral and mental health consequences of HIV-ab disclosure (AIDS Education & Prevention 1, 1-11,1989). We compared the 63 men who requested their HIV-ab status within the first 6 months those results were available to the 79 men requesting results later, and the 819 men whose results were not disclosed (ND). Also, the baseline characteristics and mental health responses of men showing behavioral change after learning HIV-ab status (responders) were compared with men who did not change (non-responders).

Results: Earlier study showed no aggregate behavioral consequences of HIV-ab disclosure. Current analyses focus on identifying the men who did and did not positively respond to antibody results with behavioral risk reduction. Responders had higher levels of risk, higher anxiety and depression levels, and were of lower socioeconomic status than non-responders. No differences were observed in terms of self-perceived risk of AIDS, health status, reasons for seeking disclosure, or attributes considered important for health related behavioral changes. Seropositive responders were more likely to delay seeking HIV-ab results and experienced the most prolonged elevations of mental health symptoms following disclosure.

Conclusions: These results suggest that there are subgroups of homosexual/bisexual men, based upon socioeconomic, behavioral, and mental health characteristics, which respond differentially to learning HIV-ab status. The implications of these findings to the design of HIV-ab testing and counseling programs need further consideration.

Th.E.P.31 PREMARITAL SCREENING FOR ANTIBODIES TO HIV-1 IN THE U.S.

White, Carol, Petersen L, and the Premarital HIV Screening Study Group, U.S.A.

Objective. To evaluate premarital (PM) HIV screening in the United States. Methods. 1) Surveyed all states to determine which had PM HIV legislation. 2) Compared number of marriages from 1/88-8/88 to similar months in previous two years to determine the impact of mandatory PM HIV screening laws in two states. 3) Conducted blinded HIV seroprevalence surveys of marriage license applicants (MLA) using routine PM syphilis serology specimens in 8 areas. Results. PM HIV legislation has been proposed in 36 states. Mandatory PM screening (started 1/1/88) in Louisiana and Illinois resulted in 14% and 13% fewer marriages and repeal of the Louisiana law (7/88). Blinded surveys of MLA showed prevalences similar to military recruit applicants (MRA).

Area	Date	MLA % POS (N)	95% C.I.	MRA % Pos*	Adult AIDS**
Alabama	11/87-01/88	0.21 (4694)	0.11-0.40	0.12	136
Alameda Co., CA	11/85-08/87	0.66 (1522)	0.34-1.25	0.48	819
Long Beach, CA	03/87-08/87	0.00 (277)	0.00-1.08	NA	NA
Connecticut	01/88-04/88	0.33 (1494)	0.12-0.82	0.28	381
Georgia	10/87-10/88	0.23 (5663)	0.13-0.40	0.32	342
Mississippi	02/88-12/88	0.00 (2226)	0.00-0.13	0.08	109
Albuquerque, NM	12/87-06/88	0.18 (541)	0.01-1.18	0.05	225
Oklahoma	03/87-07/88	0.07 (8144)	0.02-0.15	0.09	128

*Age- and sex-adjusted to MLA; **Incidence per million population ≥13 years

Conclusion. HIV antibody prevalences in MLA were as high as 0.66%. Mandatory PM screening resulted in fewer marriages in two states. Voluntary PM screening may be justified in high AIDS incidence areas.

Th.E.P.32 THE EFFECT OF MANDATORY AIDS EDUCATION ON VOLUNTARY HIV TESTING IN PRISONS

Andrus,Jon*, Fleming,D.**; Knox,C.***; McAlister,R.**; Horan,J.*; Foster,L.**; *Centers for Disease Control, Atlanta, Ga., U.S.A., **State Health Division, Portland, Ore., U.S.A., ***State Department of Corrections, Salem, Ore., U.S.A.

Objective. To assess whether mandatory interactive AIDS education leads to fewer at-risk inmates refusing to be HIV tested and counseled.
Methods. We divided 1477 consecutively admitted inmates into two cohorts by date of admission: the first admitted 9/87-12/87 received only a 10 minute videotape on AIDS (n=966) and the second, admitted 1/88-2/88, received the videotape and a mandatory interactive session with an AIDS counselor (n=511). All inmates were then offered HIV antibody (HIV Ab) testing. HIVAb status for inmates declining testing was determined by testing serum routinely drawn for syphilis serology after personal identifiers had been removed. All sera were also tested for hepatitis B core antibody (HBcAb). Results were linked to a questionnaire that assessed the inmates history of risk behaviors administered after the education was given.
Results. Sixty-three percent (927) of all the inmates were at risk for HIV infection defined as being positive for either HBcAb, IV drug use, and/or male homosexual. The cohorts were not different in their proportion of at-risk inmates (62.4% in the first and 63.4% in the second). Nineteen inmates were HIV Ab positive (1.3%, 95% confidence limits [CL] 0.7%, 1.9%). Compared to at-risk inmates who did not receive interactive AIDS education, at-risk inmates who received interactive AIDS education were 25% less likely to refuse testing for HIV (79/324 vs. 192/603, p=0.02). IV drug users who recieved interactive education were 23% less likely to refuse testing than IV drug users who did not receive education (63/279 vs. 155/512, p=0.03). HIV positive inmates who received education were 67% less likely to refuse testing than HIV positive inmates who did not receive education (1/7 vs. 5/12).
Conclusion. Providing mandatory interactive AIDS education before offering HIV testing may lead to fewer at-risk inmates refusing to be tested and counseled.

Th.E.P.33 A REPORT ON A NEWLY DEVELOPED AIDS INTERVENTION PROGRAMME IN MONTREAL.

Yuen-Boyer, Marlene; Bates,F.;Paquin,C.; Schoel,G.
CLSC Métro (Centre local de services communautaires), Montreal,Qué., Canada

Objective: To develop a comprehensive AIDS programme for the population at large that incorporates education, anonymous H.I.V. testing, follow-up counselling and medical support, with the objective to examine who, of the population at large, is using the service and to isolate the seroprevalence rate of this particular population. Method: Through a co-ordinated mandate by the Ministry of Health and Social Services and the CLSC Métro -Youth and Women's Clinic, the AIDS Intervention Centre was conceived. A staff of 4 counsellors were hired to provide the necessary education and counselling component to this programme. In-service education was provided for all support staff, both professional and non professional of CLSC Métro - Youth and Women's Clinic to assure consistency and sensitization. Telephone information, pre and post counselling, psycho-social support, follow-up and referral are provided to all beneficiaries of this programme.
Results: Since the initiation of the programme, we have tested (to date)337 individuals, which shows a seropositivity rate of 5.4%. This seropositivity rate is represented exclusively (100%) by the homosexual population.
Conclusion: This particular, comprehensive approach to H.I.V. testing is most commonly utilized by the "worried-well" population, but also reveals a seropositivity rate consistent with the prevalence rate of homosexual population which is a targeted high-risk group.

Updated statistics available on day of conference.

Th.E.P.34 SEXUALITY AND HIV TRANSMISSION IN KAGERA REGION, TANZANIA.

DR. GEORGE K. LWIHULA, FACULTY OF MEDICINE
P.O. BOX 65015 DAR ES SALAAM TANZANIA.

Kagera Region accounts for more than 60% of the total AIDS patients in Tanzania. A Sero-Survey based on healthy individuals in the area revealed prevalence rates ranging from 33% in urban areas to 10% in the rural areas. Transmission of the infection is largely heterosexual. However, no study has ever delved into the cultural factors governing sexual behaviours of the people in the area. This one year anthropological study is a contribution in that direction. It highlights on the cultural construction of sexuality among the people of Kagera with a view of designing appropriate control measures against AIDS pandemic in the area.

Th.E.P.35 SEXUALITE ET CONNAISANCE DU SIDA CHEZ LES LYCEENS ET LES JEUNES FEMMES DE DAKAR ET BANLIEUE

YOUSSOUPH M'BARGANE GUISSE ET LUDOVIC D'ALMEIDA PLURALE BP. 5356 DAKAR, SENEGAL

OBJECTIFS Les objectifs de cette enquête sur le SIDA visent à déterminer des groupes cibles, d'évaluer leur niveau de connaissance de la maladie, d'identifier les pratiques, habitudes et conduites culturelles autour de la sexualité, la contraception, les MST et le SIDA, de participer à la conception de l'information, de participer à la conception et à la realisations des actions de prévention du SIDA. Les groupes cibles sont ici des individus en activité sexuelle évidente: des femmes fréquentant des centres de PMI nombre de 400 au et des individus seuil réel désiré d'activités sexuelles: des lyceens (ennes) de collèges à Dakar au nombre de 122.
METHODOLOGIE: Un questionnaire comprenant le 4 grands thèmes envoyés a été élaboré et complèter par des interviews semi- directives industrielles et collectives.

RESULTATS: Les résultats de l'enquête montre que la sexualité du niveau de celle de la population cible est très libre: précocité, fréquence des rappots sexuelles, multipartenariat, recherche de plaisir multiforme. Ceci avec des nuances en rapport avec le niveau d'instruction, le sexe. Utilisation relativement faible des preservatifs ainsi que le multipartenariat encore persistant montre le divorce existant entre un niveau d'information grandissant et des moeurs et pratiques sexuelles très peu contrôlées. CONCLUSION: L'enquête ouvre des pistes pour améliorer et créer des instruments d'information plus adéquats et plus conformes aux réalités sociologiques et culturelles.

Th.E.P.36 THE ROLE OF IV DRUG WITHDRAWAL SYMPTOMS AND SYMPTOM ANTICIPATION IN AIDS RISK-REDUCTION

Margaret M. Connors, Spectrum House, Inc., 155 Oak St., Westboro, MA 01581 USA

Objective. To describe the experience of withdrawal within the social context of drug use and HIV-related risk activities. To determine the influence of withdrawal on the continuance of high-risk practices.
Methods. A 20-item questionnaire was administered to 130 IV-drug using individuals at a methadone maintenance facility, a detoxification unit, and a drug-free residential facility. 15% of those surveyed were followed with an in-depth interview. Self-reported information was amplified with ethnographic observations "on the street."
Results. Interpreting the withdrawal experience in a context of drug use reveals an illness category more complex than that illicited from a clinical diagnosis. The withdrawal experience affects an individual's ability to prevent AIDS transmission. 52% of those sampled who indicated that "it had come to mind that the person they were about to share a needle with might be HIV-infected" did not act on this thought in the form of prevention. Perceived withdrawal sickness was a prominent reason for not taking preventative action.
Conclusion. Interpreting the withdrawal experience in its natural context can shed light on the meaning, experience and actions taken to alleviate symptoms of withdrawal and some of the barriers to integration of needle cleaning during needle sharing episodes. AIDS outreach education could prove more effective if, as part of the negotiation with active users to adopt needle-cleaning practices, withdrawal symptoms were addressed as a problem area.

Th.E.P.37 A CROSS-CULTURAL PERSPECTIVE ON AIDS-RISK-RELATED SEXUAL BEHAVIORS AS DEPICTED IN ART THROUGHOUT HISTORY

June M. Reinisch, M. Ziemba-Davis, and S.A. Sanders
The Kinsey Institute for Research in Sex, Gender, and Reproduction, Indiana University, Bloomington, IN USA

Objective. To demonstrate that behaviors related to sexually transmitted diseases in general, and to acquired immune deficiency syndrome (AIDS) in particular, do not represent newly emerging patterns of human sexuality.
Methods. Drawing on the archives of The Kinsey Institute, we will provide examples of the representation of at-risk sexual behaviors in art and artifact from cultures around the world dating from 400 years before the Christian era to the present.
Results. Our review, which begins with the classical works of Greece and Rome where some of the earliest realistic representations of sexual behavior have been found and includes examples of erotic materials from the cultures of Prehistoric Peru, China, Japan, Persia, Africa, Latin America, Western Europe, and the United States, clearly demonstrates that behaviors implicated in the transmission of HIV are neither new nor rare.
Conclusion. Even the most cursory examination of the archaeological and ethnographic record reveals art, artifacts, literature, and ephemera that reflect the ubiquitous, panhistoric, and omnicultural nature of those behaviors implicated in the transmission of human immunodeficiency syndrome (HIV).

Th.E.P.38 TRADITIONAL HEALERS AND AIDS AMONG THE YORUBAS IN NIGERIA

Jinadu, M.K., Ajuwon, B. and Jaiyeoba, D.A.

Obafemi Awolowo University, Ile-Ife, Nigeria

Objective: To identify knowledge, attitude and practice of Yoruba traditional healers as regard AIDS.

Methods: Some well-known traditional healers in Ondo and Oyo States of the Country (N=25) were purposively selected for the study. Non-structured, indepth interview method was used.

Results: The study shows that 88% of the traditional healers believed that AIDS is not a new disease and that it is curable and preventable. Nearly all the traditional healers believed that it is acquired only through sexual intercourse.
Few of the traditional healers believed it is a variant of a syndrome called MAGUN among the yorubas and, therefore, claimed to have a cure for it.

Conclusion: These beliefs probably exert considerable influence on health seeking behavours of the communities in relation to AIDS. Implications of the findings for the prevention of HIV infection and care of AIDS patients in the country are discussed.

Th.E.P.39 AIDS - KNOWLEDGE, ATTITUDE AND PRACTICE IN A DEPRIVED URBAN AREA OF NAIROBI, KENYA

Kinuthia, Doris M.W., Orinda, V, Brady J.P. and Meme, J.S.
Department of Paediatrics, University of Nairobi, Nairobi, Kenya.

Objective. To determine the knowledge, attitude and practice about AIDS in a deprived urban area of Nairobi.
Methods. A random sample of 372 adults (sex ratio 1:1) were interviewed in Kibera, Nairobi. In this area there is no running water, no electricity and unemployment is over 50%.
Results. Knowledge: Almost all (98.4%) had heard about AIDS mainly from the radio or other people. Eighty-eight percent knew that sexual intercourse, 50% that infected blood transfusion and 48% that unsterile needles were major risk factors. Eighty per cent knew that avoidance of multiple sexual partners and having one faithful partner would reduce the risk of AIDS and only 3% thought that a vaccine or medicine would help. Eighteen per cent knew someone with AIDS and 73% knew that there is no cure.
Attitude: They shared the universal fear of an AIDS patient; 46% would avoid all physical contact and 55% would not share food, utensils, toilets or baths. However, 54% would take someone for treatment.
Practice: To avoid catching AIDS only 30% had considered reducing the number of sexual partners and less than 1% would use condoms.
Conclusions: Our findings suggest that, in a deprived urban area, knowledge about AIDS was excellent but that it had not yet influenced behaviour. Thus, education alone may not reduce the spread of AIDS.

Supported by UNICEF

Th.E.P.40 CONNAISSANCE DU SIDA: REPRESENTATIONS ET PRATIQUES POPULAIRES EN AFRIQUE CENTRALE

Schoepf, Brooke G.*, Schoepf, C.**
* Projet CONNAISSIDA, Kinshasa, Zaire;
** Woods Hole, MA, USA

Objectifs. Etudier les représentations et pratiques populaires connexes au SIDA. Offrir des exemples concrets pour élucider les divers modèles étiologiques sur lesquels sont fondées les réponses au SIDA.
Méthodes. Observation-participante, entrevues et recherches bibliographiques.
Résultats. La persistance de croyances très anciennes dans les domaines de la sexualité, de la procréation, de la vie, de la maladie et de la mort offre des échappatoires devant la nécessité de changement. Ces croyances persistent malgré la présence d'idées nouvelles disséminées par les institutions d'information contemporaines. Néanmoins, la compartimentalisation des connaissances permet d'agir une fois la nécessité appréhendée sans dissonnance cognitive.
Conclusion. Malgré la persistance des représentations et pratiques, la culture de la région permet à certaines personnes d'opérer des changements protectifs de comportements pour limiter la transmission du SIDA. Comme d'autres sont entravées davantage par leur statut socioéconomique, il serait erroné et dangereux de blamer les victimes de cette situation pour leur sort.
Mots clefs: représentations, pratiques populaires, échappatoires, changements

Rôle de la religion
Role of Religion

Th.E.P.41 RELIGIOUS ORGANIZATIONS RESPOND TO A COMMUNITY AFFECTED BY HIV

DeMartini, Rodney*; Hartquist, C.**; Rose, A.***
*Archdiocese of San Francisco,**Episcopal Chaplaincy, San Francisco General Hospital,***AIDS Project, Jewish Family and Community Services, San Francisco, U.S.A.

Objective. To demonstrate the new demands being placed on religious organizations as caregivers and to promote partnerships in education, advocacy, residential/financial services, spiritual care that impact the wider community.
Methods. the Archdiocese has a three-tiered response including education, pastoral care & direct client services provided by full-time, trained staff; all services, including residential program, emergency fund, couseling/advocacy services are available to individual living in a three county area. The Episcopal Chaplaincy provides a twelve week clinical internship enabling participants from all over the world to develop local programs in education/caregiving. The training includes ministry time in clinic, supervision, seminars, field work. The Jewish AIDS Project provides counseling, outreach to family members, financial assistance, education and referral services to its clients.
Results. Archdiocesan programs served over 3550 people in 1988; the Episcopal program has to date trained over 35 people; the Jewish AIDS Project assisted over 1050 individuals in 1988.
Conclusion. While the services/programs in these models may not be entirely replicable, they offer an example to creative/responsive outreach to challenge other religious organizations.

Th.E.P.42 INVOLVING THE RELIGIOUS COMMUNITY - A STATEWIDE MODEL

Author: The Rev. Thaddeus Bennett, M.Div.; The Rev. D. Wood, M.Div.; The Rev. Charles R. Carnahan.
Episcopal DIOCESE of Conneticut, U.S.A.

Objective: present a model for involving the Christian community in responding appropriately to the AIDS/HIV crisis.
Method: The model, AIDS Ministries Program of Connecticut, began in August of 1987 and was designed to work in a state where persons with AIDS were spread throughout the state, not just within a few urban areas. The model includes: forming an ecumenical statewide AIDS task force; creating and publishing a curriculum for AIDS education for the Christian Community; provide training programs for clergy and lay professionals on pastoral care with PWAs/HIV infected persons; development of respite care teams on a regional basis; and a PR plan that received media attention. Results: participants will leave the workshop with the following information: a) a process for getting AIDS education into your parish; b) a review of a new curriculum which will work in the Christian community and which is sensitive to AIDS/HIV issues; c) a process for setting up respite care teams using volunteers from churches; and d) how to hold Services of Healing and Prayer and thus raise consciousness and begin ministry. Conclusion: The religious community has a unique role and opportunity in responding to the AIDS/HIV crisis. That role can be defined and lived out on both the parish and denominational level.

Th.E.P.43 RELIGION AS A TOOL IN PREVENTING THE SPREAD OF HIV IN UGANDA.

Musagara, Muhammed,* Namaganda Florence**

*Health Educator, AIDS Control Programme, Uganda
**Namirembe Christian Fellowship, Uganda.

Objective: To describe the success of using religion in preventing the spread of HIV in Uganda.

Methods: Focus groups and direct observation were used in several Christian Church groups in Uganda. Interviews with AIDS patients were done. Scientific analysis of information collected reveals how important christianity has been in preventing HIV spread especially in Urban areas.

Conculusion: Christian religion has had a significant impact in the prevention of AIDS in Uganda.

Th.E.P.45 MOBILIZATION OF VOLUNTEERS FOR CONTROL OF THE HIV EPIDEMIC

Clark, Charles F; University of South Florida, Tampa, Florida U.S.A.

A review of US efforts to control Syphilis between WWI and WWII reveals that education, a partially effective drug(Arsphenamine),case finding,contact tracing and free treatment resulted in a significant drop in Wasserman positive military recruits. Identification followed by involvement in a long treatment program (18 months with Arsphenamine) modified behavior sufficiently so that further spread was significantly reduced. We must identify the 1.5 million Americans infected with HIV and embrace them in a social-medical program which will so alter their behavior that transmission of HIV will be significantly reduced. This can best be accomplished by emulating the "buddy" system of San Francisco except that the buddy begins to care for and to advocate for the HIV seropositive person as soon as that person is identified and long before that person is ill. With early identification there will be several years available for behavior modification through the social-medical-buddy involvement before the HIV positive person becomes highly infective. By that time the embrace should have been so effective that further transmission rarely occurs. The only practical way to mobilize large numbers of long term dedicated volunteer "buddies" is through the churches. The Christian Church grew explosively from the 2nd to the 4th centuries AD as the Christians cared for the victims of the smallpox and measles epidemics which struck Rome beginning in 165 AD while devotees of the State Religion fled from the ill. Such fearless demonstration by Christians of faith in God and of God's love in the face of terrifying disease attracted an enormous following. We must remind Christians of their heritage and convince them to take up this historic and critical role. Such a buddy program combined with widespread testing,contact tracing and free treatment can control HIV in our society.

Th.E.P.47 WHERE ARE PEOPLE IN ENGLAND & WALES DYING FROM AIDS?

Kennedy Ann R.; Ellam G.A.; Porter J.D.H.;
PHLS Communicable Disease Surveillance Centre. U.K.

Objectives. To determine 1) Where people with AIDS (PWA) are dying;:- in hospital, at home or hospice; 2) Whether their cause of death was related to where they die and whether these factors are changing with time.
Method. All PWA reported to the Communicable Disease Surveillance Centre by December 1988, were reviewed to ascertain those who had died and on whom there was a matched death entry. Demographic data and cause and place of death information were also collected.
Results. By the end of 1987, 1243 PWA had been diagnosed of whom 362 had matching death entry data. Of these these 302 (83.4%) died in hospital, 55(15.2%) at home, and 5(1.4%) in hospice. Of the 60 PWA who died outside hospital, 58 were men, 2 were women; 63% (38/60) were aged 30-40 years; 18% (53/228) of homosexual/bisexual men died in the community compared with 9% (1/11) of injecting drug users and 8% (3/38) of haemophiliacs. Preliminary data for 1988, albeit incomplete, confirms that place of death is changing. Data on cause of death related to place of death will be presented.
Conclusion. National surveillance data has an important role to play in understanding patterns of terminal care, which have previously not been recognized and which are of value in highlighting important resource implications.

Th.E.P.44 HOW ORGANIZED RELIGION IMPACTS ON THE AIDS PANDEMIC IN PREVENTION, EDUCATION, AND PREJUDICE

Dr. Henry J. Yeager Memorial Hospital/Brown University, U.S.A.

Objective: To examine how the major religions impinge on the AIDS crisis in two areas: prevention and education, and discrimination against PWAs and those at risk for AIDS.
Methods: An analysis will be made of pertinent statements by prominent clerics ranging from the Pope through television evangelists. Major articles in the religious press will be analysed. Secular publications will be examined for editorial opinions reflecting a religious influence.
Results: Analysis of pertinent materials shows a condemnation of the so called life styles of the groups at risk for AIDS. Many demoninations express the attitude that "they" deserve what "they" got, thus contributing to prejudice for people with the syndrome and those at risk. This attitude has helped to slow governmental and medical response to the AIDS pandemic, and added immeasurably to the attendant adverse social and economic suffering.
Furthermore, with their narrow, restrictive view of sex the same demoninations have blocked efforts to teach safe sex, thus placing at grave risk all those outside of a strict, monogamous, heterosexual marriage.
Conclusion: By not adopting a truly Christian response to those with AIDS, organized religion encourages judgmental, condemnatory reactions, actually exacerbating the adverse medical, social and economic effects of the epidemic.

Sociologie du SIDA
Sociology of AIDS

Th.E.P.46 COMPORTEMENT SEXUEL ET ATTITUDES RELATIVEMENT AU SIDA DANS LA VILLE DE LISBONNE: UNE ÉTUDE EXPLORATOIRE

AMARO, Fausto*, TELES L.**, DANTAS A.**
*Université Téchique de Lisbonne et Fondation Bom Sucesso, Lisbonne,Portugal; **Fondation Bom Sucesso, Av. Dr. Mario Moutinho (ao Restelo) 1400 Lisbonne - Portugal

OBJECTIF: La comunication présente les résultats d'une étude sur le comportement sexuel dans la ville de Lisbonne (800.000 habitants) en vue de l'obtention de données pour l'établissement d'un programme d'education sur le SIDA. Les objectifs sont simultanément substantifs et methodologiques.

MÉTHODE: Il a été utilisé une méthodologie écletique avec des techniques qualitatives et quantitatives suivantes: Sondage à l'opinion publique sur la connaissance du SIDA (N=144); - Enquête auprès des médecins et des infirmières dans un service hospitalier et un Centre de Santé (n=59)-Analyse de contenu de 583 petites annonces d'offre et de recherche sexuelle dans 4 journaux de Lisbonne durant un mois; - entrevues avec des informateurs qualifiées; - Histoires de vie d'individus appartenant à des groupes de risque.

RESULTATS: Entre les résultats à présenter on notera les données préliminaires suivantes: considerant le SIDA, celui-ci est associé par la population, en général (53%) et par le personnel de la Santé (32%) à l'homosexualité. Ces données sont discutés avec les données epidemiologiques connus.
La crainte d'être contagié par le SIDA a été détecté dans la population en générale (24%) et dans le personnel de la Santé, cette crainte étant plus grande entre le personnel de la Santé (34%).
Dans une population bien identifiée, 13% disent utiliser les préservatifs mais l'analyse a démontré que l'usage de préservatifs n'est pas continue tout au long de l'année.
L'étude du personnel de la Santé a surtout montré un manque de connaissance (59%) et une déorientation face à la nécessité de soigner des personnes HIV positives (21%).
Dans la population en générale, il a été détecté un grand manque de confiance dans les services sanitaires en ce qui concerne la contagion (22%). Les données recueillies par les annonces de journaux ont démontré: offre ou recherche de contacts homosexuels 11%, offre de massages 23% et sexe à trois 11%.

CONCLUSION: L'étude a permis le développement d'une méthodologie pour la poursuite de l'étude du comportement sexuel et l'obtention d'indicateurs pour le planning d'actions d'education sur le SIDA.

Th.E.P.48 PRATIQUES DE RISQUE ET SIDA PARMI LES HOMOSEXUELS-BISEXUELS

USIETO, RICARDO*; SASTRE, JULIA**; ARABITARTE, HECTOR***; TORRES, JOSE****; DE ANDRES, RAFAEL*****; CONTRERAS, Mª CRUZ******.
* UNIVERSITÉ INTERNATIONALE MENENDEZ PELAYO, MADRID, ESPAÑA; ** MAIRIE DE MADRID, ESPAÑA; ***COMITE CIUDADANO ANTI-SIDA DE MADRID, ESPAÑA; **** DISTREX IBERICA, S.A.,BARCELONA, ESPAÑA; *****MINISTÈRE DE SANTÉ ET DE CONSOMMATION, MADRID, ESPAÑA; ******UNIVERSITÉ INTERNATIONALE MENENDEZ PELAYO.

Objectifs. Connaître d'une façon scientifique la situation des homosexuels-bisexuels espagnols face au SIDA quant aux pratiques de risque. Connaître leur opinion en toutes les matières relatives au risque d'être porteur du VIH ou de développer la maladie. Étude détaillé des changements des habitudes, etc. des homosexuels-bisexuels espagnols.Etude de l'éloignement et du refus social dans l'Espagne.
Méthode. Enquête d'opinion pour toute l'Espagne. Personnes âgés de plus de 14 ans. Proportionnel parmi des villes de moins de 10.000 habitants et plus de 500.000 habitants. Par régions, habitat, sexe et âge. Questionnaire: 300 questions et réponses possibles, résultant 1.117 entrevues validées, avec une erreur ± 3,5% niveau de confiance = 2 (95,5%) et la variance populationale P/Q 50/50.
Résultats. 40% a un couple fixe. 50% a eu plus de 50 couples différents. Plus du 70% se stimulent les génitaux avec la bouche. 70% a eu des relations sexuelles hors de son couple. 23% utilise le préservatif pour le coït anal. 83% est informé sur le SIDA. 50% a réalisé l'éjaculation orale et 42% l'a reçue. 64% a reçu le coït anal et 75% l'a réalisé. 50% s'est observé lui-même ou chez ses camarades des traumatismes sanglants. 75% est d'accord pour se faire la preuve de détection des anticorps.
Conclusion. 57% reconnait que le SIDA a changé sa vie sexuelle. Ces changements sont: on a laissé d'ingérer de la semence (24%); on exige le préservatif (30%); on a reduit le nombre de couples (45%); on ne visite pas de "chambres noires" ou locaux gay.

Th.E.P.49 AIDS TREATMENT DEFICITS: AN ETHNOGRAPHIC STUDY OF THE MANAGEMENT OF THE AIDS EPIDEMIC, THE ONTARIO CASE

Smith, George W. Ontario Institute for Studies in Education Toronto, Ontario / AIDS ACTION NOW!, Toronto, Ontario.

The Objective: To describe the organizational conflicts producing deficits in the management of treatment for individuals with HIV infection.
Method: This research is organized from the standpoint of individuals infected with HIV. Its purpose is to make visible the social organization of the management of AIDS that goes beyond the scope of their immediate lives, and that determines the kind of treatment they receive. Technically speaking, this research constitutes an institutional ethnography of the textuall mediated organization managing the AIDS epidemic in Ontario.
Results: An analysis of the data provides a social relational description o the management of AIDS as organized within the relations of: 1) public health, 2) medical research, 3) treatment, and 4) palliative care. The firs two are put together within the bureaucratic organization linking governments (federal and provincial), university teaching hospitals, and the pharmaceutical industry. The fourth is organized as a voluntary enterprise. By way of contrast, the social relations of treatment are structured professionally within the traditional organization of the doctor-patient relation
Conclusion: Organizational conflicts exist between health protection and treatment (e.g., nominal vs. anonymous testing), research and treatment (e.g., the ethical conundrums of AIDS research), and palliative care and treatment (e.g., treatment vs. AIDS as a fatal disease). In each instance, public interests supersede private ones, resulting in the well being of the individual taking a backseat to the management of the epidemic.

Th.E.P.50 AIDS AS AN EMERGENT FIELD; LESSONS FROM A COMPARISON WITH PERINATAL MEDICINE AND GERIATRICS

Debbie Indyk, Mt. Sinai School of Medicine, NYC, NY, USA

Objective: This paper compares patterns of development of medical fields, in particular, Perinatal Medicine and Geriatrics, which provide contrasting models for analyzing the emergence of the field of AIDS.
Methods: The institutionalization of the response to AIDS is analyzed using the framework of sociology of science and medicine within the context of specialty formation and the integration of new knowledge into practice. Factors which are identified and compared include critical external forces, training programs, literature, patterns of communication, the relationship between research and practice, the locus of the work, who is doing it, who 'owns' it and the patient, and the rate of growth of the field.
Results: The speed with which AIDS moved from a fatal disease requiring primarily acute care, as well as biomedical research, to a spectrum disease requiring the full range of services typical of a chronic condition uniquely challenges the health care system. The traditional 'orderly' progression identifying etiology, diagnosis, therapeutic interventions, management and prevention was short-circuited by the overwhelming needs of a variety of constituencies, simultaneously interacting in new ways.
Conclusion: The forced negotiation between disciplines, redistribution of patients, and new divisions of labor require the formation of a new problem solving organizational apparatus linking research, education, practice and patient management. As a spectrum disease, the structures required in the elucidation and effective management of AIDS are strikingly similar to the Geriatric rather than the Perinatal Medicine model but informed by both.

Th.E.P.51 THE IMPACT OF AIDS ON THE HOMOSEXUAL CLONE COMMUNITY IN NEW YORK CITY

Levine, Martin P.; Bloomfield College, Bloomfield, New Jersey, U.S.A.

Objective: To understand the affect of AIDS on the sociocultural organization of the homosexual clone community in New York City.

Method: Longitudinal field work

Results: The impact of AIDS upon the homosexual clone community in New York resembles the psychosocial consequences of a disaster. The social science literature on calamities demonstrates that disasters destroy a community's preexisting sociocultural order and foster individual and collective trauma among survivors. Qualitative data from an ongoing field study of the homosexual clone community indicates that AIDS has similar effects among this population. The data show that the epidemic has: (1) decimated the community's social networks and gathering places; (2) transformed the group's value structures and behavioral patterns; (3) dissolved the community's sense of communallity; (4) eroded the group's sources of support and identity; and (5) engendered emotional numbness and depletion among survivors.

Th.E.P.52 CONNAISSANCE, ATTITUDES ET CROYANCES SUR LE SIDA A BANGUI (R.C.A.)

G. Grésenguet*, P. Somsé**, L. Bélec*, G. Chaze**, J.P. Danagoro**, A.J. Georges*
* Institut Pasteur de Bangui, République Centrafricaine.
** Projet OMS SIDA/ Comité de Lutte contre le SIDA, Bangui, (R.C.A)

OBJECTIF: Evaluer le niveau de connaissance de la population sur le SIDA en vue de juger de l'efficacité du programme de lutte contre le Sida en Republique Centrafricaine .
METHODE: Un échantillon randomisé de 200 personnes (âgées de 15 à 44 ans), représentatif de la population sexuellement active, a été intérrogé à Bangui (la capitale) au sujet de la connaissance et des croyances sur le SIDA, ainsi qu'au sujet de leurs pratiques sexuelles.
RESULTATS: 90% des personnes interrogées savent que le SIDA est une maladie mortelle dont le mode de transmission est surtout de type sexuel et contre laquelle il n'existe pas de traitement efficace. Les pratiques sexuelles existent précocement (58%) avec un nombre élevé de partenaires du sexe opposé (54 %). Les antécédents des maladies sexuellement transmissibles sont très fréquents (81%). Si l'utilisation du préservatif paraît acceptable (79%), elle est en pratique rarement répandue: (59%) disent l'avoir utilisé au moins une fois.
CONCLUSIONS: La population sexuellement active de Bangui a conscience des problèmes soulevés par l'existence du SIDA, mais n'a pas encore changé en profondeur de comportement sexuel.

Th.E.P.53 AIDS AS A CHALLENGE TO PHYSICIANS' PROFESSIONAL IDENTITY

Taylor, Kathryn M., Eakin, J.M., Kelner, M.J.
Physician Behaviour Research Unit, Department of Behavioural Science, University of Toronto, Toronto, Ontario, Canada, M5S 1A8.

AIDS is challenging many attitudes and practices core to physicians' professional identity. This survey reports on this challenge and its implications for the emergence of new patterns of professional behaviour. To understand how physicians are respondinq to AIDS, we conducted a mailed survey of 440 North American physicians and completed 67 indepth interviews. Respondents included a variety of medical specialties and a range of exposure to AIDS and seropositive patients. We obtained a response rate of 61% (N=267)

Five concepts central to physicians' professional behaviour were examined: (1) Autonomy (desire for professional independence): e.g. 89% believed physicians and not other health care professionals should remain key AIDS decision-makers. (2) Service (precedence of concern for other over concern for self): e.g. 67% would delay treatment of an AIDS patient in an emergency situation until the doctor was properly protected. (3) Affect (extent of emotional involvement with patients): e.g. 79% believed that physicians were generally homophobic. (4) Responsibility (primary allegiance to society or to the individual): e.g. 79% said they felt more obligation to protect others from exposure than to protect patients' privacy. (5) Skills (belief in the efficacy of one's professional tools): e.g. 45% believed a cure for AIDS will not be found in the next 10 years despite increased resources.

Th.E.P.54 A MODEL COMPARING CONDOM USE VS. PARTNER REDUCTION STRATEGIES

Reiss, Ira L. ;* and Leik, R. K.*.
*University of Minnesota, Minneapolis, Minnesota, USA.

Objective. To compare the risk reduction strategies of using condoms vs. decreasing the number of partners. This is an important choice faced by many people today.
Methods. A Probability model was developed which allows for comparing condom use with failure rates varying from 100% to 10%, to changes in number of partners from 20 to 1. Prevalence rates are simultaneously varied from .25 to .0002 and infectivity rates varied from .02 to .002. The number of sexual acts is 500.
Results. Under all the prevalence and infectivity conditions considered, having 500 sexual acts and using condoms with a 10% failure rate with 20 partners, entails a lower risk of HIV infection than having those 500 sexual acts with one partner and not using condoms. Under conditions of lowest risk, it would take a condom failure rate of well above 50% and having 20 partners to equal the risk of HIV infection entailed in have one partner and not using condoms (.012%). Even under conditions of highest risk, it would take a condom failure rate of more than 10% and having 20 partners to equal the risk of HIV infection of someone not using condoms who has one partner (25%).
Conclusion. Our results support the greater importance of careful condom use over reductions in numbers of partners as a strategy to reduce the risk of HIV infection.

Th.E.P.55 AIDS IN AN AGING SOCIETY: ETHICAL AND PSYCHOSOCIAL CONSIDERATIONS

Schmidt, Robert M.* and Kenen,R.H** . *Center for Preventive Medicine and Health Research, San Francisco State University and Pacific Presbyterian Medical Center, San Francisco, California; **Department of Sociology/Anthropology, Trenton State College, Trenton, New Jersey, USA.

Objective.To analyze ethical and psychosocial issues of AIDS in an aging society.
Methods. Health care services and health research funding agencies have not acknowledged similarities between needs of America's aging population and the estimated 1.5 million Americans infected with HIV. Knowledge of individual variation of susceptibility to HIV infection, latency of HIV disease expression, HIV infection of the central nervous system, and lifelong HIV infection in currently asymptomatic individuals is especially applicable to older people. Ethical and psychosocial issues are similar; e.g., agism, homophobism, racism, loss of self-esteem, insurance coverage, access to health benefits and services.
Results. Currently, 10% of AIDS patients are ≥ 50 years of age; 25% of these are ≥ 60 and 4% are ≥ 70 years of age. In Europe, 11% of AIDS cases have been reported in persons ≥ 50; 42% of these are ≥ 60 years of age. Ethical issues include autonomy, non-maleficence, beneficence, justice; psychosocial issues include stigmatization, erratic access to health services, age of qualifying for federal health care programs and age of receiving retirement benefits.
Conclusions. Ethical and psychosocial effects on the older individual with AIDS and the impact of the AIDS epidemic on the elderly as a group would benefit from comparative analysis. We suggest that appropriate societal responses to the AIDS pandemic and a rapidly aging population in Western countries provide a paradigm for health care services and research in the United States.

Th.E.P.56 HEALTH PROFESSIONALS' VIEWS OF SOCIAL DISTANCE FROM PERSONS WITH AIDS AND OTHER CONDITIONS

Cohen, Felissa L.*; Mudro, R.*
*University of Illinois College of Nursing, Chicago, Illinois, United States.

Objectives: To determine the social distance health professionals feel comfortable putting between themselves and persons with AIDS or other conditions. To determine whether differences in social distance were perceived for persons in various AIDS transmission categories.
Methods: The pretested instrument was developed using a modified social distance scale after the work of Bogardus and Gentry. It was distributed randomly to nurses, pharmacists, lab technicians and others at two large hospitals, one in a high AIDS prevalence area and one in a lower AIDS prevalence area in a midwestern state. 425 subjects received questionnaires, 219 responses were received for a response rate of 51.5%.
Results: Respondents perceived the most distance between themselves and persons with conditions that could be said to be under the voluntary behavioral control of the affected person such as drug abusers, ex-convicts, alcoholics, promiscuous persons, homosexuals, etc.; however, persons with AIDS from unknown sources had means that were virtually equal to homosexuals and bisexuals. No statistically significant differences were detected between those respondents in high/low prevalence areas, between those with HIV infection vs. AIDS, or between males and females. White respondents were willing to allow a closer social distance for all disease conditions and AIDS transmission categories except for IVDA's than were non-white respondents.
Conclusions: Will be reported based on results.

Th.E.P.57 GUARDIANSHIP STATUS AND SUPPORTIVE RELATIONSHIPS AS CO-DETERMINANTS OF ENROLLMENT OF HIV-POSITIVE CHILDREN IN A PLACEBO-CONTROLLED STUDY

Steinberg, Katherine*; Calvelli, T.*; Kashkin, J.*; Willoughby, A.**; Bernstein, L.* and Rubinstein, A.*
*Albert Einstein College of Medicine, Bronx, New York, **National Institute of Child Health and Development, Bethesda, Maryland.

Objective. To identify psychosocial factors influencing enrollment of asymptomatic and mildly symptomatic HIV-positive children in a double-blind placebo-controlled intravenous gamma globulin study.
Methods. Eligibility criteria: non-hemophiliac children under 13 years with CDC classifications: P_1B, P_2A, P_2C (not hypoxic), P_2D_3, P_2F. Consenting and refusing caregivers were compared re: guardianship and socioeconomic status. Supportive contacts prior to consent or refusal were enumerated.
Results. Of 38 children eligible, consent for treatment was given for 13.

Guardianship	Consent Given	Consent Withheld
biologic parent	9 (24%)*	6 (16%)*
adoptive parent	2 (5%) *	1 (3%)
other family member	2 (5%) *	4 (11%)*
foster care agency	0	14 (37%)
TOTAL:	13 (34%)	25 (66%)

*More than 1 prior supportive contact with 9 (69%) consenting caregivers and with 2 (18%) withholding.

No socioeconomic differences noted between the 2 groups of caregivers.
Conclusions. Biologic and adoptive parents are most likely to consent to the blinded treatment trial. Other family members are more likely to refuse consent while foster agencies are the most reluctant. A supportive relationship with caregivers can positively influence study enrollment.

Th.E.P.58 PERINATAL STUDY COMPLIANCE OF HIV-INFECTED WOMEN: SIGNIFICANCE OF RISK FACTORS AS A DETERMINANT

Douglas, Cecilia*; Cabat, T.*; Bueti, C.*; Calvelli, T.*; Rubinstein, A.*; Willoughby, A.**
*Albert Einstein College of Medicine, Bronx, New York, **National Institute for Child and Human Development, Bethesda, Maryland, U.S.A.

Objective. To determine whether specific risk factors influence compliance of HIV-infected women in a Prospective Perinatal Transmission Study.
Methods. Of 80 women at risk for HIV infection enrolled in a perinatal HIV transmission study over a 2 year period, 45% (36/80) were HIV-infected at entry; 60% (22/36) carried to term. Risk factors were determined by a structured questionnaire and counseling. They were categorized into 2 primary groupings: (1) Past or current intravenous drug use (IVDU), (2) Heterosexual contact with high risk partners. Compliance was defined by the patients' attending 2 post-partum visits within 6 months of delivery.
Results. Of the 36 HIV-infected women, 61% (22/36) had histories of intravenous drug use; 39% (14/36) were infected as the result of sexual contact with an HIV-infected partner. These women denied IVD usage. Of the 22 women with histories of IVDU, 77% (17/22) complied with follow-up; of the 14 women infected heterosexually, 71% (10/14) complied. In all cases, aggressive interventions and follow-up methods were employed.
Conclusion. No significant difference in compliance between the 2 groups was observed. Aggressive interventions and follow-up may normalize differences between the 2 groups.

Th.E.P.59 CHANGES IN SEXUAL BEHAVIOR OF A COHORT OF FEMALE HEALTH CARE WORKERS DURING THE AIDS ERA

Leach, Charles*; Viker, S.*; Kuhls, T.**; Parris, N.*; Cherry, J.* and Christenson,P.*
*UCLA School of Medicine, Los Angeles, California, USA; **University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, USA

Objective. To determine whether health care workers (HCWs) in a university hospital with AIDS patients altered their sexual behavior from 1984 to 1987.
Methods. As part of a prospective study examining the risk of nosocomial HIV infection, 116 female HCWs at UCLA Medical Center (Los Angeles) were enrolled in 1984 and completed followup 3 years later. At each visit HCWs responded to questions including demographics and sexual practices (sexual preference, number of sexual partners/year and number of sexual contacts/month).
Results. Fewer sexual partners in 1987 were reported by 23 of 106 respondents whereas 73 had approximately the same number and 10 had more partners ($p=.02$ for fewer partners). Those workers sexually active in 1984 ($n=70$) decreased their activity by 1.6 contacts per month in 1987 (mean ± SD= 7.4 ± 6.6 (1984) vs 5.8 ± 5.6 (1987), $p=.04$). Fourteen of 109 HCWs changed sexual preference from male to female ($n=2$) or male to no sexual partners ($n=12$) during the 3 years ($p=.04$ for less male sexual contact).
Conclusion. After 3 years of followup female HCWs in a large university hospital in Los Angeles reported fewer sexual partners, fewer sexual contacts and less heterosexual activity. This may reflect an increased awareness of risk factors for community-acquired HIV infection.

Th.E.P.60 SOCIAL ASPECTS OF AIDS : AN ANALYSIS OF ATTITUDES AND AWARENESS

S.Shanmuganandan * and P.T.K.Subramanian **
* Dept.of Geography, Madurai Kamaraj University,Madurai,India.
** Dept.of Medicine, Madurai Medical College, Madurai, India.

AIDS is the epidemic of economic, social, political andcultural reactions and responses to HIV infection and AIDS. This epidemic is of recent origin and it is also viewed a global phenomenon. A public awareness about AIDS grows, as the number of HIV-infected persons increases and as the number of AIDS cases rises steeply during next five years. The impact of AIDS and HIV infection on social and economic development may be critical. The present study is an attempt to analyse the attitudes and awareness of AIDS epidemic with the help of perception technique and tool of behavioural analysis, on the origin and prevention of the disease, medical care, public awareness among AIDS and other major killer diseases and psychological attributes such as guilt, anxiety and depression and stressful emotions. The analysis of findings revealed that the people felt the need for useful therapies and they perceived that the most effective therapy begins to bring a sense of well-being born out of a positive outlook towards life. Among urban population AIDS has caused a deep concern in the individual as well as society whereas in rural areasthe awareness of this new disease is negligible or not at all even reached. Among rural population the awareness on the prevalence of local diseases are found to be higher than AIDS. Still a higher percentage of population have no knowledge about its origin. Based on the findings it is felt essential that priority should be heavily laid to gear up mass media programmes in both urban and rural areas as the most necessary public health measures.

Arts

Th.E.P.61 OUR LADY OF AIDS: THE TALISMANIC DESIGN OF ANDRÉ DURAND'S PLAGUE ICON "VOTIVE OFFERING"

Miller, James (Professor).
University of Western Ontario, London, Canada.

In 1987 London-based Canadian artist André Durand depicted the Princess of Wales as a royal healer touching American PWA Sunnye Sherman in "Votive Offering," a large (6'x 12') oil painting in Renaissance style displayed in several British churches in 1988. The icon includes portraits of saints traditionally associated with plagues and healing miracles (George, Sebastian, Catherine of Genoa) as well as images of doctors, nurses, and gay male PWAs.
Objectives. To account for the revival of Renaissance plague iconography in the Age of AIDS; to discuss the healing function of "Votive Offering" as a magical talisman; and to consider the political implications of Durand's representation of PWAs as martyrs.
Methods. A Panofskian iconological approach to Durand's imagery will be adopted to reveal its origins in Florentine theurgy (Neoplatonic magic). Slides will be shown.
Conclusions. Mystical/magical notions of healing tend to flourish during plague-times when faith in the power of the medical and political establishment wanes. Durand's arcane art of healing is comparable to modern 'imaging' therapy.

Th.E.P.62 Back to basics:Use of Popular Theatre in AIDS Awareness Campaign.

Mupedziswa,Rodreck.
Director of Fieldwork, School of Social Work (in association with the University of Zimbabwe) P.Bag 66022, Kopje, Harare, Zimbabwe.

Objective:To show how popular theatre can be used,effectively,as a tool in the AIDS awareness campaign.
Methods: The paper seeks to show how popular theatre groups have been used in the campaign against AIDS,in Zimbabwe.It examines some of the problems that have been encountered in using popular theatre and indeed what successes have been achieved.The main focus is on the achievements of a theatre group sponsored by a non-governmental organisation called Aids Counselling Trust (ACT),which the author has been involved with.However,work by other theatre groups is also reviewed.
Results: The paper tries to show that although various approaches have been employed by various organisations to spread the message on AIDS,the message,it would appear,has by and large fallen on deaf ears.The majority of the people have still to take heed of the warning and change their sex and other habits.This paper argues that the conventional information dissermination methods and tools are often ineffective due to problems of inaccessibility (eg TV,radio,newspapers etc)for the majority of the population,and at times the problem of illiteracy. There is therefore an urgent need to develop fresh and more effective strategies for the campaign.
Conclusion: In the light of the afore-mentioned problems,some organisations have gone 'back to basics' and introduced popular theatre as the latest weapon in the AIDS awareness drive - with a considerable degree of success.

Th.E.P.63 PRIVATE/PUBLIC SECTOR COOPERATION IN AIDS EDUCATION

Downer, Ann*; C. Bishop**; Hillard, P.***; Granat, C.****
*University of Washington, Seattle, WA., USA; **SAFECO Insurance Companies; ***Seattle Public Schools; ****Plays for Living, New York City, U.S.A.

SAFECO Insurance Companies, based in Seattle, awarded a grant to Plays for Living in early 1988 to develop an AIDS education play for students in Seattle Public Schools. Plays for Living, a New York-based organization with a Seattle office, hired a playwrite, Bruce Peyton, to develop the play with a panel of local educators and SAFECO representatives. Live Wire is a 30-minute dramatic play performed by young professional actors. The performance is the "first act" of the prevention effort. The "second act" occurs when students return to classrooms to discuss the play with trained volunteers using a study guide created for this purpose. The play was performed for 6,300 students (11-14 years) during the 1988/89 school year. The use of live theater was a powerful medium for AIDS education and the involvement of SAFECO increased the perceived legitimacy of the project, contributing to its success. Evaluative comments from students, a description of the play and its development, and recommendations for working with private sector companies will be presented.

Th.E.P.64 1989 PARTNERSHIP IN CARING CALENDAR

McMenamin, Diane A.; Hostetter, C.; Health Resoures and Services Administration, Public Health Service, Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective A calendar was conceptualized as a visual expression of the message that AIDS is a human health problem worthy of a broad, societal caring response. Its purpose is to promote a partnership of community resources in providing such a caring response. This message was conveyed in a way which balanced hope and reality, and motivated viewers, especially the uninvolved, to engender a caring attitude and positive response.
Methods Collaboration with major AIDS organizations. Choice of a title which reflects the theme which is reinforced in the text. Each month focused on how different segments of society are responding. Illustrations were commissioned which symbolically and dramatically underscore the human dimension of AIDS and which move beyond stereotypes. Quotations were selected from "heros" in history to reinforce the visual images. Concrete examples of caring responses were provided, and a directory of national and local resources was included.
Results The enclosed 1989 calendar has been enthusiastically and unanimously received. It is being used in medical offices and facilities, in work places, in local, state and federal government facilities, in religious organizations, and as a training tool to emphasize a multidisciplinary, "partnership" approach to AIDS care.
Conclusion The calendar will be considered for continuation in 1990, potentially as a fundraiser, and as a vehicle for involvement of the arts in the AIDS epidemic.

Th.E.P.65 THE RURAL THEATRE PROJECT: AIDS EDUCATION IN THE VILLAGES OF TRINIDAD AND TOBAGO

Helquist, Michael*; Besly, O.**; John, R.**___***; Almedal, C.****
*AIDSCOM, Washington, D.C.; ** AIDS Educators, Trinidad and Tobago; *** Trinidad and Tobago Red Cross Society; **** Norwegian Red Cross Society.

Objective. To reach rural populations with an entertaining and educational theatre production that encourages discussion of AIDS prevention and the impact of AIDS on the community. To evaluate the effectiveness of this intervention and its relevance for other Caribbean nations.
Methods. An international collaboration developed and financed a communications research project to reach rural villages in Trinidad and Tobago with a popular theatre production that examined the impact of AIDS on a family in which a son who is bisexual contracts and dies of AIDS. A promotional campaign preceded the theatre presentations, an AIDS educator led group following the presentation. Written materials and condoms were distributed, and the audiences completed evaluation forms.
Results. More than 3700 people in 30 villages viewed the dramatic production during a five week period; all indicated an interest in additional AIDS educational presentations, both in dramatic and written form. Most questioned the meaning of the "AIDS test" and were concerned about how to avoid AIDS.
Conclusion. AIDS education via popular arts is well-received. This channel provides information in a friendly, non-threatening manner and encourages community discussion of AIDS. Theatre can help Caribbean populations address controversial subjects such as death, sexuality, and modern family life.

Th.E.P.66 PHYSICIAN-PATIENT RELATIONSHIPS IN AIDS DRAMAS

Nakajima, Gene* and Rubin, H.C.**.
*Johns Hopkins University School of Medicine, Baltimore, Maryland, USA,**Mount Sinai School of Medicine, New York, New York, USA.

In the spring of 1985 two plays about AIDS, As Is by William Hoffman, and The Normal Heart by Larry Kramer, opened in New York City. The physician-patient relationships they depict provide insight into how people with AIDS and their friends perceive doctors and interact with them.

In As Is, five nameless physicians function as shadowy, background figures who are unapproachable. They are perceived as expensive, insensitive, and ignorant. At the end of the play when the main character, Rich, is hospitalized with AIDS, a nurse and a janitor interact with him, and physician contact is noticeably absent.

In contrast to As Is, The Normal Heart portrays a physician, Dr. Emma Brookner, as an emotionally involved care-giver. She is politically aware and empathetic. She symbolizes everybody's vulnerability to disease because she is a victim of polio, who is confined to a wheelchair. In one scene she tells Felix, a major character, about his AIDS diagnosis. In another, she holds his hand as he dies.

By analyzing these two plays, one may appreciate the contrast between the special covenant Dr. Brookner and Felix share and the distance separating Rich and his doctors.

La communauté (partie 2)
Community (Part 2)

Th.E.P.67 THE FUNDACION SIDA DE PUERTO RICO EXPERIENCE

José Toro-Alfonso,PhD(c)*,M.Rodrìguez,MS**, A.Nigaglioni,MS(c)* A.Meaux,MSW*. *Fundaciòn SIDA de Puerto Rico,**University of Puerto Rico,San Juan, Puerto Rico, U.S.A.

OBJECTIVES:To describe demographic, social and clinical characteristics of clients seeking services.
METHODS:**Fundaciòn SIDA de Puerto Rico** was established in 1983 as a volunteer community organization to provide services to persons with HIV infection, their families and significant others. Clients received services in four areas: prevention and education, emotional/practical support, financial aid and advocacy. We reviewed 182 records of clients seen from Oct.1987 to Jan.1989 (91% of cumulative records).
RESULTS:There were 130 males(71%) and 52 females(29%)seeking services. The majority (53%) were in the age range of 30-39 yrs. Risk factor was known for 156 persons:24% were homosexuals and 76% were either IVDU's or their partners. PWA's accounted for 70%, PWARC 6%, and asymptomatic HIV+ 24%. Most persons (91%) were from low socioeconomic background,including some imprisoned (2%) and others homeless(6%). A large proportion (41 of 182) showed migration patterns with mainland USA.Close to half(48%) required direct financial aid, as well as emotional support(49%), and advocacy (25%).
CONCLUSION: Persons seeking aid from this community based service organization needed a wide variety of services. Long range goals of similar organizations should include these.

Th.E.P.68 Le Comité sida aide Montréal et ses activités

Lanctôt Lise
Directrice générale du CSAM, M.N.(adm), M.A.P.
Montréal, QC, Canada.

Le Comité sida aide Montréal fut mis sur pied en septembre 1985, par des intervenants de différents milieux. Depuis sa fondation, le Comité sida aide Montréal n'a cessé de progresser et d'améliorer ses services. Le CSAM est devenu par ses activités un organisme non-gouvernemental complémentaire du réseau de la santé et des services sociaux de la province, particulièrment à Montréal.
Avec l'expertise accumulée, les représentants du CSAM sont souvent appelés à travailler comme consultants dans divers endroits oeuvrant dans la lutte contre le sida.
Les objectifs du Comité sida aide Montréal sont d'assurer le support aux personnes atteintes et à leurs proches, d'aider les personnes séropositives et leurs familles et amis; de prévenir et de sensibiliser le public sur la question du sida, sur la maladie et ses effets, aider certaines populations dans ses comportements; enfin, le CSAM intervient auprès des hautes instances afin que les décideurs aient toutes les informations nécessaires pour mettre de l'avant une politique d'aide et de prévention.

Th.E.P.69 HIV RELATED SERVICES:A MODEL FOR COMMUNITY SERVICE PROVISION

Rango,Nicholas,M.D.*.
*New York State Department of Health, AIDS Institute, New York, NY, U.S.A.

Objective.To describe a model for HIV-related community services.Services include outreach, community education and support services for persons with HIV infection,their partners and families.
Method.Services are developed thru contracts with not-for-profit organizations throughout New York State.State initiatives are generated on the local level with input from community leaders,local health and human service providers to effectively respond to needs of specific regions/communities. This public/private partnership is strenthened as programs expand sources of funding as well as sphere of influence and coordination with other community-based organizations and health and human services systems.
Results.Since 1983,11 Community Service Programs(CSPs) have been developed throughout the State.Programs are located in urban areas to provide services to a region.Outlying areas and hard-to-reach populations are served through volunteer task forces, satellite offices and staff outstationed in human service settings.
Conclusions.Advantages of developing regional not-for-profit programs: greater flexibility in designing strategies for HIV prevention and support services which are responsive to regional needs.2)CSPs play a significant role in HIV related service delivery through identifying needs/gaps in services and coordinating provider resources to fill those gaps.The effectiveness of other health and human services in response to HIV is maximized through coordinating providers, thereby ensuring direct needs are met in an efficient and expeditious manner.

Th.E.P.70 CONTRIBUTIONS OF THE INTERNATIONAL GAY COMMUNITY TO AIDS RESEARCH

Falk, Lawrence A., Jr., Verick, W.A., et al. Committee for A Nobel Endeavor, Chicago, Illinois, USA

AIDS was first recognized within the gay community and since then other at-risk groups have been identified. Although the threat of AIDS is world wide, particularily to developing African nations, early recognition of high density AIDS cases within the gay community provided scientists with a cooperative group of individuals, yielding numerous clinical specimens and essential information on probable transmission modes. The international gay community has played an essential role in advances of knowledge concerning AIDS:

i. isolations of putative etiologic agent: lymphadenopathy associated virus (LAV), human T-lymphotropic virus type-III (HTLV-III) and AIDS associated virus (ARV), collectively classified as human immunodeficiency virus (HIV) were made from clinical specimens obtained from gay men
ii. blood samples from gay men expedited development of blood screening assays which have reduced significantly transfusion-associated AIDS
iii. provided the medical/scientific community with innumerable clinical specimens for immunologic and virologic studies
iv. participated in clinical studies for safety and efficacy evaluation of potential therapeutic agents
v. developed and implemented educational and safe sex programs that have served as models for programs presently in place for other at-risk groups

These contributions of the international gay community will be summarized and reviewed and compared with initial advances in hepatitis B research and vaccine development.

Th.E.P.71 LONDON LIGHTHOUSE - A CONTINUUM OF CARE

C Spence*; H MacGregor*; S Malach*; Dr S Mansfield*; U O'Brien*; M Pipes*; et al.
*Management Team, London Lighthouse, London, UK.

Objective To describe a unique model of care for people with HIV, ARC and AIDS in the London area which is of potential value in all health care planning strategies.
Method The description of London Lighthouse, a community project offering a continuum of care for people with HIV. This project has based its services on needs as defined by people with the virus and on principles of love, respect and non-oppression.
Results London Lighthouse has grown in 2 years to become one of the largest AIDS voluntary organisations in the UK. The centre's services complement the work of voluntary and statutory agencies. Care and emotional support are provided both in the home and within the centre, by means of counselling, training, health programmes and residential nursing care.
Conclusion This basic model of integrated and continuous care can be incorporated into planning strategies for other local, national and international projects and could have far reaching consequences not only for people with HIV but also for other types of health care.

Th.E.P.72 CREER UN MILIEU DE VIE: UNE APPROCHE ARCHITECTURALE NOVATRICE

Germain, Céline*, Morisset, R.**, Coutoudon, J.***;
*Corporation Félix-Hubert-D'Hérelie; **Hôtel-Dieu de Montréal;
***Atelier Habitation Montréal, Montréal, QC, Canada.

OBJECTIF: créer un milieu de vie pour les personnes atteintes qui soit adapté à leurs besoins.
METHODE: le projet a été élaboré par une équipe multidiscplinaire composée de médecins, travailleurs sociaux, architectes, administrateurs, personnes atteintes. Le projet a fait l'objet de consultations auprès d'autres groupes ou individus impliqués dans l'intervention auprès des personnes atteintes ou ayant développé un projet similaire en fonction d'autres pathologies. Les différentes étapes de la maladie et les besoins spécifiques y étant reliés ont été cernés. Le type et la qualité de l'intervention ainsi que les besoins des intervenants ont a été clairement établis.
RESULTAT:Le choix du site et le concept architectural qui réunit une rénovation sur un bâtiment ancien à une construction neuve témoignent d'une préoccupation majeure de créer un milieu de vie répondant aux différents besoins des personnes atteintes:

cadre de vie familial, enracinement dans la communauté, vie communautaire vs intimité, autonomie, semi-autonomie, convalescence, sécurité vs insécurité, silence-recueillement vs communication-expression, présence continuelle, soins et support à la vie quotidienne, encadrement médical léger, activités récréatives et artistiques.

CONCLUSION: Un concept architectural polyvalent pour recevoir 11 personnes atteintes, l'espace organizé par modules en fonction des besoins et des activités permet de répondre à une mixité de clientèle à différentes étapes de la maladie.

Éducation (partie 3)
Education (Part 3)

Th.E.P.73 THE STOP*AIDS MODEL FOR COMMUNITY CHANGE: ACCEPTABILITY IN A LOW-INCIDENCE AREA FOR AIDS

Beeker, Carolyn*; Rose, T.*
*New York State AIDS Institute; Albany NY, USA

Objective. To pilot a San Francisco-based risk reduction model in a low-incidence area for AIDS.
Method. The STOP*AIDS model, which uses the peer-led group meeting as a forum for education and support, appears to have been effective in changing sexual norms in the San Francisco gay community. Gay/bisexual volunteers from a CDC-funded AIDS prevention study were trained in a 30-hour seminar to implement the model in an area where seroprevalence is believed to be low. The trained volunteers recruited STOP*AIDS meeting participants through targeted outreach to gay bars, social networks and the prevention study cohort.
Results. During October through December 1988, 260 gay and bisexual men agreed at outreach activities to be contacted for participation in a local STOP*AIDS meeting. At recontact, 188 men were scheduled for one of 14 meetings; 86 men (46%) actually attended their scheduled meeting. Fifty-five meeting participants (63%) expressed interest in becoming STOP*AIDS project volunteers. Attrition rates are comparable to those reported for New York City and San Francisco.
Conclusion. The acceptability of STOP*AIDS at this pilot site suggests that the model may be exported to communities outside the AIDS epicenters. Even where seroprevalence is low, the need for information, emotional support and social action may be high. Studies are now needed to evaluate the effectiveness of the model in motivating sustained behavioral change.

Th.E.P.75 RESOURCES FOR EDUCATING ABOUT MARRIED HOMOSEXUAL AND BISEXUAL MEN - A FACILITATOR'S KIT IN ACTION

Molenaar, John W. Education and Liaison Officer
Gay and Married Mens Association, Melbourne, Victoria, Australia

Objective. To review materials specifically developed to assist in the understanding of the nature bisexual behaviours and H.I.V. transmission, and the significance this has for educating married homosexual men.
Methods. A review of materials contained in the AIDS and Bisexual mer and their Partners - Facilitator's Kit, analysing the approaches most appropriate to educating the target group. Exploring the needs of married homosexual men and their partners, and the implications that these have for educating about H.I.V. prevention.
Results. First hand experiences at using materials and the opportunity to discuss the relevance of the content of the content and the strategies in working with or identifying the needs of married homosexual and bisexual men and their partners.
Discussion. The Facilitator's Kit contains Workshop resources which provides participants with experiences leading to an understanding of the range of constraints and needs expereinced by married homosexual men and the implications that this has for the education about AIDS and the prevention of transmission.
Conclusion. The opportunity to discuss and explore the issues related to bisexuality, enables one to more fully appreciate the needs and concerns of many men in or community who may be at risk of contracting H.I.V.

Th.E.P.74 EDUCATIONAL INTERVENTION IN A COHORT OF HOMO/BISEXUAL MEN TOWARDS A CHANGE IN HIGH RISK BEHAVIOR FOR HIV INFECTION: AN ASSESSMENT OF THE PROCESS AND ITS EFFECTS.

Cáceres, Carlos*; Mariscal, F.**;De la Vega, E.***;Gotuzzo, E.*;Ramah, M.***
*Inst. de Med. Tropical "A. von Humboldt", Lima, Perú; **MHOL-Perú, Lima, Perú; ***AIDSCOM/Academy for Educational Development, Washington, U.S.A.

Objectives. Developing an educational intervention in a cohort of homo/bisexual men in Lima, pursuing an increase in their knowledge about HIV/AIDS and the adoption of safer sexual practices.
Methods. Fifty middle class homo/bisexual men in Lima, Perú, attend a program of three workshops offering general information about HIV/AIDS and eroticizing safer sexual practices, through several group dynamics and audiovisual methods. Pre- and post-workshop questionaires are given to attendants; so are surveys about the workshops themselves. One month after the last workshop, another questionaire is given. The trial is controlled through comparison with a non-intervented, parallel group.
Results. The program, begun in 1988, is continuing. The results from the first stages show that: (a) The starting knowledge level was high, so it did not rise significantly; (b) The attendees were generally willing to assume promptly behavioral changes towards risk reduction; and (c) The workshop was generally found to be entertaining and of appropiate length, the information appeared to be new and of appropiate complexity, and the audiovisual presentations were well accepted.
Conclusions. This program shows to be welcome and to succeed in producing the desire for behavioral change. The information level, which was already high when the trial began, does not increase significantly.

Th.E.P.76 STD PATIENTS' AND PROSTITUTES' KNOWLEDGE ON AIDS: MODIFICATION OF SEXUAL PRACTICES, AND EDUCATION NEEDS.

F. Soyinka, M.Z. Hossain, O. Onayemi
Obafemi Awolowo University, Ile-Ife, Nigeria

Objectives: To assess STD patients' and prostitutes knowledge of AIDS with a view to identifying education needs and to assess if knowledge of HIV-status could influence sexual practices.

Methodology: 50 randomly selected STD patients and 25 prostitutes volunteers were interviewed concerning knowledge on AIDS, and sexual practices. HIV-antibody screening was carried out on all and the results were made known to them. Participants were reinterviewed 6 months later concerning their sexual practices after knowledge of HIV-status.

Result: There were serious gaps in knowledge about transmission and prevention in both groups. Majority of STD patients had prostitutes as clients while prostitutes were not discriminatory. None used condoms regularly. Majority of participants who know that condom could be used to prevent STD were not aware of its effectiveness in the prevention of AIDS. Over 95% of the prostitutes who screened negative for HIV-antibody responded 6 months later that they now insist on usage of condom while 30% of STD patients said they now keep to one sexual partner or regularly use condoms.

Conclusion: Identifying various gaps and other areas of education needs would be used to provide effective information needed to design health education strategies. Knowledge of the negative status of HIV-antibody could possibly be used to modify sexual behaviour in high risk groups. Integration of AIDS campaign into STD services is recommended.

Éducation
Education

E.501

CULTURAL DIFFERENCES IN AIDS-RELATED ATTITUDES, BELIEFS, AND BEHAVIOR CHANGE

Zimmerman, Rick S.; Stevens, R. A.; Fischl, M.
University of Miami, Coral Gables, Florida, United States.

Objective. To assess differences among Hispanics, non-Hispanic Whites (Anglos), American Blacks, and Caribbean Blacks on AIDS-related attitudes and beliefs and their impact on reported behavior change.
Methods. A subsample (N=140) of respondents recruited in primary care and STD clinics for a high-risk heterosexual transmission study received a 25-minute interview. Group differences were assessed with ANOVA, and correlations assessed relationships with behavior change for each of the 4 groups.
Results. Hispanics were most worried about contracting HIV, Caribbean Blacks and Hispanics had the strongest moral associations with AIDS, Anglos had the most negative feelings about condom use, and Anglos and American Blacks had the most negative feelings about having sex only with people they knew well. Blacks reported the greatest intentions to change sexual behaviors, though there were no differences on reported behavior change. Different variables predicted reported behavior change for the various groups. American Blacks who believed that the proportion of PWAs who were women and heteroseuxal men was high, those with a positive attitude toward reducing sexual partners, and those who saw HIV as preventable were more likely to reduce risky behavior. Hispanics who had strong moralistic attitudes about AIDS, believed spontaneity was important in sex, and that their friends would approve of increased condom use were more likely to have reported change.
Conclusion. There are important cross-cultural differences in beliefs and attitudes about HIV as well as differences in predictors of behavior change. These results have important implications for public health education.

E.503

FOSTERING PUBLIC-PRIVATE PARTNERSHIPS: The New York City Experience.

*Omi, J.; *Jacques, C.; *Rautenberg, Ellen; *Hayes-Cozier, B.; : *New York City Department of Health, New York City, USA.

Objective: To describe the design and outcome of the NYCDOH technical assistance initiative for community based organizations under contract to provide AIDS prevention services.
Methods: During the 12 month fiscal year 1988-89, NYCDOH let 30 contracts with community based organizations for the provision of AIDS education and outreach services. To facilitate the coordination and effectiveness of resultant programs, DOH staff provided technical assistance to the contractors. This assistance included program development, training, evaluation design, coordination of borough and city-wide collaborative efforts, and on-site program review.
Results: Requests for technical assistance in the initial stages of the initiative were administrative in nature, i.e. clarification of fiscal and contractual policies and resource availability. Requests made by organizations later in the year concerned more programmatic issues, i.e. staff training, outreach skills, development of referral sources, and evaluation.
Conclusion: The provision of technical assistance must be responsive to the specific needs of recipients. Several factors influenced need and demand for technical assistance, including geographic density of similar efforts; size, age and sophistication of agency; familiarity of agency with contract procedures; and complexity of service scope. Thus, a multi-tiered approach was utilized: 1) organizational development, 2) program and staff development, 3) quality assurance and evaluation, 4) review and expansion.

E.505

SOCIETAL IMPACT OF HIV INFECTION IN WOMEN.

Danforth S., Carpenter Charles C.J. Brown University Medical Center. Providence. RI USA.

Objective. To study the impact of HIV infection on the families of affected women. Methods. 31 HIV-seropositive women, 26 infected by intravenous drug use (IVDU) and 5 by heterosexual transmission (HT), were thoroughly evaluated and monitored for 32-months (mean) in a multidisciplinary ambulatory care program. Intrafamily relations were observed and family counselling was provided. Results. The 31 women (mean age 31) had 57 living children, ranging in age from 1 to 20 (mean 6.2 years). 5 of the women had no living children. For the remaining 26 women, nuclear family structures remained intact in only 3 instances (2 of 5 infected via HT and 1 of 21 via IVDU). Among the remaining 23 women with children, 5 were widowed as a result of AIDS, 11 were divorced and 6 had never married. In only 7 of the 23 families were all minor children living with the affected mother. With all women who lived with one or more children, problems related to child care had a negative impact (e.g., difficulty in keeping ambulatory care appointments) on maternal health care. Conclusion. The societal impact of HIV in women is disproportionately large, both because of the effects of maternal HIV infection on family dynamics, and because obligations to childen often interfere with health care of the mother. More comprehensive efforts to deal with the emotional, social and economic impacts of HIV infection in women are urgently needed.

E.502

COMMUNITY-BASED PROJECTS FOR HIV PREVENTION: TYPES OF ORGANIZATIONS, TARGET POPULATIONS, AND EDUCATIONAL STRATEGIES

Kohmescher, Robert; Martich, F.A.; Dietz, S.E.; West, G.R.
Centers for Disease Control, Atlanta GA, USA

Objective: To provide financial support and technical assistance to minority and other community-based HIV prevention projects.
Methods: On January 9, 1989, the Centers for Disease Control (CDC) announced the availability of funds for minority and other community-based HIV prevention projects. These projects will be conducted in coordination with existing community organizations including State and local HIV prevention programs. In July 1989, awards will be made to approximately 75 community-based organizations. The CDC expects a large number of organizations to apply for this funding.
Results: Authors will report on the number and types of organizations applying for funds, the demography and risk groups of the target populations to be addressed, their size, and the amount of funding requested. Authors will summarize the proposed outcomes for these projects and the types of activities designed to contribute to their achievement. Authors will discuss the relative likelihood of the success of these projects based on the quality of their plans and their relationship to models of behavioral change. This information may be useful to community-based organizations in designing more effective proposals for behavioral change.

E.504

THE IMPACT ON CHILDREN WHOSE PARENTS OR LOVED ONES HAVE HIV DISEASE

Sinclair, Rebecca; Private Practive, counselor and consultant, Cascade Aids Project, Portland, Oregon, U.S.A.

Objective. To describe the unique personal, social, and familial issues children face when a parent or adult friend has HIV disease.
Methods. Interviews and counseling sessions with male and female children between the ages of 10-18 years and their parent, relative,or adult friend.
Results.Information gathered indicates that there are unique commonalities children and their family members experience. Some of these commonalities are: isolation, fear, anger, loss, shame, and a need to hide. These identified issues are greatly intensified because of the stigma paired with HIV disease.
Conclusion. Children who live with or know someone with HIV disease face unique difficulties. It is extremely important to identify and assist these children in breaking the cycle of fear and isolation. Care providers need to help children access their beliefs and feelings, introduce accurate information about HIV disease, and connect them with appropriate support systems.

E.506

EVALUATION OF CARE PROVISION TO AIDS PATIENTS AND PSYCHOLOGICAL PROBLEMS OF RELATIVES OF (DECEASED) AIDS PATIENTS

Boom, Frans M. van den; Roozenburg, Hans
Netherlands Institute of Mental Health, Utrecht, Netherlands

Objective: Evaluate hospital and homebased care; inventory of psychological problems and coping mechanisms of relatives. By striving for more homebased and less hospital care, the pressure on the supportsystem (partnes, family, friends) will only increase, meaning that the patient's social network will be increasingly confronted with shorter and more frequent episodes of hospitalization. Relatives of deceased AIDS patients are a valuable source of information with respect to the quality of health care, with respect to the feasibility and endurance of homebased care, to their own need for support and help, burn out, and dealing with the process of becoming ill, dying and death.
Method:_interviews with relatives of ± 100 deceased AIDS patients (the total number of deceased patients in the Netherlands is ± 300).
Results: the first results of the study, based on ± 50 interviews, will be presented.

E.507

PSYCHOSOCIAL STATUS OF PARTNERS OF HAEMOPHILIACS WITH HIV INFECTION : A CONTROLLED INVESTIGATION.

Klimes,I.*, Catalan, Jose**, Bond,A.**, Garrod,A.**, Day,A.**, and Rizza,C.***
*Dept. Clinical Psychology and **Oxford University Dept. Psychiatry, Warneford Hospital, Oxford, and *** Oxford Haemophilia Centre, Oxford, U.K.

Objective. To establish prevalence of psychosocial problems in partners of HIV+ haemophiliacs; to compare it with that of the infected partners; to identify the characteristics of those with problems; to assess the need for further psychological intervention.
Methods. Partners (n=36) of randomly selected and matched for haemophilia severity HIV+ (n=17) and HIV- (n=19) patients were studied. Measures included psychiatric state (PSE, POMS, Hopelessness); social adjustment; sexual functioning; coping (self-esteem, health locus of control, Hardiness).
Results. The majority of HIV+ subjects were asymptomatic. All the women were HIV-. Psychosocial status, coping style and other measures of partners of haemophiliacs were not affected by the men's HIV status. There was a trend suggesting that the women had worse psychosocial functioning than their partners (whatever the men's HIV status), but this seldom reached statistical significance.
Conclusions. Partners of HIV+ asymptomatic haemophiliacs do not appear to suffer more psychological difficulties than those of HIV- haemophiliacs. Possible reasons for this are considered, and include their being aware of their partner's HIV status for at least three years, and their prior experience of coping with a chronic condition such as haemophilia.

E.509

A LONGITUDINAL STUDY EXAMINING THE IMPACT OF AIDS AND HIV ON PARTNERS AND FRIENDS - RESULTS FROM BASELINE, THREE AND NINE MONTH RETEST DATA.

Church, John; Kocsis, A.E.; Vearnals, S.F.; Green, J.
Paterson Wing, St. Mary's Hospital, London, W2 1NY, U.K.

Objectives: To assist with targeting support for informal carers by 1) Determining anxiety and depression levels in carers 2) Establishing the degree of role, habit and attitudinal changes experienced 3) Isolating factors predictive of positive or negative outcome.
Method: Informal carers of PWA's and healthy seropositives were recruited (N=50). Anxiety and depression questionnaires were given along with the St. Mary's Personality, Behaviour and Cognitive Changes questionnaire. Controls were cancer carers (N=15).
Results: Carers' lives are greatly affected by the conditions of their partners. Their work and social lives are severely restricted. Many carers reported positive relationship changes. Social support and satisfaction with social support was significantly correlated with anxiety and depression levels in the carer. (P<.01). Carers at time one were highly anxious overall, 25% being more anxious and depressed than index patients. Time in itself did not have a uniform effect on anxiety and depression scores in carers. There was a trend for carers to have higher anxiety scores at time two. Those most distressed at times one and two, had less social contact at retest. A predicted factor of increase in stress levels from time one to time two was the perceived (rather than actual) impact on work, social life etc. Comparisons with impact on carers of cancer patients is also presented.
Conclusions: The impact of the caring role can be burdensome. However, it is possible to isolate factors indicating need for support in carers and the areas in which it should be provided.

E.511

E.508

THE ROLE OF PEOPLE WITH AIDS. THEIR FAMILIES AND FRIENDS AS HEALTH EDUCATORS IN THE AIDS EPIDEMIC

JD DUPREE*,S BECK**, PANEL OF PEOPLE WITH AIDS** *AIDSCOM, Washington DC U.S.A., **National Association of People with AIDS

Objective: To demonstrate that People with AIDS and their loved ones continue to be effective in AIDS education and prevention efforts; and to explore ways of overcoming cultural, moral and political resistance to their participation in that capacity.
Methods: A panel will model the effectiveness of the peer education approach. Though peer educator programs have been shown to be most effective in reaching people with health promotion messages, this model frequently encounters community resistance when applied to AIDS prevention. A teenager with AIDS at a classroom presentation may provide the most effective AIDS prevention message to that audience, school boards and/or parent groups may resist this. The authors discuss ways of working with community groups to promote use of People with AIDS, their families and friends as AIDS educators.
Results: Though health education campaigns have repeatedly shown the value of peer education, there is still much resistance to having individuals known to be infected with HIV appear at public presentations, in classrooms, churches, etc. A panel of HIV-infected people model ways to overcome this resistance, demystify people living with HIV infection, and promote not only healthier lifestyles, but more compassion and understanding.
Conclusion: People with AIDS/ARC/Ab+, their families and friends can be effective spokespersons in AIDS prevention efforts.

E.510

THE IMPACT OF AN AIDS DIAGNOSIS ON PATIENTS AND THEIR SOCIAL SUPPORT SYSTEM

Laquidara, Karen*; Jankowski, S.**, Videka-Sherman, L***
*Albany Medical Center, Albany, New York, U.S.A., **Albany Veterans Administration Medical Center, Albany, New York, U.S.A., ***State University of New York at Albany New York, U.S.A.

Objective: The primary purpose of this study was to obtain information about the impact of the diagnosis of AIDS on the social support system of persons with AIDS (PWA's).
Method: Qualitative semi-structured interviews with fifteen PWA's and their primary helpers were completed to obtain thorough and specific descriptive information about the impact of the illness on patients and their social support networks. Computerized analysis of this qualitative data was conducted with the Ethnograph analysis software. Interviews were analyzed according to grounded theory qualitative content methods (Glaser and Strauss, 1967).
Results: The PWA's and their primary helpers reported profound effects on their social networks due to the diagnosis of AIDS. The stigma associated with the illness resulted in reduced levels of support for the primary support network, and placed them at higher risk of increased stress. The diagnosis impacted on the depth and structure of the relationship between the PWA and their primary supporter and their social support network.
Conclusion: The needs of the primary support network should be assessed and addressed by the mental health professional.

E.512

PREVENTION METHODOLOGIES FOR WOMEN AT RISK FOR AIDS

Aronson, Christine and Finnegan, L.P.
Thomas Jefferson University, Philadelphia, Pennsylvania, U.S.A.

As part of on-going efforts to prevent HIV infection in women at risk, 42 drug dependent pregnant and post-partum women receiving comprehensive treatment were surveyed. Drug use history revealed that 95% are current or past IV drug users with an average of 12 years of needle sharing; 82% of the subjects reported cessation of needle sharing. The women completed questionnaires detailing their sexual and drug-using behaviors followed by a 30 minute factual didactic session on AIDS. Questionnaires were repeated two to three weeks after the session. Results revealed that 79% are currently engaged in some risk behavior for HIV infection, such as prostitution, lack of condom use and sexual partners who are IV drug users. Nearly all women (97%) knew that AIDS is spread by sharing needles and 88% knew how to effectively clean needles. All women knew that condoms provide protection during intercourse. The women showed concern about AIDS and 71% feared infection, but did not believe they would catch the disease in spite of their past and/or current high risk behaviors. Didactic sessions had little influence on the subjects' knowledge and behavior since differences in pre and post tests were insignificant. These women are clearly at high risk for exposure to HIV infection, both through sexual and needle sharing behaviors. Although this survey revealed some cessation of needle sharing practices, condom use and other safe-sex practices were negligible. Conventional teaching efforts had a limited effect on increasing knowledge or changing behaviors. Therefore, these women clearly remain at high risk for future infection in them and their children until IV drug use ceases and sexual behaviors change. As a result of this study, other methodologies are being defined in an effort to prevent HIV infection in women who are involved in high risk behaviors.

E.513

AIDS AND THE CHANGING AMERICAN FAMILY

Levine, Carol, Citizens Commission on AIDS for New York City and Northern New Jersey, New York, NY, USA

A major crisis like AIDS heightens processes of social change already underway and sets in motion new, particularized responses. This presentation will explore the potential impact of some of these changes on American families.

I. **Who Counts as "Family"?** Along with other social and cultural factors, AIDS is contributing to a broadened and more functional definition of family. The essential characteristics of these relationships are permanence (at least in intention), commitment to mutuality (not necessarily equality) of various forms of economic, social, and emotional support, and a level of intimacy that distinguishes this bond from other, less central attachments.

II. **The Failure of Institutions to Reflect the Reality of Family Functioning.** The two basic kinds of families discussed in this presentation--the biological family and the acquired or chosen family--differ in significant ways. Each demonstrates particular strengths and weaknesses in responding to the challenges of AIDS and HIV infection. This presentation will discuss in particular three areas where courts and other institutions have already had to deal with the tension and where institutional change seems most likely: (1) medical treatment decisions, (2) housing, and (3) custody.

III. **The Formation of New Families.** The process of change and adaptation is incomplete. Just as existing families continue to adjust to the exigencies of AIDS, the formation of new families may also be affected by law and changing custom. Some of these changes may reflect the epidemiology of AIDS. In some minority communities, large numbers of men and women of childbearing age are HIV-infected. These communities place a high value on reproduction; how will HIV infection, and the consequent threat of the birth of HIV-infected babies, affect the formation of new relationships? Even among groups where procreation is not a supreme value, HIV status may be influential in the formation of new relationships. Public policy and medical practice discouraging marriage and reproduction among HIV-infected people may play a significant role. Personal choices of sexual and especially marriage partners, only recently (and incompletely) freed from considerations of religion, race, and economic or social status, may be tempered by disease. A sexual relationship must always be constrained by concerns about transmission. While existing relationships may survive and even be strengthened by knowledge of a partner's HIV infection, the formation of new relationships may well be deterred by the realities of the situation.

E.514

NGOs AND AIDS - MOVING FROM APATHY TO ACTION: TWO YEARS OF EXPERIENCE FROM THE LEAGUE OF RED CROSS AND RED CRESCENT SOCIETIES.

Dick, Bruce ; Wallace, Barbara
Community Health Department, League of Red Cross & Red Crescent Societies
Geneva, Switzerland

Abstract: NGOs have been, and will continue to be at the forefront of the AIDS pandemic in the fields of prevention, counselling, care and counteracting discrimination.

However, this involvement with AIDS has not always been easy, sometimes because of pre-existing problems, sometimes as a result of relatively new difficulties posed by the pandemic.

This paper will outline and discuss the major areas of concern which have been encountered by the League of Red Cross and Red Crescent Societies during the past two years, how they have affected the activities of Red Cross and Red Crescent Societies and how they have been or are being overcome. An NGO AIDS flow-chart will be presented based on these experiences.

E.515

PRATIQUES DE RISQUE ET SIDA PARMI LA POPULATION ESPAGNOLE

USIETO, RICARDO *; SASTRE, JULIA**; TORRES, JOSE***; ANABITARTE, HECTOR****; DE ANDRES, RAFAEL*****; CONTRERAS, Mª CRUZ******
* UNIVERSITE INTERNATIONALE MENENDEZ PELAYO,MADRID, ESPAÑA; **. MAIRIE - - DE MADRID, ESPAÑA; *** DISTREX IBERICA, S.A., BARCELONA, ESPAÑA; **** COMITE ANTI-SIDA DE MADRID, ESPAÑA; *****MINISTÈRE DE SANTE ET DE CONSOMMATION, MADRID, ESPAÑA; ****** UNIVERSITE INTERNATIONALE MENENDEZ PELAYO.

Objectifs. Connaître d'une façon scientifique la situation de toute la population espagnole face au SIDA quant aux pratiques de risque. Connaître leur opinion en toutes les matières relatives au risque d'etre porteur du VIH ou de développer la maladie. Etude détaillé des changements des habitudes, etc. de toute la population espagnole.
Méthode. Enquête d'opinion pour toute l'Espagne. Personnes âgés de plus de 14 ans. Proportionnel parmi des villes de moins de 10.000 habitants et plus de 500.000 habitants. Par régions, habitat sexe et âge. Questionnaire: 333 questions et réponses possibles, résultant 1.117 entrevues valides, avec une erreur du ± 3,5% niveau de confiance = 2 (95,5%) et la variance populationale P/Q 50/50. Enquête qualitative à des groupes et à des individus de toute l'Espagne. Intervention des Comités et des Commissions Citadines de l'Etat Espagnol et le Plan du SIDA du Ministère de Santé et de Consommation.
Résultats. 36,8% de la population espagnole a maintenu des relations sexuelles avec une seule personne pendant toute sa vie; 25% entre 2 et 5; 14% entre 6 et 20. On pratique d'une façon majoritaire le coït vaginal. 45% n'utilise aucune méthode d'hygiène. 28% n'utilise aucune méthode de anticonceptive. Préservatif: 30%. Retour en arrière: 13%. Pilule: 11%. 10% a réalisé la pénétration anale, 25% l'éjaculation orale.
Conclusion. Seulement 7% de la population espagnole a changé de conduites à cause du SIDA.Ces changements sont: augmentation de l'utilisation du préservatif (13%); abandon de l'usage de la prostitution feminine (23%). 70% de toute la population est partisan de se faire la preuve de détection des anticorps.

E.516

UNE APPROCHE SOCIO-ANTHROPOLOGIQUE DU SIDA EN FRANCE

Laurent MARTY, Observatoire Régional de la Santé du Nord-Pas-de-Calais, Lille, France.

Objectif: Apporter aux personnes qui interviennent sur le Sida des éléments permettant de s'y retrouver dans la difficulté et la complexité des questions soulevées.
Méthodes: Une série d'enquêtes de type anthropologique ont été réalisées, en liaison avec les Pr. FOURIER, MOUTON et BEAUCAIRE et leur équipe, auprès de populations touchées et de "populations menacées" afin de voir la manière dont l'épidémie se transmet et est représentée dans ces milieux très différents les uns des autres.
Résultats: L'approche anthropologique des groupes touchés, notamment autour de *ce moment fondamental qu'est la sexualité*, montre que l'épidémie développe dans le corps social en des lieux où il y a eu **fragilisation du tissu social**. Cette fragilisation est à considérer comme un effet normal dans **l'époque de grande mutations** que nous vivons. Le système des relations et le système des représentations est dans une période de transition, des explorations des nouvelles limites sont réalisées - autant de phénomènes qui créent des situations de fragilisation, et qui mettent en évidence la place que tient la **communication** dans l'épidémie et sa prévention, et souligne le rôle que peut tenir la fonction de **médiation** dans la prévention.

La situation particulière de la France (pourquoi un développement plus rapide que dans les autres pays d'Europe?), et la situation atypique du Nord-Pas-de-Calais (pourquoi moins de cas que dans d'autres régions françaises comparables?) conduisent à des réflexions sur **l'importance du tissu social intermédiaire.**
Conclusions: La capacité des groupes et des individus à réagir face à l'épidémie (et à assurer la solidarité avec les personnes touchées) est liée à la **capacité de parler** du Sida, et aux **méthodes de communication** mises en œuvre à cet effet.

E.517

A CONTRIBUTION TO THE DEVELOPMENT OF A BLACK ANTHROPOLOGICAL PERSPECTIVE ON COMMUNITY-BASED AIDS EDUCATION USING THE EXPERIENCE OF COMBAT IN TORONTO, ONTARIO, CANADA.

Wilson, Jacquelyn A.*; Stevenson, B.**; Phokabye, G.***; Guishard, L.****.
*Ph.D Candidate Department of Anthropology, University of Toronto, Toronto, Ontario, Canada;**Co-Director COMBAT, Toronto, Ontario, Canada;***Law Student, York University, Toronto, Ontario, Canada; ****COMBAT Field Worker, Toronto, Ontario, Canada.

Objective: An analysis is provided of some of the major problems associated with developing and delivering culturally sensitive AIDS education information in a multi-ethnic Black community situated within a multi-racial society.
Methods: AIDS in the Black community presents a unique epidemiological configuration since, as a disease of the family, it affects all age and gender categories more or less equally. The participant observation method was used to investigate the problems that are encountered when AIDS educational information is modified in order to address each category of persons within the Toronto Black community.
Results: Despite the fact that each Black ethnic group has developed mutually unintelligible, predominantly English derived vernaculars for communication about sexual orientations and practices. (ie: botty-man, bullamen, antimen, hen and sami-maker, which all translate to homosexual orientations), there nevertheless exists underlying common cultural understandings that allow for the communication of AIDS education information.
Conclusion: Combat's experience would strongly suggest that resolutions can be found for the problems and contradictions that tend to inhibit the transmission of a quality of AIDS education information that will influence sexual behaviour within the Black community. However, the more important contradictions and conflicts between Blacks and the broader society can and have impeded the effectiveness of AIDS education in Toronto's Black community.

E.518

E.519

AN ETHNOGRAPHIC STUDY OF THE SEXUAL PRACTICES AND DRUG BEHAVIORS OF INTRAVENOUS DRUG USING MALE PROSTITUTES

Rucker, Ronn D.*; Nemeth, G.**

*Cincinnati Health Department: East Central AIDS Education and Training Center and REACH Program, the National Institute of Drug Abuse (NIDA); Cincinnati, Ohio, U.S.A., ** University of Cincinnati, Cincinnati, Ohio, U.S.A.

Despite a widespread belief that safer sexual practices have been adopted by many gay and bisexual men, little research has been conducted to determine the extent of behavior change that has occurred among male prostitutes since the appearance of AIDS. Additional knowledge in this area is important to determine what factors might be involved in designing behavioral change programs to influence these individuals to reduce or eliminate their AIDS risk behaviors.
Methods. Ethnographic techniques were employed to gain access to a cohort of 30 male prostitutes over a four year period from 1985-1989.
Results. Half of this sample had used intravenous drugs at least once. All had practiced unsafe sexual behavior on multiple occasions with different partners. Six of the individuals stating that they had practiced unsafe sex also had knowledge of their own HIV seropositivity. The unsafe sexual behavior continues to the present time and for some of the individuals was reported to be increasing along with IV drug use.
Conclusion. Effective behavioral change programs are needed to decrease transmission of HIV among male prostitutes and their sexual partners.

E.520

CULTURAL CONTEXT OF HIV INFECTION AMONG HOMELESS FAMILIES IN NEW YORK CITY

Susser, Ida
Community Health Education, Hunter College and HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, New York, U.S.A.

Objectives: To explore the significance of HIV infection and AIDS among residents of homeless shelters with particular attention to women and children in terms of their own understanding and strategies for prevention.
Methods: Field work, structured interviews, participant observation, discussions with groups and collection of documentation.
Results: Most people in shelters have heard of AIDS; the exception is women who speak mainly Spanish and live in hotels for the homeless. Most people are aware of the main sources of transmission. A clear issue emerges with regard to the limitations to their implementing preventive strategies within the life-style imposed by homelessness and lack of resources.
Conclusion: Prevention, either through individual counselling or mediated through medical care facilities, spreads information but attention to the social and economic situation will be needed for more effective changes to be implemented.

E.521

GEOGRAPHICAL MOBILITY AND HIV TRANSMISSION AMONG LONDON PROSTITUTES.

S DAY, HELEN WARD, J R W HARRIS, The Praed Street Clinic, St Mary's Hospital, London, W2, United Kingdom.

Objective: To assess the importance of geographical mobility in relation to HIV infection among prostitute women in London.

Methods: An analysis of geographical mobility among 122 women in the Praed Street Clinic prostitutes cohort was made on the basis of regular interviews and correlated with HIV status and socio-demographic factors.

Results: Forty women (33%), including 9/18 non-British nationals, have worked abroad since 1979 in a total of 20 countries:

	Place of Work				
	Middle East	Continental Europe	Australia	Far East	North America
No. Visits (No. Women)	30 (21)	22 (19)	5 (5)	5 (4)	3 (3)

Those who worked abroad were more likely to work privately or for agencies in London than those who did not (29/40 v 30/82; p = < .001); none was HIV-1 seropositive. On all but 3 visits abroad, mobility was associated with the same or lesser degree of condom use.

Conclusion: The London cohort is characterised by high mobility, especially among better paid prostitutes, and the place of work influences the safety of the contact. The potential role of prostitutes as "bridges" between areas of relatively high and low HIV prevalence is not borne out in the London study as travel is not associated with areas of known high prevelance.

E.522

SEXUAL PRACTICES AND CONDOM USE AMONGST MALE PROSTITUTES IN LONDON: DIFFERENCES BETWEEN STREETWORKING AND NON-STREETWORKING PROSTITUTES

Robinson, T.W.*; Davies, Peter* and Beveridge, S.** Project SIGMA
*South Bank Polytechnic, London, U.K., **Friends' World College, London, U.K.

Objective: To examine the differences in sexual and other practices relevant to the risk of HIV infection between non-streetworking male prostitutes (non-SWPs), commonly known as "call boys", and streetworking prostitutes (SWPs).
Methods: Between November 1988 and January 1989, as part of an ethnographic study, 12 non-SWPs, 10 SWPs and 7 clients completed a 2½ hour-long structured interview concerning sexual practices, condom and drug use.
Results: Reports from non-SWPs and their clients disagree on the incidence of 'high risk' sexual activity. According to the non-SWPs, the incidence of anal intercourse with their clients is low but is much higher with non-paying partners. Moreover, they say that condoms are more likely to be used with clients than with other partners. Their clients, however, report anal intercourse to be common.
According to their self-reports, SWPs are more likely to engage in anal intercourse with their clients than non-SWPs. With non-paying partners, anal and vaginal intercourse is high. They report lower rates of condom use than non-SWPs in both cases.
Conclusions: High risk sexual behaviour is more likely between prostitutes and their non-paying partners than with clients. SWPs are more likely than non-SWPs to engage in such behaviour with both groups of partners. Differences in the reports suggest that some non-SWPs are more likely to engage in 'high risk' activities than others.

E.523

SEXUAL PRACTICES AND HIV RISK FACTORS: THE ETHNOGRAPHY OF PROSTITUTION IN RIO DE JANEIRO, BRAZIL

Richard G. Parker, Ph.D.
Universidade do Estado do Rio de Janeiro

Objective. To differentiate between distinct forms of prostitution in Rio de Janeiro, Brazil, and to analyze variations in risk-related sexual behavior.
Methods. Ethnographic description, based on indepth interviews with selected informants, is used to distinguish between different forms of prostitution and to map out the sexual geography of Rio de Janeiro. Patterns of sexual behavior can then be linked to patterns of HIV transmission.
Results. Class and gender emerge as key factors in differentiating distinct forms of prostitution. A distinction is made between female prostitution, transvestite prostitution, and male prostitution, which, depending on the class background of the participants, take place in specific areas of the city and can be tied to specific sets of sexual practices. Different types of prostitution in different areas involve distinct patterns of heterosexual, homosexual, and bisexual behavior, as well as distinct patterns of vaginal, oral, and anal intercourse.
Conclusions. Understanding these diverse forms of prostitution is essential to understanding the role of prostitution in the spread of HIV, as well as to developing effective AIDS information materials for individuals who are involved in prostitution.

E.524

THE RESEARCHER-ADVOCATE MODEL IN THE STUDY OF PWA'S: PSYCHOSOCIAL SUPPORT AS A FEATURE OF PSYCHOSOCIAL RESEARCH

Tourigny, Sylvie C., PhD. Physician Behaviour Unit, University of Toronto, Toronto, Ontario, Canada.

Background: Because fatally ill patients (such as PWA'S) participating in psychosocial research require researcher support, I adapted Cassell's researcher-advocate model. This study examines its effectiveness for highly stressed research participants.
Objectives: This descriptive paper analyzes the methodological features of two research projects with 100% participation rates until respondent's death.
Methods: The adapted model is based on PWA'S (1) life expectancy; (2) emotional vulnerability; (3) stress levels. Researcher-advocacy includes: (a) type and frequency of feedback; (b) relationship between the researcher and PWA'S social network; (c) the researcher's role vis-a-vis HCP'S.
Results: The model provides guidelines to psychosocial AIDS researchers. Research was assessed by PWA'S and HCP'S as a "humanizing experience" in the two psychosocial studies reported, where participation was continuous despite severe disease, stress, and opportunity for non-participation. Researcher burnout was limited by the reciprocity of support built into the model.
Conclusion: Literature indicates that PWA'S are aware of the potentially depersonalizing features of clinical care. The philosophy, structure and continuity of the research-advocacy model may counteract the stress experienced by otherwise socially stigmatized research participants.

E.525

DEPRESSION VIRO-INDUITE DES DEFENSES SOCIALES.

Beauchard, Jacques
Université Paris XII Val de Marne, Créteil, France.

Objectif. Décrire la nature des résistances sociales opposées au changement des pratiques sexuelles.
Méthodes. Enquêtes sociologiques :

- enquête de référence BVA-INSERM, échantillon 1.000 personnes à risques, septembre 1988
- enquête réalisée auprès de 400 étudiants, Laboratoire de Sciences Sociales appliquées, Université Paris XII Val de Marne, Septembre 1988.

Résultats. Une sociabilité française qui souvent oppose le privé et le public voit aujourd'hui s'affaisser momentanément ses défenses collectives : l'information SIDA transmise par les médias et rationalisée par la Santé est d'emblée constituée en réalité virtuelle, hors du champ de la sphère privée, hors sujet pour l'individu, bloquée dans l'espace de la télé-sociabilité et donc sans prise sur le changement des pratiques sexuelles.
Conclusion. Nécessité d'une information de proximité qui relève du génie social.

E.526

PRATIQUES DE RISQUE ET SIDA PARMI LES TOXICOMANES ESPAGNOLS

USIETO, RICARDO*; SASTRE, J.**; ANABITARTE, H.***; TORRES, J.****; DE ANDRES, M*****; MENOR, J.******
* UNIVERSITE INTERNATIONALE MENENDEZ PELAYO, MADRID, ESPAÑA;** MAIRIE DE MADRID, ESPAÑA; ***COMITE CIUDADANO ANTI-SIDA DE MADRID, ESPAÑA; ****DISTRI[illegible] IBERICA, S.A., BARCELONA, ESPAÑA; MADRID, ESPAÑA; ******COMITTE OF RESEARCH ON KNOWLEDGE AND CULTURE,STRASBOURG *****MINISTERE DE SANTE ET DE CONSOMMATION FRANCIA.

Objectifs. Connaitre d'une façon scientifique la situation des toxicomanes espagnols en face du SIDA quant aux pratiques de risque. Connaitre leur opinion en toutes les matières relatives au risque d'etre porteur du VIH ou de développer la maladie. Etude détaillé des changements des habitudes, etc. des toxicomanes espagnols. Etude de l'émargement et du refus social en l'Espagne.
Méthode. Enquete d'opinion pour toute l'Espagne. Personnes agés de plus de 14 ans. Proportionnel parmi des villes de moins de 10.000 habitants et plus de 500.000 habitanus. Par régions, habitat, sexe, et age. Questionnaire: 333 questions et réponses possibles, résultant 1.117 entrevues valides, avec une erreur ± 3,5% niveau de confiance = 2 (95,5%) et la variance populationale P/Q 50/50.
Résultats. 70% des toxicomanes sont insatisfaits ou indifférents sexuellement. La plupart d'eux se sent malade, ils ne peuvent pas éjaculer. 75% a eu des relations sexuelles avec 5 personnes différentes. La moitié des hommes a réalisé l'éjaculation orale et la moitié des femmes l'a reçue. 41% n'emploie aucune méthode anticonceptive. 40% ne connait pas le SIDA au niveau d'information. 60% s'injecte de l'heroine, 45% de la cocaine. Un 9% seulement stérilise le materiel, et autre 9% se drogue de n'importe quelle manière.
Conclusion. Face a l'apparition du SIDA, 41% consulté ne partage pas d'aiguilles ni de seringues. Plus du 90% ne peut pas se détacher des drogues. Sexuellement on a laissé d'avoir des relations avec des prostituées (13%); 25% a reduit le nombre de couples. 50% propose de terminer le trafic pour quitter la drogue definitivement.

E.527

PSYCHOSOCIAL CONSEQUENCES OF INFORMAL CAREGIVING TO GAY MEN WITH AIDS

Siegel, K.; Raveis, Victoria H.; Kletecka, C.; Segal, J.; Moynihan, R.; Memorial Sloan-Kettering Cancer Center, New York City, U.S.A.

Objective: To understand the psychosocial consequences of providing informal assistance and care to gay men with AIDS.

Method: Structured individual interviews with gay men with AIDS and their primary caregivers.

Results: The main sources of social support and informal assistance to gay men who were diagnosed with AIDS (in the last 12 months) are their friends and lovers, followed by family members. Analyses of the initial interviews with 50 informal caregivers reveals that, even in the early stages of the disease, when the large majority of the AIDS patients were still functioning well, providing care and assistance was seriously impacting on the caregivers' own lives. A substantial minority of caregivers reported experiencing physical strain, financial burdens and employment related burdens. A sizable minority also scored in the clinical range on at least one of two measures of psychological distress (CES-D or Rutter Malaise). There is little evidence of negative coping strategies, in the form of increased substance abuse, at this stage in their caregiving experience. Furthermore, there are indications that, at least within the first year of the patients' illness, caregivers are finding some satisfactions in their role, feeling good about the job they are doing and finding it to be a source of self-esteem.

E.528

THE ESSENTIAL ROLE OF CASE MANAGEMENT AND COMMUNITY SUPPORT FOR HOME TREATMENT OF PERSONS WITH AIDS IN A LARGELY RURAL REGION.

[illegible], Adinolfi, A.; Liekweg, R.; Bartlett, J.A. Duke University Medical Center, Durham, North Carolina, U.S.A.

Objective. To assess the need for case management and community support services in a largely rural region for the successful treatment of AIDS patients at home.
Methods. Patients (22) who received therapy for an AIDS defining illness were included for analysis. All persons received at least a portion of their therapy at home. A positive outcome was defined as successful resolution at home; negative as admission to the hospital or death.
Results. Six persons received a complete course of therapy at home, while 16 began therapy while hospitalized and completed their course at home. Diagnoses included PCP (6), cryptococcal disease (6), CMV (5), wasting/dementia (4) and lymphoma (1). Therapies included IV fluid and medication (17), aerosolized medication (12), and oral antibiotics (3). Support personnel included visiting nurses (17), family members (8), friends and volunteers (26). [illegible] outcomes occurred in 12, negative in 4 (all deaths) and 6 remain in treatment. Positive outcomes were associated with the availability of live-in care givers (8), support personnel (19, mean 5 visits weekly) and a case manager (7). Four patients chose to discontinue therapy and subsequently died.
Conclusion. Seventy-five percent of our patients with AIDS were successfully treated at home for complex medical illnesses in a largely rural region. Successful treatment was dependent upon the availability of support services and a case manager to coordinate them. Health care policy in all areas must recognize the need for home nursing, volunteer networks, and case managers in caring for patients with AIDS.

E.529

DEVELOPING AN INTEGRATED AND COMPREHENSIVE LOCAL COMMUNITY RESPONSE TO AIDS IN A LOW INCIDENCE COMMUNITY

Carrick, Richard*; Coleman, D.**; Zelinski, D***.
*United Way of Franklin County, **Columbus Health Department,
***Metropolitan Human Services Commission; Columbus, Ohio USA

Objective: To develop an integrated and comprehensive community plan to deal with the problems of AIDS and HIV illness in a low incidence community.
Method: A broad-based group of community leaders was convened to provide overall direction to the effort to respond to AIDS. This group included local representatives from government, human services systems, both public and private, and the business, medical, academic, legal and gay communities. Staff support for this effort came from an interdisciplinary team assembled from 8 local human service systems who were loaned to the coalition for 9 months on a part-time basis. Primary data were collected through individually designed surveys of persons with HIV illness, businesses, hospitals, schools, and human service organizations. Secondary data were collected from focus groups of AIDS-related providers.
Results: The information base developed by the Shared Staff identified local estimates of incidence through 1991, of numbers of people in high risk transmission categories, current need for both education/prevention and treatment/support and current capacity to address those needs. From these, a plan has been developed that specifies needed effort, the projected 3 year costs and specific implementation strategies.
Conclusions: The conscious development of a broad-based community approach to the problem of AIDS has resulted in a more integrated and positive community dialogue, more effective intersystem cooperation and increased community funding.

E.530

A STATEWIDE APPROACH TO LOCAL PUBLIC HEALTH LEADERSHIP IN HIV PREVENTION

Leitheiser, A.; Heckert, K.; Beniak, Judy; Moen, M.; Parker, J.; Minnesota Department of Health (MDH), Minneapolis, MN, USA.

Objective. To design a statewide system that enables MN Community Health Services agencies to develop and implement HIV prevention programs.
Methods. In August 1987, the Commissioner of Health presented expectations for HIV prevention to 47 community health boards: appoint an HIV resource person, establish a local HIV task force, develop HIV policies, provide and coordinate community education and resources. These expectations are consistent with statewide goals for health promotion. The MDH cooperates with community health boards and staff to; fund 7 model projects, provide statewide conferences on HIV epidemiology, policy development, risk assessment and behavior change, staff an HIV Subcommittee of local health and elected officials, and develop a funding proposal to the legislature.
Results. All 47 community health boards representing 87 counties have appointed a trained HIV resource person. HIV task forces are established in most areas. Community resources are being assessed and coordinated statewide. The subcommittee developed guidelines and recommendations for HIV program development. The state legislature is considering a proposal for formula funds to community health boards. Educational products of the model projects are available.
Conclusion. Local health departments play an important role in organizing community constituencies to prevent HIV transmission. This role is enhanced through cooperative efforts between state and local health department. This approach has potential value for other state and local health departments.

E.531

A COMMUNITY-BASED APPROACH TO AIDS PREVENTION AND CONTROL

Evelyn M. Wallace**, Anne Bowlby*, Janet Victor*, Frank McGee*
Senior Medical Consultant/AIDS Co-ordinator**, AIDS Section Staff, Public Health Branch*, Ontario Ministry of Health.CANADA

The province of Ontario (pop. 9.2 million) has 40% of the cases of AIDS occurring in Canada. Epidemiologic surveillance since case reporting became mandatory in 1983 has shown that 90% of cases occur as a result of homosexual/bisexual practices. Some gay communities responded by forming local education and support committees. Recognizing the unique position of community-based organizations in the fight against disease transmission, the Ontario Ministry of Health made the decision to fund community-based AIDS education and support programs. With assistance from community activists, guidelines and a formal application form were developed. The main criteria for funding are a demonstration of the need for a program or service that does not duplicate existing services, strong community endorsement of the proposal, fiscal responsibility and the establishment of a voluntary Advisory Board.

The ministry targeted specific groups as priorities for funding. In the first year 10 community-based AIDS groups were funded and one-time grants were given to 5 other organizations mainly for educational purposes.

This paper will describe the evaluation of these programs after 1 year and show how funding enables these groups (e.g. IV drug users, prostitutes, hemophiliacs, street youth and ethnic and native communities) to assume responsibility for the control of AIDS and HIV infection at the community level.

KEY WORDS: AIDS, community groups, funding

E.532

HARRIS, ALLEN *'**; Berenstein, A.*; Hyman, F.*
'Congregation Sha'ar Zahav, San Francisco, CA, USA
**Kaiser Permanente Medical Center, San Francisco, CA, USA

Objective: To describe the design and operational structure of a community based volunteer program operating in an acute care hospital setting.
Methods: This is a volunteer directed and operated program by members of Sha'ar Zahav, which provides nutritional, psychosocial, and spiritual support to the inpatient and outpatient populations; significant others and hospital staff are included. An interest assessment of congregational membership was performed. The idea was discussed with the Bikkur Cholim (Acts of Loving Kindness) Committee at Sha'ar Zahav, a reform Jewish Congregation. We then presented the concept to administration at Kaiser Hospital, and together developed guidelines. A 1.5 hour HIV sensitivity training was offered to participants. Volunteers prepare food at home and meet at the hospital. Psychosocial and spiritual support is provided as necessary. Volunteers deliver food and visit with immobile patients. We provide live classical music and flowers to enhance the party-like atmosphere. Financial assistance is primarily from contributions directed to the program.
Results: The AIDS Brunch Program has been instituted and occurs monthly. It is coordinated by community volunteers in cooperation with hospital volunteer, social services, enviornmental services, and nursing departments. Inpatients and outpatients, with significant others, as well as hospital staff attend regularly.
Conclusion: An ongoing community based brunch program is providing support for people with HIV disease and others, in an acute care hospital setting. It has been recognized as a model in San Francisco, providing a new adjunct service utilizing community resources.

E.533

AN INNER CITY VOLUNTEER PROGRAM UTILIZING COMMUNITY AIDS EDUCATION AS A VEHICLE FOR RECRUITMENT.

B. Foust, L. Tennariello, L. Cherry, C. Niles, J. Martin, Ernest Drucker
Montefiore Medical Center, Bronx, New York, U.S.A.

Objective. To describe the effectiveness of community AIDS education as a recruitment vehicle for Project BRAVO, an inner city volunteer program.
Methods. This paper describes our work in recruiting volunteers to provide practical and emotional support to persons with AIDS (PWAs) in the Bronx, New York; an area that is predominantly comprised of people from minority backgrounds and low socio-economic status. This paper describes an AIDS education model which goes into the community to church and school organizations with already established ties to the people who live and work there. Workshops are scheduled for area residents at times that are convenient for them. Participants receive culturally sensitive AIDS education as well as an introduction into the psycho-social concerns of PWAs. Volunteers currently working with BRAVO also share their experiences and the rewards they have received from doing this work. A segment on the Epidemiology of AIDS in the Bronx, which differs somewhat from the national picture is also provided and adds a very real dimension to the day's proceedings.
Results. Project BRAVO has recruited twelve volunteers who work on a daily basis with PWAs. We have recruited twenty volunteers who are available on a per diem basis as well as four volunteers who act as peer counselors at community AIDS education seminars.
Conclusion. People from minority backgrounds and economically oppressed circumstances can be utilized as volunteers for persons with AIDS if agencies clearly state not only the need for volunteer services but what volunteer opportunities are available to them and how their role can have an impact on the community in which they live.

E.534

A COMMUNITY GENERATED AIDS PREVENTION PROGRAM: THE CASE OF CAMDEN, NEW JERSEY

Pela, Ona A*; Platt, J.J.*; Wolff, C.**; and Chavis, M.**. *University of Medicine & Dentistry of New Jersey-School of Osteopathic Medicine, Camden, NJ 08103, **Area Health Education Center, Northgate Plaza, Camden, NJ, U.S.A.

Objective: This presentation is a report of the Area Health Education Center (AHEC) community AIDS prevention outreach program. Attempts at controlling the spread of the AIDS epidemic will continue to depend on education and efforts aimed at attitude and behavior change as we search for a vaccine or cure. Change in behavior can, and should, occur at the micro- and macro-level of human interaction. This project is one such effort.
Procedure: Early in 1988, AHEC received CDC funding, through the NJ Health Department, to provide a cultuarlly sensitive AIDS education program in Camden. In developing the outreach approaches which include home visits, church meetings, etc. AHEC sought and received the cooperation of other agencies, church and community leaders. We present data on 393 participants over a 4-month period. Results: 64% of participants were female. Age range = 9-85 ($\bar{x}$=31.7) years. 72% were black, 15% were white, 10% were hispanic. 51% of those reached had never been married, while 22.4% are married. Comparison of the pre- and post- intervention global scores on the knowledge, attitude, and beliefs (KAB) questionnaire demonstrate a significant change in scores. Implications of the results are discussed.

E.535

BUILDING A COLLABORATIVE APPROACH TO AIDS PROGRAM PLANNING: THE BOSTON AIDS CONSORTIUM

Ladd, Holly D.*; Makadon,MJ*; Ramsey,J* **. * The Boston AIDS Consortium, **The Boston Foundation, Boston, MA, USA

Objective. To develop an organization to facilitate a community-based planning process that involves all interested members of of the community concerned with AIDS service, prevention and education programs.
Methods. A working group was convened in the Fall of 1987 to consider the need for a community-based planning organization for the City of Boston that would focus on the ongoing identification needs for new HIV-related services, education and prevention programs as well as the need for additional resources to support ongoing efforts. It was hoped that a consortium approach would foster collaborative efforts among diverse interests in our community.
Results. Since beginning operations in January 1988, over seventy public and private agencies and two-hundred individuals have participanted in Consortium efforts. The Consortium operates nine issue specific Task Forces (Hospital Care,Ambulatory Care,LongTerm Care,IV Drug Use, Family Networks,Mental Health Prevention and Education,Housing and Reimbursement) which are collaborative activities open to all. In October, the Consortium released its first publication, Task Force Reports and Preliminary Recommendations, and presented it to the State as a way of signifying key issues for change that had been highlighted as a result of this community process.
Conclusion. The Consortium provides a useful forum for open discussion and planning of AIDS programs in our community.

E.536

JOINT CARE PLANNING BETWEEN THE HEALTH AUTHORITY, LOCAL AUTHORITY AND VOLUNTARY ORGANISATIONS

*Mills C, **Grey E. *Riverside Health Authority, London, England, UK.
**Hammersmith & Fulham Local Authority, London, England, UK.

Objectives:- To develop common policies where possible regarding provision of services for people who are H.I.V. positive or have A.I.D.'S.
Method:- A series of sub-groups were established to report on the following to the Joint Planning Team:- Housing, Day Care, Respite Care, Domiciliary Care, Staff Training/Support, Terminal Care, Child Care, Drug Abusers. The Joint Planning Team commissioned the Social Services Department Planning & Research section to undertake a survey to enable the team to build up a picture of the services already available to those with H.I.V. related disease and the number of people requiring the services.

Results:-
1). The recommendation in these reports will act as a basis for health and local authority planning and service provision.
2). A comprehensive directory of local services for professionals working with people with H.I.V. disease has been produced.
3). During the last year a home for 2/3 people with H.I.V. disease has been established by a voluntary organisation in the borough. The Social Services department facilitates a drop-in coffee morning once a week for local people who are H.I.V. positive. The Health Authority provides health care to the residents as necessary.
4). Another home is planned for 1989. A project worker for this development has been funded by the Health Authority to facilitate the development of the homes and develop new initiatives between the voluntary organisation, Local Authority and the Health Authority.

E.537

COMMUNITY CAPACITY FOR COPING WITH HIV/AIDS

Wallman, Sandra. University College London;
IHCAR, Karolinska Institute, Stockholm, SWEDEN

Objectives: To development strategies to monitor resources and needs affecting community capacity to cope with HIV/AIDS; and to support local efforts to enhance that capacity in specified settings in Africa.
Methods: Longterm and interdisciplinary comparison of different types of community affected by the HIV/AIDS epidemic. Social research methods include ethnographic survey employing local people as interviewers; indepth case studies of family and household dynamics; focus group discussions; and Mass Observation diaries to monitor changes in community attitudes, organisation and levels of morale. All quantitative data will be stored on computer and a data base and monitor created.
Results: These materials will reveal local networks and support systems, sources and channels of communication and information, and the likely boundaries of social and sexual interaction and opportunity. The methods will provide a basis for qualitative studies of sexual relationships and decision-making lacking in KAP and general survey research to date.
Conclusions: Studies of coping in the face of crisis tend to focus on economic impact with little reference to general health or questions of community identity and morale. This programme will seek to clarify the balance of economic and affective elements. The systematic comparisons proposed will allow both the methods used and the findings on specific communities to be generalised for wider application.

E.538

PROBLEMS IN EVALUATING COMMUNITY-BASED AIDS EDUCATION PROGRAMMES

Clark, David*; Lyne, P.*; Roberts, B.* and Thoms, G.**
*Sheffield City Polytechnic, Sheffield, England; ** Shefffield Health Authority, Sheffield, England.

The paper reviews the development of evaluation frameworks and the emergence of the linear experiment paradigm, which is currently predominant in the evaluation of health promotion strategies. The limitations of this approach in the field of community-based AIDS education are discussed and the need for alternative evaluation strategies, incorporating concepts of utility and plurality, is emphasised.

Drawing on examples from the Sheffield AIDS Education Project, key obstacles to effective evaluation are outlined: epidemiological, sociological, political. The conflicting evaluation requirements of service providers and service planners are identified. The role of the evaluator is examined in relation to contrasting models, of inspector and consultant.

Examples are given of how these problems may be overcome in developing practical evaluation processes, agreed to be relevant at city level and proving applicable elsewhere.

E.539

AN ELECTRONIC INFORMATION AND EDUCATION SYSTEM ENHANCES COMMUNITY AIDS PROGRAMS

Jemison-Smith, Pearl*; Jemison, Jamie**; Beeson, Laurette*; Lacey, James**.
*University of California at Irvine, Orange, CA U.S.A.
**AIDS Coalition to Identify Orange County Needs (ACTION), Irvine, CA U.S.A.

Objective. To demonstrate the effectiveness of electronic communication in uniting community activities related to AIDS.
Methods. ACTION was established in 1984 to promote and facilitate education, planning, and coordination of efforts in Orange County. More than 50 agencies are currently involved in ACTION. Monthly meetings did not provide the needed communication in a rapid enough fashion. An electronic mail and conferencing system with up to the minute news, medical information and other data sources was implemented. The system, called AEGIS (for AIDS Education and Generalized Information Service), is easily accessible using a low cost terminal, modem and telephone line. Currently, no fees are charged for the service, which is inexpensive to operate.
Results. Participants are able to exchange information and ideas rapidly and accurately. Coordination of inter-organization events and projects is greatly simplified. People are better informed, and the decision making process is accelerated, while decision makers are better informed.
Conclusion. Electronic mail and conferencing systems can be implemented by, and are affordable to, organizations and agencies dealing with AIDS, and a substantial return on investment can be demonstrated.

E.540

COMMON BARRIERS: TOWARD AN UNDERSTANDING OF AIDS AND DISABILITY

Sands, James C.
B.C. Coalition of the Disabled, Vancouver, British Columbia, Canada

Objective. To examine how people with disabilities ought to understand AIDS.
Method. Literature review of books and articles on social aspects of AIDS compared with articles about Independent Living Movement. AIDS is examined from medical, legal and gay community perspectives with the intention of suggesting how the disabled community ought to view this disease.
Results. AIDS ought to be considered a disability by people living with other disabilities. Persons with AIDS share many common interests and barriers with the disabled community. The concept of Independent Living, defined as "a process whereby disabled citizen's achieve their desired individual lifestyle by assuming responsibility for the development and management of personal and community resources," can be useful in building understanding between these two groups.
Conclusion. Disability may be seen as a combination of physical and social factors. AIDS presents these factors in a unique way. Responses to the disease will add to understanding about self-help, self-care and Independent Living.

E.541

SOCIOLOGICAL CO-FACTORS IN THE PROGRESSION AND MORTALITY OF HIV DISEASE: BUREAUCRACY, GREED, HOMOPHOBIA AND RACISM.

Harrington, Mark; Bordowitz, G.; McCarthy, M.; Alderson, O.
AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To examine political, economic and social structures in the USA which impede access to health care and drug trials, delaying efforts to combat HIV. Methods: Analysis of drug development spending, clinical trials protocols, accural demographics, hospital and trials contracts and Federal legislation. Results: Structural deficits in the US health care delivery system include a 2-class medical system, with inadequate access to care for the poor, the slow pace of clinical trials, poor coordination among bureaucracies and the private sector, and the marginalization of groups most affected by HIV. New treat- ments are too costly for many. Congress barred funds from explicit AIDS education materials. Conclusion: The HIV epidemic has made acute the chronic inequities of health care in the USA. Health care delivery must become more equitable. Drug development should be streamlined to take advantage of new techniques and discoveries. Drugs should be provided for those unable to pay. AIDS prevention efforts must be frank and comprehensive. People living with AIDS must participate in all decisions affecting their lives.

E.542

ONE CONCEPT OF SUPPORTED HOUSING FOR PEOPLE WITH AIDS

KEELING Micheal , St Mungo Community Trust, London W6 U.K.

Objective To provide home-like, stress -free accomodation for people with AIDS who are in a respite condition, but who need to be near a hospital. Units are for three/four people

Method To develop 'caring ' families, who are grouped around a core person without AIDS. The accomodation provides bed and breakfast and all facilities for ordinary living. Bedrooms have en-suite bathrooms, there is a communalliving room. A visitors suite is provided.Support is provided by Local Goverment Domicillary Care and Health Service Community Nursing,Social Workers and Voluntary Organisations.

RESULTS Since 1987 6 people have been supported in the house, of whom three have died. Quality of life has been maintained and enhanced. Support has also been offered to families of people with AIDS.

CONCLUSION The first house, set up as an experiment has been successful in terms of appropriate service provision and cost effectiveness. Funding has now been agreed by the local Health Authority to fund a development worker for more projects.

E.543 THE COMMUNITY CARE AND RESIDENTIAL CARE NEEDS OF PEOPLE WITH AIDS IN CALGARY: REPORT FROM A DELPHI RESEARCH PROJECT

McDonald, John R.*; Natarajan, Than**

*University of Calgary, Calgary, Alberta, Canada: Executive Secretary, Health and Social Service Council, Diocese of Calgary. **Alberta Social Services, Calgary, Alberta, Canada.

Objective: To present results of a Delphi Study on residential care needs of people with AIDS in Calgary.
Methods: Interviewer-administered questionnaire examined the expert opinion of 19 persons central to AIDS community and residential care in this city of 650,000 people.
Results: While there was some disagreement, significant consensus emerged for generic hospital acute care services, a carefully and confidentiality protecting multidisciplined clinic, and an integrated hospice care service. (Results accepted for publication in the Canadian Journal of Palliative Care.)
Conclusions: Report concludes with series of recommendations for Calgary Community and for involvements of the Roman Catholic Diocese of Calgary.

E.544 REPORTED SKILLS DEFICITS IN THE USE OF CONDOMS IN A SURVEY OF GAY MEN.

Martin, David J.*, Edwards, C.W.**, Rhodes, F.***, and Corby, N.H.****.

*UCLA School of Medicine, Harbor-UCLA Medical Center, Torrance, California, **AIDS Intervention Project, Long Beach, California, ***California State University, Long Beach, California, ****Department of Public Health, Long Beach, California, USA.

Objective. To determine skills deficits in AIDS risk-reduction efforts among sexually active gay men.
Methods. A total of 425 gay/bisexual men were surveyed concerning their sexual practices at local Gay Pride events and among entrants into an ongoing AIDS-risk-reduction education program during the summer and fall of 1988, and their responses compared to those of 3,291 gay/bisexual men surveyed at an alternative test site for HIV antibody testing from December 1985 to February, 1987. In addition, they were queried regarding their use of condoms and lubricants used in anal intercourse.
Results. Compared to those surveyed in 1985-1987, gay men surveyed during 1988 reported reductions in the numbers of new sexual partners, and increases in reduced-risk sexual behaviors, including use of reduced-risk alternatives, and condoms for anal sex. Most reported use of appropriate condoms (latex rather than natural), but many reported use of inappropriate lubricants such as hand lotion, petroleum jelly, mineral oil, and vegetable oil, that increase the risk of condom breakage in anal intercourse.
Conclusion. These results suggest that ongoing efforts at AIDS-risk-reduction education require greater specificity in information regarding condom use, and may require greater specificity in other areas of risk-reduction information.

E.545 THE CHALLENGE OF AIDS IN AN AREA OF SCATTERED POPULATION AND LOW PREVALENCE

Tyson, Pat

Regional Joint AIDS Community Support Centre, 52 Clifton Road, Newcastle upon Tyne NE4 8DQ England.

Our AIDS and HIV figures are "normal" for the U.K. and very much lower than London - 28 AIDS cases and 254 diagnosed as HIV positive. We have encountered serious obstacles in pursuing our aim of developing non-hospital based care. Among the issues I would like to discuss are:

1. Medicalisation of care of people with AIDS.
2. Protectiveness/possessiveness of established carers - largely medical.
3. Lack of confidence of people with AIDS and medical providers in social workers.
4. Non-reality of AIDS as an issue in areas of normal (low) prevalence.
5. Social workers' perception of being de-skilled by HIV and its implications - is this an appropriate or inappropriate response?
6. Training - who and how to target training to social workers when AIDS is seen only in theory as a priority area, and in practice is seen not to be relevant to most social workers in a local authority.
7. Non-availability of substantial, vocal and cohesive groups of people with AIDS.

E.546 MYTHS AND REALITIES OF THE MIGRATION-AIDS RELATIONSHIP: THE CASE OF MEXICAN MIGRATION TO THE UNITED STATES

Bronfman, Mario*; Camposortega, S.* and Medina, H.**

*El Colegio de México, Mexico City, México, **CONASIDA, Mexico City, México.

The concern about the effect that movements across the frontiers -travelling, migration- may have on the dissemination of the HIV has generated a large number of proposals for action which, in general, imply taking a test and submitting some kind of certificate with the results. However, little has been researched with respect to the actual impact that temporary migration processes have on the dissemination of the HIV. The case of Mexican migration to the United States enables demonstrating the danger of jumping to conclusions. The analysis of the available information allows showing that while certain data confirm the existence of this relationship, other information weakens it.
The paper will include and up-dated analysis of the existing information about AIDS cases in Mexico and their migratory background. To this date, it has been found that some of the Mexican entities (provinces or states) which largely contribute to migration are over-represented in the distribution of AIDS cases in the country. There is also evidence that the majority of Mexican migration to the United States goes to those states with the highest prevalence of this ailment (California, Texas). Some preventive measures are suggested, as well as lines of action concerning this population group under risk.

E.547 PROJECT BEACH: A PEER APPROACH

Weise, Lynne Ann, Apson, J., Sivertson, D., Ryan, P.,
AIDS Administration DHMH, State of Maryland, U.S.A.

Outreach to the Beach is an HIV peer education and risk reduction outreach program targeting youth in a summer resort town. This program was designed to reach youth for exposure was high but educational and risk reduction messages were usually not available.

During the summer months, the population of Ocean City, a resort town on Maryland's Eastern Shore, increases from 37,000 to 250,000. Youth, who come to work in the local businesses for the summer or for a vacation, account for much of this increase. To reach these young people, three peer educators, ages 20-23, were stationed in this resort town for he summer.

Working out of the Ocean City Youth Health Center, these educators provided direct one-to-one outreach to young people on the beach, at private parties and on street corners known to be frequented for drugs and/or sex. In addition, they coordinated a 24-hour AIDS Hotline, offered to local businesses employing a large number of young people, established temporary free condom distribution sites, sponsored "Safer Sex Nights" at area nightclubs, and administered KAB surveys. They also served as pre/post-HIV test counselors for the health center.

These three educators made 2,970 direct one-to-one contacts, distributed over 10,000 condoms, and administered 500 KAB surveys. Ninety percent of the local businesses contacted agreed to make AIDS literature available to their youth employees. Overall condom distribution for the area served increased by 300% during the summer months.

E.548 ANDROLOGICAL FEATURES IN HIV1 INFECTED PATIENTS

Brockmeyer, N.H., Mertins, L., Gocs, M.
University Essen, Dept. of Dermatology, FRG

We performed a complete clinical and laboratory andrological examination in 20 HIV1 infected patients at state WR 3-5 and a minimum Karnovsky index of o.7. Diagnostic measures included registration of quantity, motility and morphology of spermatozoes, cultural and immunological assessment of microbiological parameters in sperm and serumanalysis of Testosteron, FSH and LH. In all patients analysis of spermatozoes and seminal plasma revealed a higher incidence of abnormally shaped and immobilized spermatozoes compared to normal values in our laboratory.
The quantity of spermatozoeswas diminished only in patients at state WR4 and 5. Zidovudine treatment caused an aggravation of morphological and functional damage and a further diminuition of spermatozoic numbers. In spiteof remarkable loss of libido no alterations of endocrinological parameters (LH, FSH and Testosteron) were found neither in Zidovudine treated patients nor in patients not receiving the drug. Compared to normal values in our laboratory there was no increase of leucocyte numbers or microbes in seminal plasma. We found, however, in one case a contamination with Shigella not accompanied by clinical or laboratory signs of Shigella infection in other organ systems.

E.549 CONTRACEPTIVE PRACTICES AND THEIR PERCEIVED EFFECTIVENESS IN PREVENTING HIV INFECTION AMONG FEMALE COLLEGE STUDENTS

Theocharis,Theocharis;Sy,F;Richter,D;Hussey,J and Summers,D.
University of South Carolina School of Public Health,
Columbia, SC, USA

Objective. To describe contraceptive practices of female college students and to determine their perception of the effectiveness of these practices against HIV.
Methods. 334 randomly selected, female undergraduate students, responded to a questionnaire in October 1988 in a major southeastern United States university. Data collected included demographic information, frequency of use of contraceptive methods, and the women's perception of effectiveness of these contraceptive methods in preventing HIV infection.
Results. The students' knowledge of effectiveness of contraceptive methods as a barrier against HIV was high. Most were able to identify condoms as an effective method to prevent HIV infection. 48% of the sexually active women reported using birth control pills as their main method of contraception, whereas only 18% reported regular condom use.
Conclusion. College students appear to have a high level of knowledge about HIV but only a few actually report regular condom use. More educational efforts should be aimed at changing behavior with emphasis on regular condom use for preventing HIV infection.

E.550 WILLINGNESS TO PARTICIPATE IN A NATIONWIDE SEROPREVALENCE STUDY

Bartholomeyczik, S.*, Devine, Owen**, Darrow, W.W.**, Dawson, D.A.***. *Centers for Disease Control, Atlanta, Georgia, USA (German Academic Exchange Service) and Federal Health Office, West-Berlin, FRG, **Centers for Disease Control, Atlanta, Georgia, and ***Hyattsville, Maryland, USA

Objective. To associate levels of knowledge, perceptions of risk, demographic and experience factors with a decision to participate in a nationwide seroprevalence study of HIV infection.
Methods. In 1987, the US National Health Interview Survey (NHIS) added an AIDS supplement that concluded with a question on the willingness to participate in a hypothetical nationwide seroprevalence study. Univariate and multivariate analyses (logistic regression) were used to identify factors which might influence participation.
Results. 69% were willing to participate, 21% unwilling, 7% unsure. Widowed (53% willing), older (>64 yr, 55%) and less educated respondents (<12 yr. of school: 63%) were least willing. Those with higher levels of AIDS-related knowledge (74%), higher perception of risk (78%) and greater awareness of tested people (80%) were more likely to participate. Multivariate analyses indicated that each of the three AIDS-related variables was a better predictor of willingness to participate than sociodemographic variables.
Conclusion. Those with sociodemographic characteristics most dissimilar to reported AIDS cases were least willing to participate. However, higher AIDS-related knowledge, higher perception of risk, and greater awareness of tested people were associated with a greater willingness to participate.

Éducation
Education

E.551 DEAF COMMUNITY AIDS/HIV EDUCATION IN DALLAS

Larro, M.*; Sibley, K.**; Freeman, A.C.*, Haley, Charles E.*
*Dallas County Health Department, Dallas, Texas, U.S.A.,
**Gallaudet Regional Center, Dallas, Texas, U.S.A.

Objective. To make AIDS/HIV education accessible for deaf and hearing impaired people. Methods. Deaf HIV education began with installation of a TDD (telecommunications device for the deaf) hotline at the health department. The TDD hotline number for HIV telephone information, counseling, and antibody testing appointments was the first in the U.S. Personal contacts with social service and education agencies serving the deaf community increased the health department'- visibility among the service providers and the target population. A six-part series of AIDS and safer sex workshops was developed with emphasis on practical and visual teaching methods. Deaf agency professionals were trained to help address HIV issues. Over three hundred deaf people attended the HIV workshops. The health department, along with other deafness and AIDS service agencies established the Dallas County Deaf AIDS Task Force to focus attention on education, prevention and service delivery for a population not reached by television and radio. School curriculum was developed and used to teach deaf high school students about HIV and prevention techniques. Results. Deaf people called the TDD for information, counseling, referrals, and for HIV antibody testing. The outreach education efforts provided a resource that assisted in mobilizing the deaf community to implement their own independently funded AIDS education program and to host the Southwest Conference on AIDS and Deafness. Conclusion. HIV education and services for the hearing impaired in Dallas now serve as a model for other communities.

E.552 AIDS KNOWLEDGE AND ATTITUDES OF ADULT LATINO STUDENTS IN ENGLISH-AS-A-SECOND-LANGUAGE CLASSES

Rivera, Y.; Petty, B.A.; Krepcho, M.A.; Haley, Charles E.
Dallas County Health Dept., Dallas, TX, USA

Objective. To evaluate adult Hispanics' change in knowledge of AIDS transmission and related attitudes following an AIDS education presentation. Method. A 16 - question survey was administered to adult Latinos through the English-as-a-Second-Language (ESL) classes prior to the AIDS presentation. The class provided information transmission, prevention, and sources of further information. A post-test was given to the students two weeks later. Results. The pretest was completed by 433 students in 8 schools. We received 171 completed post-tests. 48% of the respondents were male, and 50% were married. The percentage of correct answers increased significantly (p<.01) for six of nine transmission questions. Knowledge on sources of information increased from 13.6% to 63.2% (p<.0001). Scores on four transmission questions did not improve significantly since the pretest scores were over 75-93% correct.
Conclusions. Test-taking difficulties may be attributed to low literacy levels and resolved by a graphic/illustrated test format. The increases in knowledge on transmission are encouraging for our objective of reducing fear and raising risk behavior awareness.

E.553 AIDS-RELATED ISSUES: A PROFILE OF HEALTH CARE PROVIDERS SERVICING MINORITY PATIENTS

DeLoris L-James Hunter*, W.L. Greaves*, P. Carr*, W.A. Alexander**, C.R. Jonas***, S.J. Shacks****, F. Thomas*****, *Howard University, Washington, DC ** Morehouse College of Medicine, Atlanta, GA *** Detroit Medical Society, Detroit, MI **** Charles R. Drew Postgraduate Medical School, Los Angeles, CA ***** Meharry Medical College, Nashville, TN.
U.S.A.

Objective. This study sought to establish a general profile of attitudes, practices and perceptions about AIDS among health care providers who serve primarily minority patients within an urban setting.

Method. The sample of 51 predominately Black male (22) and female (29) respondents, including clinicians (50%) and other health care providers (50%), were asked to complete an 11 item questionnaire while attending a regional minority focused HIV conference. The questionnaire was developed based on a revision of selected items from the June, 1988 National Health Interview Survey, Advanced Data Report of the National Center for Statistics.

Results. An item analysis of the data revealed a recurring theme that the respondents questioned--the degree of risk for HIV infection for the general population. When asked whether they thought the risk factor was a matter of debate, the majority (98%) overwhelmingly agreed. In fact, the respondents felt that health officials conveyed a feeling of ambivalence (86%) about AIDS. Moreover, many reported that reliable and pertinent data on the incidence of HIV-1 infection was relatively sparse among the medical community (78.4%). In support of these views, the data also revealed a definite interest in seeking "real" answers to the national rate of HIV infection in the general population. The vast majority (98%) reported that, if asked to participate in a national seroprevalence study of HIV infection, they definitely would say "yes"!

An assessment of the data regarding gender and profession provided additional insight into the factors which should possibly be addressed in training activities and educational programs for health care professionals providing services to minorities who may exhibit high risk behaviors for HIV infection. Recommendations and implications for further research were indicated.

E.554 AIDS RELATED DENIAL AND ITS IMPACT ON THE AFRO-AMERICAN COMMUNITY

Williams, Dan K., ACT UP (AIDS Coalition to Unleash Power) New York, U.S.A.

Objective. To discuss AIDS related denial and how it has impacted the Afro-American community. By investigating the greatly muted response from the community a connection will be made between this reaction and its cause and effect.
Methods. This goal will be reached with imput from leaders within the Afro-American community along with research provided by educators working with this problem.
Results. Showing the correlation between the muted response fror the community and the concerns of stigmatization. We will demonstrate where stigmas have affected the community and how that history creates an atmosphere of mistrust. The end result being one where the community feels a necessity to shelter itself at almost any cost.
Conclusion. The necessity for AIDS educators and administrators to be aware of the specific needs and concerns of the Afro-American community. The need for all parties concerned to open all channels of communication so that unnecessary suffering can be alleviated has to be addressed. This problem is presented in the in the context of the Afro-American community but could represent numerous other communities affected by the AIDS crisis.

WORCESTER LATINO AIDS NETWORK

Sanchez, Luis Arturo*, Ortiz-Ortiz, L*; Collazo, J.**; Paluyera, L.****; Morales, R.****; Trillo, S.***; *Worcester City Health Department; **Worcester Area Community Mental Health Center; ***AIDS Project Worcester; ****San Juan Lutheran Church, Worcester, Massachusetts, USA.

Objective: To develop effective strategies for AIDS education and risk reduction for Latinos using resources within the Latino Community.
Methods: Through the efforts of the Worcester City Health Department, community service agencies, and Latino community leaders, a Latino AIDS Network was established. The following areas of need were identified: 1-Education/Prevention through Local Media, 2-Education/Prevention for high risk groups; 3-Education for Providers; 4-Education/Prevention for children; 5-Support services for HIV infected Latinos and their families.
Results: The following strategies have been implemented in each area of need: 1-A weekly radio program in Spanish with audience participation dealing with issues around AIDS; 2- Outreach in Night Clubs with distribution of educational materials and bleach/condoms; 3-An AIDS curriculum in Spanish for bilingual providers that work in Human service agencies and a library with videos directed toward minority communities; 4-The Worcester School Department and the Network has developed and translated into Spanish, a High School AIDS Curriculum; 5-A support group for Spanish speaking HIV infected Latinos and concerned others has been established.
Conclusion: A comprehensive AIDS education and risk reduction program directed toward the Latino community was established in the second largest city in New England. This model may be applied to other urban communities.
